Example 2: Define a scalar function that returns the tangent of a value using the existing sine and cosine functions:

```
CREATE FUNCTION TAN (X DOUBLE)
RETURNS DOUBLE
LANGUAGE SQL CONTAINS SQL NO EXTERNAL ACTION
DETERMINISTIC
RETURN SIN(x)/COS(x)
```

SIGNAL statement (SQL PL)

The SIGNAL statement is used to return an exception or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text. The SIGNAL statement places the specified condition information in the cleared diagnostics area.

Syntax

signal-information:

SET MESSAGE_TEXT = diagnostic-string-expression
(diagnostic-string-expression) ¹

Notes:

¹ (diagnostic-string-expression) must only be specified within a trigger body.

Description

label

Specifies the label for the SIGNAL statement. A label name cannot be the same as the routine name, advanced trigger name, or another label within the same scope. For additional information, see [“References to SQL labels in SQL PL”](#) on page 2260.

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATES:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

In the context of a MERGE statement, the following rules also apply:

- The SQLSTATE class (first two characters) cannot be '01' or '02', because these are not error classes.
- If the SQLSTATE class starts with the numbers '0' through '6' or the letters 'A' through 'H', the subclass (the last three characters) must start with a letter in the range of 'I' through 'Z'.
- If the SQLSTATE class starts with the numbers '7', '8', '9', or the letters 'I' through 'Z', the subclass can be any of '0' through '9' or 'A' through 'Z'.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

SQL-variable-name* or *SQL-parameter-name

Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name

Specifies an SQL variable that is declared within the *compound-statement* that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name

Specifies an SQL parameter that is defined for the routine and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name

Specifies the name of the condition that will be returned. The *SQL-condition-name* must be declared within the compound statement that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested.

SET MESSAGE_TEXT

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see [“GET DIAGNOSTICS statement” on page 1996](#).

(diagnostic-string-expression)

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see [“GET DIAGNOSTICS statement” on page 1996](#).

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of Db2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATES based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- If the compound statement is nested and the outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If the SQLSTATE or condition indicates that a warning or not found condition is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- Otherwise, the warning or not found condition is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The SIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or *condition-name*. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or *condition-name*.

Examples

- The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
    (IN ONUM INTEGER, IN CNUM INTEGER,
     IN PNUM INTEGER, IN QNUM INTEGER)
LANGUAGE SQL
SPECIFIC SUBMIT_ORDER
MODIFIES SQL DATA
BEGIN
```

```

DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
  SIGNAL SQLSTATE '75002'
    SET MESSAGE_TEXT = 'Customer number is not known';
INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
  VALUES (ONUM, CNUM, PNUM, QNUM);
END

```

- The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```

CREATE TRIGGER CK_AVAIL
NO CASCADE BEFORE INSERT ON ORDERS
REFERENCING NEW AS NEW_ORDER
FOR EACH ROW MODE DB2SQL
WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                             WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
BEGIN ATOMIC
  SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
END

```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax

Description

label

Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label. A label name cannot be the same as the routine name, advanced trigger name, or another label within the same scope. For additional information, see [“References to SQL labels in SQL PL” on page 2260](#).

search-condition

Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statements in the loop are executed.

SQL-procedure-statement

Specifies a statement to be run within the WHILE loop. The statement must be one of the statements listed under [“SQL-procedure-statement \(SQL PL\)” on page 2262](#).

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the WHILE statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: With each iteration of the WHILE statement, when the first SQL-procedure-statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search condition of that WHILE statement. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect

the successful completion of that statement. Otherwise, after the END WHILE of the WHILE statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating that search condition of that WHILE statement.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable *at_end*, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
  FETCH c1 INTO
    v_firstname, v_midinit,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN SET at_end=1;
END IF;
END WHILE;
```

Appendix A. Limits in Db2 for z/OS

Db2 for z/OS has system limits, object and SQL limits, length limits for identifiers and strings, and limits for certain data type values.

System storage limits might preclude the limits specified in this section. The limit for items not that are not specified below is limited by system storage.

Identifier length limits

The following table shows the length limits for identifiers.

Table 247. Identifier length limits. The term *byte(s)* in this table means the number of bytes for the UTF-8 representation unless noted otherwise.

Item	Limit
External-java-routine-name	1305 bytes
Name of an alias “1” on page 2300 , auxiliary table, collection, clone table, constraint, correlation, cursor (except for DECLARE CURSOR WITH RETURN or the EXEC SQL utility), Db2 REST service, distinct type (both parts of two-part name), function (both parts of two-part name), host identifier, index, JARs, parameter, procedure, role, schema, sequence, specific, statement, storage group, savepoint, SQL condition, SQL label, SQL parameter, SQL variable, synonym, table, trigger, view, XML attribute name, XML element name	128 bytes
Name of an authorization ID or name of a security label.	8 bytes
Version identifier for a routine or Db2 REST service	64 EBCDIC bytes, and the UTF-8 representation of the name must not exceed 122 bytes.
Name of a column	128 bytes “1” on page 2300
Name of cursor that is created with DECLARE CURSOR WITH RETURN	30 bytes
Name of cursor that is created with the EXEC SQL utility	8 bytes
Name of a location	16 bytes
Name of a database, table space, index space, or buffer pool	8 bytes
Name of a plan or program	8 bytes
Name of a package	8 bytes (Only 8 EBCDIC characters are used for packages that are created with the BIND PACKAGE command. 128 bytes can be used for packages that are created as a result of the CREATE FUNCTION (SQL scalar) statement, the CREATE PROCEDURE (SQL - native) statement, the CREATE TRIGGER statement, or a BIND command that specifies a zFS file as DBRM library.)

Table 247. Identifier length limits. The term *byte(s)* in this table means the number of bytes for the UTF-8 representation unless noted otherwise. (continued)

Item	Limit
Name of a profile that is created with CREATE TRUSTED CONTEXT or ALTER TRUSTED CONTEXT	127 bytes
Name of an ICF catalog.	8 bytes

Notes:

1. The 128 byte limit for the length column names is in effect when the TABLE_COLUMN_NAME_EXPANSION system parameter is on. Otherwise the limit for column names is 30 bytes. The limit is for the column name in UTF8, and its equivalent in the system EBCDIC CCSID. In a data sharing environment, it is recommended that this system parameter be enabled for all members of the data sharing group. However, there are some restrictions on the use of column names longer than 30 bytes. For more information, see [“Column names longer than 30 bytes”](#) on page 229.

Numeric limits

The following table shows minimum and maximum limits for numeric values in Db2 for z/OS.

Table 248. Numeric limits

Item	Limit
Smallest SMALLINT value	-32768
Largest SMALLINT value	32767
Smallest INTEGER value	-2147483648
Largest INTEGER value	2147483647
Smallest BIGINT value	-9223372036854775808
Largest BIGINT value	9223372036854775807
Smallest REAL value	About -7.2×10^{75}
Largest REAL value	About 7.2×10^{75}
Smallest positive REAL value	About 5.4×10^{-79}
Largest negative REAL value	About -5.4×10^{-79}
Smallest FLOAT value	About -7.2×10^{75}
Largest FLOAT value	About 7.2×10^{75}
Smallest positive FLOAT value	About 5.4×10^{-79}
Largest negative FLOAT value	About -5.4×10^{-79}
Smallest DECIMAL value	$1 - 10^{31}$
Largest DECIMAL value	$10^{31} - 1$
Largest decimal precision	31
Smallest DECFLOAT(16) value ¹	$-9.999999999999999 \times 10^{384}$
Largest DECFLOAT(16) value ¹	$9.999999999999999 \times 10^{384}$
Smallest positive DECFLOAT(16) value ¹	$1.000000000000000 \times 10^{-383}$
Largest negative DECFLOAT(16) value ¹	$-1.000000000000000 \times 10^{-383}$

Table 248. Numeric limits (continued)

Item	Limit
Smallest DECFloat(34) value ¹	-9.999999999999999999999999999999x10 ⁶¹⁴⁴
Largest DECFloat(34) value ¹	9.999999999999999999999999999999x10 ⁶¹⁴⁴
Smallest positive DECFloat(34) value ¹	1.000000000000000000000000000000x10 ⁻⁶¹⁴³
Largest negative DECFloat(34) value ¹	-1.000000000000000000000000000000x10 ⁻⁶¹⁴³
Coefficient length for DECFloat values	DECFloat(16) is 16 digits; DECFloat(34) is 34 digits
Maximum Exponent (E _{max}) for DECFloat values	DECFloat(16) is 384; DECFloat(34) is 6144
Minimum Exponent (E _{min}) for DECFloat values	DECFloat(16) is -383; DECFloat(34) is -6143
Bias for DECFloat values	DECFloat(16) is 398; DECFloat(34) is 6176

Note:

1. These are the limits for normal numbers in DECFLOAT. DECFLOAT also contains special values such as NaN and Infinity that are also valid. DECFLOAT also supports subnormal numbers that are outside of the documented range.

String length limits

The following table shows the length limits for strings in Db2 for z/OS.

Table 249. String length limits

Item	Limit
Maximum length of CHAR	255 bytes
Maximum length of GRAPHIC	127 double-byte characters
Maximum length of BINARY	255 bytes
Maximum length “1” on page 2303 of VARCHAR	• 4046 bytes for a column in a table in a table space with 4 KB pages • 8128 bytes for a column in a table in a table space with 8 KB pages • 16320 bytes for a column in a table in a table space with 16 KB pages • 32704 bytes for a column in a table in a table space with 32 KB pages Otherwise, 32704 bytes
Maximum length of VARCHAR that can be indexed by an XML index	1000 bytes after conversion to UTF-8

Table 249. String length limits (continued)

Item	Limit
Maximum length “1” on page 2303 of VARCHAR	• 2023 double-byte characters for a column in a table in a table space with 4 KB pages • 4064 double-byte characters for a column in a table in a table space with 8 KB pages • 8160 double-byte characters for a column in a table in a table space with 16 KB pages • 16352 double-byte characters for a column in a table in a table space with 32 KB pages Otherwise, 16352 double-byte characters
Maximum length “1” on page 2303 of VARBINARY	• 4046 bytes for a column in a table in a table space with 4 KB pages • 8128 bytes for a column in a table in a table space with 8 KB pages • 16320 bytes for a column in a table in a table space with 16 KB pages • 32704 bytes for a column in a table in a table space with 32 KB pages Otherwise, 32704 bytes
Maximum length of CLOB	2147483647 bytes (2 GB - 1 byte)
Maximum length of DBCLOB	1073741823 double-byte characters
Maximum length of BLOB	2147483647 bytes (2 GB - 1 byte)
Maximum length of a character constant	32704 UTF-8 bytes
Maximum length of a hexadecimal character constant	32704 hexadecimal digits
Maximum length of a graphic string constant	16352 double-byte characters (32704 bytes when expressed in UTF-8)
Maximum length of a hexadecimal graphic string constant	32704 hexadecimal digits
Maximum length of a text string used for a scalar expression	4000 UTF-8 bytes
Maximum length of a concatenated character string	2147483647 bytes (2 GB - 1 byte)
Maximum length of a concatenated graphic string	1073741824 double-byte characters
Maximum length of a concatenated binary string	2147483647 bytes (2 GB - 1 byte)
Maximum length of XML pattern text	4000 bytes after conversion to UTF-8
Maximum length of an XML element or attribute name in an XML document	1000 bytes
Maximum length of a namespace uri	1000 bytes
Maximum length of a namespace prefix	998 bytes
Largest depth of an internal XML tree	128 levels

Table 249. String length limits (continued)

Item	Limit
------	-------

Note:

1. The maximum length can be achieved only if the column is the only column in the table. Otherwise, the maximum length depends on the amount of space remaining on a page.

Datetime limits

The following table shows the minimum and maximum limits for datetime values in Db2 for z/OS.

Table 250. Datetime limits

Item	Limit
Smallest DATE value (shown in ISO format)	0001-01-01
Largest DATE value (shown in ISO format)	9999-12-31
Smallest TIME value (shown in ISO format)	00.00.00
Largest TIME value (shown in ISO format)	24.00.00
Smallest TIMESTAMP WITHOUT TIME ZONE value	0001-01-01-00.00.00.000000000000
Largest TIMESTAMP WITHOUT TIME ZONE value	9999-12-31-24.00.00.000000000000 “1” on page 2303
Smallest TIMESTAMP WITH TIME ZONE value	0001-01-01-00.00.00.000000000000 +00:00
Largest TIMESTAMP WITH TIME ZONE value	9999-12-31-24.00.00.000000000000 +00:00 “1” on page 2303
TIMESTAMP precision range	0 to 12
TIME ZONE hour range	-24 to 24
TIME ZONE minute range	0 to 59

Note:

1. The maximum value is stated as a UTC value. When a timestamp without a time zone is compared to a timestamp with time zone, a necessary adjustment is made using the implicit time zone. During that adjustment, the timestamp without time zone could be converted to a value that is greater than the maximum value for a timestamp with time zone value (this could occur on operations such as comparison and assignment). This situation can be avoided by using '9999-12-30-00.00.00.000000000000' as the maximum value for timestamp without time zone and '9999-12-30-00.00.00.000000000000 +00:00' as the maximum value for timestamp with time zone columns.

SQL statement limits

The following table shows the Db2 limits on SQL statements in Db2 for z/OS.

Table 251. Db2 limits on SQL statements

Item	Limit
Maximum number of columns that are in a table or view (the value depends on the complexity of the CREATE VIEW statement) or columns returned by a table function.	750 or fewer (including hidden columns) 749 if the table is a dependent

Table 251. Db2 limits on SQL statements (continued)

Item	Limit
Maximum number of columns that can be referenced in the target of MERGE statement.	749
Maximum number of expressions that can be referenced in the source of a MERGE statement.	750
Approximate maximum number of base tables in a SELECT, UPDATE, INSERT, MERGE, or DELETE statement or view	1024
Maximum number of tables in a FROM clause	225 or fewer, depending on the complexity of the statement
Maximum number of rows inserted with a single MERGE statement or FOR <i>n</i> ROWS form of INSERT statement	32767
Maximum row and record sizes for a table	See “Maximum record size” on page 1752 .
Maximum number of volume IDs in a storage group	133
Maximum number of partitions in a partitioned table space or partitioned index	4096 for most table space types, depending on the DSSIZE value and buffer pool page size. 64 for table spaces not defined with a DSSIZE greater than 2GB (or the LARGE clause “1” on page 2307).
Maximum sum of the lengths of limit key values of a partition boundary	765 UTF-8 bytes
Maximum size of a partition (table space or index)	For partition-by-range table spaces with relative page numbering: 1 TB For table spaces that are defined with a DSSIZE greater than 4 GB: 256 GB, depending on the page size (for 1 to 64 partitions for 4 KB pages, for 1 to 128 partitions for 8 KB pages, for 1–256 partitions for 16 KB pages, and 1–512 partitions for 32 KB pages) For table spaces that are defined with a DSSIZE of 4 GB (or the LARGE clause “1” on page 2307): 4 GB, for 1–4096 partitions For table spaces with a DSSIZE not greater than 2 GB (and not defined with the LARGE clause “1” on page 2307): 4 GB, for 1–16 partitions 2 GB, for 17–32 partitions 1 GB, for 33–64 partitions

Table 251. Db2 limits on SQL statements (continued)

Item	Limit
Maximum size of a non-partitioned index for a partitioned table space	For 5-byte EA table spaces: 16 TB for 4 KB pages 32 TB for 8 KB pages 64 TB for 16 KB pages 128 TB for 32 KB pages For table spaces that are defined with the LARGE clause “1” on page 2307: 16 TB
Maximum length of an index key	• Partitioning index: $255 - n$ • Nonpartitioning index that is padded: $2000 - n$ • Nonpartitioning index that is not padded: $2000 - n - 2m - 3d$ n Number of columns in the key that allow nulls m Number of varying-length columns in the key d Number of DECFLOAT columns in the key
Maximum number of bytes used in the partitioning of a partitioned index	255 (This maximum limit is subject to additional limitations, depending on the number of partitions in the table space. The number of partitions * (106 + limit key size) must be less than 65394.)
Maximum number of columns in an index key	64
Maximum number of expressions in an index key	64
Maximum number of subqueries in a statement	224
Maximum total length of host and indicator variables pointed to in an SQLDA	32767 bytes 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum size of application SQLDA for any statement that references host variables or parameter markers	99016 bytes
Maximum length of host variable used for insert or update operation	32704 bytes for a non-LOB 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum number of host variables or parameter markers in a statement	16000 for a distributed application that originated from a client other than z/OS. Otherwise: • 2205 for an application without any LOB or distinct type host variables or parameter markers • 750 for an application with one or more LOB or distinct type host variables or parameter markers

Table 251. Db2 limits on SQL statements (continued)

Item	Limit
Maximum length of an SQL statement	2097152 bytes
Maximum number of elements in a select list	750 or fewer, depending on whether the select list is for the result table of static scrollable cursor “2” on page 2307
Maximum number of elements in an IN list “3” on page 2307	32767
Maximum number of predicates in a WHERE or HAVING clause	Limited by storage
Maximum number of elements in a CUBE grouping	16
Maximum total length of columns of a query operation requiring sort and evaluating aggregate functions (MULTIPLE DISTINCT and GROUP BY)	65529 bytes
Maximum length of a sort key	32707 bytes
Maximum length of a check constraint	3800 bytes
Maximum number of bytes that can be passed in a single parameter of an SQL CALL statement	32765 bytes for a non-LOB 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations imposed by the application environment and host language
Maximum number of stored procedures, triggers, and user-defined functions that an SQL statement can implicitly or explicitly reference	64 nesting levels
Maximum number of parameters in a procedure or function	The SQL statement that contains the parameter list cannot exceed the maximum length of an SQL statement.
Maximum length of the SQL path	2048 bytes
Maximum length of a WLM environment name in a CREATE PROCEDURE, CREATE FUNCTION, ALTER PROCEDURE, or ALTER FUNCTION statement.	32 bytes
Maximum number of XPath level in the XMLPATTERN clause of the CREATE INDEX statement.	50 nesting levels

Table 251. Db2 limits on SQL statements (continued)

Item	Limit
Note:	
1. The LARGE keyword is tolerated for compatibility with DB2 version 5, but only if the DSSIZE clause is not specified. The DSSIZE clause is recommended for specifying a 4 GB or larger maximum partition size. For more information, see “Non-large table spaces (deprecated)” on page 1784.	
2. If the scrollable cursor is read-only, the maximum number is 749 less the number of columns in the ORDER BY that are not in the select list. If the scrollable cursor is not read-only, the maximum number is 747.	
3. FL 503 The limit of 32767 (32K) elements in the IN list of an IN predicate can be exceeded, if all of the following conditions are true and the query runs on a version 7 accelerator, which uses IBM Db2 Warehouse to process SQL statements:	
• Query acceleration is enabled and requested for the query. For more information, see Enabling acceleration of SQL queries (Db2 Performance) .	
• The application runs at Db2 application compatibility level V13R1M503 or higher.	
• Option 12 is specified in the list of values for the QUERY_ACCEL_OPTIONS subsystem parameter.	
• The target accelerator is IBM Db2 Analytics Accelerator for z/OS version 7.	
• The IN list specifies only SQL constants.	
• The query can be functionally supported by the target accelerator and IBM Db2 Warehouse.	
When such queries run on a version 7 accelerator, the enforcement of any limits on the number of elements in the IN list predicate is handled by IBM Db2 Warehouse, instead of Db2 for z/OS. IBM Db2 Warehouse has no documented limit for elements in an IN list. However, practical limitations such as the memory and processing resources available for the query in IBM Db2 Warehouse are still likely to impose some limit on the number of elements that can be specified in the IN list predicate.	
For more information, see "Accelerator-only support for more than 32K elements in an IN list" in “IN predicate” on page 312.	

System limits

The following table shows the Db2 system limits in Db2 for z/OS.

Table 252. Db2 system limits

Item	Limit
Maximum number of concurrent Db2 or application agents	Limited by the EDM pool size, buffer pool size, and the amount of storage that is used by each Db2 or application agent
Maximum number of concurrently active audit policies	FL 506 64
Maximum size of a table in a partition-by-growth (PBG) table space or partition-by-range (PBR) table space with absolute page numbering	128 terabytes (TB)
Maximum size of a table in a partition-by-range table space with relative page numbers (PBR RPN)	4096 terabytes (TB)
Maximum size of a simple or segmented table space	64 GB
Maximum size of a physical log record	36,000 bytes
Maximum size of a log space	6-byte format: 2 ⁴⁸ bytes 10-byte format: 2 ⁸⁰ bytes

Table 252. Db2 system limits (continued)

Item	Limit
Maximum size of an active log data set	768 GB minus 1 byte
Maximum size of an archive log data set	768 GB minus 1 byte
Maximum number of active log copies	2
Maximum number of archive log copies	2
Maximum number of active log data sets (each copy)	FL 508 1000
Maximum number of archive log volumes (each copy)	FL 508 14500
Maximum number of databases accessible to an application or user	Limited by system storage and EDM pool size
Maximum number of databases	65217
Maximum number of implicitly created databases	Maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, with a default of 10000
Maximum number of internal objects for each database ¹	32767
Maximum number of indexes on declared global temporary tables	10000
Maximum size of an EDM pool	The installation parameter maximum depends on available space
Maximum number of rows per page	255 for all table spaces except catalog and directory tables spaces, which have a maximum of 127
Maximum simple or segmented data set size	2 GB
Maximum partitioned data set size	See item "maximum size of a partition" in Table 251 on page 2303
Maximum LOB data set size	256 GB
Maximum number of data sets for a LOB table space	254
Maximum storage per thread for LOB data	2 GB
Maximum number of table spaces that can be defined in a work file database	500
Maximum number of tables and triggers that can be defined in a work file database	11767
Maximum number of active profiles in DSN_PROFILE_TABLE profile table	4096
Maximum number of DSN_VIRTUAL_INDEXES rows with ENABLE='Y' used by Db2	4096
Maximum number of DSN_VIRTUAL_KEYTARGETS rows with ENABLE='Y' used by Db2	4096

Table 252. Db2 system limits (continued)

Item	Limit
Note:	
1. The number of internal object descriptors (OBDs) for external objects are as follows:	
• Table space: 2 • Table: 1 • Index: 2 • Check constraint: 1 • Referential integrity relationship: 2 • Auxiliary relationship for each LOB column: 1 • XML relationship for each XML column: 1 • Trigger: 1 • View that has an INSTEAD OF trigger: 1	

Appendix B. Reserved schema names and reserved words in Db2 for z/OS

Restrictions exist on the use of certain words that are used by Db2 for z/OS. In some cases, these names are reserved and cannot be used by application programs. In other cases, certain names are not recommended for use by application programs though not prevented from being used by the database manager.

Reserved schema names in Db2 for z/OS

In general, for certain objects, schema names that begin with the prefix SYS are reserved. The schema name for these objects cannot begin with SYS except for certain exceptions.

The schema name for the objects listed in the following table must follow the restrictions listed in the table.

Recommendations:

- Do not to use SESSION as a schema name.
- Do not use SYSPUBLIC as a schema name for a table or view.

Table 253. Objects with schema name restrictions and exceptions.		
Object	Schema name restriction	Schema name exceptions
Distinct types	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS¹
User-defined functions	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS¹ • SYSFUN²
Stored procedures	Cannot begin with SYS	The schema name can be: • SYSADM • SYSFUN² • SYSIBM • SYSIBMADM • SYSPROC • SYSTOOLS¹
Sequences	Cannot begin with SYS	The schema name can be: • SYSADM
Triggers	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS¹

Table 253. Objects with schema name restrictions and exceptions. (continued)

Object	Schema name restriction	Schema name exceptions
Column masks	Cannot begin with SYS	The schema name can be: • SYSADM
Row permissions	Cannot begin with SYS	The schema name can be: • SYSADM
Notes: 1. If the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege. 2. For external user-defined scalar functions or external user-defined table functions if the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.

[Reserved words in Db2 for z/OS](#)

Reserved words in Db2 for z/OS

Keywords can be used as ordinary identifiers except in a context where they could also be interpreted as SQL syntax. When a keyword can be interpreted as SQL syntax the keyword is considered a *reserved word* in that context, which means that it cannot be used as an ordinary identifier. However, a keyword can be used as an identifier in a context where it is a reserved word, by specifying it as a delimited identifier. For example:

- ALL cannot be a column name in a SELECT statement, unless it is delimited. However, if the quotation mark (") is the escape character that begins and ends delimited identifiers, "ALL" can be used as a column name in a SELECT statement.
- COUNT cannot be used as a column name in a SELECT statement, unless it is also specified as delimited.

New reserved words for Db2 13 are identified by note [“1” on page 2321](#) in the following table. Some topics in this information might also indicate words that cannot be used in the specific context that is being described.

IBM SQL also has additional reserved words that Db2 for z/OS does not enforce. Therefore, you should not use these additional reserved words as ordinary identifiers in names that have a continuing use. For a list

of these reserved words, see  [SQL Reference for Cross-Platform Development - Version 7](#).

Table 255. Actions allowed on SQL statements in Db2 for z/OS (continued)

SQL statement	Executable	Interactively or dynamically prepared	Processed by		
			Requesting system	Server	Precompiler or coprocessor

Note:

1. The statement can be dynamically prepared. It cannot be issued dynamically.
2. The statement can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.
3. The statement can be dynamically prepared, but only from an ODBC or CLI driver that supports dynamic CALL statements.
4. The requesting system processes the PREPARE statement when the statement being prepared is ALLOCATE CURSOR or ASSOCIATE LOCATORS.
5. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only when DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.
6. This statement can be used only in the triggered action of a trigger.
7. Local special registers can be referenced in a VALUES INTO statement if it results in the assignment of a single host-variable, not if it results in setting more than one value.
8. Some processing also occurs at the requester.

Statements

This section contains syntax diagrams, semantic descriptions, rules, and examples of the use of the SQL statements.

SQL statement data access classification for routines

Certain SQL statements can be executed in a stored procedure or in a user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the routine is defined.

Appendix D. SQL statement data access classification for routines

Certain SQL statements can be executed in a stored procedure or in a user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the routine is defined.

The following table indicates whether an SQL statement (specified in the first column) is allowed to execute in a routine with the specified SQL data access classification. The letter **Y** means yes.

In general, if an executable SQL statement is encountered in a routine defined as NO SQL, SQLSTATE 38001 is returned. If the routine is defined to allow some level of SQL access, SQL statements that are not supported in any context return SQLSTATE 38003. SQL statements not allowed for routines defined as CONTAINS SQL return SQLSTATE 38004, and SQL statements not allowed for READS SQL DATA return SQLSTATE 38002.

Table 256. SQL data access classification for routines

SQL statement	Level of SQL data access			
	NO SQL	CONTAINS SQL	READS SQL DATA	MODIFIES SQL DATA

TRUNCATE				Y
UPDATE				Y
VALUES			Y	Y
VALUES INTO		Y ^{"4"} on page 2331	Y	Y
WHENEVER	Y ^{"1"} on page 2331	Y	Y	Y

Notes:

1. Although the SQL option implies that no SQL statements can be specified, non-executable statements are not restricted.
2. The stored procedure that is called must have the same or more restrictive level of SQL data access than the current level in effect. For example, a routine defined as MODIFIES SQL DATA can call a stored procedure defined as MODIFIES SQL DATA, READS SQL DATA, CONTAINS SQL, or NO SQL. A routine defined as CONTAINS SQL can call a procedure defined as CONTAINS SQL or NO SQL.
3. The statement specified for the EXECUTE statement must be a statement that is allowed for the particular level of SQL data access in effect. For example, if the level in effect is READS SQL DATA, the statement must not be an INSERT, UPDATE, MERGE, or DELETE statement.
4. The statement is supported only if it does not contain a subquery or query-expression.

Related reference

Statements

This section contains syntax diagrams, semantic descriptions, rules, and examples of the use of the SQL statements.

Actions allowed on SQL statements

Specific Db2 statements can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor.

Appendix E. SQL control statements for external SQL procedures

SQL control statements for external SQL procedures can be used only with SQL procedures that are created with the FENCED or EXTERNAL clause. *SQL control statements* provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see [Creating native SQL procedures \(Db2 Application programming and SQL\)](#) and [Migrating an external SQL procedure to a native SQL procedure \(Db2 Application programming and SQL\)](#).

SQL-control-statement:

Control statements are supported in SQL procedures. External SQL procedures are created by specifying either FENCED or EXTERNAL, LANGUAGE SQL, and an SQL routine body on the “CREATE PROCEDURE statement (SQL - external procedure) (deprecated)” on page 1642 statement. The SQL routine body must be a single SQL statement which may be an SQL control statement.

The remainder of this section contains a description of the control statements that are supported for external SQL procedures, and includes syntax diagrams, semantic descriptions, usage notes, and examples of the use of the statements that constitute the SQL routine body. In addition, you can find information about referencing SQL parameters and variables in [“References to SQL parameters and SQL variables in external SQL procedures” on page 2334](#).

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- [“SQL-procedure-statement \(external\)” on page 2334](#)

References to SQL parameters and SQL variables in external SQL procedures

SQL parameters, SQL variables, and transition variables can be referenced anywhere in the statement where an expression or a host variable can be specified. SQL parameters and SQL variables can be referenced anywhere in the compound statement in which they are declared and can be qualified with the label name that is specified at the beginning of the compound statement. Host variables cannot be specified in SQL routines. Use SQL variables, SQL parameters, and global variables instead of host variables in SQL routines. Use SQL variables, transition variables, and global variables in triggers.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or SQL variable in an SQL routine can be the same as the name of a column in a table or view that the SQL routine references. Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, SQL variable, or SQL parameter.

If the name is not qualified, the following rules describe whether the name refers to the column, the SQL variable, or the SQL parameter:

- The name is checked first as an SQL variable name and then as an SQL parameter name.
- If an SQL variable or SQL parameter by that name is not found, the name is assumed to be a column name.

The name of an SQL variable or SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to the identifier, the SQL variable, or the SQL parameter:

- In the SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter by that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT statement, the SET CONNECTION statement, and the RELEASE (connection) statement the name is used as an identifier.

Related concepts

Variables

A *variable* in an SQL statement specifies a value that can be changed when the SQL statement is executed. There are several types of variables used in SQL statements.

SQL-procedure-statement (external)

An SQL control statement may allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax

Description

SQL-label

Specifies a label for the statement. *SQL-label* must not be a delimited identifier that includes lowercase letters or special characters. The label must be unique within the procedure.

SQL-control-statement

Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL procedures.

SQL-statement

Specifies an SQL statement. These statements are described in [Chapter 7, “Statements,”](#) on page 1121.

Notes

Comments: Comments can be included within the body of an SQL procedure. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:

- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.

Handling errors and warnings: Conditions can be detected within an SQL procedure by using the following methods:

- Test the special SQL variables SQLSTATE and SQLCODE.
- Issue a GET DIAGNOSTICS statement to request the condition information. See [“GET DIAGNOSTICS statement”](#) on page 1996.
- Define condition handlers to detect and process conditions. See [“compound-statement”](#) on page 2340 for information about defining condition handlers.

assignment-statement (SQL control statements for external routines)

The assignment statement assigns a value to an SQL parameter or to an SQL variable.

Syntax

Description

SQL-parameter-name

Identifies the parameter that is the assignment target. The parameter must be specified in *parameter-declaration* in the CREATE PROCEDURE statement and must be defined as OUT or INOUT.

SQL-variable-name

Identifies the SQL variable that is the assignment target. SQL variables can be declared in a compound-statement and must be declared before it is used. For information on declaring SQL variables, see [“compound-statement”](#) on page 2340.

expression or NULL

Specifies the expression or value that is the assignment source. The expression can be any expression of the type described in [“Expressions”](#) on page 250 except it cannot contain a reference to local special registers (CURRENT SERVER, CURRENT PACKAGESET, or CURRENT PACKAGE PATH).

Notes

Assignment rules: Assignment statements in SQL procedures must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See [“Assignment and comparison”](#) on page 146 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

The ENCODING bind option is not used during processing of assignments to string variables. For example, assume that the system does not use mixed or DBCS, and the system EBCDIC SBCS CCSID is 37. Character conversion will not occur on assignment even if CCSID 500 is specified for the ENCODING bind parameter for the package for the procedure.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

Assignments involving SQL parameters:

- An IN parameter can appear on the left side of an assignment statement. When control returns to the caller, the original value of an IN parameter is passed to the caller.
- An OUT parameter can appear on the left or right side of an assignment statement. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller.
- An INOUT parameter can appear on the left or right side of an assignment statement. The first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.
- A LOB parameter can not be used as an output value in an SQL statement in an SQL procedure when connected to a remote site. To circumvent the restriction, use a LOB SQL variable instead of a LOB parameter.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

Examples

Increase the SQL variable *p_salary* by 10 percent.

```
SET p_salary = p_salary + (p_salary * .10)
```

Set SQL variable *p_salary* to the null value.

```
SET p_salary = NULL
```

Set SQL variable *midinit* to the first character of SQL variable *midname*.

```
SET midinit = SUBSTR(midname,1,1)
```

CALL statement

The CALL statement invokes a stored procedure.

Syntax

```
➤ CALL — procedure-name — argument-list ➤
```

argument-list:**Description*****procedure-name***

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list

Identifies a list of values to be passed as parameters to the stored procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See [“CALL statement” on page 1425](#) for more information.

Control is passed to the stored procedure according to the calling conventions for SQL procedures. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name

Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see [“References to SQL parameters and SQL variables in external SQL procedures” on page 2334](#).

SQL-parameter-name

Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see [“References to SQL parameters and SQL variables in external SQL procedures” on page 2334](#).

expression

The parameter is the result of the specified *expression*, which is evaluated before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- IN *expression* can contain references to multiple SQL parameters or variables. In addition to the rules stated in [“Expressions” on page 250](#) for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- INOUT or OUT *expression* can only be a single SQL parameter or variable.

NULL

The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

Notes

See “CALL statement” on page 1425 for more information on the SQL CALL statement.

Examples

Call stored procedure proc1 and pass SQL variables as parameters.

```
CALL proc1(v_empno, v_salary)
```

CASE statement

The CASE statement selects an execution path based on the evaluation of one or more conditions. A CASE statement operates in the same way as a CASE expression.

Syntax

Description

CASE

Begins a *case-expression*.

simple-when-clause

Specifies the *expression* prior to the first WHEN keyword that is tested for equality with the value of each *expression* that follows the WHEN keyword, and the result to be executed when those expressions are equal. If the comparison is true, the THEN statement is executed. If the result is unknown or false, processing continues to the next expression or the ELSE statement.

The data type of the *expression* prior to the first WHEN keyword must be comparable to the data types of each *expression* that follows the WHEN keywords.

searched-when-clause

Specifies the *search-condition* that is applied to each row or group of table data presented for evaluation, and the result when that condition is true. *search-condition* cannot contain a *fullselect*. If

the search condition is true, the THEN statement is executed. If the condition is unknown or false, processing continues to the next search condition or the ELSE statement.

SQL-procedure-statement

Specifies a statement that follows the THEN and ELSE keyword. The statement specifies the result of a *searched-when-clause* or a *simple-when-clause* that is true, or the result if no case is true. The statement must be one of the statements listed under [“SQL-procedure-statement \(external\)”](#) on page 2334.

search-condition

Specifies a condition that is true, false, or unknown about a row or group of table data.

ELSE SQL-procedure-statement

If none of the conditions specified in the *simple-when-clause* or *searched-when-clause* are true, the statements in the *else-clause* are executed.

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

END CASE

Ends a *case-statement*.

Notes

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

CASE statements that use a simple case statement WHEN clause can be nested up to three levels. CASE statements that use a searched statement WHEN clause have no limit to the number of nesting levels.

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the CASE statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the expression or search conditions of that CASE statement. If a CASE statement does not include an ELSE clause and none of the search conditions evaluate to true, an error is returned.

Examples

Example 1: Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE v_workdept
  WHEN 'A00'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 1';
  WHEN 'B01'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 3';
END CASE
```

Example 2: Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE
  WHEN v_workdept < 'B01'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 1';
  WHEN v_workdept < 'C01'
    THEN UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 2';
  ELSE UPDATE DEPT SET
      DEPTNAME = 'DATA ACCESS 3';
END CASE
```

compound-statement

A compound statement contains a group of statements and declarations for SQL variables, cursors, and condition handlers.

Syntax

Notes:

¹ Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.

SQL-variable-declaration:

SQL-condition-declaration:

return-codes-declaration:

handler-declaration:

specific-condition-value:

general-condition-value:

Description

label

Defines the label for the code block. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified on a **LEAVE** statement. If the ending label is specified, it must be the same as the beginning label.

NOT ATOMIC

NOT ATOMIC indicates that an error within the compound statement does not cause the compound statement to be rolled back.

SQL-variable-declaration

Declares a variable that is local to the compound statement.

SQL-variable-name

A qualified or unqualified name that designates a variable in an SQL procedure body. The unqualified form of *SQL-variable-name* is an SQL identifier and must not be a delimited identifier that contains lowercase letters or special characters. The qualified form is an SQL procedure statement label followed by a period (.) and an SQL identifier.

Db2 folds all SBCS SQL variable names to uppercase. SQL variable names should not be the same as column names. If an SQL statement contains an SQL variable or parameter and a column reference with the same name, Db2 interprets the name as an SQL variable or parameter name. To refer to the column, qualify the column name with the table name. Further, to avoid ambiguous variable references and to ensure compatibility with other Db2 platforms, qualify the SQL variable or parameter name with the label of the SQL procedure statement.

data-type

Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL procedure parameters. See [“CREATE PROCEDURE statement \(SQL - external procedure\) \(deprecated\)” on page 1642](#) for a description of SQL data types and lengths.

DEFAULT constant or NULL

Defines the default for the SQL variable. The variable is initialized when the SQL procedure is called. If a default value is not specified, the variable is initialized to NULL.

RESULT_SET_LOCATOR VARYING

Specifies the data type for a result set locator variable.

SQL-condition-declaration

Declares a condition name and corresponding SQLSTATE value.

SQL-condition-name

Specifies the name of the condition. The condition name is an SQL identifier and must not be a delimited identifier that includes lowercase letters or special characters. *SQL-condition-name* must be unique within the procedure body and can be referenced only within the compound statement in which it is declared.

FOR SQLSTATE string-constant

Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and cannot be '00000'.

return-codes-declaration

Declares special variables called SQLSTATE and SQLCODE that are set automatically to the value returned after processing an SQL statement. Both the SQLSTATE and SQLCODE variables can be declared only in the outermost compound statement of the SQL procedure. Assignment to these variables is not prohibited; however, assignment is ignored by exception handlers, and processing the next SQL statement replaces the assigned value.

DECLARE-CURSOR-statement

Declares a cursor. Each cursor in the procedure body must have a unique name. An OPEN statement must be specified to open the cursor, and a FETCH statement can be specified to read rows. The cursor can be referenced only from within the compound statement. For more information on declaring a cursor, see [“DECLARE CURSOR statement” on page 1865](#).

handler-declaration

Specifies a set of statements to execute when an exception or completion condition occurs in the compound statement. *SQL-procedure-statement* is the set of statements that execute when the handler receives control. See [“SQL-procedure-statement \(external\)” on page 2334](#) for information on *SQL-procedure-statement*.

A handler is active only within the compound statement in which it is declared.

The actions that a handler can perform are:

CONTINUE

Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END IF, END REPEAT, or END WHILE.

EXIT

After the handler is invoked successfully, control is returned to the end of the compound statement.

The conditions that can cause the handler to gain control are:

SQLSTATE *string-constant*

Specifies an SQLSTATE for which the handler is invoked. The SQLSTATE cannot be '00000'.

SQL-condition-name

Specifies a condition name for which the handler is invoked. The condition name must be previously defined in a condition declaration.

SQLException

Specifies that the handler is invoked when an SQLException occurs. An SQLException is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see [SQLSTATE values and common error codes \(Db2 Codes\)](#).

SQLWARNING

Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

NOT FOUND

Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes

The order of statements in a compound statement must be:

1. SQL variable, condition declarations, and return codes declarations
2. Cursor declarations
3. Handler declarations
4. SQL procedure statements

Compound statements cannot be nested.

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

The following rules apply to handlers:

- A handler declaration that contains SQLException, SQLWARNING, or NOT FOUND cannot contain additional SQLSTATE or condition names.
- Handler declarations within the same compound statement cannot contain duplicate conditions.
- A handler declaration cannot contain the same condition code or SQLSTATE value more than once, and cannot contain an SQLSTATE value and a condition name that represent the same SQLSTATE value.
- A handler is activated when it is the most appropriate handler for an exception or completion condition.
- If there is no handler for an SQL error, the error is passed to the caller in the SQLCA.
- A handler cannot be activated by an assignment statement that assigns a value to SQLSTATE.

The following rules and recommendations apply to the SQLCODE and SQLSTATE SQL variables:

- A null value cannot be assigned to SQLSTATE or SQLCODE.
- The SQLSTATE and SQLCODE variable values should be saved immediately to temporary variables if there is any intention to use the values. If a handler exists for SQLSTATE, this assignment must be done as the first statement to be processed in the handler to avoid having the value replaced by the next SQL procedure statement. If the condition raised by the SQL statement is handled, the value is changed by the first SQL statement contained in the handler.

Considerations for the SQLSTATE and SQLCODE SQL variables: The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound

statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

Examples

Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables, a condition for SQLSTATE '02000', a handler for the condition, and a cursor
- Opens the cursor, fetches a row, and closes the cursor

```
CREATE PROCEDURE PROC1(OUT NOROWS INT) LANGUAGE SQL
BEGIN
  DECLARE v_firstname VARCHAR(12);
  DECLARE v_midinit CHAR(1);
  DECLARE v_lastname VARCHAR(15);
  DECLARE v_edlevel SMALLINT;
  DECLARE v_salary DECIMAL(9,2);
  DECLARE at_end INT DEFAULT 0;
  DECLARE not_found
    CONDITION FOR '02000';
  DECLARE c1 CURSOR FOR
    SELECT FIRSTNAME, MIDINIT, LASTNAME,
      EDLEVEL, SALARY
    FROM EMP;
  DECLARE CONTINUE HANDLER FOR not_found SET NOROWS=1;
  OPEN c1;
  FETCH c1 INTO v_firstname, v_midinit,
    v_lastname, v_edlevel, v_salary;
END
```

GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See [“GET DIAGNOSTICS statement” on page 1996](#).

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL procedure, you would use either *SQL-variable-name* or *SQL-parameter-name*. In an embedded GET DIAGNOSTICS statement, you would use a *host-variable*. You can replace the instances of *host-variable* in the description of [“GET DIAGNOSTICS statement” on page 1996](#) with *SQL-variable-name* or *SQL-parameter-name*.

GOTO statement

The GOTO statement is used to branch to a user-defined label within an SQL procedure.

Syntax

►► GOTO — *label* ►►

Description

label

Specifies a labeled statement at which processing is to continue.

The labeled statement and the GOTO statement must be in the same scope. The following rules apply to the scope:

- If the GOTO statement is defined in a compound statement, *label* must be defined inside the same compound statement.

- If the GOTO statement is defined in a handler, *label* must be defined in the same handler and follow the other scope rules.
- If the GOTO statement is defined outside of a handler, *label* must not be defined within a handler.

If *label* is not defined within a scope that the GOTO statement can reach, an error is returned.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

Use the GOTO statement sparingly. Because the GOTO statement interferes with the normal sequence of processing, it makes an SQL procedure more difficult to read and maintain. Before using a GOTO statement, determine whether some other statement, such as an IF statement or LEAVE statement, can be used instead.

Examples

Use a GOTO statement to transfer control to the end of a compound statement if the value of an SQL variable is less than 600.

```
BEGIN
  DECLARE new_salary DECIMAL(9,2);
  DECLARE service DECIMAL(8,2);
  SELECT SALARY, CURRENT_DATE - HIREDATE
    INTO new_salary, service
   FROM EMP
 WHERE EMPNO = v_empno;
  IF service < 600
    THEN GOTO EXIT;
  END IF;
  IF rating = 1
    THEN SET new_salary =
      new_salary + (new_salary * .10);
  ELSEIF rating = 2
    THEN SET new_salary =
      new_salary + (new_salary * .05);
  END IF;
  UPDATE EMP
 SET SALARY = new_salary
 WHERE EMPNO = v_empno;
EXIT: SET return_parm = service;
END
```

IF statement

The IF statement selects an execution path based on the evaluation of a condition.

Syntax

Description

search-condition

Specifies the condition for which an SQL statement should be invoked. If the condition is unknown or false, processing continues to the next search condition until either a condition is true or processing reaches the ELSE clause.

SQL-procedure-statement

Specifies the statement to be invoked if the preceding *search-condition* is true. If no *search-condition* evaluates to true, then the *SQL-procedure-statement* following the ELSE keyword is invoked. The statement must be one of the statements listed under [“SQL-procedure-statement \(external\)”](#) on page 2334.

Notes

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement. If an IF statement does not include an ELSE clause and none of the search conditions evaluate to true, then when the statement that follows that IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement.

Examples

Assign a value to the SQL variable *new_salary* based on the value of SQL variable *rating*.

```
IF rating = 1
  THEN SET new_salary =
    new_salary + (new_salary * .10);
  ELSEIF rating = 2
    THEN SET new_salary =
      new_salary + (new_salary * .05);
  ELSE SET new_salary =
    new_salary + (new_salary * .02);
END IF
```

ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax

```
➤ ITERATE — label ➤
```

Description

label

Specifies the label of the LOOP, REPEAT, or WHILE statement to which the flow of control is passed.

Examples

This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of *v_dept* is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
LANGUAGE SQL
MODIFIES SQL DATA
BEGIN
  DECLARE v_dept CHAR(3);
  DECLARE v_deptname VARCHAR(29);
  DECLARE v_admdept CHAR(3);
  DECLARE at_end INTEGER DEFAULT 0;
  DECLARE not_found CONDITION FOR SQLSTATE '02000';
  DECLARE c1 CURSOR FOR
    SELECT deptno,deptname,admdept
      FROM department
     ORDER BY deptno;
  DECLARE CONTINUE HANDLER FOR not_found
  SET at_end = 1;
  OPEN c1;
  ins_loop:
  LOOP
    FETCH c1 INTO v_dept, v_deptname, v_admdept;
    IF at_end = 1 THEN
      LEAVE ins_loop;
    ELSEIF v_dept = 'D11' THEN
      ITERATE ins_loop;
    END IF;
    INSERT INTO department (deptno,deptname,admdept)
      VALUES('NEW', v_deptname, v_admdept);
  END LOOP;
  CLOSE c1;
END
```

LEAVE statement

The LEAVE statement transfers program control out of a loop or a compound statement.

Syntax

```
➤ LEAVE — label ➤
```

Description

label

Specifies the label of the compound statement or loop to exit.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples

Use a LEAVE statement to transfer control out of a LOOP statement when a negative SQLCODE occurs.

```
ftch_loop: LOOP
  FETCH c1 INTO
    v_firstname, v_midinit,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN LEAVE ftch_loop;
END IF;
END LOOP
```

LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax

Notes:

¹ Only one *label:* can be specified for each *SQL-procedure-statement*.

Description

label

Specifies the label for the LOOP statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under [“SQL-procedure-statement \(external\)”](#) on page 2334.

Examples

This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of *v_midinit* is checked to ensure that the value is not a single space (' '). If *v_midinit* is a single space, the LEAVE statement passes the flow of control outside of the loop.

```
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
LANGUAGE SQL
BEGIN
  DECLARE v_counter INTEGER DEFAULT 0;
  DECLARE v_firstname VARCHAR(12);
  DECLARE v_midinit CHAR(1);
  DECLARE v_lastname VARCHAR(15);
  DECLARE c1 CURSOR FOR
    SELECT firstname, midinit, lastname
    FROM employee;
```

```

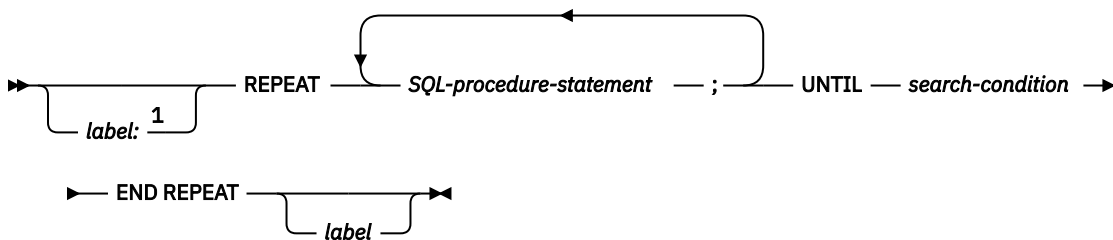

DECLARE EXIT HANDLER FOR NOT FOUND
    SET counter = -1;
OPEN c1;
fetch_loop:
LOOP
    FETCH c1 INTO v_firstname, v_midinit, v_lastname;
    IF v_midinit = ' ' THEN
        LEAVE fetch_loop;
    END IF;
    SET v_counter = v_counter + 1;
END LOOP fetch_loop;
SET counter = v_counter;
CLOSE c1;
END

```

REPEAT statement

The REPEAT statement executes a statement or group of statements until a search condition is true.

Syntax

Notes:

¹ Only one *label:* can be specified for each *SQL-procedure-statement*.

Description

label

Specifies the label for the REPEAT statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement

Specifies the statements to be executed. The statement must be one of the statements listed under [“SQL-procedure-statement \(external\)”](#) on page 2334.

search-condition

Specifies a condition that is evaluated after each execution of the REPEAT statement. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the REPEAT loop continues.

Examples

Use a REPEAT statement to fetch rows from a table.

```

fetch_loop:
REPEAT
    FETCH c1 INTO
        v_firstname, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop

```

RESIGNAL statement

The RESIGNAL statement is used within a condition handler to re-raise the current condition, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Issuing the RESIGNAL statement without an operand causes the current condition to be passed upwards.

Syntax

Description

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name or *SQL-parameter-name*

Specifies an SQL variable or SQL parameter that is defined for the procedure.

SQL-variable-name

Specifies an SQL variable that is declared within the *compound-statement* that contains the RESIGNAL statement. *SQL-variable-name* must be defined as CHAR or VARCHAR data type with a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL_parameter-name

Specifies an SQL parameter that is defined for the procedure that contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value and have a length of five bytes and must not be null. The SQL parameter must contain a valid SQLSTATE value.

SQL-condition-name

Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see [“GET DIAGNOSTICS statement” on page 1996](#).

Notes

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATE values based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the RESIGNAL statement is issued without an SQLSTATE clause or a *condition-name*, the RESIGNAL statement must be in a handler and the identical condition that activated the handler is returned. The SQLSTATE, SQLCODE, and the SQLCA associated with the condition are unchanged.

If an SQLSTATE clause or a *condition-name* was specified, the SQLCODE returned is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception is returned (an SQLSTATE class other than '01' or '02'), the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '02') is returned, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, the not-found condition is not handled, and processing continues with the next statement.

Examples

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

```
CREATE PROCEDURE divide ( IN numerator INTEGER,
                        IN denominator INTEGER,
                        OUT divide_result INTEGER)
LANGUAGE SQL
CONTAINS SQL
BEGIN
    DECLARE overflow CONDITION for SQLSTATE '22003' ;
    DECLARE CONTINUE HANDLER FOR overflow
        RESIGNAL SQLSTATE '22375';
    IF denominator = 0 THEN
        SIGNAL overflow;
    ELSE
        SET divide_result = numerator / denominator;
    END IF;
END
```

RETURN statement

The RETURN statement is used to return from the routine. For SQL functions, it returns the result of the function. For an SQL procedure, it optionally returns an integer status value.

Syntax

Description

expression

Specifies a value that is returned from the routine.

- If the routine is a function, *expression* must be specified and the value of *expression* must conform to the SQL assignment rules as described in [“Assignment and comparison” on page 146](#). If the value is being assigned to a string variable, storage assignment rules apply.
- If the routine is a procedure, the data type of *expression* must be INTEGER. If *expression* evaluates to the null value, a value of 0 is returned.

The *expression* cannot include a column name or a host variable. See [“Expressions” on page 250](#) for information on expressions. The *expression* cannot contain a scalar fullselect.

NULL

The null value is returned from the SQL function. NULL is not allowed in SQL procedures.

Notes

When a RETURN statement is not used within an SQL procedure or when no value is specified: If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:

- If the procedure returns with an SQLCODE that is greater or equal to zero, the return status is set to a value of '0'.
- If the procedure returns with an SQLCODE that is less than zero, the return status is set to a value of '-1'.

When a RETURN statement is used within an SQL procedure: If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

When the value is returned: When a value is returned from a procedure, the caller may access the value using one of the following methods:

- The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
- The parameter bound for the return value parameter marker in the escape clause CALL syntax (?=CALL...) in a CLI application.
- Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```
BEGIN
    . . . GOTO FAIL;
SUCCESS: . . . RETURN 0;
    FAIL: . . . RETURN -200;
END
```

SIGNAL statement

The **SIGNAL** statement is used to return an error or warning condition. It causes an error or warning to be returned with the specified **SQLSTATE**, along with optional message text.

Syntax

Notes:

- ¹ The SQLSTATE variation must be used within a trigger body.
² *SQL-condition-name* must not be specified within a trigger body.
³ *signal-information* must be specified within a trigger body

signal-information:

Notes:

- ¹ (*diagnostic-string-expression*) must only be specified within a trigger body.

Description

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATES:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant

A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name or SQL-parameter-name

Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name

Specifies an SQL variable that is declared within the *compound-statement*. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name

Specifies an SQL parameter that is defined for the procedure and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name

Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT

Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see [“GET DIAGNOSTICS statement” on page 1996](#).

(diagnostic-string-expression)

An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see [“GET DIAGNOSTICS statement” on page 1996](#).

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of Db2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATES based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If a SIGNAL statement is issued, the SQLCODE that is returned is based on the SQLSTATE as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception (an SQLSTATE class other than '01' or '02') is returned, one of the following actions occurs:

- If a handler exists for the specified SQLSTATE, condition, or SQLEXCEPTION, the exception is handled, and control is transferred to that handler.

- Otherwise, the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '01') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or SQLWARNING, the warning is handled, and control is transferred to that handler.
- Otherwise, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or not-found condition, the not-found condition is handled, and control is transferred to that handler.
- Otherwise, the not-found condition is not handled, and processing continues with the next statement.

When the SIGNAL statement is issued in a handler, no active handler exists.

Using a SIGNAL statement in the body of a trigger: Within the triggered action of a CREATE TRIGGER statement, the message text can be specified using only these variations:

```
SIGNAL SQLSTATE sqlstate-string-constant
  SET MESSAGE_TEXT = diagnostic-string-expression
SIGNAL SQLSTATE sqlstate-string-constant
  (diagnostic-string-expression)
```

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
    (IN ONUM INTEGER, IN CNUM INTEGER,
     IN PNUM INTEGER, IN QNUM INTEGER)
LANGUAGE SQL
SPECIFIC SUBMIT_ORDER
MODIFIES SQL DATA
BEGIN
    DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
        SIGNAL SQLSTATE '75002'
            SET MESSAGE_TEXT = 'Customer number is not known';
    INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
        VALUES (ONUM, CNUM, PNUM, QNUM);
END
```

Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```
CREATE TRIGGER CK_AVAIL
NO CASCADE BEFORE INSERT ON ORDERS
REFERENCING NEW AS NEW_ORDER
FOR EACH ROW MODE DB2SQL
WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                             WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
BEGIN ATOMIC
    SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
END
```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax

Notes:

¹ Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.

Description

label

Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

search-condition

Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statement in the loop is executed.

SQL-procedure-statement

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under [“SQL-procedure-statement \(external\)”](#) on page 2334.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable `at_end`, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
  FETCH c1 INTO
    v_firstname, v_midinit,
    v_lastname, v_edlevel, v_salary;
  IF SQLCODE=100 THEN SET at_end=1;
END IF;
END WHILE
```

Appendix F. SQL communication area (SQLCA)

An SQLCA is a structure or collection of variables that is updated after each SQL statement executes. An application program that contains executable SQL statements must provide exactly one SQLCA, with a few exceptions.

The following exceptions exist:

- A program that is precompiled with the STDSQL(YES) option must not provide an SQLCA
- In some cases a Fortran program must provide more than one SQLCA.

In all host languages except REXX, the SQL INCLUDE statement can be used to provide the declaration of the SQLCA.

In COBOL and assembler:

The name of the storage area must be SQLCA.

In PL/I, and C:

The name of the structure must be SQLCA. Every executable SQL statement must be within the scope of its declaration.

Unless noted otherwise, C is used to represent C/370 and C/C++ programming languages.

In Fortran:

The name of the COMMON area for the INTEGER variables of the SQLCA must be SQLCA1; the name of the COMMON area for the CHARACTER variables must be SQLCA2. An SQLCA definition is required for every subprogram that contains SQL statements. One is also needed for the main program if it contains SQL statements.

In Java:

The DB2Sqlca class, which is an encapsulation of the SQLCA, should be used.

In REXX:

Db2 generates the SQLCA automatically. A REXX procedure cannot use the INCLUDE statement. The REXX SQLCA has a somewhat different format from SQLCAs for the other languages.

Related reference

[DB2Sqlca class \(Db2 Application Programming for Java\)](#)

[The REXX SQLCA](#)

The REXX SQLCA consists of a set of variables, rather than a structure. Db2 makes the SQLCA available to your application automatically.

Description of SQLCA fields

For the most part, COBOL, C, PL/I, and assembler use the same names for the SQLCA fields, and Fortran uses different names. However, there is one instance where C, PL/I, and assembler names differ from COBOL.

The names in the following table are those provided by the SQL INCLUDE statement.

Table 257. Fields of SQLCA

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLCAID	sqlcaid	Not used.	CHAR(8)	An "eye catcher" for storage dumps, containing the text 'SQLCA'. The sixth byte is 'L' if line number information is returned from parsing a dynamic statement or a native SQL procedure. The sixth byte is not set when processing an external SQL procedure.
SQLCABC	sqlcabc	Not used.	INTEGER	Contains the length of the SQLCA: 136.
SQLCODE (See note 1)	SQLCODE	SQLCOD	INTEGER	Contains the SQL return code. (See note 2) Code Means 0 Successful execution (though there might have been warning messages). positive Successful execution, but with a warning condition or other information. negative Error condition.
SQLERRML (See note 3)	sqlerrml (See note 3)	SQLTXL	SMALLINT	Length indicator for SQLERRMC, in the range 0 through 70. 0 means that the value of SQLERRMC is not pertinent.
SQLERRMC (See note 3)	sqlerrmc (See note 3)	SQLTXT	VARCHAR(70)	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It may contain truncated tokens. A message length of 70 bytes indicates a possible truncation.
SQLERRP	sqlerrp	SQLERP	CHAR(8)	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. In all cases, the first three characters are 'DSN' for Db2 for z/OS.
SQLERRD(1)	sqlerrd[0]	SQLERR(1)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). On successful return from an SQL procedure, contains the return status value from the SQL procedure. SQLERRD(1) can also contain an internal error code.

Table 257. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(2)	sqlerrd[1]	SQLERR(2)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.
SQLERRD(3)	sqlerrd[2]	SQLERR(3)	INTEGER	Contains the number of rows that qualified to be deleted, inserted, or updated after a DELETE, INSERT, UPDATE, or MERGE statement. The number excludes rows affected by triggers, referential integrity constraints, or inserted rows that are the result of processing a FOR PORTION OF clause for a BUSINESS_TIME period. For the OPEN of a cursor for a SELECT with a data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled. For a DELETE statement the value will be -1 if the operation is a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria. If the delete was against a view, neither the DELETE statement nor the definition of the view included selection criteria. For a TRUNCATE statement, the value will be -1. For a PREPARE statement, contains the estimated number of rows selected. If the number of rows is greater than 2,147,483,647, a value of 2,147,483,647 is returned. For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. For a rowset-oriented FETCH, contains the number of rows fetched.

Table 257. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(3) (continued)				For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.
SQLERRD(4)	sqlerrd[3]	SQLERR(4)	INTEGER	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required (See note 4). It does not reflect an estimate of the time required. When preparing a dynamically defined SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. It is also subject to change between releases of Db2 for z/OS.
SQLERRD(5)	sqlerrd[4]	SQLERR(5)	INTEGER	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD(6)	sqlerrd[5]	SQLERR(6)	INTEGER	Contains an internal error code.
SQLWARN0	SQLWARN0	SQLWRN(0)	CHAR(1)	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.
SQLWARN1	SQLWARN1	SQLWRN(1)	CHAR(1)	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN2	SQLWARN2	SQLWRN(2)	CHAR(1)	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.

Table 257. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLWARN3	SQLWARN3	SQLWRN(3)	CHAR(1)	Contains a W if the number of result columns is larger than the number of host variables. Contains a Z if fewer locators were provided in the ASSOCIATE LOCATORS statement than the stored procedure returned.
SQLWARN4	SQLWARN4	SQLWRN(4)	CHAR(1)	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; blank if cursor is not scrollable.
SQLWARN5	SQLWARN5	SQLWRN(5)	CHAR(1)	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in Db2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN6	SQLWARN6	SQLWRN(6)	CHAR(1)	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN7	SQLWARN7	SQLWRN(7)	CHAR(1)	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number used as the operand of a decimal multiply or divide operation.
SQLWARN8	SQLWARN8	SQLWRX(1)	CHAR(1)	Contains a W if a character that could not be converted was replaced with a substitute character. Contains a Y if there was an unsuccessful attempt to establish a trusted connection.
SQLWARN9	SQLWARN9	SQLWRX(2)	CHAR(1)	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARNA	SQLWARNA	SQLWRX(3)	CHAR(1)	Contains a W if at least one character field of the SQLCA or the SQLDA names or labels is invalid due to a character conversion error.
SQLSTATE	sqlstate	SQLSTT	CHAR(5)	Contains a return code for the outcome of the most recent execution of an SQL statement (See note 5).

Table 257. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
--------------------------------------	-----------	-----------------	--------------	---------

Notes:

1. With the precompiler option STDSQL(YES) in effect, SQLCODE is replaced by SQLCADE in SQLCA.
2. For the specific meanings of SQL return codes, see [SQL codes \(Db2 Codes\)](#).
3. In COBOL, SQLERRM includes SQLERRML and SQLERRMC. In PL/I and C, the varying-length string SQLERRM is equivalent to SQLERRML prefixed to SQLERRMC. In assembler, the storage area SQLERRM is equivalent to SQLERRML and SQLERRMC. See the examples for the various host languages in [“The included SQLCA”](#) on page 2362.
4. The use of timerons may require special handling because they are floating-point values in an INTEGER array. In PL/I, for example, you could first copy the value into a BIN FIXED(31) based variable that coincides with a BIN FLOAT(24) variable.
5. For a description of SQLSTATE values, see [SQLSTATE values and common error codes \(Db2 Codes\)](#).

The included SQLCA

The description of the SQLCA that is given by INCLUDE SQLCA is shown for each of the host languages.

assembler:

```
SQLCA      DS      0F
SQLCAID    DS      CL8      ID

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. Db2 makes the SQLCA available to your application automatically.

The following table lists the variables in a REXX SQLCA.

Table 258. Variables in a REXX SQLCA

Variable	Contents
SQLCODE	Contains the SQL return code.
SQLERRMC	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It might contain truncated tokens. A message length of 70 bytes indicates a possible truncation.
SQLERRP	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. For Db2 for z/OS, the product signature is 'DSN'.
SQLERRD.1	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(1) can also contain an internal error code.
SQLERRD.2	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.
SQLERRD.3	Contains the number of rows that qualified for the operation after an SQL data change statement (but not rows deleted as a result of CASCADE delete). For the OPEN of a cursor for a SELECT with an SQL data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. Set to 0 if the SQL statement fails, indicating that all changes made in executing the statement were canceled. Set to -1 for a mass delete from a table in a segmented table space, for a truncate operation, or a delete from a view when neither the DELETE statement nor the definition of the view included selection criteria. For rowset-oriented FETCH statements, contains the number of rows returned in the rowset. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. After successful execution of the REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.

Table 258. Variables in a REXX SQLCA (continued)

Variable	Contents
SQLERRD.4	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required. This value does not reflect an estimate of the time required to execute the SQL statement. After you prepare an SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. This value is subject to change between releases of Db2 for z/OS.
SQLERRD.5	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD.6	Contains an internal error code.
SQLWARN.0	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.
SQLWARN.1	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.2	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.
SQLWARN.3	Contains a W if the number of result columns is larger than the number of host variables. Contains Z if the ASSOCIATE LOCATORS statement contains fewer locators than the stored procedure returned.
SQLWARN.4	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; otherwise, blank if cursor is not scrollable.
SQLWARN.5	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in Db2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.6	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN.7	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number that was used as the operand of a decimal multiply or divide operation.
SQLWARN.8	Contains a W if a character that could not be converted was replaced with a substitute character.
SQLWARN.9	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARN.10	Contains a W if at least one character field of the SQLCA is invalid due to a character conversion error.
SQLSTATE	Contains a return code for the outcome of the most recent execution of an SQL statement.

Appendix G. SQL descriptor area (SQLDA)

An SQLDA is a collection of variables that is required for execution of the SQL DESCRIBE statement, and can be optionally used by the PREPARE, OPEN, FETCH, EXECUTE, and CALL statements. An SQLDA can be used in a DESCRIBE or PREPARE INTO statement, modified with the addresses of host variables, and then reused in a FETCH statement.

The meaning of the information in an SQLDA depends on the context in which it is used. For DESCRIBE and PREPARE INTO, Db2 sets the fields in the SQLDA to provide information to the application program. For OPEN, EXECUTE, FETCH, and CALL, the application program sets the fields in the SQLDA to provide Db2 with information:

DESCRIBE OUTPUT or PREPARE INTO

With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about a prepared statement. Each SQLVAR occurrence describes a column of the result table.

DESCRIBE TABLE

With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the columns of a table or view. Each SQLVAR occurrence describes a column of the specified table or view.

DESCRIBE CURSOR

With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the result set that is associated with the specified cursor. Each SQLVAR occurrence describes a column of the result set.

DESCRIBE INPUT

With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the input parameter markers of a prepared statement. Each SQLVAR occurrence describes an input parameter marker.

DESCRIBE PROCEDURE

With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the result sets returned by the specified stored procedure. Each SQLVAR occurrence describes a returned result set.

OPEN, EXECUTE, FETCH, and CALL

The application program sets fields of the SQLDA to provide information about host variables or output buffers in the application program to Db2. Each SQLVAR occurrence describes a host variable or output buffer.

- For OPEN and EXECUTE, each SQLVAR occurrence describes an input value that is substituted for a parameter marker in the associated SQL statement that was previously prepared.
- For FETCH, each SQLVAR occurrence describes a host variable or buffer in the application program that is to be used to contain an output value from a row of the result.
- For CALL, each SQLVAR occurrence describes a host variable that corresponds to a parameter in the parameter list for the stored procedure.

For information on how to use the SQLDA, see [Defining SQL descriptor areas \(SQLDA\) \(Db2 Application programming and SQL\)](#).

SQLDA field descriptions

An SQLDA consists of four variables, a header, and an arbitrary number of occurrences of a sequence of variables collectively named SQLVAR.

In DESCRIBE and PREPARE INTO, each occurrence of the SQLVAR describes the column of a table. In FETCH, OPEN, EXECUTE, and CALL, each occurrence describes a host variable.

The order of the SQLVAR entries matches the order of the columns in the table or the order of the parameter markers in the SQL statement.

Related tasks

Defining SQL descriptor areas (SQLDA) ([Db2 Application programming and SQL](#))

Related reference

[DESCRIBE statements](#)

The DESCRIBE statements obtain information about database objects. You can obtain the following types of information with DESCRIBE statements, each of which is described separately.

[PREPARE statement](#)

The PREPARE statement creates an executable SQL statement from a string form of the statement. The character-string form is called a *statement string*. The executable form is called a *prepared statement*.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

The following table describes the fields in the SQLDA header.

Table 259. Fields of the SQLDA header

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE “1” on page 2369 and PREPARE INTO	Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL
sqldaid SQLDAID	CHAR(8)	An "eye catcher" for storage dumps. For DESCRIBE OUTPUT or DESCRIBE INPUT, Db2 sets the first 6 bytes to 'SQLDA ' (five letters followed by the space character), the seventh byte to a space character or a number indicating the number of SQLVAR entries needed, and the eighth byte to a space character. For more information about how the 7th byte of SQLDAID is used, see “Determining how many SQLVAR occurrences are needed” on page 2371 . For DESCRIBE CURSOR, the field is set to 'SQLRS'. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1. For DESCRIBE PROCEDURE, it is set to 'SQLPR'.	A plus sign (+) in the 6th byte (for example, the first six bytes contain 'SQLDA+') indicates that the SQLNAME field contains an overriding CCSID. A '2' in the 7th byte indicates the two SQLVAR entries were allocated for each column or parameter. A '3' in the 7th byte indicates that three SQLVAR entries were allocated for each column or parameter. Although three entries are never needed on input to Db2, an SQLDA with three entries might be used when the SQLDA was initialized by a DESCRIBE or PREPARE INTO with a USING BOTH clause. Otherwise, the SQLDAID field is not used.
sqldabc SQLDABC	INTEGER	Length of the SQLDA, equal to $SQLN \times 44 + 16$.	Length of the SQLDA, greater than or equal to $SQLN \times 44 + 16$.

Table 259. Fields of the SQLDA header (continued)

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE “1” on page 2369 and PREPARE INTO	Usage in FETCH, INSERT, OPEN, EXECUTE, and CALL
sqln SQLN	SMALLINT	Unchanged by Db2. The field must be set to a value greater than or equal to zero before the statement is executed. The field indicates the total number of occurrences of SQLVAR. At the very least, the number should be: - For DESCRIBE INPUT, the number of parameter markers to be described. - For other DESCRIBEs or PREPARE INTO: the number of columns of the result, or a multiple of the columns of the result when there are multiple sets of SQLVAR entries because column labels are returned in addition to column names.	Total number of occurrences of SQLVAR provided in the SQLDA. SQLN must be set to a value greater than or equal to zero.
sqld SQLD	SMALLINT	The number of columns described by occurrences of SQLVAR. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables described by occurrences of SQLVAR.

Note:

- The third column of this table represents several forms of the DESCRIBE statement:
 - For DESCRIBE OUTPUT and PREPARE *statement-name* INTO statements, the column pertains to columns of the result table.
 - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
 - For DESCRIBE INPUT, the column pertains to parameter markers.
 - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

Related reference

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

SQLVAR entries in the SQLDA

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

SQLVAR entries in the SQLDA

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Base SQLVAR entry

The base SQLVAR entry is always present. The fields of this entry contain the base information about the column or host variable such as data type code, length attribute (except for LOBs), column name (or label), host variable address, and indicator variable address.

Extended SQLVAR entry

The extended SQLVAR entry is needed (for each column) if the result includes any LOB or distinct type⁴⁰ columns. For distinct types, the extended SQLVAR contains the distinct type name. For LOBs, the extended SQLVAR contains the length attribute of the host variable and a pointer to the buffer that contains the actual length. If locators are used to represent LOBs, an extended SQLVAR is not necessary.

The extended SQLVAR entry is also needed for each column when the USING BOTH clause was specified, which indicates that both columns names and labels are returned. The DESCRIBE *output* and PREPARE statements can include the USING BOTH clause.

The fields in the extended SQLVAR that return LOB and distinct type information do not overlap, and the fields that return LOB and label information do not overlap. Depending on the combination of labels, LOBs and distinct types, more than one extended SQLVAR entry per column may be required to return the information. See [“Determining how many SQLVAR occurrences are needed” on page 2371](#).

The following table shows how to map the base and extended SQLVAR entries. For an SQLDA that contains both base and extended SQLVAR entries, the base SQLVAR entries are in the first block, followed by a block of extended SQLVAR entries, which if necessary, are followed by a second block of extended SQLVAR entries. In each block, the number of occurrences of the SQLVAR entry is equal to the value in SQLD⁴¹ even though many of the extended SQLVAR entries might be unused.

Table 260. Contents of SQLVAR arrays

LOBs	Distinct types ¹	7th byte of SQLDAID	SQLD	Minimum for SQLN ²	Set of SQLVAR entries		
					First set (Base)	Second set (Extended)	Third set (Extended)
USING BOTH clause not specified:							
No	No	Space	<i>n</i>	<i>n</i>	Column names, labels	Not Used	Not Used
Yes ³	Yes ³	2	<i>n</i>	<i>2n</i>	Column names, labels	LOBs, distinct types, or both	Not used
USING BOTH clause was specified:							
No	No	Space	<i>2n</i>	<i>2n</i>	Column names	Labels	Not used
Yes	No	2	<i>n</i>	<i>2n</i>	Column names	LOBs and labels	Not used
No	Yes	3	<i>n</i>	<i>3n</i>	Column names	Distinct types	Labels

⁴⁰ DESCRIBE INPUT does not return information about distinct types.

⁴¹ When an extended SQLVAR entry is present for each column for *labels* (and there are no LOB or distinct type columns in the result),

Table 260. Contents of SQLVAR arrays (continued)

LOBs	Distinct types ¹	7th byte of SQLDAID	SQLD	Minimum for SQLN ²	Set of SQLVAR entries		
					First set (Base)	Second set (Extended)	Third set (Extended)
Yes	Yes	3	<i>n</i>	<i>3n</i>	Column names	LOBs and distinct types	Labels

Notes:

1. DESCRIBE INPUT does not return information about distinct types.
2. The number of columns or host variables that the SQLDA describes.
3. Either LOBs, distinct types, or both are present.
4. Here, the 7th byte is set to a space and SQLD is set to two times the number of columns in the result. For all other values of the 7th byte for USING BOTH, SQLD is set to the number of columns in the result, and the 7th byte can be used to determine how many SQLVAR entries are needed for each column of the result.

Related reference

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

Determining how many SQLVAR occurrences are needed

The number of SQLVAR occurrences needed depends on the statement that the SQLDA was provided for and the data types of the columns or parameters being described.

If the USING BOTH clause was not specified for the statement and neither LOBs nor distinct types are present in the result, only one SQLVAR entry (a base entry) is needed for each column. The 7th byte of SQLDAID is set to a space. The SQLD is set to the number of columns in the result and represents the number of SQLVAR occurrences needed. If an insufficient number of SQLVAR occurrences were provided, Db2 returns a +236 warning in SQLCODE if the standards option was set. Otherwise, SQLCODE is zero.

If USING BOTH is specified and neither LOBs nor distinct types are present in the result, an extended SQLVAR entry per column is needed for the labels in addition to the base SQLVAR entry. The 7th byte of the SQLDAID is set to space. SQLD is set to the twice the number of columns in the result and represents the combined number of base and extended SQLVAR occurrences needed.

If LOBs, distinct types, or both are present in the results, one extended SQLVAR entry is needed per column in addition to the base SQLVAR entry with one exception. The exception is that when the USING BOTH clause is specified and distinct types are present in the results, two extended SQLVAR entries per column are needed. When a sufficient number of SQLVAR entries are provided in the SQLDA for both the base and extended SQLVARs, information for the LOBs and distinct types is returned. The 7th byte of SQLDAID is set to the number of SQLVAR entries that were used for each column:

2

Two SQLVAR entries per column (a base and an extended)

3

Three SQLVAR entries per column (a base and two extended)

SQLD is set to the number of columns in the result. Therefore, the value of the 7th byte of SQLDAID multiplied by the value of SQLD is the total number SQLVAR entries that were provided.

Otherwise, when an insufficient number of SQLVAR entries have been provided when LOBs or distinct types are present, Db2 indicates that by returning one of the following warnings in SQLCODE. Db2 also

sets the 7th byte of SQLDAID to indicate how many SQLVAR entries are needed for each column of the result.

+237

There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. In this case, there were enough base SQLVAR entries to describe the data, so the base SQLVAR entries are set. However, sufficient extended SQLVAR entries were not provided so the distinct type names are not returned.

+238

There are insufficient SQLVAR entries to describe the data, and the data includes LOBs. In this case no information is returned in the SQLVAR entries.

+239

There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. There weren't even enough base SQLVAR entries. In this case no information is returned in the SQLVAR entries.

Field descriptions of an occurrence of a base SQLVAR

The fields of a base SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of a base SQLVAR.

Table 261. Fields in an occurrence of a base SQLVAR

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE “1” on page 2375 and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqltype SQLTYPE	SMALLINT	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see Table 263 on page 2378 . For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377 .
sqllen SQLLEN	SMALLINT	The length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. For XML, the value is 0. Field SQLLONGLEN in the extended SQLVAR contains the length attribute.	The length attribute of the host variable. See “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. Field SQLLONGLEN in the extended SQLVAR contains the length attribute. For XML AS BLOB, CLOB, or DBCLOB, sqllen is 0 as for LOB types.

Table 261. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE ^{"1" on page 2375} and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqldata SQLDATA	Pointer	For string columns or parameters, SQLDATA contains X'0000zzzz', where zzzz is the associated CCSID. For character strings, SQLDATA can alternatively contain X'FFFF', which indicates bit data. Not used for other types of data. For datetime columns, SQLDATA can contain the CCSID of the string representation of the datetime value. For DESCRIBE PROCEDURE, the result set locator value associated with the result set.	Contains the address of the host variable.
sqlind SQLIND	Pointer	Reserved For DESCRIBE PROCEDURE, it is set to -1.	Contains the address of an associated indicator variable, if SQLTYPE is odd. Otherwise, the field is not used.

Table 261. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE ^{"1" on page 2375} and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqlname SQLNAME	VARCHAR(30)	Contains the unqualified name or label of the column, or a string of length zero if the name or label does not exist. If the name is longer than 30 bytes, it is truncated at a byte boundary. For more information about column names, see Names of result columns. For DESCRIBE PROCEDURE, SQLNAME contains the cursor name used by the stored procedure to return the result set. The values for SQLNAME appear in the order the cursors were opened by the stored procedure. For DESCRIBE INPUT, SQLNAME is not used. For DESCRIBE CURSOR, DESCRIBE OUTPUT and DESCRIBE TABLE, SQLNAME contains at most 30 bytes of EBCDIC of a column name. If the column name is longer than 30 bytes it is truncated to at most 30 bytes.	Can contain CCSID and/or host-variable-array dimension information. Db2 interprets the third and fourth byte of the data portion of SQLNAME as the CCSID of the host variable if all of the following are true and the third and fourth byte are not X'0000': • The sixth byte of SQLDAID is '+' (x'4E'). • SQLTYPE indicates the host variable is a string variable. • The length of SQLNAME is 8. • The first two bytes of the data portion of SQLNAME are X'0000'. If the third and fourth byte of the data portion of SQLNAME are X'0000', Db2 uses the appropriate default CCSID. For FETCH, OPEN, INSERT, and EXECUTE, if the length of SQLNAME is 8, and the first two bytes of the data portion of SQLNAME are X'0000', Db2 interprets the fifth through eighth bytes of the data portion of the SQLNAME field as follows:

Table 261. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE ^{"1" on page 2375} and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
(cont.) sqlname SQLNAME			• Fifth and sixth bytes: A flag field that indicates the type of host variable that is being described by the current SQLDA entry. The values of this field are as follows: – X'0000' - host variable – X'0100' - XML host variable (XML AS BLOB, XML AS CLOB, XML AS DBCLOB) – X'0001' - host-variable array – X'0101' - XML host-variable array – X'0002' - special host variable that represents the value for 'n' in a multiple-row INSERT statement • Seventh and eighth bytes: If the sixth byte is X'01', a binary small integer (halfword) that represents the dimension of the host-variable-array, and the corresponding indicator-array if one is specified.

Notes:

1. The third column of this table represents several forms of the DESCRIBE statement:
 - For [DESCRIBE OUTPUT](#) and [PREPARE *statement-name* INTO](#) statements, the column pertains to columns of the result table.
 - For [DESCRIBE CURSOR](#), the column pertains to a result set associated with a cursor.
 - For [DESCRIBE INPUT](#), the column pertains to parameter markers.
 - For [DESCRIBE PROCEDURE](#), the column pertains to the result sets returned by the stored procedure.

[The SQLDA Header](#)

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

[SQLVAR entries in the SQLDA](#)

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Field descriptions of an occurrence of an extended SQLVAR

The fields of an extended SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of an extended SQLVAR entry.

Table 262. Fields in an occurrence of an extended SQLVAR

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE ^{"1" on page 2377} and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
len.sqllonglen SQLLONGL SQLLONGLEN	INTEGER	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) column	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) host variable. Db2 ignores the SQLLEN field in the base SQLVAR for these data types. The length attribute indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB.
*	INTEGER	Reserved	Reserved.
sqldatalen SQLDATAL SQLDATALEN	Pointer	Not used	Used only for LOB (BLOB, CLOB, and DBCLOB) host variables. If the value of the field is null, the actual length of the LOB is stored in the 4 bytes immediately before the start of the data, and SQLDATA points to the first byte of the field length. The actual length indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB. If the value of the field is not null, the field contains a pointer to a 4-byte long buffer that contains the actual length <i>in bytes</i> (even for DBCLOBs) of the data in the buffer pointed to from the SQLDATA field in the matching base SQLVAR. Regardless of whether this field is used, field SQLLONGLEN must be set.

Table 262. Fields in an occurrence of an extended SQLVAR (continued)

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE ^{“1” on page 2377} and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqldatatype_name SQLNAME SQLDATATYPE- NAME	VARCHAR(30)	A SQLTNAME field of the extended SQLVAR is set to one of the following: - For a distinct type column, the database manager sets this field to the fully qualified distinct type name. If the qualified name is longer than 30 bytes, it is truncated. - For a label, the database manager sets this field to label. In the case that both a distinct type name and a label need to be returned in extended SQLVAR entries (USING BOTH has been specified), the distinct type name is returned in the first extended SQLVAR entry and the label in the second extended SQLVAR entry.	Not used.

Note:

- The third column of this table represents several forms of the DESCRIBE statement:
 - For DESCRIBE OUTPUT and PREPARE *statement-name* INTO statements, the column pertains to columns of the result table.
 - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
 - For DESCRIBE INPUT, the column pertains to parameter markers.
 - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

SQLVAR entries in the SQLDA

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

SQLTYPE and SQLLEN fields of the SQLDA

The contents of the SQLTYPE and SQLLEN fields of the SQLDA depends on the SQL statement that is returning the value.

The following table shows the values that can appear in the SQLTYPE and SQLLEN fields of the SQLDA. In DESCRIBE and PREPARE INTO, an even value of SQLTYPE means the column does not allow nulls, and an odd value means the column does allow nulls. In DESCRIBE INPUT statements, only odd values are returned for SQLTYPE. In FETCH, OPEN, EXECUTE, and CALL, an even value of SQLTYPE means no

indicator variable is provided, and an odd value means that SQLIND contains the address of an indicator variable.

Table 263. *SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL*

SQLTYPE	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
	Column or parameter data type	SQLLEN	Host variable data type	SQLLEN
384/385	Date	10 ¹	Fixed-length character string representation of a date	Length attribute of the host variable
388/389	Time	8 ²	Fixed-length character string representation of a time	Length attribute of the host variable
392/393	Timestamp without time zone	19 for TIMESTAMP(0) otherwise 20+p for TIMESTAMP(p) ⁵	fixed-length Character string representation of a timestamp	Length attribute of the host variable
400/401	N/A	N/A	NUL-terminated graphic string	Length attribute of the host variable
404/405	BLOB	0 ³	BLOB or XML AS BLOB	Not used. ³
408/409	CLOB	0 ³	CLOB or XML AS CLOB	Not used. ³
412/413	DBCLOB	0 ³	DBCLOB or XML AS DBCLOB	Not used. ³
448/449	Varying-length character string	Length attribute of the column	Varying-length character string	Length attribute of the host variable
452/453	Fixed-length character string	Length attribute of the column	Fixed-length character string	Length attribute of the host variable
456/457	Long varying-length character string SQLTYPE values 448/449 are returned instead of 456/457 for statements that are bound in Version 9 or later.	Length attribute of the column	Long varying-length character string	Length attribute of the host variable
460/461	N/A	N/A	NUL-terminated character string	Length attribute of the host variable
464/465	Varying-length graphic string	Length attribute of the column	Varying-length graphic string	Length attribute of the host variable
468/469	Fixed-length graphic string	Length attribute of the column	Fixed-length graphic string	Length attribute of the host variable

Table 263. *SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)*

SQLTYPE	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
	Column or parameter data type	SQLLEN	Host variable data type	SQLLEN
472/473	Long graphic string SQLTYPE values 464/465 are returned instead of 472/473 for statements that are bound in Version 9 or later.	Length attribute of the column	Long graphic string	Length attribute of the host variable
480/481	Floating point	4 for single precision, 8 for double precision	Floating point	4 for single precision, 8 for double precision
484/485	Packed decimal	Precision in byte 1; scale in byte 2	Packed decimal	Precision in byte 1; scale in byte 2
492/493	Big integer ⁴	8	Big integer	8
496/497	Large integer	4	Large integer	4
500/501	Small integer	2	Small integer	2
504/505	N/A	N/A	DISPLAY SIGN LEADING SEPARATE, NATIONAL SIGN LEADING SEPARATE	Precision in byte 1; scale in byte 2
904/905	ROWID	40	ROWID	40
908/909	Varying-length binary string	Length attribute of the column	Varying-length binary string	Length attribute of the host variable
912/913	Fixed-length binary string	Length attribute of the column	Fixed-length binary string	Length attribute of the host variable
916/917	BLOB_FILE	267		
920/921	CLOB_FILE	267		
924/925	DBCLOB_FILE	267		
960/961	BLOB locator	4	BLOB_LOCATOR	4
964/965	CLOB locator	4	CLOB_LOCATOR	4
968/969	DBCLOB locator	4	DBCLOB_LOCATOR	4
972	Not applicable	Not applicable	Result set locator	4
988/989	XML	0	Invalid. Instead, use one of the following: XML AS BLOB, XML AS CLOB, XML AS DBCLOB	Not used
996/997	DECFLOAT(16) DECFLOAT(34)	8 16	DECFLOAT(16) DECFLOAT(34)	8 16

Table 263. *SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)*

SQLTYPE	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
	Column or parameter data type	SQLLEN	Host variable data type	SQLLEN
2448/2449	Timestamp with time zone	147 for TIMESTAMP(0) WITH TIME ZONE otherwise 148+ <i>p</i> for TIMESTAMP(<i>p</i>) WITH TIME ZONE ⁵	Varying-length character string representation of a timestamp with time zone	Length attribute of the host variable

Note:

1. SQLLEN might be different if a date installation exit is specified.
2. SQLLEN might be different if a time installation exit is specified.
3. Field SQLLONGLEN in the extended SQLVAR contains the length attribute of the column. In REXX, the SQLVAR length attribute field name is SQLLONGL and SQLLEN is not used.
4. BIGINT is supported by other Db2 platforms.
5. *p* is the timestamp precision.

SQLVAR entries in the SQLDA

For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Unrecognized and unsupported SQLTYPES

The values that appear in the SQLTYPE field of the SQLDA are dependent on the level of data type support available at the sender as well as at the receiver of the data. This support is particularly important as new data types are added to the product.

New data types might not be supported by the sender or receiver of the data and might not be recognized by the sender or receiver of the data. Depending on the situation, the new data type might be returned, a compatible data type that is agreed to by both the sender and the receiver of the data might be returned, or an error might occur.

When the sender and receiver agree to use a compatible data type, the following table indicates the mapping that takes place. This mapping takes place when at least one of the sender or receiver does not support the data type provided. The unsupported data type can be provided by either the application or the database manager.

Table 265. Compatible data types for unsupported data types

Data type	Compatible data type
ROWID	VARCHAR(40) FOR BIT DATA

No indication is given in the SQLDA that the data type is substituted.

The included SQLDA

Only assembler, C, C++, COBOL, and PL/I C are supported for the SQLDA that is given by INCLUDE SQLDA.

assembler:

★

SQLSECT RESTORE

In the above declaration, SQLSECT SAVE is a macro invocation that remembers the current CSECT name. SQLSECT RESTORE is a macro invocation that continues that CSECT.

C and C++:

```

```

Identifying an SQLDA in C or C++

A *descriptor-name* can be specified in the CALL, DESCRIBE, EXECUTE, FETCH, and OPEN statements. When the host application is written in C or C++, *descriptor-name* can be a pointer variable with pointer notation.

For example, *descriptor-name* could be declared as

```
sqlda *outsqlda;
```

Afterwards, it could be used in a statement like the following:

```
EXEC SQL DESCRIBE STMT1 INTO DESCRIPTOR :*outsqlda;
```

The REXX SQLDA

A REXX SQLDA consists of a set of REXX variables with a common stem. The stem must be a REXX variable name that contains no periods and is the same as the value of *descriptor-name* that you specify when you use the SQLDA in an SQL statement. Db2 does not support the INCLUDE SQLDA statement in REXX.

The following table shows the variable names in a REXX SQLDA. The values in the second column of the table are values that Db2 inserts into the SQLDA when the statement executes. Except where noted otherwise, the values in the third column of the table are values that the application must put in the SQLDA before the statement executes.

Table 266. Fields of a REXX SQLDA

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
<i>stem</i> .SQLD	The number of columns that are described in the SQLDA. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables that are used by the SQL statement.
<i>stem.n</i> .SQLTYPE	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377. The data type of the host variable cannot be BLOB locator, CLOB locator, or DBCLOB locator.
<i>stem.n</i> .SQLLONGL	For a LOB column, the length of the string representation of the value or parameter.	For a host variable that has a LOB data type, the length attribute of the host variable. For a description of supported values, see “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377.

Table 266. Fields of a REXX SQLDA (continued)

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
<i>stem.n</i> .SQLLEN	For a column other than a DECIMAL, NUMERIC, or LOB column, the length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377 for a description of allowable values.	For a host variable that does not have a decimal or LOB data type, the length attribute of the host variable. See “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377 for a description of allowable values.
<i>stem.n</i> .SQLLEN.SQLPRECISION	For a DECIMAL or NUMERIC column, the precision of the column or parameter.	For a host variable with a decimal data type, the precision of the host variable.
<i>stem.n</i> .SQLLEN.SQLSCALE	For a DECIMAL or NUMERIC column, the scale of the column or parameter.	For a host variable with a decimal data type, the scale of the host variable.
<i>stem.n</i> .SQLCCSID	For a string column or parameter, the CCSID of the column or parameter.	For a string host variable, the CCSID of the host variable.
<i>stem.n</i> .SQLUSECCSID	Not used.	Set to a new CCSID. If set, REXX will change the CCSID of the SQLDATA.
<i>stem.n</i> .SQLLOCATOR	For DESCRIBE PROCEDURE, the value of a result set locator.	Not used.
<i>stem.n</i> .SQLDATA	Not used.	Before EXECUTE or OPEN, contains the value of an input host variable. The application must supply this value. After FETCH, contains the values of an output host variable.
<i>stem.n</i> .SQLIND	Not used.	Before EXECUTE or OPEN, contains a negative number to indicate that the input host variable in <i>stem.n</i> .SQLDATA is null. The application must supply this value. After FETCH, contains a negative number if the value of the output host variable in <i>stem.n</i> .SQLDATA is null.
<i>stem.n</i> .SQLNAME	The name of the <i>n</i> th column in the result table. For DESCRIBE PROCEDURE, contains the cursor name that is used by the stored procedure to return the result set. The values for SQLNAME appear in the order that the cursors were opened by the stored procedure.	Not used.

Table 266. Fields of a REXX SQLDA (continued)

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
<i>stem.n</i> .SQLTNAME	The fully qualified distinct type name of the <i>n</i> th column in the result table. If the qualified name is longer than 30 bytes, it is truncated.	Not used.

Appendix H. Db2 catalog tables

Db2 for z/OS maintains a set of tables (in database DSNDB06) called the Db2 catalog.

About the Db2 catalog tables

The catalog tables contain information about Db2 objects such as tables, views, and indexes. When you create, alter, or drop an object, Db2 inserts, updates, or deletes rows of the catalog that describe the object.

The DSNDB06 system database contains the Db2 catalog.

When you create, alter, or drop any structure, Db2 inserts, updates, or deletes rows in the catalog table that describe the structure and how it relates to other structures. For example, SYSIBM.SYSTABLES is one catalog table that records information when a table is created. Db2 inserts a row into SYSIBM.SYSTABLES that includes the table name, its owner, its creator, and the name of its table space and its database.

Related concepts

[Reorganizing the Db2 catalog and directory](#)

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

Related reference

[SQL statements allowed on the catalog](#)

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

Db2 catalog tables and table spaces

Db2 for z/OS maintains a set of tables (in database DSNDB06) called the Db2 catalog.

The catalog tables describe such things as table spaces, tables, columns, indexes, privileges, application plans, and packages. Authorized users can query the catalog; however, it is primarily intended for use by Db2 and is therefore subject to change.

The catalog tables are updated by Db2 during normal operations in response to certain SQL statements, commands, and utilities.

All catalog tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

About these topics

These topics describe the Db2 catalog by describing the columns of each catalog table.

Programming interface information

Not all catalog table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the table that describes the column. The meanings of the Use column values are shown in the following table.

Use column value	Meaning
G	Column is part of the general-use programming interface
S	Column is part of the product-sensitive interface
I	Column is for internal use only
N	Column is not used

For columns with N or I in the Use column, the name of the column and its description might not appear in the explanation of the column.

For more information about programming interface information, see [Programming interface information \(Introduction to Db2 for z/OS\)](#).

Db2 catalog tables, table spaces, and indexes

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM.

Table	Table space	Indexes (Type “2” on page 2405)	Description
IPLIST	SYSDDF	DSNDUX01 (U)	Contains a row for each IP address that corresponds to a remote DRDA server
IPNAMES	SYSDDF	DSNFPX01 (UC)	Contains a row for each remote DRDA server that Db2 can access using TCP/IP
LOCATIONS	SYSDDF	DSNFCX01 (UC)	Contains a row for every accessible remote server
LULIST	SYSDDF	DSNFLX01 DSNFLX02	Contains a row for each real LU name that is associated with the dummy LU name for a data sharing group
LUMODES	SYSDDF	DSNFMX01 (UC)	Contains a row for the conversation limit for each combination of LU name and VTAM logon mode description
LUNAMES	SYSDDF	DSNFNX01 (UC)	Contains a row for each remote SNA client or server
MODESELECT	SYSDDF	DSNFDX01 (UC)	Contains a row for each VTAM logon mode and combination of authorization ID, plan name, and LU name
SYSAUDITPOLICIES	SYSTSADT	DSNAPX03 (UC)	Each row represents an audit policy.
FL 505 SYSAUDITPOLICIES_H	SYSTSADH	—	A history table for temporal versioning of the “ SYSAUDITPOLICIES catalog table ” on page 2417 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSAUTOALERTS	SYSTSATS	DSNALX01 (UC) DSNALX02 (N) DSNALX03 (N) DSNALX04 (N) DSNALX05 (N) DSNALX06 (N)	Contains a row for each recommendation from the autonomic procedures
SYSAUTOALERTS_OUT	SYSTSATX	DSNALX07 (A)	Contains the LOB data for the OUTPUT column of SYSIBM.SYSAUTOALERTS

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSAUTORUNS_HIST	SYSTSPRH	DSNPHX01 (UC) DSNPHX02 (N) DSNPHX03 (N)	Contains a row for each execution of an autonomic procedure.
SYSAUTORUNS_HISTOU	SYSTSPHX	DSNPHX04 (A)	Contains the LOB data for the OUTPUT column of SYSIBM.SYSAUTORUNS_HIST
SYSAUTOTIMEWINDOWS	SYSTSATW	DSNTWX01 (UC)	Contains a row for each time period during which autonomic procedures can be run
SYSAUXRELS	SYSTSAUX	DSNOXX01 (NC) DSNOXX02 (N)	Contains one row for each auxiliary table for a LOB column
SYSCHECKDEP	SYSTSCKD	DSNSDX01 (UC)	Contains one row for each reference to a column in a table check constraint
SYSCHECKS2	SYSTSCHX	DSNCHX01 (UC)	Contains one row for each table check constraint
SYSCHECKS	SYSTSCKS	DSNSCX01 (UC)	Contains one row for each table check constraint
SYSCOLAUTH	SYSTSFAU	DSNACX01 (N) DSNACX02 (N) DSNACX03 (N) DSNACX04 (N)	Records the UPDATE privileges that are held by users on individual columns of a table or view
FL 505 SYSCOLAUTH_H	SYSTSFAH	—	A history table for temporal versioning of the “SYSCOLAUTH catalog table” on page 2430 table. For more information, see “Temporal versioning for Db2 security-related catalog tables” on page 2851.
SYSCOLDIST	SYSSTATS	DSNTNX01 (NC)	Contains cardinality, frequency, and histogram statistics for a single column or a column group.
SYSCOLDIST_HIST	SYSHIST	DSNHFX01 (N)	Contains accumulated rows from SYSCOLDIST
SYSCOLDISTSTATS	SYSSTATS	DSNTPX01 (NC)	Contains cardinality, frequency, and histogram statistics for a single column or a column group. Each partition can have 0 or more rows.
SYSCOLSTATS	SYSSTATS	DSNTCX01 (NC)	Contains partition statistics for selected columns. Each column contains a row for each partition in the table

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSCOLUMNS	SYSTSCOL	DSNDCX01 (U) DSNDCX02 (N) DSNDCX05 (N) DSNDCX06 (N)	Contains one row for every column of each table and view
SYSCOLUMNS_HIST	SYSHIST	DSNHEX01 (N)	Contains accumulated rows from SYSCOLUMNS
SYSCONSTDEP	SYSTSCON	DSNCCX01 (N) DSNCCX02 (N)	Records dependencies on check constraints or user-defined defaults for a column
SYSCONTEXTAUTHIDS	SYSCTX	DSNCDX01 (UC) DSNCDX02 (N)	Contains the authorization ID under which a trusted context can be used.
FL 505 SYSCONTEXTAUTHID_H	SYTSCXH	—	A history table for temporal versioning of the “ SYSCONTEXTAUTHIDS catalog table ” on page 2463 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSCONTEXT	SYSCTX	DSNCTX01 (UC) DSNCTX02 (U) DSNCTX03 (U) DSNCTX04 (N)	Contains one row for each trusted context.
FL 505 SYSCONTEXT_H	SYTSCNH	—	A history table for temporal versioning of the “ SYSCONTEXT catalog table ” on page 2460 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSCONTROLS	SYTSTCTL	DSNCLX01 (U) DSNCLX02 (U) DSNCLX03 (N) DSNCLX04 (N) DSNCLX05 (N)	Contains one row for each row permission and column mask.
FL 505 SYSCONTROLS_H	SYTSTCTH	—	A history table for temporal versioning of the “ SYSCONTROLS catalog table ” on page 2464 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSCONTROLS_DESC	SYTSTCTD	DSNTRX02 (A)	Contains the LOB data for the DESCRIPTOR column of SYSIBM.SYSCONTROLS

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
FL 505 SYSCONTROLS_DESC_H	SYSTSCHD	DSNTRX04 (A)	Contains the LOB data for the DESCRIPTOR column of SYSIBM.SYSCONTROLS_H
SYSCONTROLS_RTXT	SYSTSCTR	DSNTRX01 (A)	Contains the LOB data for the RULETEXT column of SYSIBM.SYSCONTROLS.
FL 505 SYSCONTROLS_RTXT_H	SYSTSCHR	DSNTRX03 (A)	Contains the LOB data for the RULETEXT column of SYSIBM.SYSCONTROLS_H
SYSCOPY	SYSTSCPY	DSNUCH01 (N) DSNUCX01 (N)	Contains information that is needed for recovery
SYSCTXTTRUSTATTRS	SYSCTX	DSNCAX01 (UC)	Contains the attributes for a given trusted context
FL 505 SYSCTXTTRUSTATTR_H	SYSTSTAH		A history table for temporal versioning of the “ SYSCTXTTRUSTATTRS catalog table ” on page 2487 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSDATABASE	SYTSDBA	DSNDDH01 (U) DSNDDX02 (N)	Contains one row for each database, except for database DSND01
SYSDATATYPES	SYTSDAT	DSNODX01 (U) DSNODX02 (U)	Contains one row for each distinct data type
SYSDBAUTH	SYTSDBU	DSNADH01 (N) DSNADX01 (N) DSNADH02 (N)	Records the privileges held by users over databases
FL 505 SYSDBAUTH_H	SYTSDBH	—	A history table for temporal versioning of the “ SYSDBAUTH catalog table ” on page 2494 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSDBRM	SYTSDBR	DSNDBX01 (N) DSNDBX02 (U)	Contains one row for each DBRM of each application plan
SYSDEPENDENCIES	SYTSDEP	DSNONX01 (U) DSNONX02 (N)	Records the dependencies between objects

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSDUMMY1	SYSEBCDC	—	Contains one row. This table is used by SQL statements that do not use any tables but must specify a table name.
SYSDUMMYA	SYSTSASC	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSTSASC is an ASCII table space.
SYSDUMMYE	SYSEBCDC	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSEBCDIC is an EBCDIC table space.
SYSDUMMYU	SYSTSUNI	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSTSUNI is a UNICODE table space.
SYSDYNQRY	SYSTSDQY	DSNDQX01 (U) DSNDQX02 (UC) DSNDQX11 (U)	Contains one row for each stabilized dynamic query.
SYSDYNQRYDEP	SYSTSDQD	DSNDQX03 (N) DSNDQX04 (N) DSNDQX05 (N) DSNDQX12 (N)	Records the dependencies of stabilized dynamic queries.
SYSDYNQRY_EXPL	SYSTSDQE	DSNDQX08 (A)	Internal use for stabilized dynamic queries.
SYSDYNQRY_OPL	SYSTSDQO	DSNDQX10 (A)	Internal use for stabilized dynamic queries.
SYSDYNQRY_SHTEL	SYSTSDQH	DSNDQX09 (A)	Internal use for stabilized dynamic queries.
SYSDYNQRY_SPAL	SYSTSDQS	DSNDQX07 (A)	Internal use for stabilized dynamic queries.
SYSDYNQRY_TXTL	SYSTSDQT	DSNDQX06 (A)	Internal use for stabilized dynamic queries.
SYSENVIRONMENT	SYSTSENV	DSNOEX01 (U)	Records the environment variables when an object is created
SYSFIELDS	SYSTSFLD	DSNDFX01 (N)	Contains one row for every column that has a field procedure

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSFORIGNKEYS	SYSTSFOR	DSNDRH01 (N)	Contains one row for every column of every foreign key
SYSINDEXCLEANUP	SYSTSIXC	DSNICX01 (N)	Contains time window data to control index cleanup processing.
SYSINDEXCONTROL	SYSTSICO		Contains rows that specify time windows to control the use of memory allocated for an index.
SYSINDEXES	SYSTSIXS	DSNDXX01 (U) DSNDXX02 (U) DSNDXX03 (U) DSNDXX04 (N) DSNDXX07	Contains one row for every index
SYSINDEXES_RTSECT	SYSTSIXR	DSNDXX06 (A)	Contains the LOB data for the RTSECTION column of SYSIBM.SYSINDEXES.
SYSINDEXES_TREE	SYSTSIXT	DSNDXX05 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSINDEXES.
SYSINDEXES_HIST	SYSHIST	DSNHHX01 (NC) DSNHHX02 (N)	Contains accumulated rows from SYSINDEXES
SYSINDEXPART	SYSTSIPT	DSNDRX01 (U) DSNDRX02 (N) DSNDRX03 (N)	Contains one row for each nonpartitioned index and one row for each partition of a partitioning index or DPSI
SYSINDEXPART_HIST	SYSHIST	DSNHGX01 (N)	Contains accumulated rows from SYSINDEXPART
SYSINDEXSPACESTATS	SYSTSISS	DSNRTX02 (U) DSNRTX03 (N)	Contains Real-time Statistics for index spaces.
SYSIXSPACESTATS_H	SYSTSISH		A history table for temporal versioning of the “ SYSINDEXSPACESTATS catalog table ” on page 2545 table. For more information, see “ Temporal versioning for Db2 statistics-related catalog tables ” on page 2850.
SYSINDEXSTATS	SYSSTATS	DSNTXX01 (UC)	Contains one row for each partition of a partitioning index or data-partitioned secondary index (DPSI)
SYSINDEXSTATS_HIST	SYSHIST	DSNHIX01 (NC)	Contains accumulated rows from SYSINDEXSTATS
SYSJARCLASS_SOURCE	SYSJAUXB	DSNJSX01 (A)	Contains the source code for a Java stored procedure

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type "2" on page 2405)	Description
SYSJARCONTENTS	SYSJAVA	DSNJCX01 (NC)	Records the classes for each JAR file for a Java stored procedure
SYSJARDATA	SYSJAUXA	DSNJDX01 (A)	Contains the contents of the JAR file for each Java stored procedure
SYSJAROBJECTS	SYSJAVA	DSNJOX01 (UC)	Records the contents of each JAR file for a Java stored procedure
SYSJVAOPTS	SYSJAVA	DSNJVX01 (UC)	Records the build options for a Java stored procedure
SYSJAVAPATHS	SYSJAVA	DSNJPX01 (U) DSNJPX02 (N)	Contains the complete JAR class resolution path, and records the dependencies that one JAR has on the JARs in its Java path.
SYSKEYS	SYSTSKEY	DSNDKX01 (U) DSNDKX02 (N) DSNDKX03 (U)	Contains one row for each column of an index key
SYSKEYCOLUSE	SYTSKYC	DSNCUX01 (N)	Contains a row for every column in a unique constraint (primary key or unique key)
SYSKEYTARGETS	SYSTARG	DSNRKX01 (UC) DSNRKX02 (N)	Contains one row for each key-target participating in an extended index definition
SYSKEYTARGETS_HIST	SYSHIST	DSNHKX01 (N)	Contains accumulated rows from SYSKEYTARGETS
SYSKEYTARGETSTATS	SYSSTATS	DSNTKX01 (U)	Contains partition statistics for selected key-targets
SYSKEYTGTDIST	SYSSTATS	DSNTDX01 (N)	Contains one or more rows for the first key-target of an extended index key
SYSKEYTGTDIST_HIST	SYSHIST	DSNTDX02 (N)	Contains accumulated rows from SYSKEYTGTDIST
SYSKEYTGTDISTSTATS	SYSSTATS	DSNTSX01 (N)	Contains zero or more rows per partition for the first key-target of a data-partitioned secondary index (DPSI)
SYSLEVELUPDATES	SYSTSLVH	DSNLVX01 (N) DSNLVX02 (N)	Contains information about the function levels, catalog levels, and code levels of the Db2 subsystem or data sharing group.
SYSLOBSTATS	SYSSTATS	DSNLNX01 (UC)	Contains one row for each LOB table space
SYSLOBSTATS_HIST	SYSHIST	DSNHJX01 (NC)	Contains accumulated rows from SYSLOBSTATS

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSOBDS “1” on page 2405	SYSALTER	DSNDOB01 (N) DSNDOB02 (N)	Contains one row for each table space or index that can be recovered to an image copy that was made before the first version was generated. Important: Do not manipulate data in the SYSIBM.SYSOBDS catalog table, except at the direction of IBM Support.
SYSOBD_AUX “1” on page 2405	SYSTSOBX	DSNOB03 (A)	Contains the LOB data for the OBD_IMAGE column of SYSIBM.SYSOBDS.
FL 504 SYSOBJEVENTS	SYSTSOEV	DSNOEH01 (UC) DSNOEH02 (U)	Object-level event information for utility executions. A row is inserted for each table space or index space processed by a utility execution if utility object-level history collection is active. For partitioned objects, a row is inserted for each partition.
SYSOBJROLEDEP	SYSROLES	DSNRDX01 (UC) DSNRDX02 (N)	Contains one row for each dependent role
SYSPACKAGE	SYSTSPKG	DSNKKX01 (U) DSNKKX02 (U)	Contains one row for each package
SYSPACKAUTH	SYSTSPKA	DSNKAX01 (N) DSNKAX02 (N) DSNKAX03 (N)	Contains the privileges that are held by users over packages
FL 505 SYSPACKAUTH_H	SYSTSPKH	—	A history table for temporal versioning of the “SYSPACKAUTH catalog table” on page 2604 table. For more information, see “Temporal versioning for Db2 security-related catalog tables” on page 2851.
SYSPACKCOPY	SYSTSPKC	DSNPCX01 (UC)	Contains one row for the previous version of each package and one row for the original version of each package.
SYSPACKDEP	SYSTSPKD	DSNKDX01 (N) DSNKDX03 (N)	Records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, and triggers
SYSPACKLIST	SYSTSPKL	DSNKLX01 (N) DSNKLX02 (U)	Contains one row for every package list entry for a plan

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type "2" on page 2405)	Description
SYSPACKSTMT	SYSTSPKS	DSNKSX01 (UC)	Contains one row for every SQL statement that belongs to a package
SYSPACKSTMT_STMB	SYSTSPVR	DSNKSX02 (A)	Contains the LOB data for the STMTBLOB column of SYSIBM.SYSPACKSTMT.
SYSPACKSTMT_STMT	SYSTSPKX	DSNPKX01 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSPACKSTMT.
SYSPACKSTMTCOPY	SYSTSPSC	DSNKTX01 (U) DSNKTX02 (U)	Contains statement-level information for the non-current package copies (previous, original, and phased-out).
SYSPACKSTMTDEP	SYSTSPSD	DSNKNX01 (N) DSNKNX02 (N)	Contains information about statement-level dependencies between application statements and objects for a current package and all of the package copies.
SYSPARMS	SYSTSPRM	DSNOPX01 (U) DSNOPX02 (N) DSNOPX03 (N) DSNOPX04 (N)	Contains a row for each parameter of a routine or a row for each column of a table that is passed as a parameter to a routine
SYSPENDINGDDL	SYSTSPEN	DSNPDX01 (N) DSNPDX02 (N)	Contains information about which objects have pending definition changes. The entries exist only during the window between when the pending option is run and when the utility materializes these pending options.
SYSPENDINGDDLTEXT	SYSTSPDT	DSNPDX03 (A)	Contains the LOB data for the STATEMENT_TEXT column of SYSIBM.SYSPENDINGDDL.
SYSPENDINGOBJECTS	SYSTSPDO	DSNPOX01 (N) DSNPOX02 (N) DSNPOX03 (N)	Contains name and OBID information about the pending-CREATE objects, whose data sets are created but object definitions have not been materialized to the real catalog.
SYSPKSYSTEM	SYSTSPKY	DSNKYX01 (N)	Contain one row of system information for each package
SYSPLAN	SYSTSPLN	DSNPPH01 (U)	Contains one row for each application plan
SYSPLANAUTH	SYSTSPLA	DSNAPH01 (N) DSNAPX01 (N) DSNAPX02 (N)	Records the privileges that are held by users over application plans

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
FL 505 SYSPLANAUTH_H	SYSTSPLH	—	A history table for temporal versioning of the “ SYSPLANAUTH catalog table ” on page 2658 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSPLANDEP	SYSTSPLD	DSNGGX01 (N) DSNGGX05 (N)	Records the dependencies of plans on tables, views, aliases, synonyms, table spaces, and indexes
SYSPLSYSTEM	SYSTSPLY	DSNKPX01 (N)	Contains one row of system information for each plan
SYSQUERY	SYSTSQRY	DSNQYX01 (N) DSNQYX02 (U) DSNQYX03 (N) DSNQYX04 (N)	Contains a set of queries
SYSQUERY_AUX	SYSTSQRA	DSNQSX01 (A)	Contains the LOB data for the STMTTEXT column of SYSIBM.SYSQUERY
SYSQUERYOPTS	SYSTSQRO	DSNQPX01 (N)	Contains optimization parameters for the queries in SYSIBM.SYSQUERY.
SYSQUERYPLAN	SYSTSQRP	DSNQNX01 (N)	Contains the plan hint information for the queries in the SYSIBM.SYSQUERY table
SYSQUERYPREDICATE	SYSTSQRE	DSNQEX01 (UC) DSNQEX02 (N)	Contains rows that describe the predicates within a query. Rows are added to this table by using the BIND QUERY command. Rows are removed from this table by using the FREE QUERY command.
SYSQUERYSEL	SYSTSQRS	—	Contains rows that describe the selectivity of predicates. Rows are added to this table by using the BIND QUERY command. Rows are removed from this table by using the FREE QUERY command.
SYSRELS	SYSTSREL	DSNDLX01 (N) DSNDLX02 (N) DSNDLX03 (N) DSNDLX04 (U)	Contains one row for every relationship
SYSRESAUTH	SYSGPAUT	DSNAGH01 (N) DSNAGX01 (N)	Records the privileges that are held by users over buffer pools, storage groups, table spaces, and collections

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
FL 505 SYSRESAUTH_H	SYSTSAUH	—	A history table for temporal versioning of the “ SYSRESAUTH catalog table ” on page 2692 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSROLES	SYSROLES	DSNRLX01 (UC)	Contains one row for each role
FL 505 SYSROLES_H	SYSTSR LH	—	A history table for temporal versioning of the “ SYSROLES catalog table ” on page 2695 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSROUTINES	SYSTSROU	DSNOFX01 (U) DSNOFX02 (U) DSNOFX03 (N) DSNOFX04 (U) DSNOFX05 (N) DSNOFX06 (N) DSNOFX07 (U) DSNOFX08 (N)	Contains a row for every routine
SYSROUTINESTEXT	SYSPLUXA	DSNPLX01 (A)	Contains LOB data for the column SYSIBM.SYSROUTINES.TEXT
SYSROUTINES_TREE	SYSPLUXB	DSNPLX02 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSROUTINES.
SYSROUTINEAUTH	SYSTSRAU	DSNOAX01 (N) DSNOAX02 (U) DSNOAX03 (N)	Records the privileges that users hold on routines
FL 505 SYSROUTINEAUTH_H	SYSTSRAH	—	A history table for temporal versioning of the “ SYSROUTINEAUTH catalog table ” on page 2697 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSROUTINES_OPTS	SYSGRTNS	DSNROX01 (UC)	Contains one row to record the build options for each generated routine
SYSROUTINES_SRC	SYSGRTNS	DSNRSX01 (N) DSNRSX02 (U)	Contains one or more rows for the source code for each generated routine
SYSSCHEMAAUTH	SYSTSSCM	DSNSKX01 (N) DSNSKX02 (N)	Contains one or more rows for each grantee of a privilege on a schema

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
FL 505 SYSSCHEMAAUTH_H	SYSTSSCH	—	A history table for temporal versioning of the “ SYSSCHEMAAUTH catalog table ” on page 2716 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSSEQUENCEAUTH	SYSSEQ2	DSNWCX01 (N) DSNWCX02 (N) DSNWCX03 (N)	Records the privileges that users hold on sequences
FL 505 SYSSEQUENCEAUTH_H	SYSTSSAH	—	A history table for temporal versioning of the “ SYSSEQUENCEAUTH catalog table ” on page 2718 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSSEQUENCES	SYSSEQ	DSNSQX01 (U) DSNSQX02 (UD) DSNSQX03 (N)	Contains one row for each identity column or user-defined sequence.
SYSSEQUENCESDEP	SYSSEQ2	DSNSRX01 (N) DSNSRX02 (N)	Records the dependencies of identity columns on the corresponding entries in SYSIBM.SYSSEQUENCES
SYSSESSION	SYSTSSES	DSNSNX02 (N)	Contains session tokens that are generated by the server and associated session data.
SYSSESSION_EX	SYSTSSNX	DSNSNX04 (U) DSNSNX05 (U)	Contains the global variable data of LOB or array type that corresponds to the locator stored in the GLOBAL_VARIABLES column of SYSSESSION table.
SYSSESSION_GV	SYSTSSNL	DSNSNX01 (U)	Contains the LOB data for the GLOBAL_VARIABLES column of SYSIBM.SYSSESSION table.
SYSSESSION_DATA	SYSTSSXL	DSNSNX03 (U)	Contains LOB data for the DATA column of the SYSSESSION_EX table.
SYSSESSION_STATUS	SYSTSSSTA	DSNSNX06 (U)	Contains the session token and timestamp value when the corresponding session data was last referenced.
SYSSTATFEEDBACK	SYSTSSFB	DSNSFX01 (UC)	Contains one row for every missing or conflicting statistic that is identified during query optimization.

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSSTMT	SYSTSSTM	DSNPSX01 (N) DSNPSX02 (N)	Contains one or more rows for each SQL statement of each DBRM
SYSSTOGROUP	SYSTSSTG	DSNSSH01 (U)	Contains one row for each storage group
SYSSTRINGS	SYSTSSRG	DSNSSX01 (U)	Contains information necessary to perform string translations
SYSSYNONYMS	SYSTSSYN	DSNDYX01 (U) DSNDYX02 (N)	Contains one row for each synonym of a table or view
SYSTABAUTH	SYSTSTAU	DSNATX01 (N) DSNATX02 (N) DSNATX03 (N) DSNATX04 (N) DSNATX05 (U)	Records the privileges that are held by users on tables, views, and triggers
FL 505 SYSTABAUTH_H	SYSTSTBH	—	A history table for temporal versioning of the “ SYSTABAUTH catalog table ” on page 2738 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSTABCONST	SYSTSTBC	DSNCNX01 (U) DSNCNX02 (N)	Contains one row for each unique constraint that was created in Db2 for z/OS DB2 version 7 or later
SYSTABLES	SYSTSTAB	DSNDTX01 (U) DSNDTX02 (N) DSNDTX03 (N) DSNDTX05	Contains one row for each table, view, and alias
SYSTABLES_HIST	SYSHIST	DSNHDX01 (N)	Contains accumulated rows from SYSTABLES
SYSTABLES_PROFILES	SYSTSTPF	DSNPRX01 (UC)	Contains a row for each profile that is associated with a table in SYSIBM.SYSTABLES
SYSTABLES_PROFILE_TEXT	SYSTSPTX	DSNPRX02 (UC)	Contains the LOB data for the PROFILE_TEXT column of SYSIBM.SYSTABLES_PROFILES
SYSTABLEPART	SYSTSTPT	DSNDPX01 (U) DSNDPX02 (N) DSNDPX03 (N) DSNDPX04 (N) DSNDPX05 (N)	Contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space
SYSTABLEPART_HIST	SYSHIST	DSNHGX01 (N)	Contains accumulated rows from SYSTABLEPART

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSTABLESPACE	SYSTSTSP	DSNDSX01 (U)	Contains one row for each table space
SYSTABLESPACESTATS	SYSTSTSS	DSNRTX01 (U)	Contains Real Time Statistics for table spaces.
SYSTABSPACESTATS_H	SYSTSTSH		A history table for temporal versioning of the “ SYSTABLESPACESTATS catalog table ” on page 2781 table. For more information, see “ Temporal versioning for Db2 statistics-related catalog tables ” on page 2850.
SYSTABSTATS	SYSSTATS	DSNTTX01 (U) DSNTTX02 (N)	Contains one row for each partition of a partitioned table space and no rows for nonpartitioned table spaces
SYSTABSTATS_HIST	SYSHIST	DSNHBX01 (NC)	Contains accumulated rows from SYSTABSTATS
SYSTRIGGERS	SYSTSTRG	DSNOTX01 (UC) DSNOTX02 (N) DSNOTX03 (N)	Contains one row for each trigger
SYSTRIGGERS_STMT	SYSTSTRT	DSNOTX04 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSTRIGGERS
SYSUSERAUTH	SYSUSER	DSNAUH01 (N) DSNAUX02 (N)	Records the system privileges that are held by users
FL 505 SYSUSERAUTH_H	SYSTSUAH	—	A history table for temporal versioning of the “ SYSUSERAUTH catalog table ” on page 2798 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.
SYSUTILITIES	SYSTSUTL	DSNULX01 (U) DSNULX02 (N)	Contains one row for each utility executed if utility history collection is active.
SYSVARIABLEAUTH	SYSTSVAU	DSNVAX01 (N) DSNVAX02 (N) DSNVAX03 (N)	Contains one row for each authorization ID that has privileges for each global variable.
FL 505 SYSVARIABLEAUTH_H	SYSTSVAH	—	A history table for temporal versioning of the “ SYSVARIABLEAUTH catalog table ” on page 2807 table. For more information, see “ Temporal versioning for Db2 security-related catalog tables ” on page 2851.

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type “2” on page 2405)	Description
SYSVARIABLES	SYSTSVAR	DSNOVX01 (U)	Contains one row for each global variable that has been created.
SYSVARIABLES_DESC	SYSTSVAD	DSNOVX03 (A)	Contains the LOB data for the DESCRIPTOR column of SYSIBM.SYSVARIABLES.
SYSVARIABLES_TEXT	SYSTSVAT	DSNOVX02 (A)	Contains the LOB data for the DEFAULTTEXT column of SYSIBM.SYSVARIABLES.
SYSVIEWS	SYSTSVEW	DSNVVX01 (U)	Contains one or more rows for each view
SYSVIEWS_STMT	SYSTSVWT	DSNVWX01 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSVIEWS
SYSVIEWS_TREE	SYSTSVTR	DSNVWX02 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSVIEWS
SYSVIEWDEP	SYSTSVWD	DSNGGX02 (N) DSNGGX03 (N) DSNGGX04 (N) DSNGGX06	Records the dependencies of views on tables and other views
SYSVIEWDEP_H	SYSTSVDH	—	Not used.
SYSVOLUMES	SYSTSVOL	DSNSSH02 (N)	Contains one row for each volume of each storage group
SYSXMLRELS	SYSXML	DSNXRX01 (N) DSNXRX02 (N)	Contains one row for each XML table that is created for an XML column
SYSXMLSTRINGS	SYSXML	DSNXSX01 (UC) DSNXSX02 (U)	Each row holds a single string and its unique ID. They are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a name space URI.
SYSXMLTYPMOD	SYSTSXTM	DSNTMX01 (U)	Contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated, and deleted.
SYSXMLTYPMSHEMA	SYSTSXTS	DSNMSX01 (U) DSNMSX02 (N)	Contain rows about XML schemas for the XML type modifiers that are stored in SYSXMLTYPMOD. Each row contains one XML schema specification for one XML type modifier. Rows in this table can be inserted, updated, and deleted.

Table 267. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. (continued)

Table	Table space	Indexes (Type "2" on page 2405)	Description
<u>USERNAMES</u>	SYSDDF	DSNFEX01 (U)	Contains a row for each authorization ID to be translated or checked as it is sent to or from this Db2

Notes:

1. Descriptions of the SYSIBM.SYSOBDS and SYSIBM.SYSOBD_AUX catalog tables are available only to users who work in enterprises with a Db2 13 license. For more information see "Internal catalog table formats" in [Advanced diagnostic information for Db2 12 for z/OS](#).

2. The following index types are indicated:

A

Auxiliary

N

Nonunique

U

Unique

UC

Unique clustering

UD

Unique descending

Db2 13 catalog levels

The *catalog level* of a data sharing group or subsystem indicates that a particular CATMAINT utility UPDATE LEVEL job was run on the Db2 catalog, and the data sharing group or Db2 subsystem is ready for the activation of certain function levels.

Db2 13 uses the following Db2 catalog levels:

- V13R1M508
- V13R1M507
- V13R1M505
- V13R1M504
- V13R1M501
- V13R1M100

Tip: When you update the Db2 catalog level, you can specify either the target function level or the catalog level. If you specify the function level, Db2 determines the appropriate target catalog level, and the CATMAINT utility completes any required catalog level updates in sequential order. For more information, see [CATMAINT \(Db2 Utilities\)](#).

For a summary of the changes, see [Catalog changes in Db2 13 \(Db2 for z/OS What's New?\)](#).

Trailing blanks in converted catalog columns

Db2 subsystems that were migrated from earlier releases might have trailing blanks in catalog table columns that were converted from fixed to varying length data types. You might need to make adjustments in applications that use these columns in comparisons. For more information, see [Trailing blanks in Db2 catalog columns \(Db2 Administration Guide\)](#).

Release indicators in the Db2 catalog

Some objects depend on functions in particular releases of Db2. If you are running on a release of Db2 and fall back to a previous release, an object that depends on the more recent release becomes frozen. The object is marked with a release dependency indicator and is unavailable until remigration.

The release dependency indicator, which is listed in the IBMREQD, RELCREATED, and RELBOUND columns of the catalog tables, shows the release of Db2 upon which the objects depend.

Important: The IBMREQD column is not a reliable indicator for indicating release dependencies. Where possible, the RELCREATED and RELBOUND columns should be used instead.

Db2 release dependency indicators in the IBMREQD, RELCREATED, and RELBOUND columns might use the following values:

Values	Meanings for IBMREQD, RELCREATED, and RELBOUND columns
R	Db2 13
Q	Db2 12
P	Db2 11
O	DB2 10
M	DB2 9
L	DB2 version 8
K	DB2 version 7
J	DB2 version 6
I	DB2 version 6
H	DB2 version 5
G	DB2 version 4
F	DB2 version 3R1
E	DB2 version 2R3
D	DB2 version 2R2
C	DB2 version 2R1
B	DB2 version 1R3
Y	Rows with IBMREQD='Y' were provided with the Db2 for z/OS product code
N	Rows with IBMREQD='N' have no release dependency and were not provided with the Db2 for z/OS product code

Trailing blanks in converted catalog columns

Db2 subsystems that were migrated from earlier releases might have trailing blanks in catalog table columns that were converted from fixed to varying length data types. You might need to make adjustments in applications that use these columns in comparisons. For more information, see [Trailing blanks in Db2 catalog columns \(Db2 Administration Guide\)](#).

Related concepts

[Reorganizing the Db2 catalog and directory](#)

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

Related reference

[SQL statements allowed on the catalog](#)

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

[Catalog indexes](#)

Indexes are defined on most catalog tables to improve catalog access.

IPLIST catalog table

The IPLIST table allows multiple IP addresses to be specified for a given LOCATION. The schema is SYSIBM.

Insert rows into this table when you want to define a remote Db2 data sharing group. The same value for the IPADDR column cannot appear in both the IPNAMES table and the IPLIST table. Rows in this table can be inserted, updated, and deleted.

Table 268. SYSIBM.IPLIST table column descriptions

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	This column is associated with the value specified in the LINKNAME column in the SYSIBM.LOCATIONS table and the SYSIBM.IPNAMES table. The values of the other columns in the SYSIBM.IPNAMES table apply to the server identified by the LINKNAME column in this row.	G
IPADDR	VARCHAR(254) NOT NULL	This column contains an IPv4 or IPv6 address, or fully qualified domain name of a remote TCP/IP host of the server. If WLM Domain Name Server workload balancing is used, this column must contain the member specific domain name. If Dynamic VIPA workload balancing is used, this column must contain the member specific Dynamic VIPA address. The IPADDR column must be specified as follows: - An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.912' would be interpreted as an IPv4 address. - An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. - A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example fully qualified domain name is 'stlmvs1.svl.example.com'.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

IPNAMES catalog table

The IPNAMES catalog table defines the remote DRDA servers Db2 can access using TCP/IP. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Table 269. SYSIBM.IPNAMES table column descriptions			
Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value specified in this column must match the value specified in the LINKNAME column of the associated row in SYSIBM.LOCATIONS.	G
<u>FL 505</u> SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the DRDA security option used for outbound connections when local Db2 SQL applications connect to any remote server associated with this TCP/IP host. For more information about the meanings of these options, see SYSIBM.IPNAMES columns (Managing Security). A Already verified D User ID with security-sensitive data encryption E Userid, password, and security-sensitive data encryption P Password R RACF PassTicket T Authentication token (RACF-generated token) <i>Security-sensitive data</i> is any input or output data. Examples are rows that are retrieved from a remote server, rows that are sent to the remote server, and SQL statement text.	G

Table 269. SYSIBM.IPNAMES table column descriptions (continued)

Column name	Data type	Description	Use
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls outbound authorization ID translation. Outbound translation is performed when an authorization ID is sent by Db2 to a remote server. O An outbound ID is subject to translation. Rows in the SYSIBM.USERNAMES table are used to perform ID translation. No translation or "come from" checking is performed on inbound IDs. S Row in the SYSIBM.USERNAMES table is used to obtain the system AUTHID used to establish a trusted connection. blank No translation occurs. The supported values depend on the IPNAMES, SECURITY_OUT and LOCATIONS.TRUSTED column values. For more information, see "Supported combinations for SECURITY_OUT and USERNAMES column values" in SYSIBM.IPNAMES columns (Managing Security).	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
IPADDR	VARCHAR(254) NOT NULL WITH DEFAULT	This column contains an IPv4 or IPv6 address, or fully qualified domain name of a remote TCP/IP host. The IPADDR column must be specified as follows: - An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.91' would be interpreted as an IPv4 address. - An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. - A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example fully qualified domain name is 'stlmvs1.svl.example.com'.	G

LOCATIONS catalog table

The LOCATIONS catalog table contains a row for every accessible remote server. The schema is SYSIBM. The row associates a LOCATION name with the TCP/IP or SNA network attributes for the remote server. Requesters are not defined in this table.

Rows in this table can be inserted, updated, and deleted.

Table 270. SYSIBM.LOCATIONS table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	A unique location name for the accessible server. This is the name by which the remote server is known to local Db2 SQL applications.	G
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM or TCP/IP attributes associated with this location. For any LINKNAME specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the VTAM communication attributes for the remote location. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the TCP/IP communication attributes for the remote location. For accelerators that are defined with an alias (logical name), specify a LINKNAME value of DSNACCELERATORALIAS.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

Table 270. SYSIBM.LOCATIONS table column descriptions (continued)

Column name	Data type	Description	Use
PORT	VARCHAR(96) NOT NULL WITH DEFAULT	TCP/IP is used for outbound DRDA connections when the following statement is true: - A row exists in SYSIBM.IPNAMES, where the LINKNAME column matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. If the above mentioned row is found, the value of the PORT column is interpreted as follows: - If PORT is blank, the default DRDA port (446) is used. - If PORT is nonblank, the value specified for PORT can take one of two forms: - If the value in PORT is left justified with 1-5 numeric characters, the value is assumed to be the TCP/IP port number of the remote database server. - Any other value is assumed to be a TCP/IP service name, which can be converted to a TCP/IP port number using the TCP/IP getservbyname socket call. TCP/IP service names are not case sensitive.	G
TPN	VARCHAR(192) NOT NULL WITH DEFAULT	Used only when the local Db2 begins an SNA conversation with another server. When used, TPN indicates the SNA LU 6.2 transaction program name (TPN) that will allocate the conversation. A length of zero for the column indicates the default TPN. For DRDA conversations, this is the DRDA default, which is X'07F6C4C2'. For Db2 private protocol conversations, this column is not used. When the server is Db2 Server for VSE & VM, TPN should contain the resource ID of that machine.	G
DBALIAS	VARCHAR(128) NOT NULL	Database alias. The name associated with the server. This name is used to access a remote database server. If DBALIAS is blank, the location name is used to access the remote database server. This column does not change the name of any database objects sent to the remote site that contains the location qualifier. This column applies only to DRDA connections. For information about accelerators that are defined with an alias, see Using an alias for an accelerator (Db2 Performance).	G
TRUSTED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the connection to the remote server can be trusted. This is restricted to TCP/IP only. This column is ignored for connections using SNA. Y Location is trusted. Access to the remote location requires trusted context defined at the remote location. N Location is not trusted.	G

Table 270. SYSIBM.LOCATIONS table column descriptions (continued)

Column name	Data type	Description	Use
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates the use of the Secure Socket Layer (SSL) protocol for outbound DRDA connections when local Db2 applications connects to the remote database server using TCP/IP. Y Indicates a secure connection using SSL is required for the outbound DRDA connection. N Indicates a secure connection is not required for the outbound DRDA connection.	G

LULIST catalog table

The LULIST catalog table allows multiple LU names to be specified for a given LOCATION. The schema is SYSIBM.

Insert rows into this table when you want to define a remote Db2 data sharing group. The same value for LUNAME column cannot appear in both the SYSIBM.LUNAMES table and the SYSIBM.LULIST table. Rows in this table can be inserted, updated, and deleted.

Table 271. SYSIBM.LULIST table column descriptions

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value of the LINKNAME column in the SYSIBM.LOCATIONS table with which this row is associated. This is also the value of the LUNAME column in the SYSIBM.LUNAMES table. The values of the other columns in the SYSIBM.LUNAMES row apply to the LU identified by the LUNAME column in this row of SYSIBM.LULIST.	G
LUNAME	VARCHAR(24) NOT NULL	The VTAM logical unit name (LUNAME) of the remote database system. This LUNAME must not exist in the LUNAME column of SYSIBM.LUNAMES.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

LUMODES catalog table

Each row of the LUMODES table provides VTAM with conversation limits for a specific combination of LUNAME and MODENAME. The schema is SYSIBM. The table is accessed only during the initial conversation limit negotiation between Db2 and a remote LU. This negotiation is called *change-number-of-sessions* (CNOS) processing.

Rows in this table can be inserted, updated, and deleted.

Table 272. SYSIBM.LUMODES table column descriptions

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	LU name of the server involved in the CNOS processing.	G
MODENAME	VARCHAR(24) NOT NULL	Name of a logon mode description in the VTAM logon mode table.	G
CONVLIMIT	SMALLINT NOT NULL	Maximum number of active conversations between the local Db2 and the other system for this mode. Used to override the number in the DSESLIM parameter of the VTAM APPL definition statement for this mode.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

LUNAMES catalog table

The LUNAMES table must contain a row for each remote SNA client or server that communicates with Db2. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Table 273. SYSIBM.LUNAMES table column descriptions

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	Name of the LU for one or more accessible systems. A blank string indicates the row applies to clients whose LU name is not specifically defined in this table. All other column values for a given row in this table are for clients and servers associated with the row's LU name.	G
SYSMODENAME	VARCHAR(24) NOT NULL WITH DEFAULT	Mode used to establish inter-system conversations. A blank indicates the default mode IBMDB2LM (Db2 private protocol access and for collecting sysplex balancing information from remote data sharing groups). If private protocols are used to access a remote Db2 LU or if the remote LU is a member of a Db2 data sharing group, use a separate mode other than the default mode.	G

Table 273. SYSIBM.LUNAMES table column descriptions (continued)

Column name	Data type	Description	Use
SECURITY_IN	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security options that are accepted by this Db2 when an SNA client connects to Db2: V The option is "verify". An incoming connection request must include one of the following: a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. A The option is "already verified". A request does not need a password, although a password is checked if it is sent. With this option, an incoming connection request is accepted if it includes any of the following: a userid, a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. If the USERNAMES column contains 'I' or 'B', RACF is not invoked to validate incoming connection requests that contain only a userid unless one of the following situations is true: • The RACF access control authorization exit (DSNX@XAC) is enabled • The IBM supplied RACF SECLABEL resource class is active.	G

Table 273. SYSIBM.LUNAMES table column descriptions (continued)

Column name	Data type	Description	Use
SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security option that is used when local Db2 SQL applications connect to any remote server associated with this LUNAME: A The option is "already verified". Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. R The option is "RACF PassTicket". Outbound connection requests contain a userid and a RACF PassTicket. The server's LU name is used as the RACF PassTicket application name. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. P The option is "password". Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table or RACF, depending upon the value specified in the ENCRYPTPSWDS column. The USERNAMES column must specify 'B' or 'O'.	G
ENCRYPTPSWDS	CHAR(1) NOT NULL WITH DEFAULT 'N'	This column only applies to Db2 for z/OS partners. It is provided to support connectivity to prior releases of Db2 that are unable to support RACF PassTickets. For connections between Version 5 and later, use the SECURITY_OUT='R' option instead of the ENCRYPTPSWDS='Y' option. N No, passwords are not in internal RACF encrypted format. This is the default. Y Yes for outbound requests, the encrypted password is extracted from RACF and sent to the server. For inbound requests, the password is treated as encrypted.	G

Table 273. SYSIBM.LUNAMES table column descriptions (continued)

Column name	Data type	Description	Use
MODESELECT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether to use the SYBIBM.MODESELECT table: N Use default modes: IBMDB2LM (for Db2 private protocol) and IBMRDB (for DRDA). Y Searches SYSIBM.MODESELECT for appropriate mode name.	G
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls inbound and outbound authorization ID translation, and "come from" checking. Inbound translation and "come from" checking are performed when an authorization ID is received from a remote client. Outbound translation is performed when an authorization ID is sent by Db2 to a remote server. When 'I', 'O', or 'B' is specified in this column, rows in the SYSIBM.USERNAMES table are used to perform ID translation. I An inbound ID is subject to translation and "come from" checking. No translation is performed on outbound IDs. O No translation or "come from" checking is performed on inbound IDs. An outbound ID is subject to translation. B An inbound ID is subject to translation and "come from" checking. An outbound ID is subject to translation. blank No translation occurs.	G
GENERIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether Db2 should use its real LU name or generic LU name to identify itself to the partner LU, which is identified by this row. N The real VTAM LU name of this Db2 subsystem Y The VTAM generic LU name of this Db2 subsystem	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

MODESELECT catalog table

The MODESELECT catalog table associates a mode name with any conversation created to support an outgoing SQL request. The schema is SYSIBM. Each row represents one or more combinations of LUNAME, authorization ID, and application plan name.

Rows in this table can be inserted, updated, and deleted.

Table 274. SYSIBM.MODESELECT table column descriptions

Column name	Data type	Description	Use
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all authorization IDs.	G
PLANNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Plan name associated with the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all plan names.	G
LUNAME	VARCHAR(24) NOT NULL	LU name associated with the SQL request.	G
MODENAME	VARCHAR(24) NOT NULL	Name of the logon mode in the VTAM logon mode table to be used in support of the outgoing SQL request. If blank, IBMDB2LM is used for Db2 private protocol connections and IBMRDB is used for DRDA connections.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSAUDITPOLICIES catalog table

The SYSAUDITPOLICIES table contains one row for each audit policy. The schema is SYSIBM.

A user with SECADM authority has the privilege to select from, insert, update, or delete from the SYSAUDITPOLICIES catalog table. A user with SQLADM, system DBADM, DATAACCESS, ACCESSCTRL, SYSCTRL or SYSADM authority has the privilege to select from this catalog table.

If a view is created on this catalog table, the DATAACCESS authority can perform insert, update, and delete on the view to indirectly insert, update, and delete on the catalog table.

FL 505 SYSIBM.SYSAUDITPOLICIES has an associated history table, SYSIBM.SYSAUDITPOLICIES_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions

Column name	Data type	Description	Use
AUDITPOLICYNAME	VARCHAR(128) NOT NULL	Name of the audit policy. The name must be an identifier of 1 to 128 characters and must begin with a letter. Any other values result in an error being returned when audit policy is started.	G

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions (continued)

Column name	Data type	Description	Use
OBJECTSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of the audited object. The object schema only applies to categories, OBJMAINT and EXECUTE.	G
OBJECTNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the object. The object name only applies to categories, OBJMAINT and EXECUTE. Object name can be specified using an SQL LIKE predicate. If the object name is specified using an SQL LIKE predicate, it has to be specified as a delimited identifier. The escape character to be used for the SQL LIKE predicate is obtained from RGFESCP subsystem parameter. If not specified, the default escape character is '+'. C Clone table P Implicit table created for XML columns T Table blank All of the above object types All other values Error when audit policy is started The object type only applies to categories, OBJMAINT and EXECUTE	G
OBJECTTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of the object. C Clone table P Implicit table created for XML columns T Table blank All of the above object types All other values Error when audit policy is started The object type only applies to categories, OBJMAINT and EXECUTE	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was inserted.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was last updated.	G
CHECKING	CHAR(1) NOT NULL WITH DEFAULT	Value of the CHECKING audit category: A Audit all failures (Authorization and authentication failures) blank Audit none All other values Error when audit policy is started	G

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions (continued)

Column name	Data type	Description	Use
VALIDATE	CHAR(1) NOT NULL WITH DEFAULT	Value of the VALIDATE audit category: A Audit all blank Audit none All other values Error when audit policy is started	G
OBJMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when the table that is identified by OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns is altered or dropped: A Audit when the specified table is altered or dropped blank Audit none All other values Error when audit policy is started	G
EXECUTE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of auditing that is performed. Auditing is done for every unique operation on a table by an SQL statement with a unique statement ID. The table on which the SQL statement operates is identified by the OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns. A Audit when an operation of any kind is performed on the table during a utility or application process. C Audit when an insert, update, or delete operation is performed on the table during a utility or application process. blank No auditing is done. All other values An error occurs when the audit policy is started.	G
CONTEXT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for the start of a utility, a change to a utility object or phase, and the end of utility: A Audit all utilities blank Audit none All other values Error when audit policy is started	G

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions (continued)

Column name	Data type	Description	Use
SECMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when a grant or revoke is made or a trusted context is created or altered: A Audit all blank Audit none All other values Error when audit policy is started	G
SYSADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform system administration tasks: blank Audit none * Audit all the authorities I Installation SYSADM L SYSCTRL O SYSOPR R Installation SYSOPR S SYSADM All other values Error when audit policy is started The value of SYSADMIN can be a concatenated string of all supported values. For example, 'LOS' would indicate auditing of any operation that is performed using the administrative authorities: SYSCTRL, SYSOPR, and SYSADM. Multiple occurrences of a value are ignored.	G

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions (continued)

Column name	Data type	Description	Use
DBADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform database administration tasks: blank Audit none * Audit all the authorities B System DBADM C DBCTRL D DBADM E SECADM G ACCESSCTRL K SQLADM M DBMAINT P PACKADM T DATAACCESS All other values Error when audit policy is started The value of DBADMIN can be a concatenated string of all supported values. For example, 'BMP' would indicate auditing of any operation that is performed using the administrative authorities: System DBADM, DBMAINT, and PACKADM. Multiple occurrences of a value are ignored.	G
DBNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Database name. The database name can be used to specify the database for auditing DBADM, DBCTRL, and DBMAINT authorities. If the database name is not specified, then all the databases, including implicit databases are audited. If the database name is specified, it only applies to DBADM, DBCTRL, and DBMAINT authorities in category, DBADMIN.	G
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the package collection. The package collection can be used to specify the collection name for auditing PACKADM authority. If specified, all packages in that collection are audited. If the collection name is not specified, packages in all collections are audited. If the package collection is specified, it only applies to PACKADM authority in category, DBADMIN.	G

Table 275. SYSIBM.SYSAUDITPOLICIES table column descriptions (continued)

Column name	Data type	Description	Use
DB2START	CHAR(1) NOT NULL WITH DEFAULT	Indicates if audit policies are to be started automatically during Db2 start up. Up to 8 audit policies can be specified. Y Audit policy will be started automatically during Db2 startup. S Audit policy will be started automatically during Db2 startup. The audit policy can be stopped only by a user with SECADM authority. T Audit policy will be started automatically during Db2 startup. The audit policy can be modified or stopped only by a user with the required permit to the audit policy profile in an external security product, such as RACF. N Audit policy will not be started automatically during Db2 startup. All other values Error when audit policy is started	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSAUTOALERTS catalog table

The SYSAUTOALERTS table contains one row for each recommendation from autonomic procedures. The schema is SYSIBM.

Table 276. SYSIBM.SYSAUTOALERTS table column descriptions

Column name	Data type	Description	Use
ALERT_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the alert described in this row.	G
HISTORY_ENTRY_ID	BIGINT NOT NULL	The ID of the entry in the ADMIN_UTLPROCEDURES_HIST procedure that produced this alert.	G
ACTION	VARCHAR(32) NOT NULL	The type of action requested by this alert.	G
TARGET_QUALIFIER	VARCHAR(128) NOT NULL	The qualifier name of the Db2 object (the database name) to which this alert applies.	G
TARGET_OBJECT	VARCHAR(128) NOT NULL	The name of the Db2 object (the table space name) to which this alert applies.	G
TARGET_PARTITION	SMALLINT NOT NULL	The partition number of the Db2 object to which this alert applies. Zero, if this alert applies to all partitions or if the object is not partitioned.	G
OPTIONS	VARCHAR(4000)	The options that should be specified when the corresponding action is run: USE PROFILE Use the options specified in the profile TABLE Options only apply for this table COLUMNS Options only apply for these columns SAMPLE The table space is too big and sampling is allowed	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the alert was issued.	G
DURATION	INTEGER	An estimate of the time, in seconds, that would be needed to run the corresponding action. If this column contains NULL, the execution plan might overwrite the time window.	G

Table 276. SYSIBM.SYSAUTOALERTS table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	VARCHAR(32)	The status of the actual planned task. Valid values are: OPEN The alert is not yet resolved INPROGRESS The alert execution is in progress COMPLETED The alert execution is complete	G
STARTTS	TIMESTAMP	The timestamp for when the alert execution started. This column contains NULL if the task execution has not yet started.	G
ENDTS	TIMESTAMP	The timestamp for when the alert execution ended. This column contains NULL if the task execution has not yet ended.	G
RETURN_CODE	INTEGER	The return code that is written directly by the autonomic stored procedure that resolved the alert. This column contains NULL if the alert is not yet resolved, if the autonomic stored procedure failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the alert was not resolved successfully. This column contains NULL if the alert is not yet resolved, or if the autonomic stored procedure that executes the alert does not write any error message. No ERROR_MESSAGE text is expected in case of a successful execution.	G
OUTPUT	CLOB(2M)	The output that is written directly by the autonomic stored procedure that executes the planned task. This column contains NULL if the task is not yet executed, if the execution failed, or if the autonomic stored procedure does not write any output.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the CLOB column of this table.	G

SYSAUTOALERTS_OUT catalog table

The SYSAUTOALERTS_OUT catalog table is an auxiliary table for the OUTPUT column of the SYSAUTOALERTS catalog table. The schema is SYSIBM.

Table 277. SYSIBM.SYSAUTOALERTS_OUT table column descriptions

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSAUTORUNS_HIST catalog table

The SYSAUTORUNS_HIST table contains one row for each time an autonomic procedures has been run. The schema is SYSIBM.

Table 278. SYSIBM.SYSAUTORUNS_HIST table column descriptions

Column name	Data type	Description	Use
HISTORY_ENTRY_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the entry in the history table.	G
PROC_NAME	VARCHAR(128) NOT NULL	The name of the autonomic stored procedure that produced this entry.	G
STARTTS	TIMESTAMP	The timestamp when the autonomic stored procedure started.	G
ENDTS	TIMESTAMP	The timestamp when the autonomic stored procedure ended.	G
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the autonomic stored procedure was not successful. No ERROR_MESSAGE text is expected in case of a successful execution.	G
RETURN_CODE	INTEGER	The return code written directly by the autonomic stored procedure. This column contains NULL if the autonomic stored procedure execution failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the OUTPUT column of this table.	G

SYSAUTORUNS_HISTOU catalog table

The SYSAUTORUNS_HISTOU catalog table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTORUNS_HIST table. The schema is SYSIBM.

Table 279. SYSIBM.SYSAUTORUNS_HISTOU table column descriptions

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSAUTOTIMEWINDOWS catalog table

The SYSAUTOTIMEWINDOWS table contains one row for each time period during which autonomic procedures can be run. The schema is SYSIBM.

Table 280. SYSIBM.SYSAUTOTIMEWINDOWS table column descriptions

Column name	Data type	Description	Use
WINDOW_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the time window described in this row.	G
DB2_SSID	CHAR(4)	The Db2 member name on which the planned tasks have to be run. If this column contains NULL, the tasks in this time window can be run on any Db2 member.	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates how the value of the DAY column is interpreted: M The value of the DAY column is interpreted as a day of the month W The value of the DAY column is interpreted as a day of the week	G
MONTH	INTEGER	Month in which the time window applies. The value will be from 1 (January) to 12 (December). If this column contains NULL, the time window applies to all months. If MONTH_WEEK is 'W', this column must be NULL.	G
DAY	INTEGER	Day of the month or day of the week for which the time window applies. If this column contains NULL, the time window applies to every day of the month or to every day of the week (depending on the value of the MONTH_WEEK column).	G
FROM_TIME	TIME	The time of day at which the time window begins. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the TO_TIME column contains NULL.	G
TO_TIME	TIME	The time of day at which the time window ends. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the FROM_TIME column contains NULL.	G
ACTION	VARCHAR(256)	The comma-separated list of actions that are allowed during this time window. If this column contains NULL, all actions are allowed.	G

Table 280. SYSIBM.SYSAUTOTIMEWINDOWS table column descriptions (continued)

Column name	Data type	Description	Use
MAX_TASKS	INTEGER	The number of concurrent actions that are allowed during this time window. If this column contains NULL, any number of actions are allowed concurrently.	G

SYSAUXRELS catalog table

The SYSAUXRELS table contains one row for each auxiliary table created for a LOB column. A base table space that is partitioned must have one auxiliary table for each partition of each LOB column. The schema is SYSIBM.

Table 281. SYSIBM.SYSAUXRELS table column descriptions

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the LOB column in the base table.	G
PARTITION	SMALLINT NOT NULL	Partition number if the base table space is partitioned. Otherwise, the value is 0.	G
AUXTBOWNER	VARCHAR(128) NOT NULL	The schema of the auxiliary table.	G
AUXTBNAME	VARCHAR(128) NOT NULL	Name of the auxiliary table.	G
AUXRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the auxiliary table.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSCHECKDEP catalog table

The SYSCHECKDEP table contains one row for each reference to a column in a check constraint. The schema is SYSIBM.

Table 282. SYSIBM.SYSCHECKDEP table column descriptions

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Name of the check constraint.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column that the check constraint refers to.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSCHECKS catalog table

The SYSIBM.SYSCHECKS table contains one row for each check constraint. The schema is SYSIBM.

Table 283. SYSIBM.SYSCHECKS table column descriptions

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the check constraint.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database for the check constraint.	S
OBID	SMALLINT NOT NULL	Internal identifier of the check constraint.	S
TIMESTAMP	TIMESTAMP NOT NULL	Time when the check constraint was created.	G
RBA	CHAR(10) NOT NULL FOR BIT DATA	The log RBA when the check constraint was created.	G

Table 283. SYSIBM.SYSCHECKS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators .	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G
CHECKCONDITION	VARCHAR(7400) NOT NULL	Text of the check constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	The type of period associated with the check constraint: B BUSINESS_TIME check constraint blank Not applicable	G

SYSCHECKS2 catalog table

The SYSCHECKS2 table contains one row for each check constraint for catalog tables created in or after Version 7. The schema is SYSIBM. Check constraints for catalog tables created before Version 7 are not included in this table.

Table 284. SYSIBM.SYSCHECKS2 table column descriptions

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G

Table 284. SYSIBM.SYSCHECKS2 table column descriptions (continued)

Column name	Data type	Description	Use
PATHSCHEMAS	VARCHAR(2048) NOT NULL	SQL path at the time the check constraint was created. The path is used to resolve unqualified cast function names that are used in the constraint definition.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSCOLAUTH catalog table

The SYSCOLAUTH table records the UPDATE or REFERENCES privileges that are held by users on individual columns of a table or view. The schema is SYSIBM.

FL 505 SYSIBM.SYSCOLAUTH has an associated history table, SYSIBM.SYSCOLAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 285. SYSIBM.SYSCOLAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privilege or the name of an application plan or package that uses the privilege. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: blank An authorization ID L Role P An application plan or a package. The grantee is a package if COLLID is not blank.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table or view on which the update privilege is held.	G
TNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G

Table 285. SYSIBM.SYSCOLAUTH table column descriptions (continued)

Column name	Data type	Description	Use
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
COLNAME	VARCHAR(128) NOT NULL	Name of the column to which the UPDATE privilege applies.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S
PRIVILEGE	CHAR(1) NOT NULL WITH DEFAULT	Indicates which privilege this row describes: R Row pertains to the REFERENCES privilege. blank Row pertains to the UPDATE privilege.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: L Role blank Authorization ID that is not a role	G

Table 285. SYSIBM.SYSCOLAUTH table column descriptions (continued)

Column name	Data type	Description	Use
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSCOLDIST catalog table

The SYSCOLDIST catalog table contains one or more rows for the cardinality, frequency, and histogram statistics for a single column or a column group. The schema is SYSIBM.

Rows in the SYSCOLDIST catalog table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 286. SYSIBM.SYSCOLDIST table column descriptions

Column name	Data type	Description	Use
FREQUENCY	SMALLINT NOT NULL	Db2 utilities might populate this value, but its use is not recommended in DB2 version 5 or later. For best results, use its replacement, the FREQUENCYF column.	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

Table 286. SYSIBM.SYSCOLDIST table column descriptions (continued)

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: C Cardinality F Frequent value H Histogram Statistics N Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls at the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G

Table 286. SYSIBM.SYSCOLDIST table column descriptions (continued)

Column name	Data type	Description	Use
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSCOLDISTSTATS catalog table

The SYSCOLDISTSTATS catalog table contains zero or more rows per partition for the cardinality, frequency, and histogram statistics for a single column or a column group. The schema is SYSIBM.

No row is inserted if the index is a non-partitioned index. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 287. SYSIBM.SYSCOLDISTSTATS table column descriptions

Column name	Data type	Description	Use
FREQUENCY	SMALLINT NOT NULL	Db2 utilities might populate this value, but its use is not recommended in DB2 version 5 or later. For best results, use its replacement <code>ejbd</code> , the FREQUENCYF column.	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G

Table 287. SYSIBM.SYSCOLDISTSTATS table column descriptions (continued)

Column name	Data type	Description	Use
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: C Cardinality F Frequent value H Histogram statistics N Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	If TYPE is C, the value is the number of distinct values for the column group. If TYPE is N or TYPE is F, the value is the number of rows or keys in the partition for which the FREQUENCYF value applies. If TYPE is H, the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G

Table 287. SYSIBM.SYSCOLDISTSTATS table column descriptions (continued)

Column name	Data type	Description	Use
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSCOLDIST_HIST catalog table

The SYSCOLDIST_HIST catalog table contains history rows from the SYSCOLDIST catalog table. The schema is SYSIBM.

Rows are added or changed in the SYSCOLDIST_HIST catalog table when the RUNSTATS utility collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 288. SYSIBM.SYSCOLDIST_HIST catalog table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If the NUMCOLUMNS value is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S

Table 288. SYSIBM.SYSCOLDIST_HIST catalog table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: C Cardinality F Frequent value H Histogram Statistics N Non-padded frequent value	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	When TYPE='C', this is the number of distinct values for the column group. When TYPE='H', this is the number of distinct values for the column group in a quantile indicated by the QUANTILENO value. The value is -1 if statistics have not been gathered.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT(8) NOT NULL DEFAULT -1	Gives the percentage of rows in the table with the value specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by the QUANTILENO value. whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G

Table 288. SYSIBM.SYSCOLDIST_HIST catalog table column descriptions (continued)

Column name	Data type	Description	Use
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the QUANTILENO value. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the QUANTILENO value. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSVOLSTATS catalog table

The SYSVOLSTATS table contains partition statistics for selected columns. The schema is SYSIBM. For each column, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects either indexed column statistics or non-indexed column statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 289. SYSIBM.SYSVOLSTATS table column descriptions

Column name	Data type	Description	Use
HIGHKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOWKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S

Table 289. SYSIBM.SYSCOLSTATS table column descriptions (continued)

Column name	Data type	Description	Use
COLCARD	INTEGER NOT NULL	Number of distinct column values in the partition.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
—	VARCHAR(1000) NOT NULL FOR BIT DATA	Internal use only.	I
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: blank Statistics have not been collected or varchar column statistical values are padded. N Varchar column statistical values are not padded. This is an updatable column.	G

SYSCOLUMNS catalog table

The SYSCOLUMNS table contains one row for every column of each table and view. The schema is SYSIBM.

Table 290. SYSIBM.SYSCOLUMNS table column descriptions			
Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view which contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view; for example 4 (out of 10).	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: INTEGER Large integer SMALLINT Small integer FLOAT Floating-point CHAR Fixed-length character string VARCHAR Varying-length character string LONGVAR Varying-length character string (for columns that were added before Version 9) DECIMAL Decimal GRAPHIC Fixed-length graphic string VARG Varying-length graphic string LONGVARG Varying-length graphic string (for columns that were added before Version 9) DATE Date TIME Time TIMESTAMP Timestamp TIMESTZ Timestamp with time zone BLOB Binary large object CLOB Character large object DBCLOB Double-byte character large object ROWID Row ID data type	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
COLTYPE (continued)		DISTINCT Distinct type XML XML data type BIGINT Big integer BINARY Fixed-length binary string VARBIN Varying-length binary string, or a Db2 11 VARCHAR or VARGRAPHIC Unicode column in an EBCDIC table DECFLOAT Decimal floating point	

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. INTEGER 4 SMALLINT 2 BIGINT 8 FLOAT 4 or 8 CHAR Length of string VARCHAR Maximum length of string LONGVAR Maximum length of string (for columns that were added before Version 9) DECIMAL Precision of number DECFLOAT 8 or 16 GRAPHIC Number of DBCS characters VARGRAPHIC Maximum number of DBCS characters. For a Db2 11 VARGRAPHIC Unicode column in an EBCDIC table, this value is the maximum number of bytes. LONGVARG Maximum number of DBCS characters (for columns that were added before Version 9) BINARY Length of string VARBINARY Maximum length of string DATE 4 TIME 3 TIMESTAMP WITHOUT TIME ZONE The integral part of $((p+1)/2) + 7$ where p is the precision of the timestamp TIMESTAMP WITH TIME ZONE The integral part of $((p+1)/2) + 9$ where p is the precision of the timestamp	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH (continued)	SMALLINT NOT NULL	LOB 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. INLINE LOB Greater than 4 - For a table, a field of length 4 plus the inline length (in byte) is stored in the base table. The maximum length of the LOB column is found in LENGTH2. BLOB 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. CLOB 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the CLOB column is found in LENGTH2. DBCLOB 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. ROWID 17 - The maximum length of the stored portion of the identifier. XML 6 - If column cannot contain multiple versions of an XML document. 14 - If column can contain multiple versions of an XML document. For more information, see How Db2 uses XML versions (Db2 Programming for XML). DISTINCT The length of the source data type.	G
SCALE	SMALLINT NOT NULL	If the column type is DECIMAL, this value represents the scale. If the column type is timestamp or timestamp with time zone, this value represents the number of fractional second digits. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: N No Y Yes The value can be N for a view column that is derived from an expression that is not a simple column name or constant, or from a function. Nevertheless, such a column allows nulls when an outer select list refers to it.	G
COLCARD	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the COLCARDF column.	N
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S
UPDATES	CHAR(1) NOT NULL	Whether the column can be updated: N No Y Yes The value is N if the column is: - Derived from a function or expression - A column with a row ID data type (or a distinct type based on a row ID type) - A read-only view	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULT	CHAR(1) NOT NULL	The contents of this column are meaningful only if the TYPE column for the associated SYSTABLES row indicates that this is for a table (T) or a created temporary table (G). Default indicator: A The column is defined as a ROWID with the GENERATED ALWAYS attribute. B The column is defined as a built-in data type with a default value that depends on the data type of the column. D The column is defined as a ROWID with the GENERATED BY DEFAULT attribute. E The column is defined with the FOR EACH ROW ON UPDATE and GENERATED ALWAYS attributes. F The column is defined with the FOR EACH ROW ON UPDATE and GENERATED BY DEFAULT attributes. I The column is defined with the AS IDENTITY and GENERATED ALWAYS attributes. J The column is defined with the AS IDENTITY and GENERATED BY DEFAULT attributes. K The column is defined for the implicit DOCID column for a base table that contains XML data. L The column is defined with the AS SECURITY LABEL attribute. N The column has no default value. Q The column is defined with the AS ROW BEGIN attribute. R The column is defined with the AS ROW END attribute.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: S The column has a default value that is the value of the SQL authorization ID of the process at the time a default value is used. U The column has a default value that is the value of the SESSION_USER special register at the time a default value is used. X The column is defined with the AS TRANSACTION START ID attribute. Y If the NULLS column is Y, the column has a default value of null. If the NULLS column is N, the default value depends on the data type of the column. Data type Default Value Numeric 0 Fixed-length character string Blanks Fixed-length graphic string Blanks Fixed-length binary string Hexadecimal blanks Varying-length string A string length of 0 Date The current date Time The current time Timestamp The current timestamp Timestamp with time zone The current timestamp with time zone 1 The column has a default value that is the string constant found in the DEFAULTVALUE column of this table row. The column has a graphic data type and has a default value that is the graphic string found in the DEFAULTVALUE column of this table row.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: 2 The column has a default value that is the floating-point constant found in the DEFAULTVALUE column of this table row. 3 The column has a default value that is the decimal constant found in the DEFAULTVALUE column of this table row. 4 The column has a default value that is the integer constant found in the DEFAULTVALUE column of this table row. 5 The column has a default value that is the hexadecimal character string found in the DEFAULTVALUE column of this table row. 6 The column has a default value that is the UX string found in the DEFAULTVALUE column of this table row. 7 The column has a graphic data type and has a default value that is the character string constant found in the DEFAULTVALUE column of this table row. 8 The column has a character data type and has a default value that is the graphic string constant found in the DEFAULTVALUE column of this table row. 9 The column has a default value that is the DECFLOAT constant found in the DEFAULTVALUE column of this table row. a The column is defined with an expression that specifies a special register. The default value is the value of the special register. b The column is defined with an expression that specifies a built-in session variable. The default value is the value of the built-in session variable. d The column is defined with the DATA CHANGE OPERATION clause. The default value is an I, U, or D character indicating which data change operation the row represents.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
KEYSEQ	SMALLINT NOT NULL	The numeric position of the column within the primary key of the table. The value is 0 if it is not part of a primary key.	G
FOREIGNKEY	CHAR(1) NOT NULL	Applies to character or CLOB columns, where it indicates the subtype of the data: B BIT data M MIXED data S SBCS data blank Indicates one of the following subtypes: - MIXED data if the encoding scheme is Unicode, or if the encoding scheme is not Unicode and the value of MIXED DATA on installation panel DSNTIPS is YES - SBCS data if the encoding scheme is not Unicode and the value of MIXED DATA on the installation panel DSNTIPS is NO. For views defined prior to Version 7, subtype information is not available and the default (MIXED or SBCS) is used.	G
FLDPROC	CHAR(1) NOT NULL	Whether the column has a field procedure: N No Y Yes blank The column is for a view defined prior to Version 7. Views defined after Version 7 contain Y or N.	G
LABEL	VARCHAR(90) NOT NULL	The column label provided by the user with a LABEL statement; otherwise, the value is an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULTVALUE	VARCHAR(1536) NOT NULL WITH DEFAULT	This field is meaningful only if the column being described is for a table (the TYPE column of the associated SYSTABLES row is T for table or G for created temporary table). When the DEFAULT column is 1, 2, 3, 4, 5, 6, 7, 8, or 9, this field contains the default value of the column. If the default value is a string constant or a hexadecimal constant (DEFAULT is 1, 5, 6, 7, or 8 respectively), the value is stored without delimiters. If the default value is a numeric constant (DEFAULT is 2, 3, 4, or 9), the value is stored as specified by the user, including sign and decimal point representation, or special constant values, as appropriate for the constant. When the DEFAULT column is S or U and the default value was specified when a new column was defined with the ALTER TABLE statement, this field contains the value of the CURRENT SQLID or SESSION_USER special register at the time the ALTER TABLE statement was executed. This default value applies only to rows that existed before the ALTER TABLE statement was executed. When the DEFAULT column is L and the column was added as a new column with the ALTER TABLE statement, this field contains the security label of the user at the time the ALTER TABLE statement was executed. This default value applies only to rows that existed before the ALTER TABLE statement was executed. When the DEFAULT column contains a, this field contains the name of the special register. When the DEFAULT column contains b, this field contains the qualified name of the session variable. When the DEFAULT column contains d, this field contains DATA CHANGE OPERATION. <u>FL 503</u> When the DEFAULT column contains E or F, and the column was added as a new row change timestamp column with the ALTER TABLE statement, this field contains the timestamp of when the ALTER TABLE statement was executed. This default value applies only to rows that existed before the ALTER TABLE statement was executed.	G
COLCARDF	FLOAT NOT NULL WITH DEFAULT	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column. This is an updatable column.	S

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
COLSTATUS	CHAR(1) NOT NULL WITH DEFAULT	Indicates the status of the definition of a column: I The definition is incomplete because a LOB table space, auxiliary table, or index on an auxiliary table has not been created for the column. blank The definition is complete.	G
LENGTH2	INTEGER NOT NULL WITH DEFAULT	Maximum length of the data retrieved from the column. Possible values are: 0 Column is not a LOB or ROWID column 40 For a ROWID column, the length of the returned value 1 to 2,147,483,647 bytes For a LOB column, the maximum length	G
DATATYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. The DATATYPEID value corresponds to one of the SQLTYPE values in “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377. However, the DATATYPEID value is not a reliable indicator of the nullability of the column. A column with an even DATATYPEID value might allow nulls, and a column with an odd DATATYPEID value might not allow nulls. To determine the nullability of the column, use the NULLS column value. If the column was created prior to DB2 version 6, the value is 0.	S
SOURCETYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. If the column was created prior to DB2 version 6, the value is 0.	S
TYPESCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT 'SYSIBM'	If COLTYPE is 'DISTINCT', the schema of the distinct type. Otherwise, the value is 'SYSIBM'.	G
TYPENAME	VARCHAR(128) NOT NULL WITH DEFAULT	If COLTYPE is 'DISTINCT', the name of the distinct type. Otherwise, the value is the same as the value of the COLTYPE column. TYPENAME is set only for columns created in DB2 version 6 or later. The value for columns created earlier is not filled in.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the column was created. The value is '0001-01-01.00.00.00.000000' if the column was created prior to migration to DB2 version 6 or if the column is in a catalog table.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: blank Statistics have not been collected or varchar column statistical values are padded. N Varchar column statistical values are not padded. This is an updatable column.	G
PARTKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The numeric position of the column within the partitioning key of the table. The value is 0 if it is not part of the partitioning key. This column is applicable only if the table uses table-controlled partitioning.	G
PARTKEY_ORDERING	CHAR(1) NOT NULL WITH DEFAULT	Order of the column in the partitioning key: A Ascending D Descending blank Column is not used as part of a partitioning key This column is applicable only if the table uses table-controlled partitioning.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when alter occurred.	G
CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the column. 0 if the object was created prior to Version 8, or is not a character of graphic string column. CCSID is not 0 if COLTYPE is VARBINARY because the object is a Db2 11 Unicode column in an EBCDIC table.	G
HIDDEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the column is implicitly hidden: P Partially hidden. The column is implicitly hidden from SELECT *. R Partially hidden. The column is a ROWID column that was explicitly defined with the IMPLICITLY HIDDEN attribute. N Not hidden. The column is visible to all SQL statements.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
CONTROL_ID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the column access control mask defined for this column. 0 if no column access control mask is defined for the column.	S
XML_TYPEMOD_ID	INTEGER NOT NULL WITH DEFAULT	The ID of the XML type modifier. It is set to 0 if the column is not an XML column or has no XML type modifier.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or the end of the period for a SYSTEM_TIME or BUSINESS_TIME period: B Column is the start of period BUSINESS_TIME. C Column is the end of period BUSINESS_TIME with an exclusive end point. I Column is the end of period BUSINESS_TIME with an inclusive end point. S Column is the start of period SYSTEM_TIME. T Column is the end of period SYSTEM_TIME. blank Column is not used as either the start or the end of a period.	G
GENERATED_ ATTR	CHAR(1) NOT NULL WITH DEFAULT	Indicates the columns generated attribute: A Column is defined as GENERATED_ALWAYS. D Column is defined as GENERATED BY DEFAULT. blank Not applicable or the value of the DEFAULT column is A, D, E, F, I, or J or defined from a prior release of Db2.	G
HASHKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The column's numeric position within the table's hash key. The value is 0 if the column is not part of the hash key. This column is applicable only if the table that use hash organization.	G

Table 290. SYSIBM.SYSCOLUMNS table column descriptions (continued)

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Encoding scheme of the column: blank The column has a data type that does not have an encoding scheme, or the column was created prior to Db2 12. A ASCII E EBCDIC U Unicode	G

SYSCOLUMNS_HIST catalog table

The SYSCOLUMNS_HIST catalog table contains rows from SYSCOLUMNS. The schema is SYSIBM.

Rows are added or changed in the SYSCOLUMNS_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view that contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view. For example 4 (out of 10).	G

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: INTEGER Large integer SMALLINT Small integer FLOAT Floating-point CHAR Fixed-length character string VARCHAR Varying-length character string LONGVAR Varying-length character string (for columns that were added before Version 9) DECIMAL Decimal GRAPHIC Fixed-length graphic string VARG Varying-length graphic string LONGVARG Varying-length graphic string (for columns that were added before Version 9) DATE Date TIME Time TIMESTAMP Timestamp TIMESTZ Timestamp with time zone BLOB Binary large object CLOB Character large object DBCLOB Double-byte character large object ROWID Row ID data type	G

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
COLTYPE (continued)		DISTINCT Distinct type	
		XML XML data type	
		BIGINT Big integer	
		BINARY Fixed-length binary string	
		VARBIN Varying-length binary string	
		DECFLOAT Decimal floating point	

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. INTEGER 4 SMALLINT 2 FLOAT 4 or 8 CHAR Length of string VARCHAR Maximum length of string LONGVAR Maximum length of string (for columns that were added before Version 9) DECIMAL Precision of number GRAPHIC Number of DBCS characters VARGRAPHIC Maximum number of DBCS characters LONGVARG Maximum number of DBCS characters (for columns that were added before Version 9) DATE 4 TIME 3 TIMESTAMP WITHOUT TIME ZONE The integral part of $((p+1)/2) + 7$ where p is the precision of the timestamp TIMESTAMP WITH TIME ZONE The integral part of $((p+1)/2) + 9$ where p is the precision of the timestamp BLOB 4 - The length of the field that is stored in the base table. The maximum length of the LOB column is found in LENGTH2. CLOB 4 - The length of the field that is stored in the base table. The maximum length of the CLOB	G

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH (continued)		DBCLOB 4 - The length of the field that is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. ROWID 17 - The maximum length of the stored portion of the identifier. DISTINCT The length of the source data type. XML 6 BIGINT 8 BINARY The length of the string VARBINARY The maximum length of string DECFLOAT 8 or 16	
LENGTH2	INTEGER NOT NULL	Maximum length of the data retrieved from the column. Possible values are: 0 Column is not a LOB or ROWID column 40 For a ROWID column, the length of the returned value 1–2,147,483,647 bytes For a LOB column, the maximum length	G
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: N No Y Yes	G
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S

Table 291. SYSIBM.SYSCOLUMNS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G
COLCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column.	S
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: blank Statistics have not been collected or varchar column statistical values are padded. N Varchar column statistical values are not padded. This is an updatable column.	G

SYSCONSTDEP catalog table

The SYSCONSTDEP table records dependencies on check constraints or user-defined defaults for a column. The schema is SYSIBM.

Table 292. SYSIBM.SYSCONSTDEP table column descriptions

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the dependency exists.	G
BSHEMA	VARCHAR(128) NOT NULL	Schema of the object on which the dependency exists.	G
BTYPE	CHAR(1) NOT NULL	Type of object on which the dependency exists: F Function instance	G

Table 292. SYSIBM.SYSCONSTDEP table column descriptions (continued)

Column name	Data type	Description	Use
DTBNAME	VARCHAR(128) NOT NULL	Name of the table to which the dependency applies.	G
DTBCREATOR	VARCHAR(128) NOT NULL	The schema of the table to which the dependency applies.	G
DCONSTNAME	VARCHAR(128) NOT NULL	If DTYPE = 'C', the unqualified name of the check constraint. If DTYPE = 'D', a column name.	G
DTYPE	CHAR(1) NOT NULL	Type of object: C Check constraint D User-defined default constant	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
DTBOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table or a zero length string for tables that were created in a Db2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID R Role	G

SYSCONTEXT catalog table

The SYSCONTEXT table contains one row for each trusted context. The schema is SYSIBM.

FL 505 SYSIBM.SYSCONTEXT has an associated history table, SYSIBM.SYSCONTEXT_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 293. SYSIBM.SYSCONTEXT table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trusted context.	G

Table 293. SYSIBM.SYSCONTEXT table column descriptions (continued)

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal context ID.	G
DEFINER	VARCHAR(128) NOT NULL	Authorization ID or role that defined the trusted context.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of the definer: L Role blank Authorization ID	G
SYSTEMAUTHID	VARCHAR(128) NOT NULL	The Db2 primary authorization ID that is used to establish the connection. For remote requests, SYSTEMAUTHID is derived from the system user ID that is provided by an external entity, such as a middleware server. For local requests, SYSTEMAUTHID depends on one of the following sources of the address space: BATCH USER parameter on JOB statement RRSAF USER parameter on JOB statement or RACF user TSO TSO logon ID	G
DEFAULTROLE	VARCHAR(128) NOT NULL	Name of the trusted context default role.	G
OBJECTOWNERTYPE	CHAR(1) NOT NULL	Whether the ROLE AS OBJECT OWNER AND QUALIFIER clause is specified in the definition of this trusted context: L ROLE AS OBJECT OWNER AND QUALIFIER is specified. A role owns any object created in the trusted context. The role is used as the default for the CURRENT SCHEMA special register. The role is included in the SQL PATH. blank ROLE AS OBJECT OWNER is not specified. An authorization ID owns any object created in the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the trusted context is created.	G

Table 293. SYSIBM.SYSCONTEXT table column descriptions (continued)

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL	The time when the trusted context is last altered.	G
ENABLED	CHAR(1) NOT NULL	The status of the trusted context: Y Enabled N Disabled	G
ALLOWPUBLIC	CHAR(1) NOT NULL	Whether the connection is allowed to be reused for PUBLIC: Y Connection reuse is allowed N Connection reuse is not allowed	G
AUTHENTICATEPUBLIC	CHAR(1) NOT NULL	Whether authentication is required for PUBLIC when ALLOWPUBLIC is Y: Y Authentication token is required for PUBLIC. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a KERBEROS token N Authentication is not required	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
DEFAULTSECURITYLABEL	VARCHAR(24) NOT NULL	Name of the context default RACF security label.	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G

Table 293. SYSIBM.SYSCONTEXT table column descriptions (continued)

Column name	Data type	Description	Use
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSCONTEXTAUTHIDS catalog table

The SYSCONTEXTAUTHIDS table contains one row for each authorization ID with which the trusted context can be used. The schema is SYSIBM.

[FL 505](#) SYSIBM.SYSCONTEXTAUTHIDS has an associated history table, SYSIBM.SYSCONTEXTAUTHIDS_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 294. SYSIBM.SYSCONTEXTAUTHIDS table column descriptions

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G
AUTHID	VARCHAR(128) NOT NULL	The primary authorization ID that can reuse a connection. When RACF is used, this is a RACF profile name that contains the primary authorization IDs that are permitted to use the connection in the identified trusted context. A RACF profile name in this column has an ampersand (&) sign as the first character, to distinguish it from an authorization ID.	G
AUTHENTICATE	CHAR(1) NOT NULL	Whether authentication is required for the authorization ID in the AUTHID column: Y Authentication token is required for the authorization ID. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a Kerberos token N Authentication is not required	G

Table 294. SYSIBM.SYSCONTEXTAUTHIDS table column descriptions (continued)

Column name	Data type	Description	Use
ROLE	VARCHAR(128) NOT NULL	The role for the authorization ID in the AUTHID column. The role supersedes the default role that is defined for the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the authorization ID is added to the trusted context.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
SECURITYLABEL	VARCHAR(24) NOT NULL	RACF security label for AUTHID. The security label supersedes the default security label, if any, that is defined for the context.	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSCONTROLS catalog table

The SYSCONTROLS table contains one row for each row permission and column mask. The schema is SYSIBM.

[FL 505](#) SYSIBM.SYSCONTROLS has an associated history table, SYSIBM.SYSCONTROLS_H, which provides temporal versioning of the catalog table. SYSIBM.SYSCONTROLS_RTXT_H and SYSIBM.SYSCONTROLS_DESC_H are the history tables for the auxiliary tables, SYSIBM.SYSCONTROLS_RTXT and SYSIBM.SYSCONTROLS_DESC, which are associated with the two LOB columns, RULETEXT and DESCRIPTOR. The history tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 295. SYSIBM.SYSCONTROLS table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the row permission or column mask.	G
NAME	VARCHAR(128) NOT NULL	Name of the row permission or column mask.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the row permission or column mask.	G
OWNERTYPE	CHAR(1) NOT NULL	Indicates the type of the owner: blank An authorization ID L Role	G
TBSHEMA	VARCHAR(128) NOT NULL	Schema of the table for which the row permission or column mask is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table for which the row permission or column mask is defined.	G
TBCORRELATION	VARCHAR(128) NOT NULL WITH DEFAULT	If specified, the correlation name of the table for which the row permission or column mask is defined. Otherwise, the value is an empty string.	G
COLNAME	VARCHAR(128) NOT NULL	Column name for which the column mask is defined. Blank if this is a row permission.	G
COLNO	SMALLINT NOT NULL	Column number for which the column mask is defined. 0 if this is a row permission.	G
CONTROL_ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal access control ID.	S
CONTROL_TYPE	CHAR(1) NOT NULL	Indicates the type of the access control object: R Row permission M Column mask	G
ENFORCED	CHAR(1) NOT NULL	Indicates the type of the access enforced by the row permission. Column mask always has a value of 'A'. A All access	G

Table 295. SYSIBM.SYSCONTROLS table column descriptions (continued)

Column name	Data type	Description	Use
IMPLICIT	CHAR(1) NOT NULL	Indicates whether the row permission was implicitly created: N The row permission was explicitly created or this is a column mask Y The row permission was implicitly created	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the row permission or the column mask is enabled for access control: N Not enabled Y Enabled	G
STATUS	CHAR(1) NOT NULL	Indicates the status of the row permission or column mask definition: blank The definition of the row permission or column mask is complete. R An error occurred when an attempt was made to regenerate the row permission or column mask.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 in which the row permission or column mask was created. See Release dependency indicators for values.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was last changed.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by using the COMMENT ON statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL	Internal identifier of the environment.	G
ROWID	ROWID	Row identifier to support LOB columns in the table.	G

Table 295. SYSIBM.SYSCONTROLS table column descriptions (continued)

Column name	Data type	Description	Use
RULETEXT	CLOB(2MB) NOT NULL	The source text of the search condition or expression portion of the CREATE PERMISSION or CREATE MASK statement. Note: The lowercase letters in ordinary tokens are folded to uppercase in the text. However, lowercase letters in ordinary tokens are folded to uppercase in a C or Java program only if the appropriate precompiler option is specified.	G
DESCRIPTOR	BLOB(2MB) NOT NULL	Internal description of the row permission or column mask	S
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
REGENERATETS	TIMESTAMP(12) NOT NULL	The time when the object was regenerated. The value is valid only for objects that can be regenerated. If no regeneration has occurred, this column contains the same value as the CREATEDTS column.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSCOPY catalog table

The SYSCOPY table contains information needed for recovery. The schema is SYSIBM.

Table 296. SYSIBM.SYSCOPY table column descriptions

Column name	Data type	Description	Use
DBNAME	CHAR(8) NOT NULL	Name of the database.	G
TSNAME	CHAR(8) NOT NULL	Name of the target table space or index space.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DSNUM	INTEGER NOT NULL	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ICTYPE	CHAR(1) NOT NULL	Type of operation: A ALTER B REBUILD INDEX C CREATE D CHECK DATA LOG(NO) (no log records for the range are available for RECOVER utility) E RECOVER (to current point) F COPY FULL YES I COPY FULL NO J REORG TABLESPACE or LOAD REPLACE compression dictionary write to log L SQL (type of operation) M MODIFY RECOVERY utility P RECOVER TOCOPY, RECOVER TOLOGPOINT, or RECOVER TORBA (to a point in time) Q QUIESCE R LOAD REPLACE LOG(YES) S LOAD REPLACE LOG(NO) T TERM UTILITY command V REPAIR CATALOG utility W REORG LOG(NO) X REORG LOG(YES) Y LOAD LOG(NO) Z LOAD LOG(YES)	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ICDATE	CHAR(6) NOT NULL	Date of the last image copy	N
START_RBA	CHAR(10) NOT NULL FOR BIT DATA	An 80-bit positive integer that contains the RBA/LRSN of a point in the Db2 recovery log. (The LRSN is the RBA in a data-sharing environment.) - For ICTYPE I or F, the starting point for all updates since the image copy was taken - For ICTYPE J, the RBA/LRSN of the compression dictionary - For ICTYPE M, the RBA of the highest deleted SYSCOPY or SYSLGRNX record - For ICTYPE P, the point after the log-apply phase of point-in-time recovery - For ICTYPE Q, the point after all data sets have been successfully quiesced - For ICTYPE R or S, the end of the log before the start of the LOAD utility and before any data is changed - For ICTYPE T, the end of the log when the utility is terminated - For other values of ICTYPE, the end of the log before the start of the RELOAD phase of the LOAD or REORG utility.	G
FILESEQNO	INTEGER NOT NULL	Tape file sequence number of the copy.	G
DEVTYPE	CHAR(8) NOT NULL	Device type the copy is on.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DSNAME	CHAR(44) NOT NULL	For ICTYPE='P' (RECOVER TOCOPY only), 'I', or 'F', DSNAME contains the data set name. Otherwise, DSNAME contains the name of the database and table space or index space in the form, <i>database-name.space-name</i>, or DSNAME is blank for any row migrated from a release prior to Version 4. For redirected recoveries, DSNAME contains the source table space or index space name, in the form, <i>database-name.space-name</i>. A SYSCOPY record with ICTYPE='W' and STYPE='M' for the target table space indicates that a REORG moved a table into the target table space. In this case, the DSNAME column contains the name of the source table space, <i>database-name.tablespace-name</i>. The DBNAME column contains the name of the target database, <i>database-name</i>, and the TSNAME column contains the name of the target table space, <i>tablespace-name</i>.	G
ICTIME	CHAR(6) NOT NULL	Time of the last image copy.	N
SHRLEVEL	CHAR(1) NOT NULL	SHRLEVEL parameter value on COPY (for ICTYPE F or I only): C CHANGE R REFERENCE blank Does not describe an image copy or was migrated from Version 1 Release 1 of Db2.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DSVOLSER	VARCHAR(1784) NOT NULL	If the operation is not an image copy operation that creates a FlashCopy image copy with consistency (an image copy operation with the FLASHCOPY CONSISTENT option), this value is: • A comma-separated list of 6-byte volume serial numbers of the data set, if the data set is not cataloged. • Blank if the data set is cataloged. If the operation is a FlashCopy image copy with consistency that had uncommitted units of work backed out or a sequential image copy that was created from such a FlashCopy image copy by COPY or COPYTOCOPY, this value is a comma-separated list of values in one of the following forms: <i>memberID-ckptrba</i> This format is used for SYSCOPY records that were inserted before SYSCOPY was converted to the Db2 11 enabling-new-function mode format. <i>ckptrba</i> is the 12-byte hexadecimal checkpoint RBA for the member. <i>memberID+ckptrba</i> This format is used for SYSCOPY records that were inserted after SYSCOPY was converted to the Db2 11 new-function mode format or later. <i>ckptrba</i> is the 20-byte hexadecimal checkpoint RBA for the member. <i>memberID</i> is a 3-digit ID for a member of a data sharing group. For a non-data sharing environment, <i>memberID</i> is 000.	G
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	The date and time when the row was inserted. For the COPYTOCOPY utility, this value is the date and time when the row was inserted for the primary local site or primary recovery site copy. For an EXCHANGE DATA statement, this is the time that the statement is run.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ICBACKUP	CHAR(2) NOT NULL WITH DEFAULT	Specifies the type of image copy contained in the data set: blank LOCALSITE primary copy (first data set named with COPYDDN) FC FlashCopy copy LB LOCALSITE backup copy (second data set named with COPYDDN) RP RECOVERYSITE primary copy (first data set named with RECOVERYDDN) RB RECOVERYSITE backup copy (second data set named with RECOVERYDDN)	G
ICUNIT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the media that the image copy data set is stored on: D DASD T Tape blank Medium is neither tape nor DASD, the image copy is from a Db2 release prior to Version 2 Release 3, or ICTYPE is not 'I' or 'F'.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STYPE	CHAR(1) NOT NULL WITH DEFAULT	When ICTYPE=A, the values are: A A partition was added or inserted to a table. B The MEMBER CLUSTER value was changed. C A column was added to a table and an index in different commit scopes, index compression was activated or deactivated, or a column was dropped from a table. A column was added to a table and an index in different commit scopes, or a column was dropped from a table. D Either the DSSIZE attribute of the table space was altered or the default value of a column of a table was altered. E The data set numbers of a base table and its associated clone table are exchanged. F The page size attribute of the table space or index was altered. G An index was regenerated H The table was altered to hash organization, the size of the hash space was changed, or the hash organization was dropped. The value of the TTYPE column indicates the action taken. I The inline length attribute of the LOB column was altered by REORG. L The logging attribute of the table space was altered to LOGGED. M The MAXPARTITIONS attribute of the table space was altered. N An index was altered to not padded O The logging attribute of the table space was altered to NOT LOGGED. P An index was altered to padded R A table was altered to rotate partitions.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STYPE (continued)		When ICTYPE=A, the values are (continued): S The SEGSIZE attribute of the table space was altered. T Table space or table attribute was altered U An ALTER TABLE ALTER COLUMN DROP DEFAULT statement was executed on a column that was previously added with an ALTER TABLE ADD COLUMN statement. V A column in a table was altered for a numeric data type change and the column is in an index. X A REORG dropped one or more empty partitions from the related table space. Y An index was altered to COPY YES Z A column that is in the key of an index that was versioned prior to DB2 version 8 was altered. When ICTYPE=C, the values are: L The logging attribute of the table space was LOGGED. O The logging attribute of the table space was NOT LOGGED. When ICTYPE=E, the values are: B RECOVER utility with the BACKOUT keyword. blank RECOVER utility without the BACKOUT keyword. When ICTYPE=F, the values are: C DFSMS concurrent copy ("I" instance of the table space) J DFSMS concurrent copy ("J" instance of the table space) N A FlashCopy copy is not consistent. Q Sequential copy is consistent	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STYPE (continued)		When ICTYPE=F, the values are (continued): R LOAD REPLACE(YES) S LOAD REPLACE(NO) T FlashCopy copy is consistent. U Sequential copy is not consistent V ALTER INDEX NOT PADDED W REORG LOG(NO) X REORG LOG(YES) Y LOAD RESUME YES LOG(NO) Z LOAD RESUME YES LOG(YES) blank Db2 image copy When ICTYPE=L, the value is: M Mass DELETE, TRUNCATE TABLE, DROP TABLE, or ALTER TABLE ROTATE PARTITION. The LOWDSNUM column contains the table OBID of the affected table. The MERGECOPY utility, when used to merge an embedded copy with subsequent incremental copies, also produces a record that contains ICTYPE=F and the STYPE of the original image copy (R, S, W, or X). When ICTYPE = M and the MODIFY RECOVERY utility was executed to delete SYSCOPY and/or SYSLGRNX records, the value is R. When ICTYPE=O, the values are: B A table space or partition that was in reordered row format was recovered to a point in time when it was in basic row format. R A table space or partition was converted to reordered row format as a result of REORG or LOAD REPLACE.	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
SType (continued)		When ICTYPE=P, the values are: B RECOVER with the BACKOUT YES option. C RECOVER without using LOGONLY with consistency. F Indicates RECOVER using FROM , where the table space was recovered using recovery resources from a different source table space. J RECOVER using LOGONLY without consistency and using the ENFORCE NO option. K RECOVER without using LOGONLY or the BACKOUT YES and the ENFORCE NO options. L RECOVER using LOGONLY without consistency. M RECOVER using LOGONLY with consistency. blank RECOVER without using LOGONLY without consistency. When ICTYPE=Q and option WRITE(YES) is in effect when the quiesce point is taken, the value is W. When ICTYPE=R or S, the values are: A Resetting REORG pending status T First materializing the default value for a row change timestamp column When ICTYPE=T, this field indicates which COPY utility was terminated by the TERM UTILITY command or the START DATABASE command with the ACCESS(FORCE) option. The values are: F COPY FULL YES When ICTYPE=T, the values are (continued): I COPY FULL NO	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STYPE (continued)		When ICTYPE=W, the values are: M REORG on the source table space materialized an ALTER TABLESPACE MOVE TABLE statement When ICTYPE=W or X, the values are: A Resetting REORG pending status or REBALANCE T First materializing the default value for a row change timestamp column For other values of ICTYPE, the value is blank.	
PIT_RBA	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The meaning of the value depends on the value of the ICTYPE column: ICTYPE='P' The LRSN for the point in the Db2 log. (The LRSN is the RBA in a non-data-sharing environment) The value indicates the stop location of a point-in-time recovery. If a record contains ICTYPE='P' and PIT_RBA=X'000000000000', the copy pending status is active and a full image copy is required. If such a record is encountered during fallback processing of RECOVER, the recover job fails, and a point-in-time recovery is required. PIT_RBA can be zero if the point-in-time recovery is completed by the fall-back processing of RECOVER, or if ICTYPE=P from a prior release of Db2. ICTYPE='F' or 'I' and SHRLEVEL='C' The current RBA or LRSN that corresponds to the point in the Db2 log when the SHRLEVEL CHANGE copy completes. ICTYPE='F', SHRLEVEL='R' or 'C', and ICBACKUP='FC' The RBA or LRSN that corresponds to the point in the Db2 log when the FlashCopy completes. CTYPE='F' and SHRLEVEL 'R' or 'C', STYPE= 'T', 'N', 'Q', or 'U' The RBA or LRSN that corresponds to the point in the Db2 log when the FlashCopy completes. ICTYPE=J The RBA where the compression dictionary is written to the log. In data sharing environments, it is the RBA of the member writing to the log. ICTYPE='M' The RBA/LRSN for the end of the log when the utility completes. For other all other ICTYPE values, this field contains X'00000000000000000000'.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
GROUP_MEMBER	CHAR(8) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the operation. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment at the time the operation was performed.	G
OTYPE	CHAR(1) NOT NULL WITH DEFAULT 'T'	Type of object that the recovery information is for: I Index space T Table space	G
LOWDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the lowest partition in the range for SYSCOPY records created for REORG and LOAD REPLACE for resetting a REORG pending status. Version number of an index for SYSCOPY records created for a COPY (ICTYPE=F) of an index space (OTYPE=I). (An index is versioned when a VARCHAR column in the index key is lengthened.) - When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, LOWDSNUM = 1. - When ICTYPE=A and STYPE=X, this value is the lowest partition number that was dropped by REORG. - When ICTYPE=A, STYPE=T, TTYPE=PBG, this value is the number of partitions for the partition-by-growth table space before the conversion - When ICTYPE=A, STYPE=T, TTYPE=PBR, this value is the number of partitions for the partition-by-range table space before the conversion	G
HIGHDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the highest partition in the range. This column is valid only for SYSCOPY records created for REORG and LOAD REPLACE for resetting REORG pending status. - When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, this value is the number of the highest partition that is copied. - When ICTYPE=A and STYPE=X, this value is the highest partition number that was dropped by REORG. - When ICTYPE=A, STYPE=T, TTYPE=PBG, this value is the number of partitions for partition-by-range table space after the conversion. - When ICTYPE=A, STYPE=T, TTYPE=PBG, this value is always 1.	G
COPYPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages written to the copy data set. For inline copies, this number might include pages appearing more than once in the copy data set.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	The number of pages in the table space or index at the time of COPY. This number might include pre-formatted pages that are not actually copied. When ICTYPE=A, SYTPE=H, and TTYPE=S or D , this column contains the previous HASHDATAPAGES value. When ICTYPE=A, SYTPE=H, and TTYPE=A this column contains zero.	G
CPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of changed pages since last copy.	G
JOBNAME	CHAR(8) NOT NULL WITH DEFAULT	Job name of the utility. For changes that cause pending definition changes to object, this column might not be accurate.	G
AUTHID	CHAR(8) NOT NULL WITH DEFAULT	Authorization ID of the utility. For changes that cause pending definition changes to object, this column might not be accurate.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	When ICTYPE= B, F, I, R, S, W, or X: - For a single-table table space, this value is the version number of the oldest format of data for an object. - For a multiple-table table space: - A value of zero indicates that there is a least one table in the table space that has data rows in version 0 format. - When ICTYPE=B, F, I, W, or X, a value greater than 0 is the oldest version for tables that are not at version 0. Any tables that are at version 0 have system pages for a version 0 format. - When ICTYPE=R or S: - A value greater than 0 is the oldest version for tables that are not at version 0. Any tables that are at version 0 have system pages for a version 0 format. - A value of -1 means that the oldest version number cannot be determined. For other values of ICTYPE, the value is -1. The default value of this column is 0.	G
LOGICAL_PART	INTEGER NOT NULL WITH DEFAULT	Logical partition number.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
LOGGED	CHAR(1) NOT NULL WITH DEFAULT	Indicates the logging attribute of the table space at the time the SYSCOPY record is written: • Y — indicates that the logging attribute of the table space is LOGGED • N — indicates that the logging attribute of the table spaces is NOT LOGGED • blank — indicates that the row was inserted prior to DB2 9 or is not specified. For non-LOB table spaces or an index space, blank indicates that the logging attribute is LOGGED.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TTYPE	CHAR(8) NOT NULL WITH DEFAULT	The value of TTYPE column indicates different information depending on the values of the ICTYPE, STYPE, and in some cases, OTYPE column. When ICTYPE=A and STYPE=B: Y The previous member cluster attribute of the table space is being used. N The previous member cluster attribute of the table space is not being used. When ICTYPE=A and STYPE=C: blank A column was added to a table. D A column was dropped from a table. CMP=N Index compression was activated with the ALTER INDEX COMPRESS YES statement. CMP=Y Index compression was deactivated with the ALTER INDEX COMPRESS NO statement. When ICTYPE=A and STYPE=D: x The previous DSSIZE attribute value for the table space in units of G, M, or K. blank The default value of a column of a table was altered. When ICTYPE=A and STYPE=F: x The previous page size attribute value for the table space in units of K. When ICTYPE=A and STYPE=H: A Hash organization was added. The record is written when the hash space is materialized at REORG. D Hash organization was dropped. The record is written immediately when the ALTER statement is issued. S The size of the hash space was changed. The value of the NAPGESF column contains the previous HASHDATAPAGES value. The record is written when the hash space is materialized at REORG.	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TTYPE (continued)		When ICTYPE=A and STYPE=I: D REORG decremented the inline length of the LOB column I REORG incremented the inline length of the LOB column When ICTYPE=A and STYPE=M: I The table space was converted from a single-table simple table space to a partition-by-growth table space. n The previous value of the MAXPARTITIONS attribute for the table space. S The table space was converted from single-table segmented table space to a partition-by-growth table space. When ICTYPE=A and STYPE=P: ABSOLUTE The table space was converted from absolute to relative page numbering. When ICTYPE=A and STYPE=S: n The previous value of the SEGSIZE attribute for the table space. P The table space was converted from a partitioned (non-UTS) table space to a partition-by-range table space. When ICTYPE=A and STYPE=T: M One or more tables were moved by the ALTER TABLESPACE MOVE TABLE statement PBG The table was altered from growth-based partitions (PBG) to range-based partitions (PBR) PBR The table was altered from range-based partitions (PBR) to growth-based partitions (PBG) When ICTYPE=E: blank The full recovery reset the object N The full recovery did not reset the object	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TTYPE (continued)		When ICTYPE=F and OTYPE=I: S indicates that the directory pages for the index image copy are at the front of each partition and are indicated with a 'V' or '8'. When ICTYPE=F and STYPE=N, Q, T, or U, this column indicates the utility that made the FlashCopy: A LOAD RESUME LOG NO B REBUILD C COPY D LOAD RESUME LOG YES E LOAD SHRLEVEL CHANGE L LOAD P REPAIR R LOAD REPLACE LOG YES S LOAD REPLACE LOG NO T COPYTOCOPY W REORG TABLESPACE LOG NO X REORG TABLESPACE LOG YES When ICTYPE=F and STYPE=R, S, Y, or Z: V This inline sequential image copy created by LOAD contains pages updated during the INDEXVAL and ENFORCE phases. Rows that were loaded with unique index violations, referential constraint violations, or index evaluation errors were removed from pages in the image copy.	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TTYPE (continued)		When ICTYPE=I: N Indicates that no system pages are in this incremental image copy. blank Indicates that system pages are in this incremental image copy. I Indicates that the incremental copy was created for a table space or partition with the TRACKMOD YES attribute using the RBA or LRSN in each page instead of the modified page indicator bits in the space map pages. When ICTYPE=P, R, S, W, X, this column provides additional diagnostic information: B Indicates that the RBA or LRSN format changed to basic 6-byte format. BRF Indicates that the row format is the basic row format. BRF I Indicates that the row format is the basic row format, and the FORMAT INTERNAL option was specified. E Indicates that the RBA or LRSN format changed to extended 10-byte format. F Indicates that the REORG utility was run with the FASTSWITCH YES option. RRF I Indicates that the row format is the reordered row format, and the FORMAT INTERNAL option was specified. S Indicates that the REORG utility was run with the FASTSWITCH NO option. When ICTYPE=M and STYPE=R: blank MODIFY RECOVERY deleted rows from SYSIBM.SYSLGRNX. N MODIFY RECOVERY did not delete rows from SYSIBM.SYSLGRNX.	

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TTYPE (continued)		When ICTYPE=T: B Indicates that a broken page was detected during copy. When ICTYPE=W or X and STYPE=H: n the previous value of HASHDATAPAGES When ICTYPE=Y or Z: blank Indicates that the FORMAT INTERNAL option was not specified during LOAD. I Indicates that the FORMAT INTERNAL option was specified during LOAD. When ICTYPE=A-A, A-R, B, C, P, R, S, W, or X, indicates that the page format was changed by the ALTER ADD PARTITION, ALTER ROTATE PARTITION, or CREATE statement, or by the LOAD REPLACE, REBUILD, REORG, or RECOVER utilities: B Indicates that the page format was created or converted to basic page format with 6-byte RBA or LRSN values E Indicates that the page format was created or converted to extended page format with 10-byte RBA or LRSN values. When ICTYPE=A and STYPE=A or R: B Indicates that the page format was converted to basic page format with 6-byte RBA or LRSN values. E Indicates that the page format was converted to extended page format with 10-byte RBA or LRSN values.	
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	When STYPE = E and ICTYPE = A, INSTANCE indicates the data set instance number of a base object after an EXCHANGE statement completes. The value of the INSTANCE column for the last data exchange will match the value of the INSTANCE column for the SYSIBM.SYSTABLESPACE table. For an image copy, INSTANCE indicates the instance number of the current base objects (table and index).	G

Table 296. SYSIBM.SYSCOPY table column descriptions (continued)

Column name	Data type	Description	Use
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	The Db2 release that created the object. Blank if created prior to DB2 9. For other values, see "Release dependency indicators" in Appendix H, "Db2 catalog tables," on page 2389.	G
MODECREATED	CHAR(2) NOT NULL WITH DEFAULT	The latest mode to which the Db2 subsystem had been migrated when the SYSCOPY record was written: C Conversion mode or CM* E Enabling-new-function mode or ENFM* N New-function mode blank Prior to Db2 11	G
EVENTID	BIGINT	Event identifier of the utility that inserted the row (when utility history collection is active). The value in this column corresponds to the EVENTID column value in the SYSIBM.SYSUTILITIES table. If utility history collection is not active, this column will be NULL.	G

SYSCTXTTRUSTATTRS catalog table

The SYSCTXTTRUSTATTRS table contains one row for each list of attributes for a given trusted context. The schema is SYSIBM.

FL 505 SYSIBM.SYSCTXTTRUSTATTRS has an associated history table, SYSIBM.SYSCTXTTRUSTATTR_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see ["Temporal versioning for Db2 security-related catalog tables"](#) on page 2851.

Table 297. SYSIBM.SYSCTXTTRUSTATTRS table column descriptions

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G
NAME	VARCHAR(128) NOT NULL	The name of the trust attribute. Possible values include the following: 'ADDRESS' 'ENCRYPTION' 'JOBNAME' 'SERVAUTH'	G

Table 297. SYSIBM.SYSCTXTTRUSTATTRS table column descriptions (continued)

Column name	Data type	Description	Use
VALUE	VARCHAR(254) NOT NULL	The value of the trust attribute. Possible values including the following attributes: - An IPv4 address is represented as a dotted decimal IP address. An example of an IPv4 address is '9.112.46.111'. - An IPv6 address is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in a compressed form as '2001:DB8::8:800:200C:417A'. - An IPv4 subnet address is represented as <i>IPv4-address/mm</i> where <i>IPv4-address</i> is the initial IPv4 address of a subnet and <i>mm</i> ranges 1-32 which represents the number of initial bits of an IPv4 address that belong in the subnet. An example of an IPv4 address is '9.112.46.0/24'. - An IPv6 subnet address is represented as <i>IPv6-address/mm</i> where <i>IPv6-address</i> is the initial IPv6 address of a subnet and <i>mm</i> ranges 1-128 which represents the number of initial bits of an IPv6 address that belong in the subnet. An example of an IPv6 address is '2001:0DB8:0000:0000:0000:0000:0000:0000/32'. This subnet address can also be expressed in a compressed form as '2001:DB8::/32'. - A domain name which is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. - The minimum level of encryption of the data stream (network encryption) for the connection. Supported values are 'NONE', 'LOW', and 'HIGH'. - A job or started task name for local applications. If the job name ends with *, any job name that matches the characters prior to * in the specified job name are considered for establishing the trusted connection. - A network access security zone name in the RACF SERVAUTH class.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the attribute is created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Table 297. SYSIBM.SYSCTXTTRUSTATTRS table column descriptions (continued)

Column name	Data type	Description	Use
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSDATABASE catalog table

The SYSDATABASE table contains one row for each database. The schema is SYSIBM.

Table 298. SYSIBM.SYSDATABASE table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Database name.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the database.	G
STGROUP	VARCHAR(128) NOT NULL	Name of the default storage group of the database; blank for a system database.	G
BPOOL	CHAR(8) NOT NULL	Name of the default buffer pool of the table space; blank for a system table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database. If there were 32511 databases or more when this database was created, the DBID is a negative number.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Table 298. SYSIBM.SYSDATABASE table column descriptions (continued)

Column name	Data type	Description	Use
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the database.	G
ROSHARE	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	Not used.	N
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of database: blank Not a work file database or a TEMP database. T A TEMP file database. W A work file database. The database is DSNDB07, or it was created with the WORKFILE clause and used as a work file database by a member of a Db2 data sharing group.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that uses this work file database. This column is blank if the work file database was not created in a Db2 data sharing environment, or if the database is not a work file database as indicated by the TYPE column.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the database. For DSNDB04 and DSNDB06, the value is '1985-04-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER DATABASE statement was applied. If no ALTER DATABASE statement has been applied, ALTEREDTS has the value of CREATEDTS.	G
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the database: E EBCDIC A ASCII U Unicode blank For DSNDB04, a work file database, and a TEMP database.	G

Table 298. SYSIBM.SYSDATABASE table column descriptions (continued)

Column name	Data type	Description	Use
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the database. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
INDEXBP	CHAR(8) NOT NULL WITH DEFAULT 'BPO'	Name of the default buffer pool for indexes.	G
IMPLICIT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the database was implicitly created: Y The database was implicitly created N The database was explicitly created	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSDATATYPES catalog table

The SYSDATATYPES table contains one row for each user-defined type defined to the system. The schema is SYSIBM.

Table 299. SYSIBM.SYSDATATYPES table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G

Table 299. SYSIBM.SYSDATATYPES table column descriptions (continued)

Column name	Data type	Description	Use
OWNER	VARCHAR(128) NOT NULL	Owner of the data type.	G
NAME	VARCHAR(128) NOT NULL	Name of the data type.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the data type.	G
SOURCESCHEMA	VARCHAR(128) NOT NULL	Schema of the source data type.	G
SOURCETYPE	VARCHAR(128) NOT NULL	Name of the source type.	G
METATYPE	CHAR(1) NOT NULL	The class of data type: A User-defined ordinary array type L User-defined associative array type T Distinct type	G
DATATYPEID	INTEGER NOT NULL	Internal identifier of the data type.	S
SOURCETYPEID	INTEGER NOT NULL	Internal ID of the built-in data type on which the distinct type or array elements are based.	S
LENGTH	INTEGER NOT NULL	Maximum length or precision for a data type that is based on the IBM-defined DECIMAL data type. The data type can be a distinct type or an array type.	G
SCALE	SMALLINT NOT NULL	One of the following values: - For a data type that is based on the IBM-defined DECIMAL data type, the scale. The data type can be a distinct type or an array type. Number of fractional second digits for a data type that is based on the IBM-defined timestamp or timestamp with time zone type. - For a data type that is based on the IBM-defined TIMESTAMP or TIMESTAMP WITH TIME ZONE type, the number of fractional-second digits. - For any other data type, the value is 0. If the value is a timestamp, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G

Table 299. SYSIBM.SYSDATATYPES table column descriptions (continued)

Column name	Data type	Description	Use
SUBTYPE	CHAR(1) NOT NULL	Subtype of the data type, if the source type is one of the character types. The data type can be a distinct type or an array type. Possible values are: B The subtype is FOR BIT DATA. S The subtype is FOR SBCS DATA. M The subtype is FOR MIXED DATA. blank The source type is not a character type.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the data type was created.	G
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the data type: A ASCII E EBCDIC U Unicode	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

Table 299. SYSIBM.SYSDATATYPES table column descriptions (continued)

Column name	Data type	Description	Use
INLINE_LENGTH	INTEGER NOT NULL WITH DEFAULT -1	The inline length attribute of the type if it is based on a LOB source type: -1 This type does not specify INLINE LENGTH greater than or equal to 0 The inline length attribute (in byte) of the type if it is based on a LOB source type	G
ARRAYLENGTH	BIGINT NOT NULL WITH DEFAULT	Maximum cardinality, if the data type is an ordinary array type. For all other data types, the value is 0.	G
ARRAYINDEXTYPEID	INTEGER NOT NULL WITH DEFAULT	Data type of the index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEXTYPELEN	BIGINT NOT NULL WITH DEFAULT	Maximum length of the array index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEXSUBTYPE	CHAR(1) NOT NULL WITH DEFAULT	Subtype of the array index: B The subtype is FOR BIT DATA. S The subtype is FOR SBCS DATA. M The subtype is FOR MIXED DATA. blank The array index is not a character type.	G

SYSDBAUTH catalog table

The SYSDBAUTH table records the privileges that are held by users over databases. The schema is SYSIBM.

FL 505 SYSIBM.SYSDBAUTH has an associated history table, SYSIBM.SYSDBAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 300. SYSIBM.SYSDBAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Application ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G

Table 300. SYSIBM.SYSDBAUTH table column descriptions (continued)

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Database name.	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: blank Authorization ID L Role	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable C DBCTRL D DBADM E SECADM G ACCESSCTRL L SYSCTRL M DBMAINT S SYSADM	G
CREATETABAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create tables within the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G

Table 300. SYSIBM.SYSDBAUTH table column descriptions (continued)

Column name	Data type	Description	Use
CREATETSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create table spaces within the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
DBADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBADM authority over the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
DBCTRLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBCTRL authority over the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
DBMAINTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBMAINT authority over the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
DISPLAYDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the DISPLAY command for the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G

Table 300. SYSIBM.SYSDBAUTH table column descriptions (continued)

Column name	Data type	Description	Use
DROPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the ALTER DATABASE and DROP DATABASE statement: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
IMAGCOPYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the COPY, MERGECOPY, MODIFY, and QUIESCE utilities on the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
LOADAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the LOAD utility to load tables in the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
REORGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the REORG utility to reorganize table spaces and indexes in the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
RECOVERDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER and REPORT utilities on table spaces in the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G

Table 300. SYSIBM.SYSDBAUTH table column descriptions (continued)

Column name	Data type	Description	Use
REPAIRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DIAGNOSE and REPAIR utilities on table spaces and indexes in the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
STARTDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the START command against the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
STATSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the CHECK and RUNSTATS utilities against the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
STOPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the STOP command against the database: blank Privilege is not held G Privilege held with the GRANT option Y Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G

Table 300. SYSIBM.SYSDBAUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSDBRM catalog table

The SYSDBRM table contains one row for each DBRM of each application plan. The schema is SYSIBM.

Table 301. SYSIBM.SYSDBRM table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
TIMESTAMP	CHAR(8) NOT NULL FOR BIT DATA	Consistency token.	S
PDSNAME	VARCHAR(132) NOT NULL	Name of the partitioned data set of which the DBRM is a member.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan of which this DBRM is a part.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G

Table 301. SYSIBM.SYSDBRM table column descriptions (continued)

Column name	Data type	Description	Use
PRECOMPTIME	CHAR(8) NOT NULL	Not used.	N
PRECOMPDATE	CHAR(6) NOT NULL	Not used.	N
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for the SQL statements in the DBRM: N Apostrophe Y Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in the DBRM: N Period Y Comma	G
HOSTLANG	CHAR(1) NOT NULL	The host language used: B Assembler language C OS/VS COBOL D C F Fortran P PL/I 2 VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) 3 IBM COBOL (Release 2 or subsequent releases) 4 C++	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Table 301. SYSIBM.SYSDBRM table column descriptions (continued)

Column name	Data type	Description	Use
CHARSET	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: A No K Yes	G
MIXED	CHAR(1) NOT NULL WITH DEFAULT	Indicates if mixed data was in effect when the application program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 104): N No Y Yes	G
DEC31	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether DEC31 was in effect when the program was precompiled: blank No Y Yes For more information, see “Arithmetic operators in expressions” on page 255 .	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	Version identifier for the DBRM.	G
PRECOMPTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the DBRM was precompiled.	G
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSDEPENDENCIES catalog table

The SYSDEPENDENCIES table records the dependencies between objects. The schema is SYSIBM.

Table 302. SYSIBM.SYSDEPENDENCIES table column descriptions

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which another object is dependent. If BTYPE is F, the name is the specific name of the function. If BTYPE is W or Z, the name is the name of the table for which the period is defined.	G
BSHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object on which another object is dependent.	G
BCOLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Column name of the object on which another object is dependent.	G
BCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object on which another object is dependent.	G

Table 302. SYSIBM.SYSDEPENDENCIES table column descriptions (continued)

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	The type of object that is identified by BNAME, BSCHEMA, and BCOLNAME: C Column E INSTEAD OF trigger F Function G Global temporary table H Global variable I Index M Materialized query table O Procedure P Partitioned table space Q Sequence R Table space S Synonym T Table U User-defined type, which is a distinct type or an array type. V View W SYSTEM_TIME period Z BUSINESS_TIME period 0 (zero) Alias	G
BOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object on which another object is dependent.	G

Table 302. SYSIBM.SYSDEPENDENCIES table column descriptions (continued)

Column name	Data type	Description	Use
BOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object on which another object is dependent: L Role blank Authorization ID that is not a role	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that has dependencies on another object.	G
DSHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object that has dependencies on another object.	G
DCOLNAME	VARCHAR(128) NOT NULL	Column name of the object that has dependencies on another object.	G
DCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object that has dependencies on another object.	G
DTYPE	CHAR(1) NOT NULL	The type of the object that is identified by DSHEMA, DNAME, DCOLNAME, and DVERSION: B Trigger package for basic trigger “1” on page 2505 C Generated column F Function I Index M Materialized query table “1” on page 2505 O Procedure “1” on page 2505 V View “1” on page 2505 X Row permission Y Column mask 1 Trigger package for an advanced trigger	G
DOWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the object that has dependencies on another object.	G

Table 302. SYSIBM.SYSDEPENDENCIES table column descriptions (continued)

Column name	Data type	Description	Use
DOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object that has dependencies on another object: L Role blank Authorization ID if not a role	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
BAUTH	SMALLINT NOT NULL WITH DEFAULT	The privilege that is held on the object on which another object is dependent.	G
DVERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier of the object that is identified by DSCHEMA and DNAME if the object has a version. This column contains a zero length string for the objects that are created prior to DB2 10 and for the rows that correspond to objects without versions.	G

Notes:

- For base objects that were created in DB2 10 or earlier, the SYSDEPENDENCIES catalog table contains no information for dependencies on objects of the following types:
 - For views or materialized query tables, see “SYSVIEWDEP catalog table” on page 2815.
 - For SQL scalar functions, procedures, or triggers, see “SYSPACKDEP catalog table” on page 2623 and “SYSSEQUENCESDEP catalog table” on page 2724.

SYSDDUMMY1 catalog table

The SYSDDUMMY1 catalog table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

Unlike most other catalog tables, which reside in Unicode table spaces, the SYSIBM.SYSDDUMMY1 table resides in the SYSEBCDC table space, which is defined with the EBCDIC encoding scheme.

Table 303. SYSIBM.SYSDDUMMY1 table column descriptions

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYA catalog table

The SYSDUMMYA table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

The SYSIBM.SYSDUMMYA table resides in the SYSTSASC table space, which is defined with the CCSID ASCII encoding scheme.

Table 304. SYSIBM.SYSDUMMYA table column descriptions

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYE catalog table

The SYSDUMMYE table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

The SYSIBM.SYSDUMMYE table resides in the SYSEBCDC table space, which is defined with the EBCDIC encoding scheme.

Table 305. SYSIBM.SYSDUMMYE table column descriptions

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYU catalog table

The SYSDUMMYU table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

The SYSIBM.SYSDUMMYU table resides in SYSTSUNI table space, which is defined with the Unicode encoding scheme.

Table 306. SYSIBM.SYSDUMMYU table column descriptions

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSDYNQRY catalog table

The SYSDYNQRY table contains information for the stabilization of access paths for dynamic SQL statements. The schema is SYSIBM.

Table 307. SYSIBM.SYSDYNQRY table column descriptions

Column name	Data type	Description	Use
SDQ_STMT_ID	BIGINT NOT NULL GENERATED BY DEFAULT AS IDENTITY	The identifier of the stabilized dynamic query.	
STBLGRP	VARCHAR(128) NOT NULL	The name of the stabilization group.	
COPYID	SMALLINT NOT NULL WITH DEFAULT	The copy type of the stabilized runtime structures for the query in this row: 0 The current copy. 4 An invalid copy.	
CURSQLID	VARCHAR (128) NOT NULL	The current SQLID for the stabilized dynamic query.	
CURSCHEMA	VARCHAR (128) NOT NULL	Current schema for stabilized dynamic query.	
CURAPPLCOMPAT	VARCHAR (10) NOT NULL	Current application compatibility for stabilized dynamic query.	
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the SQL statement text of the stabilized dynamic query.	
QUERY_HASH_VERSION	INTEGER NOT NULL	The version of the query hash.	

Table 307. SYSIBM.SYSDYNQRY table column descriptions (continued)

Column name	Data type	Description	Use
VALID	CHAR(1) NOT NULL	Whether the stabilized dynamic query is valid. 'A' An ALTER statement changed the description of the table or base table of a view referred to by the query. For a CREATE INDEX statement involving data sharing, VALID is also marked as 'A'. The changes do not invalidate the query. 'H' An ALTER TABLE statement changed the description of the table or base table of a view referred to by the query. For objects that were created in Db2 releases prior to Version 5, the change invalidates the query. 'N' The stabilized access path is not valid. 'Y' The stabilized access path for the dynamic query is valid.	
LASTUSED	DATE WITH DEFAULT	The date on which the query that uses the stabilized runtime structures was last run.	
RELBOUND	CHAR(1) NOT NULL	The Db2 release in which the query was stabilized. See Release dependency indicators .	
GROUP_MEMBER	VARCHAR(24) NOT NULL	The data sharing member name that updates the row.	
UPDATEDTS	TIMESTAMP NOT NULL	Timestamp when statement was stabilized.	
ROWID	ROWID NOT NULL GENERATED ALWAYS	Internal use only.	
STMTTEXT	CLOB (2M) NOT NULL	The text of the SQL statement and any attribute string.	
DATA1	BLOB(2G) INLINE LENGTH (32329)	Internal use only.	
DATA2	BLOB(2G) NOT NULL	Internal use only.	
DATA3	BLOB(2G) NOT NULL	Internal use only.	
DATA4	BLOB(2G) NOT NULL	Internal use only.	
DATA5	VARCHAR(128) NOT NULL	Internal use only.	

Table 307. SYSIBM.SYSDYNQRY table column descriptions (continued)

Column name	Data type	Description	Use
DATA6	CHAR(8) NOT NULL FOR BIT DATA	Internal use only.	
FUNCTION_LVL	VARCHAR(10)	The function level of the query.	G

SYSDYNQRYDEP catalog table

The SYSDYNQRYDEP table contains information about dependencies for dynamic query packages. The schema is SYSIBM.

Access paths for SQL statements might depend on objects that Db2 does not actually use when it processes the selected access paths. Such dependencies are recorded in the SYSDYNQRYDEP catalog table, but they are not be shown in EXPLAIN output.

Table 308. SYSIBM.SYSDYNQRYDEP table column descriptions

Column name	Data type	Description	Use
SDQ_STMT_ID	BIGINT NOT NULL	The identifier of the stabilized dynamic SQL statement.	G
COPYID	SMALLINT NOT NULL	The copy type of the stabilized runtime structures for the query in this row: 0 The current copy. 1 The previous copy. 2 The original copy.	G
BQUALIFIER	VARCHAR(128) NOT NULL	The value of the column depends on the type of object: - If BNAME identifies a table space (BTYPE is 'R'), the value is the name of its database. - If BNAME identifies a table on which a period is defined (BTYPE is 'W' or 'Z'), the value is the qualifier of that table. - If BNAME identifies user-defined function, a cast function, a stored procedure, or a sequence (BTYPE is 'F', 'O', or 'Q'), the value is the schema name. - If BNAME identifies a role, the value is blank. - Otherwise, the value is the schema of BNAME.	G
BNAME	VARCHAR(128) NOT NULL	The name of the object that the query depends on.	G

Table 308. SYSIBM.SYSDYNQRYDEP table column descriptions (continued)

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME and BQUALIFIER: 'E' INSTEAD OF trigger 'F' User-defined function or cast function 'G' Global temporary table. 'I' Index. 'M' Materialized query table 'O' Stored procedure 'P' Partitioned table space if it is defined as LARGE or with the DSSIZE parameter 'Q' Sequence object 'R' Table space 'S' Synonym 'T' Table 'U' Distinct type 'V' View 'W' SYSTEM_TIME period 'Z' BUSINESS_TIME period 'O' (zero) Alias	G
CLASS	CHAR(1) NOT NULL	'A' Authorization dependency 'D' Data Definition Language dependency	G

Table 308. SYSIBM.SYSDYNQRYDEP table column descriptions (continued)

Column name	Data type	Description	Use
BAUTH	SMALLINT NOT NULL WITH DEFAULT	The privilege that is held on the object on which the query depends. The privilege applies only when CLASS is 'A'. 50 SELECTAUTH 51 INSERTAUTH 52 DELETEAUTH 53 UDPATEAUTH 64 EXECUTEAUTH 263 USAGEAUTH 291 READAUTH 292 WRITEAUTH 0 The column is not used. CLASS is 'D'.	G
AUTHID_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of authorization indicated by AUTHID. " (blank) The value of CLASS is 'D', or the value of CLASS is 'A' and AUTHID contains the name of an authorization ID. 'L' AUTHID contains the name of a role.	G
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	The owner of the privilege on the object on which the query is dependent, or a zero-length string if the value of CLASS is 'D'.	G
DBNAME	VARCHAR(128) NOT NULL WITH DEFAULT	If the value of SDBADMAUTH is 'Y', DBNAME contains the name of the database on which the user or role indicated by AUTHID holds DBADM authority. Otherwise the value is blank.	G

Table 308. SYSIBM.SYSDYNQRYDEP table column descriptions (continued)

Column name	Data type	Description	Use
BADMINAUTH	CHAR(1) NOT NULL	The authority that allowed access to the object on which the query is dependent. The admin authority only applies when CLASS is 'A'. 'B' SDBADMAUTH 'D' DBADMAUTH 'G' ACCESSCTRLAUTH 'K' SQLADMAUTH 'L' SYSCTRLAUTH 'S' SYSADMAUTH 'T' DATAACCESSAUTH " Authority not held	G
PUBLICAUTH	CHAR(1) NOT NULL WITH DEFAULT	'Y' This privilege is held by PUBLIC by the user or role indicated in AUTHID. ' ' (blank) This privilege is not held by PUBLIC, or the value of CLASS is 'D'.	G
ALLOBJAUTH	CHAR(1) NOT NULL WITH DEFAULT	'Y' The privilege is held on all objects within the schema by the user or role indicated in AUTHID. ' ' (blank) This privilege is not held on all objects within the schema, or the value of CLASS is 'D'.	G
QUERY_HASH	BINARY(16) WITH DEFAULT	The hash key of the statement text if the value of CLASS is 'D', otherwise hexadecimal zeros.	G
—	CLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I
—	CHAR(8) NOT NULL FOR BIT DATA	Internal use only.	I

Table 314. SYSIBM.SYSENVIRONMENT table column descriptions (continued)

Column name	Data type	Description	Use
HOST_LANGUAGE	CHAR(8) NOT NULL	The host language: • ASM • C • CPP • IBMCOB • JAVA • PLI • FORTRAN	G
CHARSET	CHAR(1) NOT NULL	The character set: A Alphanumeric	G
FOLD	CHAR(1) NOT NULL	FOLD is only applicable when HOST_LANGUAGE is C or CPP. Otherwise FOLD is blank. N Lower case letters in SBCS ordinary identifiers are not folded to uppercase Y Lower case letters in SBCS ordinary identifiers are folded to uppercase blank Not applicable	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The rounding mode that is used when arithmetic and casting operations are performed on DECFLOAT data: C ROUND_CEILING D ROUND_DOWN F ROUND_FLOOR G ROUND_HALF_DOWN E ROUND_HALF_EVEN H ROUND_HALF_UP U ROUND_UP	G

Table 314. SYSIBM.SYSENVIRONMENT table column descriptions (continued)

Column name	Data type	Description	Use
CREATEDTS	TIMESTAMP(12) NOT NULL	The time when the row was inserted.	G
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT	The application compatibility level that is associated with this environment.	G
		V13R1M5nn Compatibility with the behavior of the identified Db2 13 function level. For example, V13R1M508 specifies compatibility with the highest available Db2 13 function level. The equivalent function level or higher must be activated. For information about the new capabilities that become available in each application compatibility level, see V13R1Mnnn application compatibility levels (Db2 Application programming and SQL).	
		V12R1M5nn Compatibility with the behavior of the identified Db2 12 function level. For information about the new capabilities that become available in each application compatibility level, see V12R1Mnnn application compatibility levels (Db2 Application programming and SQL). Tip: Extra program preparation steps might be required to increase the application compatibility level for applications that use data server clients or drivers to access Db2 for z/OS. For more information, see Setting application compatibility levels for data server clients and drivers (Db2 Application programming and SQL).	
		V12R1 Compatibility with the behavior of Db2 12 function level 500. This value has the same result as specifying V12R1M500.	
		V11R1 Compatibility with the behavior of Db2 11 new-function mode.	
		V10R1 Compatibility with the behavior of DB2 10 new-function mode. For more information, see V10R1 application compatibility level (Db2 Application programming and SQL).	

SYSFIELDS catalog table

The SYSFIELDS table contains one row for every column that has a field procedure. The schema is SYSIBM.

Table 315. SYSIBM.SYSFIELDS table column descriptions

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of this column in the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
FLDTYPE	VARCHAR(24) NOT NULL	Data type of the encoded values in the field (This column might contain statistical values from a prior release.): INTEGER Large integer SMALLINT Small integer FLOAT Floating-point CHAR Fixed-length character string VARCHAR Varying-length character string DECIMAL Decimal GRAPHIC Fixed-length graphic string VARG Varying-length graphic string	G

Table 315. SYSIBM.SYSFIELDS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the field; or, for a decimal field, its precision. (This column might contain statistical values from a prior release.) The number does not include the internal prefixes that can be used to record actual length and null state. INTEGER 4 SMALLINT 2 FLOAT 8 CHAR Length of string VARCHAR Maximum length of string DECIMAL Precision of number GRAPHIC Number of DBCS characters VARG Maximum number of DBCS characters	G
SCALE	SMALLINT NOT NULL	Scale if FLDTYPE is DECIMAL; otherwise, the value is 0.	G
FLDPROC	VARCHAR(24) NOT NULL	For a row describing a field procedure, the name of the procedure. (This column might contain statistical values from a prior release.)	G
WORKAREA	SMALLINT NOT NULL	For a row describing a field procedure, the size, in bytes, of the work area required for the encoding and decoding of the procedure. (This column might contain statistical values from a prior release.)	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
EXITPARML	SMALLINT NOT NULL	For a row describing a field procedure, the length of the field procedure parameter value block. (This column might contain statistical values from a prior release.)	G
PARMLIST	VARCHAR(735) NOT NULL	For a row describing a field procedure, the parameter list following FLDPROC in the statement that created the column, with insignificant blanks removed. (This column might contain statistical values from a prior release.)	G

Table 315. SYSIBM.SYSFIELDS table column descriptions (continued)

Column name	Data type	Description	Use
EXITPARM	VARCHAR(1530) NOT NULL FOR BIT DATA	For a row describing a field procedure, the parameter value block of the field procedure (the control block passed to the field procedure when it is invoked). (This column might contain statistical values from a prior release.)	G

SYSFOREIGNKEYS catalog table

The SYSFOREIGNKEYS table contains one row for every column of every foreign key. The schema is SYSIBM.

Table 316. SYSIBM.SYSFOREIGNKEYS table column descriptions

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
RELNAME	VARCHAR(128) NOT NULL	Constraint name for the constraint for which the column is part of the foreign key.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in its table.	G
COLSEQ	SMALLINT NOT NULL	Numeric place of the column in the foreign key.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSINDEXCLEANUP catalog table

The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects. The schema is SYSIBM.

Table 317. SYSIBM.SYSINDEXCLEANUP table column descriptions

Column name	Data type	Description	Use
DBNAME	VARCHAR(24)	The name of the database that contains the index space.	G
INDEXSPACE	VARCHAR(24)	The name of the index space.	G

Table 317. SYSIBM.SYSINDEXCLEANUP table column descriptions (continued)

Column name	Data type	Description	Use
ENABLE_DISABLE	CHAR(1) NOT NULL	Specifies whether the row enables or disables cleanup for the specified index space. 'E' Enabled 'D' Disabled	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates the meaning of the value of the DAY column: 'M' The value indicates the day of the month. 'W' The value indicates a day of the week.	G
MONTH	SMALLINT	The month in which the time window applies. For example a 1 value indicates January and a 12 value indicates December. If this column contains NULL, the time window applies to all months. If the value of the MONTH_WEEK column is 'W', this value must be NULL.	G
DAY	SMALLINT	The day of the month or the day of the week for which the time window applies, as specified by the value of the MONTH_WEEK column. For example, if MONTH_WEEK='W', a 1 value indicates Monday and 7 indicates Sunday. If the value of this column is NULL, the time window applies to every day of the month or every day of the week.	G
START_TIME	TIME	The local time at the beginning of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the END_TIME column contains NULL.	G
END_TIME	TIME	The local time at the end of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the START_TIME column contains NULL.	G

SYSINDEXCONTROL catalog table

The SYSINDEXCONTROL table contains rows that specify time windows to control the use of memory allocated for an index. Each row specifies a time window for enabling or disabling the use of memory for a specific index object. The schema is SYSIBM.

Tip: Fast index traversal is intended to be automatically controlled by Db2. Use the SYSIBM.SYSINDEXCONTROL catalog table only to define exceptions, when the automatic processing is unacceptable. Index performance optimization might be impeded if the number of rows in this catalog table becomes too large.

Table 318. SYSIBM.SYSINDEXCONTROL table column descriptions			
Column name	Data type	Description	Use
SSID	CHAR(4)	The name of a Db2 subsystem. In data sharing, if this column is NULL, this row applies to all members of the data sharing group.	G
PARTITION	SMALLINT	Partition number. If this column is NULL, then the action is applicable to all partitions of the specified index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The purpose for which memory is being used: F A structure for fast index traversal (FTB)	G
ACTION	CHAR(1) NOT NULL WITH DEFAULT 'A'	The action that is being performed: A The index is candidate for FTB creation when the INDEX_MEMORY_CONTROL subsystem parameter setting is (SELECTED,n) D Disable FTB creation F Force FTB creation	G
MONTH_WEEK	CHAR(1)	The meaning of the value in the DAY column. M A day of the month W A day of the week	G
MONTH	SMALLINT	Month during which the time window applies. Valid values are 1 (January) to 12 (December), or NULL. If this column contains NULL, the time window applies to all months. If MONTH_WEEK is 'W', this column value must be NULL.	G

Table 318. SYSIBM.SYSINDEXCONTROL table column descriptions (continued)

Column name	Data type	Description	Use
DAY	SMALLINT	Day of the month or day of the week for which the time window applies. • If MONTH_WEEK='M', valid values are 1 (first day of the month) to the number of the last day of the month, or NULL. • If MONTH_WEEK='W', valid values are 1 (Monday) to 7 (Sunday), or NULL. If this column contains NULL, the time window applies to every day of the month, or to every day of the week, depending on the value of the MONTH_WEEK column.	G
FROM_TIME	TIME	The time of day at which the time window begins. If this column contains NULL, no limitation on the time exists. This column contains NULL if the TO_TIME column contains NULL.	G
TO_TIME	TIME	The time of day at which the time window ends. If this column contains NULL, no limitation on the time exists. This column contains NULL if the FROM_TIME column contains NULL.	G

SYSINDEXES catalog table

The SYSINDEXES table contains one row for every index. The schema is SYSIBM.

Table 319. SYSIBM.SYSINDEXES table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
UNIQUERULE	CHAR(1) NOT NULL	Whether the index is unique: C Yes, and it is used to enforce the uniqueness of a UNIQUE constraint or hash key columns. D No (duplicates are allowed) U Yes P Yes, and it is a primary index (As in prior releases of Db2, a value of P is used for primary keys that are used to enforce a referential constraint.) N Yes, and it is defined with UNIQUE WHERE NOT NULL R Yes, and it is an index used to enforce the uniqueness of a non-primary parent key G Yes, and it is an index used to enforce the uniqueness of values in a column defined as ROWID GENERATED BY DEFAULT X Yes, and it is an index used to enforce the uniqueness of values in a column that is used to identify or find XML values associated with a specific row.	G
COLCOUNT	SMALLINT NOT NULL	The number of columns in the key.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified for the index: N No Y Yes	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
CLUSTERED	CHAR(1) NOT NULL	Whether the table is actually clustered by the index: N A significant number of rows are not in clustering order, or statistics have not been gathered. Y Most of the rows are in clustering order. blank Not applicable. This is an updatable column that can also be changed by the RUNSTATS utility. For a sparse index, the statistic is based on the actual contents of the index.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
OBID	SMALLINT NOT NULL	Internal identifier of the index fan set descriptor.	S
ISOBID	SMALLINT NOT NULL	Internal identifier of the index page set descriptor.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the index.	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space.	G
FIRSTKEYCARD	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the FIRSTKEYCARDF column.	N
FULLKEYCARD	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the FULLKEYCARDF column.	N
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered. This is an updatable column.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered. This is an updatable column.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the index.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
PGSIZE	SMALLINT NOT NULL	Contains the value 4, 8, 16, or 32 which indicates the size, in KB, of the leaf pages in the index. If the index was created prior to DB2 9, the value will be 4096 for a 4 KB page size.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are erased when dropped. The value is meaningless if the index is partitioned: N No Y Yes	G
DSETPASS	VARCHAR(24) NOT NULL	Not used	N
CLOSERULE	CHAR(1) NOT NULL	Whether the data sets are candidates for closure when the limit on the number of open data sets is reached: N No Y Yes	G
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the index, as determined by the last execution of the STOSPACE utility. The value is 0 if the index is not related to a storage group, or if STOSPACE has not been run. If the index space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are defined in a storage group.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CLUSTERRATIO	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the index.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
IOFACTOR	SMALLINT NOT NULL	Internal use only.	I
PREFETCHFACTOR	SMALLINT NOT NULL	Not used	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
INDEXTYPE	CHAR(1) NOT NULL WITH DEFAULT	The index type: 2 Type 2 index or a hash overflow index on non-partitioned tables. blank Type 1 index D Data-partitioned secondary index P An index that is both partitioned and is a partitioning index (index that is on a table that uses table-controlled partitioning).	G
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the index. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
PIECESIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in KB for non-partitioned indexes. A value of 0 indicates a partitioned index or an index was created in an earlier release than DB2 version 5.	G
COPY	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether COPY YES was specified for the index, which indicates if the index can be copied and if SYSIBM.SYSLGRNX recording is enabled for the index. N No Y Yes	G
COPYLRN	CHAR(10) NOT NULL WITH DEFAULT X'0000000000000000' FOR BIT DATA	The value can be either an RBA or LRSN. (LRSN is only for data sharing.) If the index is currently defined as COPY YES, the value is the RBA or LRSN when the index was created with COPY YES or altered to COPY YES, not the current RBA or LRSN. If the index is currently defined as COPY NO, the value is set to X'00000000000000000000' if the index was created with COPY NO; otherwise, if the index was altered to COPY NO, the value in COPYLRN is not changed when the index is altered to COPY NO.	G
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	When multiplied by 100, the value of the column is the percentage of rows that are in clustering order. For example, a value of '.9125' indicates 91.25%. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table, a node ID index or an XML index. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character field string provided by the user with the COMMENT statement.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
PADDED	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether keys within the index are padded for varying-length column data: Y The index contains varying-length character or graphic data and is PADDED (the varying-length columns are padded to their maximum length). N The index contains varying-length character or graphic data and is NOT PADDED (the varying-length columns are not padded to their maximum length). Index-only access to all column data is possible. blank The index does not contain varying-length character or graphic data, or the index was created or altered prior to DB2 version 8.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this index. A value of zero indicates that a version-creating alter has never occurred against this index.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index space and any image copies of the index.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the index space. A zero indicates that the index space has never had been versioned. After the version number reaches the maximum value, the number will wrap back to one.	G
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	Release of Db2 that was used to create the object, blank for indexes created before Version 8. For all other values, see Release dependency indicators .	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
KEYTARGET_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of key-targets for an extended index. The value is 0 for a simple index.	G
UNIQUE_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of columns or key-targets that make up the unique constraint of an index, when other non-constraint enforcing columns or key-targets exist. Otherwise the value is 0.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
IX_EXTENSION_TYPE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the type of extended index: N Node ID index S Index on a scalar expression T Spatial index V XML index blank Simple index	G
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT ' N'	Indicates whether index compression is active: N Index compression is not active Y Index compression is active	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the index. The value is an empty string for indexes created in a Db2 release prior to Db2 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
DATA REPEAT FACTOR	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
HASH	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is the hash overflow index for a hash table. N No. N is the default. Y Yes	G
SPARSE	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is sparse or not. N No. N is the default. Every data row has an index entry. Y Yes. This index might not have an entry for each data row in the table. X Excluded. This index will not have an index entry when every data row for a key column contains the NULL value.	G
PARSETREE	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I
RTSECTION	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I
DSSIZE	FL 508 BIGINT WITH DEFAULT NULL	<u>FL 508</u> For indexes on tables that reside in UTS or LOB table spaces, the maximum or default size in KB of data sets for the index, depending on the type of index: • Non-partitioned indexes: the maximum size of the entire index. • Partitioned indexes with absolute page numbering (APN): the maximum size of each data set for the index. • Partitioned indexes with relative page numbering (RPN): the default size of each data set for the index. • Indexes on auxiliary or XML tables: the maximum size of the entire index. • Indexes on tables in non-UTS table spaces: 0 The value is NULL for indexes created before Db2 12 until you run a specific CATMAINT UPDATE UNLDDN job at catalog level V13R1M508 or higher.	G

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
PAGENUM	CHAR(1) NOT NULL WITH DEFAULT 'A'	Format of page numbers for the index, indicating absolute or relative page numbering. A Indicates absolute addressing. The page number is an absolute number from the first page of the index. If the index is partitioned, the partition number is embedded in the page number. R Indicates relative addressing for partitioned indexes. The page number is relative to the start of the partition. NULL for objects that were created before Db2 12	G
PARTKEYCOLNUM	SMALLINT NOT NULL WITH DEFAULT	Reserved for future IBM use.	I
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Reserved for future IBM use.	I
INDEXSTATUS	VARCHAR(30) NOT NULL WITH DEFAULT	Reserved for future IBM use.	I
PARTITIONS	SMALLINT	Reserved for future IBM use.	I
PQTY	INTEGER WITH DEFAULT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY accepts space in 1 KB units. A value of -1 indicates that one of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. This column contains the null value when the value is unknown for objects created prior to Db2 12.	

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
STORTYPE	CHAR(1) WITH DEFAULT NULL	Type of storage allocation: E Explicit (storage group not used) I Implicit (storage group used) This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
STORNAME	VARCHAR(128) WITH DEFAULT NULL	Name of storage group used for space allocation. Blank if storage group not used. This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
VCATNAME	VARCHAR(24) WITH DEFAULT NULL	Name of integrated catalog facility catalog used for space allocation. This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
FREEPAGE	SMALLINT WITH DEFAULT NULL	Number of pages loaded before a page is left as free space. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
PCTFREE	SMALLINT WITH DEFAULT NULL	Percentage of each page left as free space. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
GBPCACHE	CHAR(1) WITH DEFAULT NULL	Group buffer pool cache option specified for this index or index partition. Blank Only changed pages are cached in the group buffer pool. A Changed and unchanged pages are cached in the group buffer pool. N No data is cached in the group buffer pool. This column contains the null value when the value is unknown for objects created prior to Db2 12.	

Table 319. SYSIBM.SYSINDEXES table column descriptions (continued)

Column name	Data type	Description	Use
SECQTY1	INTEGER WITH DEFAULT NULL	Secondary space allocation in units of 4 KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4 KB blocks. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
ENFORCED_CONS	CHAR(1) NOT NULL WITH DEFAULT	Whether the index is an enforcing non-unique constraint. Blank The index does not enforce a non-unique constraint. F The index enforces a foreign key for a temporal referential constraint.	
IMPLICIT	CHAR(1) NOT NULL WITH DEFAULT	Whether the index was implicitly created. Possible values are: Blank n/a N The index was explicitly created. Y The index was implicitly created.	
REGENERATETS	TIMESTAMP(12) NOT NULL	The time when the object was regenerated. The value is valid only for objects that can be regenerated. If no regeneration has occurred, this column contains the same value as the CREATEDTS column.	G
KEYLABEL	VARCHAR(192) NOT NULL WITH DEFAULT	The key label that is specified at the table level. Otherwise, the value is an empty string.	

SYSINDEXES_HIST catalog table

The SYSINDEXES_HIST catalog table contains rows from SYSINDEXES. The schema is SYSIBM.

Rows are added or changed in the SYSINDEXES_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 320. SYSIBM.SYSINDEXES_HIST table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G

Table 320. SYSIBM.SYSINDEXES_HIST table column descriptions (continued)

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified when the index was created: N No Y Yes	G
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered.	S
STATTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered.	S
CLUSTERRATIOF	FLOAT(8) NOT NULL	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G

Table 320. SYSIBM.SYSINDEXES_HIST table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
DATAPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXES_RTSECT catalog table

The SYSINDEXES_RTSECT catalog table is an auxiliary table for the RTSECTION column of the SYSIBM.SYSINDEXES table and is required to hold LOB data. The schema is SYSIBM.

Table 321. SYSIBM.SYSINDEXES_RTSECT table column descriptions

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSINDEXES_TREE catalog table

The SYSINDEXES_TREE catalog table is an auxiliary table for the PARSETREE column of the SYSINDEXES table and is required to hold LOB data. The schema is SYSIBM.

Table 322. SYSIBM.SYSINDEXES_TREE table column descriptions

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSINDEXPART catalog table

The SYSINDEXPART table contains one row for each nonpartitioned secondary index (NPSI) and one row for each partition of a partitioning index or a data-partitioned secondary index. The schema is SYSIBM.

Table 323. SYSIBM.SYSINDEXPART table column descriptions

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G

Table 323. SYSIBM.SYSINDEXPART table column descriptions (continued)

Column name	Data type	Description	Use
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: E Explicit, and STORNAME names an integrated catalog facility catalog I Implicit, and STORNAME names a storage group This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2	G
STORNAME	VARCHAR(128) NOT NULL	Name of storage group or integrated catalog facility catalog used for space allocation. This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2	G
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation. This column is not used for rows representing catalog indexes. Catalog data sets are managed by Db2	G
CARD	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the CARDF column.	N
FAROFFPOS	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the FAROFFPOSF column.	N
LEAFDIST	INTEGER NOT NULL	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index.	S
NEAROFFPOS	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the NEAROFFPOSF column.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
LIMITKEY	VARCHAR(512) NOT NULL FOR BIT DATA	The high value of the limit key of the partition in an internal format. An empty string if the index is not partitioned or for a data-partitioned secondary index (DPSI). If any column of the key has a field procedure, the internal format is the encoded form of the value.	S

Table 323. SYSIBM.SYSINDEXPART table column descriptions (continued)

Column name	Data type	Description	Use
FREEPAGE	SMALLINT NOT NULL	Number of pages that are loaded before a page is left as free space.	G
PCTFREE	SMALLINT NOT NULL	Percentage of each leaf or nonleaf page that is left as free space.	G
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage allocated to the index space partition, as determined by the last execution of the STOSPACE utility. 0 The STOSPACE or RUNSTATS utility has not been run or the data set for the index has been created during the first insert operation or when the LOAD utility was run. -1 The index was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into the index, and data has yet to be inserted into the index. -2 The value exceeds the maximum size for an integer value. See the SPACEF column value. A non-negative value Indicates that the data sets for the index space are defined with the underlying data sets allocated. The STOSPACE utility updates this value if the index is related to a storage group. The RUNSTATS utility updates this value if run with RUNSTATS INDEX and UPDATE(ALL) or UPDATE(SPACE).	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected.	G
INDEXTYPE	CHAR(1) NOT NULL	Not used.	N
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option specified for this index or index partition. blank Only changed pages are cached in the group buffer pool. A Changed and unchanged pages are cached in the group buffer pool. N No data is cached in the group buffer pool.	G

Table 323. SYSIBM.SYSINDEXPART table column descriptions (continued)

Column name	Data type	Description	Use
FAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
NEAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. Not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for this index's data set name. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics have not been gathered. This is an updatable column.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This is an updatable column. This value is only for the last DSNUM for the object.	G

Table 323. SYSIBM.SYSINDEXPART table column descriptions (continued)

Column name	Data type	Description	Use
PSEUDO_DEL_ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries (entries that are logically deleted but still physically present in the index). For a non-unique index, value is the number of RIDs that are pseudo deleted. For a unique index, the value is the number of keys and RIDs that are pseudo deleted. The value is -1 if statistics have not been gathered. This is an updatable column.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index part and any image copies of the index part.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT -1	Time when the partition was created.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The RBA and LRSN format for the page sets of the index partition: B The page sets are still in the basic 6-byte format. E The page sets are converted to the extended 10-byte format. U The format is undefined because DEFINE NO was specified when the index was created. blank The page sets are still in the basic 6-byte format, the index was created before Db2 11 new-function mode (NFM), and no utility that sets the RBA_FORMAT value has run for the index partition in Db2 11 NFM or higher.	G

Table 323. SYSIBM.SYSINDEXPART table column descriptions (continued)

Column name	Data type	Description	Use
DSSIZE	FL 508 BIGINT WITH DEFAULT NULL	FL 508 For indexes on tables that reside in UTS or LOB table spaces, the maximum size in KB of data sets for the index, depending on the type of index: • Non-partitioned indexes: the maximum size of the entire index. • Partitioned indexes: the maximum size of each data set for the index. • Indexes on auxiliary or XML tables: the maximum size of the entire index. • Indexes on tables in non-UTS table spaces: 0 The value is NULL for indexes created before Db2 12 until you run a specific CATMAINT UPDATE UNLDDN job at catalog level V13R1M508 or higher.	G
PAGENUM	CHAR(1) NOT NULL WITH DEFAULT 'A'	Format of pages for the index, indicating absolute or relative page numbering. A Indicates absolute addressing so that PAGENUM contains the embedded partition number. R Indicates relative addressing so that PAGENUM contains only the relative page number. NULL for objects that were created before Db2 12.	G
LIMITKEY_EXTERNAL	VARCHAR(765) NOT NULL	Reserved for future IBM use.	I

SYSINDEXPART_HIST catalog table

The SYSINDEXPART_HIST catalog table contains rows from SYSINDEXPART. The schema is SYSIBM.

Rows are added or changed in the SYSINDEXPART_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 324. SYSIBM.SYSINDEXPART_HIST table column descriptions

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G

Table 324. SYSIBM.SYSINDEXPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G
LEAFDIST	INTEGER NOT NULL WITH DEFAULT -1	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G

Table 324. SYSIBM.SYSINDEXPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
FAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
NEAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. Not applicable for an index on an auxiliary table. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This value is only for the last DSNUM for the object.	G
PSEUDO_DEL_ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries. The value is -1 if statistics have not been gathered.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned index spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned index space. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S

Table 324. SYSIBM.SYSINDEXPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXSPACESTATS catalog table

The SYSINDEXSPACESTATS table contains real time statistics for index spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted. However, the following columns cannot be updated: SYS_START, SYS_END, and TRANS_START.

In data sharing environments, the values in SYSIBM.SYSINDEXSPACESTATS can be negative for short periods of time for certain situations.

SYSIBM.SYSINDEXSPACESTATS has an associated history table, SYSIBM.SYSIXSPACESTATS_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be inserted, updated, and deleted with proper authorization. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 catalog tables” on page 2849](#).

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSINDEXSPACESTATS table is inserted or last updated.	G
NLEVELS	SMALLINT	The number of levels in the index tree. A null value indicates that the number of levels is unknown.	G
NPAGES	INTEGER	The number of pages in the index tree that contain only pseudo-deleted index entries. This is an updatable column.	G
NLEAF	INTEGER	The number of leaf pages in the index. This is an updatable column.	G
NACTIVE	INTEGER	The number of active pages in the index space or partition. This value is equivalent to the number of pre-formatted pages. A null value indicates that the number of active pages is unknown.	G
SPACE	BIGINT	The amount of space, in KB, that is allocated to the index space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
EXTENTS	INTEGER	The number of extents in the index space or partition. For multi-piece index spaces, this value is the number of extents for the last data sets. For a data set that is stripped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the index space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the index space or partition or that the timestamp is unknown.	G
REBUILDLASTTIME	TIMESTAMP	The timestamp that the REBUILD INDEX utility was last run on the index space or partition. A null value indicates that the timestamp that the REBUILD INDEX was last run is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp when the REORG INDEX utility was last run on the index space or partition, or if the REORG INDEX utility has not been run, the time when the index space or partition was created. A null value indicates that the timestamp is unknown.	G
REORGINSERTS	BIGINT	The number of index entries that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G
REORGDELETES	BIGINT	The number of index entries that have been deleted from the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted index entries is unknown.	G
REORGAPPENDINSERT	BIGINT	The number of index entries that have a key value that is greater than the maximum key value in the index or partition that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
REORGPSEUDODELETES	BIGINT	The number of pseudo-deleted index entries stored in the index space or partition. A pseudo-delete is a RID entry that has been marked as deleted. A null value indicates that the number of pseudo-deleted index entries is unknown.	G
REORGMASDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
REORGLAFNEAR	INTEGER	The net number of leaf pages located physically near (within 2–16 pages) previous pages for successive active leaf pages since the object was created. A null value means that the value is unknown. A negative value is possible in some cases. Two index leaf pages are considered near if the distance is within 2–16 pages. (The optimal distance is 1 page.) Conditions that can increase the value of this counter • A leaf page is added during a page split and the distance between the predecessor page and new page, or between the new page and the successor page, is near. • An index page is deleted and the distance between the new predecessor and successor pages is near Conditions that can decrease the value of this counter • A leaf page is deleted the distance between the predecessor page and the deleted page, or between the successor page and the deleted page, was near. • An index page is added during a page split and the distance between the original predecessor and successor pages was near.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
REORGLEAFFAR	INTEGER	The net number of leaf pages located physically far away (more than 16 pages away) from previous leaf pages for successive active leaf pages since the object was created. A null value means that the value is unknown. Two index leaf pages are considered <i>far</i> apart if the distance is greater than 16 pages. Conditions that can increase the value of this counter • A leaf page is added during a page split and the distance between the predecessor page and new page, or between the new page and successor page, is far. • An index page is deleted the distance between the new predecessor and successor pages is far. Conditions that can decrease the value of this counter • A leaf page is deleted and the distance between the predecessor page and the deleted page, or between the successor page and the deleted page, was far. • An index page is added during a page split and the distance between the predecessor and successor pages was far.	G
REORGNUMLEVELS	INTEGER	The number of levels in the index tree that were added or removed since the last REORG, REBUILD INDEX, or LOAD REPLACE, or the object was created. A null value means that the number of added or deleted levels is unknown.	G
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the index space or partition, or the time when the index space or partition was created.	G
STATSINSERTS	BIGINT	The number of index entries that have been inserted into the index space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
STATSDELETES	BIGINT	The number of index entries that have been deleted since the last RUNSTATS on the index space or partition, or since the object was created. A null value means that the number of deleted index entries is unknown.	G
STATSMASSDELETE	INTEGER	The number of times that the index or index space partition was mass deleted since the last RUNSTATS, or the object was created. A null value indicates that the number of mass deletes is unknown.	G
COPYLASTTIME	TIMESTAMP	The timestamp of the last full image copy on the index space or partition. A null value means that COPY has never been run on the index space or partition, or that the timestamp of the last full image copy is unknown.	G
COPYUPDATEDPAGES	INTEGER	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the number of distinct pages that have been updated since the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the total number of distinct pages that were updated during the time that the last COPY utility was run, and since the last time that the COPY utility was run. A null value indicates that the number of updated pages is unknown.	G
COPYCHANGES	BIGINT	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the number of insert, update, and delete operations since the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the total number of insert, update, and delete operations, or the number of rows loaded, during the time that the last COPY utility was run, and since the last time that the COPY utility was run. A null value indicates that the number of insert, update, and delete operations is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run. A null value indicates that the LRSN or RBA is unknown.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
COPYUPDATETIME	TIMESTAMP	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the timestamp of the first update that occurred after the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the timestamp of the first update that occurred during the time that the last COPY utility was run, or since the last time that the COPY utility was run. A null value indicates that the timestamp is unknown.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database.	G
ISOBID	SMALLINT NOT NULL	The internal identifier of the index space page set descriptor.	I
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor for the table space that is associated with the index.	G
PARTITION	SMALLINT NOT NULL	The data set number within the index space. For partitioned index spaces, this value corresponds to the partition number for a single partition. For non-partitioned index spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set 1 or 2. This is an updatable column.	G
TOTALENTRIES	BIGINT	The number of entries, including duplicate entries, G in the index space or partition. A null value indicates that the number of entries is unknown.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database.	G
NAME	VARCHAR(128) NOT NULL	The name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
INDEXSPACE	VARCHAR(24) NOT NULL	The name of the index space.	G
LASTUSED	DATE	The date when the index was last used in an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement, or was used to enforce referential integrity constraints. If this field value indicates that an index has not been used for an extended period of time, consider dropping the index. For a data-partitioned secondary index, this column is only updated for one partition, even though more than one partition is accessed. The default value is NULL.	G
REORGINDEXACCESS	BIGINT	The number of times since the object was created, or since the last REORG, REBUILD INDEX, or LOAD REPLACE, that the index was used in one of the following situations: • In an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement • For enforcement of referential integrity constraints For hash overflow indexes, this value is the number of times that Db2 used the hash overflow index. Use this value with other recommendations to determine when to run REORG INDEX. For example, when the ratio of SYSTABLESPACESTATS.TOTALROWS to SYSINDEXSPACESTATS.TOTALENTRIES indicates that REORG INDEX needs to be run, but this value is very low, REORG INDEX might not yet be necessary. A null value indicates that the number of times the index was used is unknown.	G
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the index or index partition data set is defined. HDD Hard Disk Drive SSD Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used.	G

Table 325. SYSIBM.SYSINDEXSPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
—	BIGINT	Reserved for future IBM use.	R
GETPAGES	BIGINT	The number of getpage requests for the index space since the object was created, or since the last REORG, LOAD RELACE, or REBUILD INDEX was run. The value wraps if it exceeds the largest possible BIGINT value, which is 9223372036854775807.	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	The transaction-start-ID column, for system-period data versioning.	G
REORGTOTALSPLITS	INTEGER	The number of index splits since last reorganization or rebuild.	G
REORGSPPLITIME	BIGINT	Aggregated elapsed time in milliseconds for all index splits since last reorganization or rebuild.	G
REORGEXCSPLITS	INTEGER	The number of abnormal index splits (such as elapsed times greater than 1 second) since last reorganization or rebuild.	G

SYSINDEXSTATS catalog table

The SYSINDEXSTATS table contains one row for each partition of a partitioning index or a data-partitioned secondary index. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 326. SYSIBM.SYSINDEXSTATS table column descriptions

Column name	Data type	Description	Use
FIRSTKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index partition.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree.	S
IOFACTOR	SMALLINT NOT NULL	Not used.	N
PREFETCHFACTOR	SMALLINT NOT NULL	Not used.	N
CLUSTERRATIO	SMALLINT NOT NULL	For the index partition, the percentage of rows that are in clustering order. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	N
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G

Table 326. SYSIBM.SYSINDEXSTATS table column descriptions (continued)

Column name	Data type	Description	Use
KEYCOUNT	INTEGER NOT NULL	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
KEYCOUNTF	FLOAT WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '91.25' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
DATAPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXSTATS_HIST catalog table

The SYSINDEXSTATS_HIST catalog table contains rows from the SYSINDEXSTATS table. The schema is SYSIBM.

Rows are added or changed in the SYSINDEXSTATS_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 327. SYSIBM.SYSINDEXSTATS_HIST table column descriptions

Column name	Data type	Description	Use
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index partition. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. The value is -1 if statistics have not been gathered.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. The value is -1 if statistics have not been gathered.	S
KEYCOUNTF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered. Total number of rows in the partition. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT(8) NOT NULL	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '0.9125' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G

Table 327. SYSIBM.SYSINDEXSTATS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
DATAREPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSJARCLASS_SOURCE catalog table

The SYSJARCLASS_SOURCE catalog table is an auxiliary table for SYSIBM.SYSJARCONTENTS. The schema is SYSIBM.

Table 328. SYSIBM.SYSJARCLASS_SOURCE table column descriptions

Column name	Data type	Description	Use
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G

SYSJARCONTENTS catalog table

The SYSJARCONTENTS table contains Java class source for an installed JAR file. The schema is SYSIBM.

Table 329. SYSIBM.SYSJARCONTENTS table column descriptions

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
CLASS	VARCHAR(384) NOT NULL	The class name contained in the JAR file.	G
CLASS_SOURCE_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support CLOB data type.	G
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G

Table 329. SYSIBM.SYSJARCONTENTS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSJARDATA catalog table

The SYSJARDATA table is an auxiliary table for SYSIBM.SYSJAROBJECTS. The schema is SYSIBM.

Table 330. SYSIBM.SYSJARDATA table column descriptions

Column name	Data type	Description	Use
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file.	G

SYSJAROBJECTS catalog table

The SYSJAROBJECTS table contains binary large object representing the installed JAR file. The schema is SYSIBM.

Table 331. SYSIBM.SYSJAROBJECTS table column descriptions

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
JAR_DATA_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support BLOB data type.	G
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file. This is an updatable column.	G
PATH	VARCHAR(2048) NOT NULL	The class resolution path of the JAR file. This is an updatable column.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the JAR object was created.	G

Table 331. SYSIBM.SYSJAROBJECTS table column descriptions (continued)

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL	Time when the JAR object was altered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G

SYSJAVAOPS catalog table

The SYSJAVAOPS table contains build options used during INSTALL_JAR. The schema is SYSIBM.

Table 332. SYSIBM.SYSJAVAOPS table column descriptions

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
BUILDSHEMA	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
DBRMLIB	VARCHAR(256) NOT NULL	PDS name where DBRM is located.	G
HPJCOMPILE_OPTS	VARCHAR(512) NOT NULL	HPJ compile options used to install the routine.	G
BIND_OPTS	VARCHAR(2048) NOT NULL	Bind options used to install the routine.	G
POBJECT_LIB	VARCHAR(256) NOT NULL	PDSE name where program object is located.	G

Table 332. SYSIBM.SYSJAVAOPTS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSJAVAPATHS catalog table

The SYSJAVAPATHS table contains the complete class resolution path of a JAR file, and records the dependencies that one JAR file has on the JAR files in its Java path. The schema is SYSIBM.

Table 333. SYSIBM.SYSJAVAPATHS table column descriptions

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
ORDINAL	SMALLINT NOT NULL	The ordinal number of the path element within the JAR file's Java path.	G
PE_CLASS_PATTERN	VARCHAR(2048) NOT NULL	The pattern for the names of the classes that are to be searched for in this path element's JAR file.	G
PE_JARSCHEMA	VARCHAR(128) NOT NULL	The schema of this path element's JAR file.	G
PE_JAR_ID	VARCHAR(128) NOT NULL	The name of this path element's JAR file.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSKEYCOLUSE catalog table

The SYSKEYCOLUSE table contains a row for every column in a unique constraint (primary key or unique key) from the SYSIBM.SYSTABCONST table. The schema is SYSIBM.

Table 334. SYSIBM.SYSKEYCOLUSE table column descriptions

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key (the first position in the key is 1).	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table on which the constraint is defined.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: B The column is the start of the period BUSINESS_TIME. C Column is the end of period BUSINESS_TIME with an exclusive end point. I Column is the end of period BUSINESS_TIME with an inclusive end point. blank Column is not used as either the start or the end of a BUSINESS_TIME period.	G

SYSKEYS catalog table

The SYSKEYS table contains one row for each column of an index key. The schema is SYSIBM.

Table 335. SYSIBM.SYSKEYS table column descriptions

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the index.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column of the key.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table. For example, 4 (out of 10).	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key for an index on columns. For example, 4 (out of 4). The value is meaningless for an expression-based index.	G
ORDERING	CHAR(1) NOT NULL	Order of the column in the key: blank Index is an expression-based index or the column is specified for the index using the INCLUDE clause A Ascending order D Descending order R Random order	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

Table 335. SYSIBM.SYSKEYS table column descriptions (continued)

Column name	Data type	Description	Use
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: B The column is the start of the period BUSINESS_TIME. C Column is the end of period BUSINESS_TIME with an exclusive end point. I Column is the end of period BUSINESS_TIME with an inclusive end point. blank Column is not used as either the start or the end of a BUSINESS_TIME period, or the index is not used as an enforcing index.	G
CREATEDTS	TIMESTAMP(12) NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the index.	G

[Index keys \(Db2 Administration Guide\)](#)

SYSKEYTARGETS catalog table

The SYSKEYTARGETS table contains one row for each key-target that is participating in an extended index definition. The schema is SYSIBM.

Table 336. SYSIBM.SYSKEYTARGETS table column descriptions

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table if the expression is a single column. Otherwise the value is 0. For XML indexes, this field is also 0.	G
ORDERING	CHAR(1) NOT NULL	Order of the key: A Ascending	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G

Table 336. SYSIBM.SYSKEYTARGETS table column descriptions (continued)

Column name	Data type	Description	Use
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type. The DATATYPEID value corresponds to one of the SQLTYPE values in “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377. However, the DATATYPEID value is not a reliable indicator of the nullability of the column. A column with an even DATATYPEID value might allow nulls, and a column with an odd DATATYPEID value might not allow nulls. To determine the nullability of the column, use the NULLS column value.	G
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this column contains 0. For a distinct type, this column contains the internal ID of the built-in type on which the distinct type is based.	G

Table 336. SYSIBM.SYSKEYTARGETS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. data type value of the LENGTH column INTEGER 4 SMALLINT 2 FLOAT 4 or 8 CHAR The length of the string VARCHAR The maximum length of the string DECIMAL The precision of the number GRAPHIC The number of DBCS characters VARGRAPHIC The maximum number of DBCS characters DATE 4 TIME 3 TIMESTAMP WITHOUT TIME ZONE The integral part of $((p+1)/2) + 7$ where p is the precision of the timestamp TIMESTAMP WITH TIME ZONE The integral part of $((p+1)/2) + 9$ where p is the precision of the timestamp BIGINT 8 BINARY The length of the string VARBINARY The maximum length of the string DECFLOAT 8 or 16	G

Table 336. SYSIBM.SYSKEYTARGETS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: 0 Not a ROWID column 40 For a ROWID column, the length of the value that is returned	G
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: N No Y Yes. Y also indicates that the index is an XML index.	G
CCSID	INTEGER NOT NULL	The CCSID of the key. CCSID contains 0 if the key is a non-character type key.	G
SUBTYPE	CHAR(1) NOT NULL	SUBTYPE applies to character keys only and indicated the subtype of the data: B BIT data M MIXED data S SBCS data blank non-character data	G
—	VARCHAR(512) NOT NULL FOR BIT DATA	Internal use only.	I
CREATEDTS	TIMESTAMP NOT NULL	The timestamp for when the key-target is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 in which the key-target is created. See Release dependency indicators for values.	G

Table 336. SYSIBM.SYSKEYTARGETS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
DERIVED_FROM	VARCHAR(4000) NOT NULL	For an index on a scalar expression, DERIVED_FROM contains the text of the scalar expression that is used to generated the key-target value. For an XML index, this is the XML pattern that is used to generate the key-target value. Otherwise DERIVED_FROM contains an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	S
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value. HIGH2KEY is an updatable column.	S
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value. LOW2KEY is an updatable column.	S
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: N VARCHAR column statistical values are not padded blank Statistics have not been collects or VARCHAR column statistical values are padded STATS_FORMAT is an updatable column.	G

SYSKEYTARGETSTATS catalog table

The SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 337. SYSIBM.SYSKEYTARGETSTATS table column descriptions

Column name	Data type	Description	Use
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
HIGHKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The highest key value.	S
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	S
LOWKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The lowest key value.	S
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	S
PARTITION	SMALLINT NOT NULL	The partition number of the table space.	G
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G

Table 337. SYSIBM.SYSKEYTARGETSTATS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: N VARCHAR column statistical values are not padded blank Statistics have not been collected or VARCHAR column statistical values are padded	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values for the key target.	S

SYSKEYTARGETS_HIST catalog table

The SYSKEYTARGETS_HIST table contains rows from the SYSKEYTARGETS table. The schema is SYSIBM.

Whenever rows are added or changed in SYSKEYTARGETS, the rows are also written to this table. Rows in this table can be inserted, updated, and deleted.

Table 338. SYSIBM.SYSKEYTARGETS_HIST table column descriptions

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G

Table 338. SYSIBM.SYSKEYTARGETS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type. The DATATYPEID value corresponds to one of the SQLTYPE values in “SQLTYPE and SQLLEN fields of the SQLDA” on page 2377. However, the DATATYPEID value is not a reliable indicator of the nullability of the column. A column with an even DATATYPEID value might allow nulls, and a column with an odd DATATYPEID value might not allow nulls. To determine the nullability of the column, use the NULLS column value.	G
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this field contains 0. For a distinct type, this field contains the internal ID of the built-in type on which the distinct type is based.	G

Table 338. SYSIBM.SYSKEYTARGETS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. data type value of the LENGTH column INTEGER 4 SMALLINT 2 FLOAT 4 or 8 CHAR The length of the string VARCHAR The maximum length of the string DECIMAL The precision of the number GRAPHIC The number of DBCS characters VARGRAPHIC The maximum number of DBCS characters DATE 4 TIME 3 TIMESTAMP WITHOUT TIME ZONE The integral part of $((p+1)/2) + 7$ where p is the precision of the timestamp TIMESTAMP WITH TIME ZONE The integral part of $((p+1)/2) + 9$ where p is the precision of the timestamp BIGINT 8 BINARY The length of the string VARBINARY The maximum length of the string DECFLOAT 8 or 16	G

Table 338. SYSIBM.SYSKEYTARGETS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: 0 Not a ROWID column 40 For a ROWID column, the length of the value that is returned	G
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: N No Y Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	G
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	G
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	G

Table 338. SYSIBM.SYSKEYTARGETS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: N VARCHAR column statistical values are not padded blank Statistics have not been collected or VARCHAR column statistical values are padded	G

SYSKEYTGTDIST catalog table

The SYSKEYTGTDIST table contains one or more rows for the first key-target of an extended index key. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 339. SYSIBM.SYSKEYTGTDIST table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	S

Table 339. SYSIBM.SYSKEYTGTDIST table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: C Cardinality F Frequent value N Non-padded frequent value H Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	S
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	S
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics. The value is always 1 when the object is an XML index.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains a value that indicates the percentage of entries in the index that have the value that is contained in the KEYVALUE column. When TYPE='H', FREQUENCYF contains a value that indicates the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in the QUANTILENO column. To determine the percentage from the value of FREQUENCYF, multiply the value by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates '15.3' percent.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G

Table 339. SYSIBM.SYSKEYTGTDIST table column descriptions (continued)

Column name	Data type	Description	Use
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSKEYTGTDISTSTATS catalog table

The SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 340. SYSIBM.SYSKEYTGTDISTSTATS table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	The partition number of the table space that contains the index in which the key is defined.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G

Table 340. SYSIBM.SYSKEYTGTDISTSTATS table column descriptions (continued)

Column name	Data type	Description	Use
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: C Cardinality F Frequent value N Non-padded frequent value H Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in the quantile that is in QUANTILENO.	S
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT	Identifies the set of keys that are associated with the statistics. If the statistics are only associated with a single key, KEYGROUPKEYNO contains a zero length value. Otherwise, KEYGROUPKEYNO contains an array of SMALLINT key numbers that have a dimension that is equal to the value in NUMKEYS.	S
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT	Identifies the number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUANTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE is the lower bound for the quantile that is indicated in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G

Table 340. SYSIBM.SYSKEYTGTDISTSTATS table column descriptions (continued)

Column name	Data type	Description	Use
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE is the upper bound for the quantile that is indicated in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G
—	VARCHAR(1000)	Internal use only.	I

SYSKEYTGTDIST_HIST catalog table

The SYSKEYTGTDIST_HIST table contains rows from the SYSKEYTGTDIST table. Whenever rows are added or changed in SYSKEYTGTDIST, the rows are also written to this table.

Rows in this table can be inserted, updated, and deleted.

Table 341. SYSIBM.SYSKEYTGTDIST_HIST table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	G

Table 341. SYSIBM.SYSKEYGTDIST_HIST table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: C Cardinality F Frequent value N Non-padded frequent value H Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	G
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	G
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUANTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G

Table 341. SYSIBM.SYSKEYTGTDIST_HIST table column descriptions (continued)

Column name	Data type	Description	Use
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSLEVELUPDATES catalog table

The SYSLEVELUPDATES table contains information about the catalog level and function level of the Db2 subsystem or data sharing group. The schema is SYSIBM.

Table 342. SYSIBM.SYSLEVELUPDATES table column descriptions

Column name	Data type	Description	Use
FUNCTION_LVL	VARCHAR(10)	Function level in effect when this record was inserted.	G
PREV_FUNCTION_LVL	VARCHAR(10)	Previous function level.	G
HIGH_FUNCTION_LVL	VARCHAR(10)	Highest activated function level.	G
CATALOG_LVL	VARCHAR(10)	The catalog level.	G
OPERATION_TYPE	CHAR(1)	Type of operation: 'C' Catalog level change. 'F' Function level change. 'M' Code level change.	G
EFFECTIVE_TIME	TIMESTAMP(12)	Time when the operation completed.	G
EFFECTIVE_LRSN		RBA (or LRSN for data sharing) depicting the time that an operation completed.	G
OPERATION_TEXT	VARCHAR(256)	The text of the operation.	G
GROUP_MEMBER	VARCHAR(24)	Name of the group member on which the operation was run.	G

SYSLOBSTATS catalog table

The SYSLOBSTATS table contains one row for each LOB table space. The schema is SYSIBM.

Table 343. SYSIBM.SYSLOBSTATS table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
AVGSIZE	INTEGER NOT NULL	Average size of a LOB, measured in bytes, in the LOB table space.	S
FREESPACE	INTEGER NOT NULL	Number of kilobytes of available space in the LOB table space.	S
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSLOBSTATS_HIST catalog table

The SYSLOBSTATS_HIST table contains rows from SYSIBM.SYSLOBSTATS. The schema is SYSIBM.

Rows are added or changed in the SYSLOBSTATS_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 344. SYSIBM.SYSLOBSTATS_HIST table column descriptions

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G

Table 344. SYSIBM.SYSLOBSTATS_HIST table column descriptions (continued)

Column name	Data type	Description	Use
FREESPACE	INTEGER NOT NULL	Number of pages of free space in the LOB table space.	S
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSOBJEVENTS catalog table

The SYSOBJEVENTS table contains object-level event information for utility executions if collection of utility object-level history is active. The schema is SYSIBM.

[FL 504](#)

Rows in this table can be updated, inserted, and deleted by authorized users.

Table 345. SYSIBM.SYSOBJEVENTS table column descriptions

Column name	Data type	Description	Use
EVENTID	BIGINT NOT NULL	The identifier for the utility execution. The value is the same as EVENTID column value in the corresponding SYSUTILITIES row for the utility execution.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database which contains the table space or index space.	G
PSID	SMALLINT NOT NULL	The internal identifier of page set descriptor for the table space or index space.	G
PARTITION	SMALLINT NOT NULL	The physical partition number, a nonzero value, for a partitioned table space or index. Zero for a nonpartitioned table space or index.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set instance 1 or 2.	G

Table 345. SYSIBM.SYSOBJEVENTS table column descriptions (continued)

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	The name of the database that contains the table space or index space.	G
SPACENAME	VARCHAR(24) NOT NULL	The table space or index space name.	G
OBJTYPE	CHAR(1) NOT NULL	The type of object: T Table space I Index space	G
EVENTTS	TIMESTAMP NULLABLE WITH DEFAULT NULL	Starting timestamp (in local time) of utility processing for the object. NULL when processing has not started. For more information, see Utility object-level history information in SYSOBJEVENTS (Db2 Utilities) .	G
COUNT	BIGINT NULLABLE WITH DEFAULT NULL	When COUNT is applicable to the utility and object, • NULL indicates processing of the object has not started or is in progress. • Count of pages, rows, keys, or LOBs for the physical partition or nonpartitioned object processed by the utility. NULL when COUNT is not applicable to the utility and object. Some utilities do not set a value for this column. For more information, see Utility object-level history information in SYSOBJEVENTS (Db2 Utilities) .	G
ELAPSEDTIME	BIGINT NULLABLE WITH DEFAULT NULL	The elapsed time in microseconds for COPY and RECOVER. • For COPY utility, the elapsed time to create a sequential image copy(s) for the object. • For RECOVER utility, the elapsed time to restore a sequential image copy(s) for the object. The elapsed time for the log processing phases is not included. NULL when the utility is not a COPY or RECOVER that processed a sequential image copy. For more information, see Utility object-level history information in SYSOBJEVENTS (Db2 Utilities) .	G
INSERTEDBY	VARCHAR(9) NOT NULL	'DB2' for rows inserted by IBM Db2 Utilities. This column should be set to an identifiable value for rows inserted by users or programs.	G

SYSOBJROLEDEP catalog table

The SYSOBJROLEDEP table lists the dependent objects for each role. The schema is SYSIBM.

Table 346. SYSIBM.SYSOBJROLEDEP table column descriptions

Column name	Data type	Description	Use
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that created the object.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: L Role blank Authorization ID	G
ROLENAME	VARCHAR(128) NOT NULL	Name of the role on which there is a dependency.	G
DSHEMA	VARCHAR(128) NOT NULL	Name of the schema of the dependent object.	G
DNAME	VARCHAR(762) NOT NULL	Name of the dependent object.	G

Table 346. SYSIBM.SYSOBJROLEDEP table column descriptions (continued)

Column name	Data type	Description	Use
DTYPE	CHAR(1) NOT NULL	The type of the dependent object in DNAME: B Trigger D Database E Distinct type F User-defined function H Global variable I Index J JAR file L Role M Materialized query table N Trusted context O Stored procedure Q Sequence R Table space S Storage group T Table V View X Row permission Y Column mask 0 (zero) Alias	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPACKAGE catalog table

The SYSPACKAGE table contains a row for every package. The schema is SYSIBM.

Table 347. SYSIBM.SYSPACKAGE table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. For a package derived from a Db2 DBRM, it is one of the following values: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the package. The creator is the authorization ID under which the package was bound or rebound. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
PKSIZE	INTEGER NOT NULL	Size of the base section of the package, in bytes. Tip: Packages are divided into <i>sections</i> . The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections of the plan that contain SQL statements processed at bind time.	G
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G
VALID	CHAR(1) NOT NULL	Whether the package is valid: A An ALTER statement changed the description of the table or base table of a view referred to by the package. The changes do not invalidate the package. However, a rebind might be required for the package to pick up the changes from the ALTER statement. H An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of Db2 prior to Version 5, the change invalidates the package. N No Y Yes S <u>FL 502</u> One or more of the statements in the package are invalidated. Note: At function level 502 or higher, a package that is bound with DEPLEVEL(STATEMENT) option can be marked with VALID='S' if it is invalidated by a DROP FUNCTION statement. However, after the PTF for APAR PH55497 is applied, Db2 always marks a package that is invalidated by a DROP FUNCTION statement with VALID='N', regardless of the DEPLEVEL bind option for the package.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: N A package with package-level dependency cannot be allocated. An explicit BIND or REBIND is required before the package can be allocated. R FL 504 A package in rebind-advisory status because autobind phase-in has failed can be allocated; however, an explicit REBIND is recommended to make the package valid. R FL 504 Yes, with rebind-advisory status; autobind phase-in has failed and an explicit REBIND is recommended to make the package valid. Y Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: B All checking must be performed at bind time. R Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound R RR (repeatable read) S CS (cursor stability) T RS (read stability) U UR (uncommitted read) blank Not specified, and therefore at the level specified for the plan executing the package	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: C Value used was COMMIT. D Value used was DEALLOCATE. I The local package is inheriting the value from the plan blank Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: N No Y Yes	G
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: N Apostrophe Y Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: N Period Y Comma	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	Host language, or a value set by the program preparation process: B Assembler language C OS/VS COBOL D C F Fortran J Java P PL/I R REST 2 VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) 3 IBM COBOL (Release 2 or subsequent releases) 4 C++ blank For remotely bound packages, trigger packages (TYPE='T' or '1'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: K Yes A No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 104): N No Y Yes	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 256): N No Y Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: A Data currency is required for all cursors. Inhibit blocking for all cursors. B Data currency is not required for ambiguous cursors. C Data currency is required for ambiguous cursors. blank The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: C CONTINUE N NOPACKAGE	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
REMOTE	CHAR(1) NOT NULL	Source of the package: C Package was created by BIND COPY. D Package was created by BIND COPY with the OPTIONS(COMMAND) option. K The package was copied from a package that was originally bound on behalf of a remote requester. L The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. N Package was locally bound from a DBRM. Y Package was bound on behalf of a remote requester.	G
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-Db2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is an empty string for: • A package for a basic trigger (TYPE='T'). • A package for an application that was precompiled without SQL processing option VERSION, or was precompiled with an empty string for the VERSION value. (TYPE=blank).	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: • For Db2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, "<LUSQLDS>"). • For non-Db2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: ANY DEGREE(ANY) 1 or blank DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: B BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. D DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. E DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. H INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
DYNAMICRULES (continued)		I INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. R RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. blank DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see “Authorization IDs and dynamic SQL” on page 94.	
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: A Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. N Bind option REOPT(NONE) indicates that the access path is determined at bind time. Y Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. 1 Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: N Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. Y Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. I The local package is inheriting the value from the plan blank Blank for a trigger package. Otherwise, the bind option was not specified for the package and is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: N The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at each commit point or rollback operation. Y The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past each commit point or rollback operation.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses the default SQL path.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: F A CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a compiled SQL scalar function package. N A CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. T A CREATE TRIGGER or ALTER TRIGGER statement for a basic trigger created the package. blank BIND PACKAGE command created the package. 1 A CREATE TRIGGER or ALTER TRIGGER statement for an advanced trigger created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'D'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: D DRDA C DRDA access with package-based continuous block fetch enabled.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to Db2. Refer to the ACCESSPATH column in the “SYSPACKSTMT catalog table” on page 2626 for information about which statements are using the specified hints.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: ccsid The specified or derived CCSID. 0 The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. I The local package is inheriting the value from the plan N Bind option IMMEDIATEWRITE(NO) indicates normal write activity is done. Y Bind option IMMEDIATEWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. 1 Bind option IMMEDIATEWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. blank A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. blank Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCOD	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner blank Authorization ID L Role	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: C ROUND_CEILING D ROUND_DOWN F ROUND_FLOOR G ROUND_HALF_DOWN E ROUND_HALF_EVEN H ROUND_HALF_UP U ROUND_UP blank The package created in a Db2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if Db2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): A Db2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. L Db2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the package was used. The LASTUSED value is set to '0001-01-01' when the package is created, and the value is updated after the package is allocated. The LASTUSED value is not always updated immediately, and it might be updated after delay of one or more days. Note: A package that contains only certain static SQL statements, such as COMMIT or ROLLBACK, can be used without being allocated, and the LASTUSED value is not updated in these situations. The following commands preserve the existing LASTUSED value: • BIND REPLACE of the same package version • REBIND	G
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: blank Not specified U USECURRENTLYCOMMITTED W WAITFOROUTCOME	G
EXTENDEDINDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option: blank Not specified N EXTENDEDINDICATOR NO Y EXTENDEDINDICATOR YES	G
COPYID	INTEGER NOT NULL	The current copy of the package.	G
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option: E PLANMGMT EXTENDED B PLANMGMT BASIC blank PLANMGMT OFF	G
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option: S PLANMGMTSCOPE STATIC	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option at the conclusion of a successful bind operation. N NO or NONE: Access paths were not reused. W WARN: Db2 attempted to reuse access paths. If an access path could not be reused, Db2 generated a new access path. E ERROR: Access paths were successfully reused. No error condition prevented Db2 from reusing access paths.	G
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option: Y APRETAINDUP YES specified. All copies were retained. 0 APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences. 1 APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy. 2 APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	G
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option: Y References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register. N References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	G
RECORDTEMPORALHIST	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.	N

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option: Y References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register. N References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT	The application compatibility level of the package, or blank if the package was bound before Db2 11, or not determined. V13R1M5nn Compatibility with the behavior of the identified Db2 13 function level. For example, V13R1M508 specifies compatibility with the highest available Db2 13 function level. The equivalent function level or higher must be activated. For information about the new capabilities that become available in each application compatibility level, see V13R1Mnnn application compatibility levels (Db2 Application programming and SQL). V12R1M5nn Compatibility with the behavior of the identified Db2 12 function level. For information about the new capabilities that become available in each application compatibility level, see V12R1Mnnn application compatibility levels (Db2 Application programming and SQL). Tip: Extra program preparation steps might be required to increase the application compatibility level for applications that use data server clients or drivers to access Db2 for z/OS. For more information, see Setting application compatibility levels for data server clients and drivers (Db2 Application programming and SQL). V12R1 Compatibility with the behavior of Db2 12 function level 500. This value has the same result as specifying V12R1M500. V11R1 Compatibility with the behavior of Db2 11 new-function mode. V10R1 Compatibility with the behavior of DB2 10 new-function mode. For more information, see V10R1 application compatibility level (Db2 Application programming and SQL).	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the ARCHIVESENSITIVE bind option. Y References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value. N References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	G
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	Internal use only.	I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option. Y The Db2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution. N The Db2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements. blank The package was bound before Db2 11, or not determined.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	The origin of the EXPLAIN records: A Automatic bind B BIND command G Implicit automatic regeneration of the SQL routine or trigger for changed options, or an explicit ALTER REGENERATE of the SQL routine or trigger for the package I Implicit automatic regeneration of the SQL routine or trigger for the package because of fallback, coexistence, or deployment to a different release where the routines or triggers are incompatible. R REBIND command blank The row existed before Db2 12. This is the default value.	G
APREUSE_NO_FL	VARCHAR(10) NOT NULL WITH DEFAULT	The function level when the package was bound with APREUSE(NO), or blank if the package was bound before Db2 12, or not determined. This is the default value.	G
APREUSE_NO_TS	TIMESTAMP NOT NULL WITH DEFAULT	The bind time when the package was bound with APREUSE(NO): 0001-01-01-00.00.00.000000 The package was bound before Db2 12. This is the default value.	G
CONC_STMT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether statement concentration is enabled: N No. This is the default value. Y Yes	G
FUNCTION_LVL	VARCHAR(10) NOT NULL WITH DEFAULT	The function level of the package, or blank if the package was bound before Db2 12, or not determined.	G

Table 347. SYSIBM.SYSPACKAGE table column descriptions (continued)

Column name	Data type	Description	Use
DEPLEVEL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Dependency level, which is used to indicate if the package contains statement-level dependencies in addition to package-level dependency. S The package has both statement-level and package-level dependencies. P The package has package-level dependencies only.	G

SYSPACKAUTH catalog table

The SYSPACKAUTH table records the privileges that are held by users over packages. The schema is SYSIBM.

FL 505 SYSIBM.SYSPACKAUTH has an associated history table, SYSIBM.SYSPACKAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 348. SYSIBM.SYSPACKAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges, the name of a plan that uses the privileges or PUBLIC for a grant to PUBLIC.	G
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Collection name for the package or packages on which the privilege was granted.	G
NAME	VARCHAR(128) NOT NULL	Name of the package on which the privileges are held. An asterisk (*) if the privileges are held on all packages in a collection.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package, as stored in the SYSPACKAGE catalog table. The value can also be blank. Db2 does not use this value to determine authorization for package operations such as bind, copy, or execution.	S
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the privilege was granted.	G

Table 348. SYSIBM.SYSPACKAUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: blank An authorization ID L Role P An application plan	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable A PACKADM (on collection *) C DBCTRL D DBADM E SECADM G ACCESSCTRL L SYSCTRL M DBMAINT P PACKADM (on a specific collection) S SYSADM T DATAACCESS	G
BINDAUTH	CHAR(1) NOT NULL	Whether GRANTEE can use the BIND and REBIND subcommands on the package: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 348. SYSIBM.SYSPACKAUTH table column descriptions (continued)

Column name	Data type	Description	Use
COPYAUTH	CHAR(1) NOT NULL	Whether GRANTEE can COPY the package: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the package: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSPACKCOPY catalog table

The SYSPACKCOPY table contains one row for the previous version of each package and one row for the original version of each package. The schema is SYSIBM.

Table 349. SYSIBM.SYSPACKCOPY table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	Consistency token for the package. For a package derived from a Db2 DBRM, this is either: - The "level" as specified by the LEVEL option when the package's program was precompiled - The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the package. The creator is the authorization ID under which the package was bound or rebound. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created. For the previous or original copy, this is the timestamp that indicates when the package was created. For the phased-out copy, this is the timestamp indicating when the copy became phased-out.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G

⁴² Packages are divided into *sections*. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G
PKSIZE	INTEGER NOT NULL	Size of the base section ⁴² of the package, in bytes.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections ⁴² of the plan that contain SQL statements processed at bind time.	G
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G
VALID	CHAR(1) NOT NULL	Whether the package is valid: A An ALTER statement changed the description of the table or base table of a view referred to by the package. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". The changes do not invalidate the package. H An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of Db2 prior to Version 5, the change invalidates the package. N No Y Yes S One or more of the statements in the package are invalidated. Note: At function level 502 or higher, a package that is bound with DEPLEVEL(STATEMENT) option can be marked with VALID='S' if it is invalidated by a DROP FUNCTION statement. However, after the PTF for APAR PH55497 is applied, Db2 always marks a package that is invalidated by a DROP FUNCTION statement with VALID='N', regardless of the DEPLEVEL bind option for the package.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: N No; an explicit BIND or REBIND is required before the package can be allocated. Y Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: B All checking must be performed at bind time. R Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound R RR (repeatable read) S CS (cursor stability) T RS (read stability) U UR (uncommitted read) blank Not specified, and therefore at the level specified for the plan executing the package	G
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: C Value used was COMMIT. D Value used was DEALLOCATE. blank Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: N No Y Yes	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: N Apostrophe Y Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: N Period Y Comma	G
HOSTLANG	CHAR(1) NOT NULL	Host language, or a value set by the program preparation process: B Assembler language C OS/VS COBOL D C F Fortran J Java P PL/I R REST 2 VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) 3 IBM COBOL (Release 2 or subsequent releases) 4 C++ blank For remotely bound packages, trigger packages (TYPE='T'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: K Yes A No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see "Character strings" on page 104): N No Y Yes	G
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see "Arithmetic with two decimal operands" on page 256): N No Y Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: A Data currency is required for all cursors. Inhibit blocking for all cursors. B Data currency is not required for ambiguous cursors. C Data currency is required for ambiguous cursors. blank The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: C CONTINUE N NOPACKAGE	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
REMOTE	CHAR(1) NOT NULL	Source of the package: C Package was created by BIND COPY. D Package was created by BIND COPY with the OPTIONS(COMMAND) option. K The package was copied from a package that was originally bound on behalf of a remote requester. L The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. N Package was locally bound from a DBRM. Y Package was bound on behalf of a remote requester.	G
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-Db2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is blank for a trigger package (TYPE='T').	G
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: - For Db2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, "<LUSQLDS>"). - For non-Db2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: ANY DEGREE(ANY) 1 or blank DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: B BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. D DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. E DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. H INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DYNAMICRULES (cont.)		I INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. R RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. blank DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see “Authorization IDs and dynamic SQL” on page 94.	
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: A Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. N Bind option REOPT(NONE) indicates that the access path is determined at bind time. Y Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. 1 Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: N Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. Y Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. blank Bind option not specified for the package. It is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: N The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at each commit point. Y The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past each commit point.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses the default SQL path.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: F CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. N CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. R CREATE TRIGGER or ALTER TRIGGER statement created the package, and the package is a trigger package that has been created or regenerated in Db2 11 new-function mode or later. T CREATE TRIGGER statement prior to Db2 11 new-function mode has created the package, and the package is a trigger package. CREATE TRIGGER statement created the package, and the package is a trigger package. blank BIND PACKAGE command created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: D DRDA C DRDA access with the capability for package-based continuous block fetch.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to Db2. Refer to the ACCESSPATH column in the “SYSPACKSTMT catalog table” on page 2626 for information about which statements are using the specified hints.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: ccsid The specified or derived CCSID. 0 The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. N Bind option IMMEDIATEWRITE(NO) indicates normal write activity is done. Y Bind option IMMEDIATEWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. 1 Bind option IMMEDIATEWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. blank A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. blank Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCODE	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner blank Authorization ID L Role	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: C ROUND_CEILING D ROUND_DOWN F ROUND_FLOOR G ROUND_HALF_DOWN E ROUND_HALF_EVEN H ROUND_HALF_UP U ROUND_UP blank The package created in a Db2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if Db2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): A Db2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. L Db2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the corresponding objects are used.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: blank Not specified U USECURRENTLYCOMMITTED W WAITFOROUTCOME	G
EXTENDEDINDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option: N EXTENDEDINDICATOR NO Y EXTENDEDINDICATOR YES	G
COPYID	INTEGER NOT NULL	The version of the copy of the package that this row explains: 0 or 4 through 16 The phased-out copy of the package 1 The previous copy of the package 2 The original copy of the package	G
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option: E PLANMGMT EXTENDED B PLANMGMT BASIC blank PLANMGMT OFF	G
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option: S PLANMGMTSCOPE STATIC	G
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option: N NO or NONE: Access paths are not reused. E ERROR: Db2 tries to reuse access paths. Processing ends when an access path cannot be reused.	I

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option: Y APRETAINDUP YES specified. All copies were retained. 0 APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences. 1 APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy. 2 APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	G
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option: Y References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register. N References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	G
RECORDTEMPORALHIST	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.	N
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option: Y References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register. N References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT 'Y'	The value of the APPLCOMPAT bind option: V10R1 SQL statements in the package have V10R1 compatibility behavior. V11R1 SQL statements in the package have V11R1 compatibility behavior.	G
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the ARCHIVESENSITIVE bind option. Y References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value. N References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	G
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	Internal use only.	I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option. Y The Db2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution. N The Db2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements.	G

Table 349. SYSIBM.SYSPACKCOPY table column descriptions (continued)

Column name	Data type	Description	Use
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	The origin of the EXPLAIN records: A Automatic bind B BIND command G Explicit ALTER REGENERATE of the SQL procedure for the package I Implicit automatic regeneration of the SQL procedure for the package R REBIND command blank The row existed before Db2 12. This is the default value.	G
APREUSE_NO_FL	VARCHAR(10) NOT NULL WITH DEFAULT	The function level when the package was bound with APREUSE(NO), or blank if the package was bound before Db2 12, or not determined. This is the default value.	G
APREUSE_NO_TS	TIMESTAMP NOT NULL WITH DEFAULT	The bind time when the package was bound with APREUSE(NO): 0001-01-01-00.00.00.000000 The package was bound before Db2 12. This is the default value.	G
CONC_STMT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether statement concentration is enabled: N No. This is the default value. Y Yes	G
FUNCTION_LVL	VARCHAR(10)	The function level of the package.	G
DEPLEVEL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Dependency level, which is used to indicate if the package contains statement-level dependencies in addition to package-level dependencies. S The package has both statement-level and package-level dependencies. P The package has package-level dependencies only.	G

SYSPACKDEP catalog table

The SYSPACKDEP table records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, functions, and stored procedures. The schema is SYSIBM.

Access paths for SQL statements might depend on objects that Db2 does not actually use when it processes the selected access paths. Such dependencies are recorded in the SYSPACKDEP catalog table, but they are not shown in EXPLAIN output.

Table 350. SYSIBM.SYSPACKDEP table column descriptions

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object that a package depends on. If BTYPE is W or Z, the value is the name of the table on which the period is defined.	G
BQUALIFIER	VARCHAR(128) NOT NULL	The value of the column depends on the type of object: • If BNAME identifies a table space (BTYPE is R), the value is the name of its database. • If BNAME identifies a table on which a period is defined (BTYPE is W or Z), the value is the qualifier of that table. • If BNAME identifies user-defined function, a cast function, a stored procedure, or a sequence (BTYPE is F, O, or Q), the value is the schema name. • If BNAME identifies a role, the value is blank. • Otherwise, the value is the schema of BNAME.	G

Table 350. SYSIBM.SYSPACKDEP table column descriptions (continued)

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME and BQUALIFIER: A Alias E INSTEAD OF trigger F User-defined function or cast function H Global variable G Global temporary table I Index M Materialized query table O Stored procedure P Partitioned table space if it is defined as LARGE or with the DSSIZE parm Q Sequence object R Table space S Synonym T Table U User-defined type, which is a distinct type or an array type. V View W SYSTEM_TIME period Z BUSINESS_TIME period 0 (zero) Sequence alias	G
DLOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
DCOLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G

Table 350. SYSIBM.SYSPACKDEP table column descriptions (continued)

Column name	Data type	Description	Use
DNAME	VARCHAR(128) NOT NULL	Name of the package.	G
DCONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: - The "level" as specified by the LEVEL option when the package's program was precompiled - The timestamp indicating when the package's program was precompiled, in an internal format.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Owner of the package:	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package: F Compiled SQL scalar function N Native SQL routine package O Original copy of a package P Previous copy of a package R Reserved for IBM use T Trigger package for a basic trigger blank Not a trigger package or a native SQL routine package 1 Trigger package for an advanced trigger	G
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner of the package: blank Authorization ID L Role	G
COPYID	INTEGER NULLABLE	The copy ID of the package.	G

Related reference

[SYSDYNQRYDEP catalog table](#)

The SYSDYNQRYDEP table contains information about dependencies for dynamic query packages. The schema is SYSIBM.

SYSPACKLIST catalog table

The SYSPACKLIST table contains one or more rows for every local application plan bound with a package list. Each row represents a unique entry in the plan's package list. The schema is SYSIBM.

Table 351. SYSIBM.SYSPACKLIST table column descriptions

Column name	Data type	Description	Use
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
SEQNO	SMALLINT NOT NULL	Sequence number of the entry in the package list.	G
LOCATION	VARCHAR(128) NOT NULL	Location of the package. Blank if this is local. An asterisk (*) indicates location to be determined at run time.	G
COLLID	VARCHAR(128) NOT NULL	Collection name for the package. An asterisk (*) indicates that the collection name is determined at run time.	G
NAME	VARCHAR(128) NOT NULL	Name of the package. An asterisk (*) indicates an entire collection.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the row was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSPACKSTMT catalog table

The SYSPACKSTMT table contains one or more rows for each SQL statement in a package that is bound locally, and one or more rows for a subset of the SQL statements in a package that is bound remotely. The schema is SYSIBM.

Table 352. SYSIBM.SYSPACKSTMT table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: - The "level" as specified by the LEVEL option when the package's program was precompiled - The timestamp indicating when the package's program was precompiled, in an internal format	S
SEQNO	INTEGER NOT NULL	Sequence number of the statement. Rows that contain zero in the SEQNO, STMTNO, and SECTNO column values are for IBM internal use only.	G
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. If the STMTNO value is zero, the statement number is greater 32767 and the STMTNOI column contains the statement number. A negative value indicates a statement number greater than 32767 in a DRBM created in DB2 version 2.2 or earlier. To convert a negative value to a meaningful statement number, add 65536 to the negative STMTNO value. For example, -26472 is equivalent to +39064 (-26472 + 65536). Rows that contain zero in the SEQNO, STMTNO, and SECTNO column values are for IBM internal use only.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement. For generated packages for SQL routines, such as procedures and user-defined functions, and advanced triggers, a value of 1 indicates the control statement for the routine or advanced trigger. For basic trigger packages, a value of 1 indicates the WHEN clause for activating the trigger. Rows that contain zero in the SEQNO, STMTNO, and SECTNO column values are for IBM internal use only.	G
BINDERROR	CHAR(1) NOT NULL	Whether an SQL error was detected at bind time: N No Y Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package.	G
—	VARCHAR(3500) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: R RR (repeatable read) T RS (read stability) S CS (cursor stability) U UR (uncommitted read) L RS isolation, with a <i>lock-clause</i> X RR isolation, with a <i>lock-clause</i> blank The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: A Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. B Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. C Compiled - statement was bound successfully using defaults for input variables during access path selection. D Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. E Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. F Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. G Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. H Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. I Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
STATUS (cont.)		J Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. K Control - CALL statement. L Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. M Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. O Compiled for acceleration. The static query was bound successfully for acceleration and will be routed to an accelerator when executed. blank The statement is non-executable, or was bound in a Db2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints: H Optimization hints were used. A The access path was reused because of the APREUSE bind option. blank One of the following situations: • The access path was determined without the use of hints, and a previous access path was not reused. • No access path is associated with the statement. • The statement is a dynamic SQL statement	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	The statement number of the statement in the source program. A negative value indicates a statement number greater than 32767 in a DRBM created in DB2 version 2.2 or earlier. To convert a negative value to a meaningful statement number, add 65536 to the negative STMTNO value. For example, -26472 is equivalent to +39064 (-26472 + 65536).	G

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. For generated packages for SQL routines, such as procedures and user-defined functions, and advanced triggers, a value of 1 indicates the control statement for the routine or advanced trigger. For basic trigger packages, a value of 1 indicates the WHEN clause for activating the trigger.	G
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: Y Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. N Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. blank Indicates that the SQL statement was bound prior to Version 7.	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT -1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of -1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, DECLARE CURSOR, or REFRESH TABLE statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
STMT_ID	BIGINT NOT NULL	A unique statement identifier.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G
—	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	For dynamic statements, this column is blank. For static statements, one of the following values to indicate the reason that an implicit query transformation occurred when the package was bound: A The statement was bound with implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank One of the following occurred: • The statement did not bind successfully and the VALIDATE(RUN) bind option was used. • The statement was bound without implicit query transformation.	G
QUERYID	BIGINT NOT NULL WITH DEFAULT -1	The unique identifier for locating records in the SYSIBM.SYSQUERY catalog table. The -1 default value indicates that no QUERYID value was found for the SQL statement when the package was bound.	G
QUERY_HASH	CHAR(16) NOT NULL WITH DEFAULT FOR BIT DATA	The hash key for locating records in the SYSIBM.SYSQUERY catalog table. This value is not unique for each statement. Other columns for the collection ID, package name, section number, and query number can be used with the hash key for uniqueness. The '00'x default value indicates that no hash key was generated for the SQL statement when the package was bound.	G
QUERY_HASH_VERSION	INTEGER NOT NULL WITH DEFAULT -1	The hash version for locating records in the SYSIBM.SYSQUERY catalog table. The -1 default value indicates that no hash key was generated for the SQL statement when the package was bound.	G
COPYID	INTEGER NULLABLE	FL 502 If the DEPLEVEL bind option is STATEMENT, COPYID contains the copy ID of the package. If the DEPLEVEL bind option is PACKAGE, COPYID is null.	G

Table 352. SYSIBM.SYSPACKSTMT table column descriptions (continued)

Column name	Data type	Description	Use
VALID	CHAR(1) WITH DEFAULT NULL	Whether the statement is valid: A An ALTER statement changed the description of the table or base table of a view referred to by the statement. The changes do not invalidate the statement. However, a rebind might be required for the statement to pick up the changes from the ALTER statement. N No Y Yes NULL The statement-level validity is unknown. Refer to the value of the VALID column of the SYSPACKAGE table for the package-level validity.	G

SYSPACKSTMT_STMB catalog table

The SYSPACKSTMT_STMB table is an auxiliary table for the STMTBLOB column of the SYSPACKSTMT table and is required to hold LOB data. The schema is SYSIBM.

Table 353. SYSIBM.SYSPACKSTMT_STMB table column descriptions

Column name	Data type	Description	Use
—	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

SYSPACKSTMT_STMT catalog table

The SYSPACKSTMT_STMT table is an auxiliary table for the STATEMENT column of the SYSPACKSTMT table and contains the LOB data. The schema is SYSIBM.

Table 354. SYSIBM.SYSPACKSTMT_STMT table column descriptions

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G

SYSPACKSTMTCOPY catalog table

The SYSPACKSTMTCOPY table records statement-level information for the non-current package copies (previous, original, and phased-out). The schema is SYSIBM.

⁴³ Rows in which the value of SEQNO and SECTNOI are zero are for internal use.

⁴⁴ To convert a negative STMTNO to a meaningful statement number that corresponds to your precompile output, add 65536 to it. For example, -26472 is equivalent to +39064 (-26472 + 65536).

Table 355. SYSIBM.SYSPACKSTMTCOPY table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format	S
SEQNO	INTEGER NOT NULL	Sequence number of the statement.	G
BINDERROR	CHAR(1) NOT NULL	Whether an SQL error was detected at bind time: N No Y Yes	G

Table 355. SYSIBM.SYSPACKSTMTCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL	Status of binding the statement: A Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. B Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. C Compiled - statement was bound successfully using defaults for input variables during access path selection. D Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. E Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. F Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. G Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. H Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. I Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Table 355. SYSIBM.SYSPACKSTMTCOPY table column descriptions (continued)

Column name	Data type	Description	Use
STATUS (cont.)		J Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. K Control - CALL statement. L Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. M Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. O Compiled for acceleration. The static query was bound successfully for acceleration and will be routed to an accelerator when executed. blank The statement is non-executable.	S
ACCESSPATH	CHAR(1) NOT NULL	For static statements, indicates if the access path for the statement is based on user-specified optimization hints: H Optimization hints were used. A The access path was reused because of the APREUSE bind option. blank One of the following situations: • The access path was determined without the use of hints, and a previous access path was not reused. • No access path is associated with the statement. • The statement is a dynamic SQL statement	G
SECTNOI	INTEGER NOT NULL	The section number of the statement. For generated packages for SQL routines (such as procedures and user-defined functions) and for advanced triggers, a value of 1 indicates the control statement for the routine or advanced trigger. For basic trigger packages, a value of 1 indicates the WHEN clause for activating the trigger.	G

Table 355. SYSIBM.SYSPACKSTMTCOPY table column descriptions (continued)

Column name	Data type	Description	Use
EXPLAINABLE	CHAR(1) NOT NULL	Contains one of the following values: Y Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the <i>owner.PLAN_TABLE</i> . N Indicates that the SQL statement does not have any rows describing its access path in the <i>owner.PLAN_TABLE</i> .	G
STMT_ID	BIGINT NOT NULL	A statement identifier.	G
EXPANSION_REASON	CHAR(2) NOT NULL	For dynamic statements, this column is blank. For static statements, one of the following values to indicate the reason that an implicit query transformation occurred when the package was bound: A The statement was bound with implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank One of the following occurred: - The statement did not bind successfully and the VALIDATE(RUN) bind option was used. - The statement was bound without implicit query transformation.	G
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key for locating records in the SYSIBM.SYSQUERY catalog table. A '00'x value indicates that no hash key was generated for the SQL statement when the package was bound.	G
QUERY_HASH_VERSION	INTEGER NOT NULL	The hash version for locating records in the SYSIBM.SYSQUERY catalog table. A -1 value indicates that no hash version was generated for the SQL statement when the package was bound.	G

Table 355. SYSIBM.SYSPACKSTMTCOPY table column descriptions (continued)

Column name	Data type	Description	Use
COPYID	INTEGER NO NULL	The copy ID of the package.	G
VALID	CHAR(1) NULLABLE	Whether the statement is valid: A An ALTER statement changed the description of the table or base table of a view referred to by the statement. The changes do not invalidate the statement. However, a rebind might be required for the statement to pick up the changes from the ALTER statement. N No Y Yes	G

SYSPACKSTMTDEP catalog table

The SYSPACKSTMTDEP table records dependencies between application statements and objects. It contains the statement-level dependencies for a current package and all of the package copies. The schema is SYSIBM.

Tip: FL 502 Db2 starts populating starts this table at application compatibility level V13R1M502 or higher.

Table 356. SYSIBM.SYSPACKSTMTDEP table column descriptions

Column name	Data type	Description	Use
BSCHEMA	VARCHAR(128) NOT NULL	The value of the column is the schema of the object identified in the BNAME column, except in the following cases: - If BNAME identifies a table space (BTYPE is R), the value is the name of the database for the table space. - If BNAME identifies a table on which a period is defined (BTYPE is W or Z), the value is the qualifier of that table. - If BNAME identifies a user-defined function, a cast function, a stored procedure, or a sequence (BTYPE is F, o, or Q), the value is the schema name. - If BNAME identifies a role, the value is blank.	S
BNAME	VARCHAR(128) NOT NULL	The name of an object that the statement depends on. If BTYPE is W or Z, the value is the name of the table on which the period is defined.	G

Table 356. SYSIBM.SYSPACKSTMTDEP table column descriptions (continued)

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	The type of object identified by BNAME and BSCHEMA: A Alias E INSTEAD OF trigger F User-defined function or cast function H Global variable G Global temporary table I Index M Materialized query table O Stored procedure P Partitioned table space if it defined as LARGE or with the DSSIZE parameter Q Sequence object R Table space S Synonym T Table V View W SYSTEM_TIME period Z BUSINESS_TIME period 0 (zero) Sequence alias	G
DLOCATION	VARCHAR(128) NOT NULL	Always contains blanks.	S
DCOLLID	VARCHAR (128) NOT NULL	Name of the package collection.	G
DNAME	VARCHAR (128) NOT NULL	Name of the package.	G

Table 356. SYSIBM.SYSPACKSTMTDEP table column descriptions (continued)

Column name	Data type	Description	Use
DCONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: - The "level" as specified by the LEVEL option when the program for the package was precompiled. - The timestamp indicating when the program for the package was precompiled, in an internal format.	S
DTYPE	CHAR(1) NOT NULL	Type of package: R Reserved for IBM use blank Not a trigger package or a native SQL routine package	G
DSTMT_ID	BIGINT NOT NULL	A unique statement identifier.	G
DSEQNO	INTEGER NOT NULL	The sequence number of the statement.	G
DCOPYID	INTEGER NOT NULL	The copy ID of the package that contains the statement.	G
DOWNER	VARCHAR (128) NOT NULL	Owner of the package that contains the statement.	G
DOWNER_TYPE	CHAR(1) NOT NULL	Indicates the type of the owner of the package that contains the statement: L Role blank Authorization ID	G

SYSPARMS catalog table

The SYSPARMS table contains a row for each parameter of a routine or multiple rows for table parameters (one for each column of the table). The schema is SYSIBM.

Table 357. SYSIBM.SYSPARMS table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G

Table 357. SYSIBM.SYSPARMS table column descriptions (continued)

Column name	Data type	Description	Use
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: F User-defined function or cast function P Stored procedure	G
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: N Not a cast function Y A cast function The only way to get a value of Y is if a user creates a distinct type when Db2 implicitly generates cast functions for the distinct type.	G
PARMNAME	VARCHAR(128) NOT NULL	Name of the parameter. For a table parameter, the parameter name in the row corresponding to the first column of the table is the parameter name specified on CREATE; an empty string or blanks are stored for the parameter name for the rows corresponding to the remaining columns.	G
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S

Table 357. SYSIBM.SYSPARMS table column descriptions (continued)

Column name	Data type	Description	Use
ROWTYPE	CHAR(1) NOT NULL	The following values indicate the type of parameter described by this row: P Input parameter. O Output parameter; not applicable for functions B Both an input and an output parameter; not applicable for functions R Result before casting; not applicable for stored procedures C Result after casting; not applicable for stored procedures S Input parameter of the underlying built-in source function. For a sourced function and a given ORDINAL value: • The row with ROWTYPE = P describes the input parameter of the user-defined function (identified by ROUTINEID). • The row with ROWTYPE = S describes the corresponding input parameter of the built-in function that is the underlying source function (identified by the SOURCESHEMA and SOURCESPECIFIC values). A value of 'X' indicates that the row is not used to describe a particular parameter of the routine. Instead, for a routine that was created prior to Version 9, the row is used to record a CCSID for the encoding scheme specified in a PARAMETER CCSID clause, or a DATATYPEID for the representation of the variable length character string parameters of a LANGUAGE C routine, as specified in a PARAMETER VARCHAR clause. For routines created with Version 8 (new function mode) or later releases, the CCSID is recorded in the PARAMETER_CCSID column of SYSROUTINES. For routines created with Version 9 or later releases, the DATATYPEID information to support PARAMETER VARCHAR is recorded in the PARAMETER_VARCHARFORM column of SYSIBM.SYSROUTINES.	G

Table 357. SYSIBM.SYSPARMS table column descriptions (continued)

Column name	Data type	Description	Use
ORDINAL	SMALLINT NOT NULL	If ROWTYPE is B, O, P, or S, the value is the ordinal number of the parameter within the routine signature. If ROWTYPE is C or R, the value depends on the type of function: - For a scalar function, the value is 0. - For a table function, the value is the ordinal number of the column of the output table. If ROWTYPE is X, the value is 0.	G
TYPESHEMA	VARCHAR(128) NOT NULL	Schema of the data type of the parameter.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type of the parameter.	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. When ROWTYPE is X and ORDINAL is 0, a non-zero DATATYPEID indicates that actual representation, for a LANGUAGE C routine, of any varying length string parameters that appear in the routine's parameter list or in the RETURNS clause.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based.	S
LOCATOR	CHAR(1) NOT NULL	Indicates whether a locator to a value, instead of the actual value, is to be passed or returned when the routine is called: N The actual value is to be passed. Y A locator to a value is to be passed	G
TABLE	CHAR(1) NOT NULL	The data type of a column for a table parameter: N This is not a table parameter. Y This is a table parameter.	G
TABLE_COLNO	SMALLINT NOT NULL	For table parameters, the column number of the table. Otherwise, the value is 0.	G

Table 357. SYSIBM.SYSPARMS table column descriptions (continued)

Column name	Data type	Description	Use
LENGTH	INTEGER NOT NULL	Length attribute of the parameter or result; If the parameter or result length is determined during function resolution, the length attribute can also be 0. In the case of a decimal parameter or result this is the precision. If the parameter is an array, the value is 0.	G
SCALE	SMALLINT NOT NULL	Scale of the data type of the parameter or number of fractional second digits of timestamp or timestamp with time zone parameter. If it is TIMESTAMP parameter where LENGTH is 10 and SCALE is 0, the number of fractional second digits is 6.	G
SUBTYPE	CHAR(1) NOT NULL	If the data type is a distinct type, the subtype of the distinct type, which is based on the subtype of its source type: B The subtype is FOR BIT DATA. S The subtype is FOR SBCS DATA. M The subtype is FOR MIXED DATA. blank The source type is not a character type. If the parameter is an array type, the value is blank.	G
CCSID	INTEGER NOT NULL	CCSID of the data type for a character, date, time, timestamp or graphic data type. If the parameter is a datetime array, the value is 0. (not null) When ROWTYPE is X and ORDINAL is 0, the CCSID column is the CCSID for all character and graphic string parameters.	G
CAST_FUNCTION_ID	INTEGER NOT NULL	Internal function ID of the function used to cast the argument, if this function is sourced on another function, or result. Otherwise, the value is 0. Not applicable for stored procedures.	S
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the parameter: A ASCII E EBCDIC U Unicode blank The source type is not a character, graphic, or datetime type. If the parameter is an array type, the value is blank.	G

Table 357. SYSIBM.SYSPARMS table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for a parameter of a native SQL procedure or a parameter of a non-inline SQL scalar function. This value is a zero-length string for rows that were created prior to Version 9, or for rows for parameters that correspond to neither native SQL procedures nor non-inline SQL scalar functions.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G

SYSPENDINGDDL catalog table

The SYSPENDINGDDL table contains information about which objects have pending definition changes. The entries only exist during the window between when the pending option is executed and when the utility applies these pending changes to the object. The schema is SYSIBM.

Table 358. SYSIBM.SYSPENDINGDDL table column descriptions

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database for the pending option.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space for the pending option.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object that contains the pending option.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object that contains the pending option.	G
OBJJOBID	SMALLINT NOT NULL	Internal identifier of the object.	S

Table 358. SYSIBM.SYSPENDINGDDL table column descriptions (continued)

Column name	Data type	Description	Use
OBJTYPE	CHAR(1) NOT NULL	Type of object that is identified by OBJSCHEMA and OBJNAME. I The object is an index S The object is a table space T The object is a table	G
STATEMENT_TYPE	CHAR(1) NOT NULL	The type of the statement for the pending option. A An ALTER statement R A RECOVER statement	G
OPTION_ENVID	INTEGER NOT NULL	Internal identifier of the environment for the pending option.	G
OPTION_KEYWORD	VARCHAR(128) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the name of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the name of the RECOVER option.	G
OPTION_VALUE	VARCHAR(4000) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the value of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the value of the RECOVER option.	G
OPTION_SEQNO	SMALLINT NOT NULL	The sequence of the pending option within the statement.	G
CREATEDTS	TIMESTAMP(12) NOT NULL	Timestamp when the pending option was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ROWID	ROWID	ID to support LOB columns for source text	G
STATEMENT_TEXT	CLOB(2M) NOT NULL	The source text of the original statement for the pending option.	G

Table 358. SYSIBM.SYSPENDINGDDL table column descriptions (continued)

Column name	Data type	Description	Use
COLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the column with a pending definition change.	G
PARTITION	SMALLINT NOT NULL	The physical partition number that was specified in the alter statement. The value is 0 if no physical partition number was specified.	G
PARTITION_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column is populated if the PARTITION column has a non-zero value. The keyword that is associated with the PARTITION clause of the ALTER TABLE statement. For example, suppose that you issued the following statement: <pre>ALTER TABLE ALTER PARTITION</pre> In that case, this column contains ALTER.	G
COLUMN_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column contains the keyword that corresponds to the column that is listed in COLNAME.	G
REORG_SCOPE_ LOWPART	SMALLINT	Logical partition number of the lowest partition in the range for REORG to materialize pending definition changes. Adjacent logical partitions must be reorganized together to materialize pending definition changes. The value is 0 if the range is the entire partitioned table space or index space, or if the record is generated by the RECOVER utility. This column contains the null value when the value is unknown for pending definition changes executed prior to Db2 12.	
REORG_SCOPE_ HIGHPART	SMALLINT	Logical partition number of the highest partition in the range for REORG to materialize pending definition changes. Adjacent logical partitions must be reorganized together to materialize pending definition changes. The value is 0 if the range is the entire partitioned table space or index space, or if the record is generated by the RECOVER utility. This column contains the null value when the value is unknown for pending definition changes executed prior to Db2 12.	

SYSPENDINGOBJECTS catalog table

The SYSPENDINGOBJECTS table contains the name of and OBID information about objects that are the pending creation. The data sets for these objects are created but the object definition have not been materialized to the catalog. The entries in this table only exist during the time between when the names

of the new objects are generated and when the catalog definition of the new objects are materialized. The schema is SYSIBM.

Table 359. SYSIBM.SYSPENDINGOBJECTS table column descriptions

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the base table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the base table space page set descriptor.	S
PARTITION	SMALLINT NOT NULL	Partition number with which the object is associated.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column contained in the base table space with which the object is associated.	G
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object.	G
OBJTYPE	CHAR(1) NOT NULL	Type of object identified by OBJSCHEMA and OBJNAME. I The object is an index S The object is a table space T The object is a table	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space. An empty string if the object is not an index.	G
OBJJOBID	SMALLINT NOT NULL	Internal identifier of the object.	S
OBJPSID	SMALLINT NOT NULL	Internal identifier of the object page set descriptor, or 0 if the object does not have a page set descriptor.	S

SYSPKSYSTEM catalog table

The SYSPKSYSTEM table contains zero or more rows for each package. Each row for a given package represents one or more connections to an environment where the package can be executed. The schema is SYSIBM.

Table 360. SYSIBM.SYSPKSYSTEM table column descriptions

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: - The "level" as specified by the LEVEL option when the package's program was precompiled - The timestamp indicating when the package's program was precompiled, in an internal format.	S
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: BATCH TSO batch CICS Customer Information Control System DB2CALL Db2 call attachment facility DLIBATCH DLI batch support facility IMSBMP IMS BMP region IMSMPP IMS MPP and IFP region REMOTE remote server RRSAF Resource Recovery Services attachment facility UNKNOWN The environment is unknown.	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: N Disabled Y Enabled	G

Table 360. SYSIBM.SYSPKSYSTEM table column descriptions (continued)

Column name	Data type	Description	Use
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: - Blank if SYSTEM=BATCH or SYSTEM=DB2CALL - The LU name for a database server if SYSTEM=REMOTE - Either the requester's location (if the product is Db2) or the requester's LU name enclosed in angle brackets if SYSTEM=REMOTE. - The name of a single connection if SYSTEM has any other value. CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all servers or connections for the indicated environment.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPLAN catalog table

The SYSPLAN table contains one row for each application plan. The schema is SYSIBM.

Table 361. SYSIBM.SYSPLAN table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
BINDDATE	CHAR(6) NOT NULL	Not used.	N
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: B All checking must be performed during BIND. R Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G

⁴⁵ Plans are divided into *sections*. The base section of the plan must be in the EDM pool during the entire time the application program is executing. Other sections of the plan, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
ISOLATION	CHAR(1) NOT NULL	Isolation level for the plan: R RR (repeatable read) T RS (read stability) S CS (cursor stability) U UR (uncommitted read)	G
VALID	CHAR(1) NOT NULL	Whether the application plan is valid: A An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". H An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. N No Y Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the application plan can be allocated: N No; an explicit BIND or REBIND is required before the plan can be allocated Y Yes	G
BINDTIME	CHAR(8) NOT NULL	Not used.	N
PLSIZE	INTEGER NOT NULL	Size of the base section ⁴⁵ of the plan, in bytes.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections ⁴⁵ of the plan that contain SQL statements processed at bind time.	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
ACQUIRE	CHAR(1) NOT NULL	When resources are acquired: A At allocation U At first use	G
RELEASE	CHAR(1) NOT NULL	When resources are released: C At commit D At deallocation	G
EXREFERENCE	CHAR(1) NOT NULL	Not used.	N
EXSTRUCTURE	CHAR(1) NOT NULL	Not used.	N
EXCOST	CHAR(1) NOT NULL	Not used.	N
EXPLAN	CHAR(1) NOT NULL	EXPLAIN option specified for the plan; that is, whether information on the plan's statements was added to the owner's PLAN_TABLE table: N No Y Yes	G
EXPREDICATE	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the plan was bound or rebound: B Data currency is not required for ambiguous cursors. Allow blocking for ambiguous cursors. C Data currency is required for ambiguous cursors. Inhibit blocking for ambiguous cursors. N Blocking is inhibited for ambiguous cursors, but the plan was created before the CURRENTDATA option was available.	G
BOUNDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the binder of the plan.	G
QUALIFIER	VARCHAR(128) NOT NULL WITH DEFAULT	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the plan.	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
CACHESIZE	SMALLINT NOT NULL WITH DEFAULT	Size, in bytes, of the cache to be acquired for the plan. A value of zero indicates that no cache is used.	G
PLENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of package list entries for the plan. The negative of that number if there are rows for the plan in SYSIBM.SYSPACKLIST but the plan was bound in a prior release after fall back.	G
DEFERPREP	CHAR(1) NOT NULL WITH DEFAULT	Whether the package was last bound with the DEFER(PREPARE) option: N No Y Yes	G
CURRENTSERVER	VARCHAR(128) NOT NULL WITH DEFAULT	Location name specified with the CURRENTSERVER option when the plan was last bound. Blank if none was specified, implying that the first server is the local Db2 subsystem.	G
SYSENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of rows associated with the plan in SYSIBM.SYSPSYSTEM. The negative of that number if such rows exist but the plan was bound in a prior release after fall back. A negative value or zero means that all connections are enabled.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the plan was last bound: ANY DEGREE(ANY) 1 or blank DEGREE(1). Blank if the plan was migrated.	G
SQLRULES	CHAR(1) NOT NULL WITH DEFAULT	The SQLRULES option used when the plan was last bound: D or blank SQLRULES(DB2) S SQLRULES(STD) blank A migrated plan	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
DISCONNECT	CHAR(1) NOT NULL WITH DEFAULT	The DISCONNECT option used when the plan was last bound: E or blank DISCONNECT(EXPLICIT) A DISCONNECT(AUTOMATIC) C DISCONNECT(CONDITIONAL) blank A migrated plan	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the plan was last bound: B BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. blank RUN. Dynamic SQL statements in the plan are executed with DYNAMICRULES run behavior.	G
BOUNDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the plan was bound.	G
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: A Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. N Bind option REOPT(NONE) indicates that the access path is determined at bind time. Y Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. 1 Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: N The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit or rollback. Y The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit or rollback.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the plan. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses a default SQL path of: SYSIBM, SYSFUN, SYSPROC, <i>plan qualifier</i> .	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL with three-part names is implemented with DRDA or Db2 private protocol access: D DRDA P Db2 private protocol	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in the <i>owner.PLAN_TABLE</i> to be used as input to Db2. Contains blanks if no rows in the <i>owner.PLAN_TABLE</i> are to be used as input.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: ccsid The specified or derived CCSID. 0 The default CCSID as specified on panel DSNTIPF at installation time. Used when the plan was bound prior to Version 7	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. N Bind option IMMEDIATEWRITE(NO) indicates normal write activity is done. Y Bind option IMMEDIATEWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. 1 Bind option IMMEDIATEWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. blank A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. blank Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCOD	CHAR(1)	Not used.	N
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G

Table 361. SYSIBM.SYSPLAN table column descriptions (continued)

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the plan was last bound: C ROUND_CEILING D ROUND_DOWN F ROUND_FLOOR G ROUND_HALF_DOWN E ROUND_HALF_EVEN H ROUND_HALF_UP U ROUND_UP blank The plan was created in a Db2 release prior to Version 9.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	FL 507 The last date that the plan was used. The LASTUSED value is set to '0001-01-01' when the plan is allocated, and the value is updated approximately 24 hours after the plan is used while real time statistics are enabled. The following commands and operations preserve the existing value: • BIND REPLACE of the same plan version • REBIND • Automatic rebinds	N
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: blank Not specified U USECURRENTLYCOMMITTED W WAITFOROUTCOME	G
PROGAUTH	CHAR(1) NOT NULL WITH DEFAULT 'D'	Indicates whether Db2 checks if a program is authorized to run a plan: D DISABLE E ENABLE	G

SYSPLANAUTH catalog table

The SYSPLANAUTH table records the privileges that are held by users over application plans. The schema is SYSIBM.

FL 505 SYSIBM.SYSPLANAUTH has an associated history table, SYSIBM.SYSPLANAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on [page 2851](#).

Table 362. SYSIBM.SYSPLANUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges. Could also be PUBLIC for a grant to PUBLIC.	G
NAME	VARCHAR(24) NOT NULL	Name of the application plan on which the privileges are held.	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL	Not used.	N

Table 362. SYSIBM.SYSPLANUTH table column descriptions (continued)

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable C DBCTRL D DBADM E SECADM G ACCESSCTRL L SYSCTRL M DBMAINT S SYSADM	G
BINDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND, REBIND, or FREE subcommands against the plan: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can run application programs that use the application plan: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G

Table 362. SYSIBM.SYSPLANUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: blank Authorization ID L Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSPLANDEP catalog table

The SYSPLANDEP table records the dependencies of plans on tables, views, aliases, synonyms, table spaces, indexes, functions, and stored procedures. The schema is SYSIBM.

Table 363. SYSIBM.SYSPLANDEP table column descriptions

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object the plan depends on.	G
BCREATOR	VARCHAR(128) NOT NULL	If BNAME is a table space, its database. Otherwise, the schema of BNAME. If BNAME is a role, the value is blank.	G

Table 363. SYSIBM.SYSPLANDEP table column descriptions (continued)

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME: A Alias E INSTEAD OF trigger F User-defined function or cast function H Global variable G Global temporary table I Index M Materialized query table O Stored procedure P Partitioned table space if it is defined as LARGE or with the DSSIZE parm Q Sequence object R Table space S Synonym T Table V View	G
DNAME	VARCHAR(24) NOT NULL	Name of the plan.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSPLSYSTEM catalog table

The SYSPLSYSTEM table contains zero or more rows for every plan. Each row for a given plan represents one or more connections to an environment in which the plan could be used. The schema is SYSIBM.

Table 364. SYSIBM.SYSPLSYSTEM table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the plan.	G
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: BATCH TSO batch DB2CALL Db2 call attachment facility CICS Customer Information Control System DLIBATCH DLI batch support facility IMSBMP IMS BMP region IMSMPP IMS MPP or IFP region	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: N Disabled Y Enabled	G
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: - Blank if SYSTEM=BATCH or SYSTEM=DB2CALL - The name of a single connection if SYSTEM has any other value CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all connections for the indicated environment.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSQUERY catalog table

Each SYSIBM.SYSQUERY table row identifies a SQL statement. The information is used to influence access path selection when matching statements are optimized. The schema is SYSIBM.

Table 365. SYSIBM.SYSQUERY table column descriptions

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL GENERATED BY DEFAULT AS IDENTITY	Unique identifier for the query.	G
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by statement text.	G
SCHEMA	VARCHAR(128) NOT NULL	The default schema name for unqualified objects in the query or blank. If the query contains unqualified objects and access path hints exist for the query, the access path hints are applied only if the default schema matches the schema in the access path hint.	G
QUERY_SEC_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the modified statement text.	G
QUERY_HASH_VERSION	INTEGER NOT NULL	The version of the query hash.	G
SOURCE	SMALLINT NOT NULL	The source of the row: 0 Statement-level optimization hints.	G
USERFILTER	CHAR(8) NOT NULL	Filter name that is used to group a set of queries or blank.	G
—	CHAR(128) NOT NULL	Internal use only.	I

Table 365. SYSIBM.SYSQUERY table column descriptions (continued)

Column name	Data type	Description	Use
PLAN_VALID	CHAR(1) NOT NULL	Whether plan hints are valid: blank No access path is specified for the statement, but optimization parameters exist in SYSQUERYOPTS Y An access path is specified in SYSQUERYPLAN for the statement. The access path is also valid if the statement has already been executed and the access path was used. N An access path is specified in SYSQUERYPLAN, but the access path is invalid and not used.	G
INVALID_REASON	INTEGER NOT NULL	When PLAN_VALID is N, this column contains the reason that the access path is invalid. If PLAN_VALID is Y or blank, this column contains -1. For descriptions of the reason code values, see: +395 (Db2 Codes) .	S
LOCATION	VARCHAR(128) NOT NULL	Not used.	N
COLLECTION	VARCHAR(128) NOT NULL	Name of the collection of the originating query or blank.	G
PACKAGE	VARCHAR(128) NOT NULL	Name of the package of the originating query or blank.	G
VERSION	VARCHAR(128) NOT NULL	Version of the package or blank.	G
AUTHID	VARCHAR(128) NOT NULL	Authorization ID that was in effect when the query was captured or blank.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp when the package was bound or when BIND QUERY was run	G
RELBOUND	CHAR(1) NOT NULL	The release of Db2 in which the package was bound, or blank. See Release dependency indicators for values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
STMTNO	INTEGER NOT NULL	The statement number in the package. -1 when not applicable.	G

Table 365. SYSIBM.SYSQUERY table column descriptions (continued)

Column name	Data type	Description	Use
SECTNO	INTEGER NOT NULL	The section number in the package. -1 when not applicable.	G
STMTTEXT	CLOB(2M) INLINE LENGTH 2048	The text of the matching SQL statement. The value is populated from the value of the QUERY_TEXT column of the DSN_USERQUERY_TABLE table, with the following items removed: • Blanks including leading and trailing blanks, and embedded blanks that are not within literal strings between pairs of quotation mark symbols • White space, including leading and trailing white space, and white space that is not within a literal string between a pair of quotation mark symbols • SQL comments • EXPLAIN clauses	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT '-1'	The query number.	G
CLIENT_USERID	VARCHAR(255)	User ID of the client.	G
CLIENT_WRKSTNNAME	VARCHAR(255)	Name of the client workstation.	G
CLIENT_APPLNAME	VARCHAR(255)	Name of the client application.	G
SELECTVTY_OVERRIDE	CHAR(1) NOT NULL	Whether selectivity overrides are in effect for the query: 'Y' Selectivity overrides are in effect 'N' Selectivity overrides are not in effect.	G
ACCESSPATH_HINT	CHAR(1) NOT NULL	Whether access paths are specified for the matching statements: 'Y' An access paths is specified and in effect 'N' An access path hints is specified and in effect blank An access path might be specified. When the value is blank you must query the SYSIBM.SYSQUERYPLAN catalog table to determine whether an access path is specified	G

Table 365. SYSIBM.SYSQUERY table column descriptions (continued)

Column name	Data type	Description	Use
OPTION_OVERRIDE	CHAR(1) NOT NULL	Whether statement-level optimization parameters are in effect for matching statements: 'Y' Optimization parameters are in effect. 'N' Optimization parameters are not in effect. blank Optimization parameters might be in effect. When the value is blank you must query the SYSIBM.SYSQUERYOPTS catalog table to determine whether option overrides are in effect.	G
SELECTIVITY_VALID	CHAR(1) NOT NULL	Whether selectivity overrides are valid: blank No selectivity overrides exist for the statement. 'Y' Selectivity overrides exist for the query. The overrides are valid if the statement has already been executed and the overrides were used. 'N' Selectivity overrides exist but the overrides are invalid and not used.	G
FUNCTION_LVL	VARCHAR(10)	The function level of the query.	G

SYSQUERYOPTS catalog table

The SYSQUERYOPTS table contains optimization parameters for the queries that are in the SYSQUERY table. The schema is SYSIBM.

Table 366. SYSIBM.SYSQUERYOPTS table column descriptions

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. This column corresponds to the QUERYID column in the SYSIBM.SYSQUERY table.	G

Table 366. SYSIBM.SYSQUERYOPTS table column descriptions (continued)

Column name	Data type	Description	Use
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. 0 Current version of the plan hints. 1 Previous version of the plan hints used by PLAN STABILITY 2 Original version of the plan hints used by PLAN STABILITY	G
REOPT	CHAR(1) NOT NULL	The value of the REOPT bind option that is in effect for the plan: 1 REOPT(ONCE) A REOPT(AUTO) N REOPT(NONE) Y REOPT(ALWAYS) blank REOPT is not specified	G
STARJOIN	CHAR(1) NOT NULL	Whether star join is enabled: Y Star join is enabled N Star join is disabled blank Star join is not specified	G
MAX_PAR_DEGREE	INTEGER NOT NULL	The maximum parallel degree. This column will contain a value in the range 0–254. If the value of the column is -1, the maximum parallel degree is not specified.	G
DEF_CURR_DEGREE	CHAR(3) NOT NULL	Whether query parallelism is enabled: ONE Query parallelism is disabled ANY Query parallelism is enabled blank Query parallelism is disabled	G
SJTABLES	INTEGER NOT NULL	The number of tables specified in a query to qualify for star join processing. If this column contains -1, star join processing is not specified.	G
—	VARCHAR(128) NOT NULL	Internal use only.	I

Table 366. SYSIBM.SYSQUERYOPTS table column descriptions (continued)

Column name	Data type	Description	Use
GROUP_MEMBER	VARCHAR(24) NOT NULL	The group member name to which the parameters are to be applied. This column contains blank if the group member name is not specified.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSQUERYPLAN catalog table

The SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSQUERYPLAN table, distinguished by the value of the COPYID column. The schema is SYSIBM.

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. The value of QUERYID corresponds to the value of the QUERYID column in the SYSIBM.SYSQUERY column.	G
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. 0 Current version of the plan hints. 1 Previous version of the plan hints used by PLAN STABILITY 2 Original version of the plan hints used by PLAN STABILITY	G
PLAN_VALID	CHAR(1) NOT NULL	Whether the plan hints are valid: N The plan hints are invalid Y The plan hints are valid	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	G
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.	G
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: 0 The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. 1 A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. 2 A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. 3 Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. 4 A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.	G
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Materialized query table • Created or declared temporary table • Materialized view • materialized table expression The value is blank if METHOD is 3. The column can also contain the name of a table in the form DSNWFQB(<i>qblockno</i>). DSNWFQB(<i>qblockno</i>) is used to represent the intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. DSN_DIM_TBLX(<i>qblockno</i>) is used to the represent the work file of a star join dimension table.	G
—	SMALLINT NOT NULL	Internal use only.	I

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
ACCESSTYPE	CHAR(2) NOT NULL	The method of accessing the new table: A Accelerated query table access. DI By an intersection of multiple DOCID lists to return the final DOCID list DU By a union of multiple DOCID lists to return the final DOCID list DX By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list E By direct row access using a row change timestamp column. H By hash overflow index (identified in ACCESSCREATOR and ACCESSNAME) I By an index (identified in ACCESSCREATOR and ACCESSNAME) IN By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table. I1 By a one-fetch index scan M By a multiple index scan (followed by MX, MI, MU, or MH) MH By the hash overflow index named in ACCESSNAME MI By an intersection of multiple indexes MU By a union of multiple indexes MX By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
ACCESSTYPE (continued)		N - By an index scan when the matching predicate contains the IN keyword - By an index scan when Db2 rewrites a query using the IN keyword - By hash access with the IN keyword - By hash access when Db2 rewrites a query using the IN keyword NR Range list access. P By a dynamic pair-wise index scan R By a table space scan RW By a work file scan of the result of a materialized user-defined table function V By buffers for an INSERT statement within a SELECT blank Not applicable to the current row	
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.	G
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.	G
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(<i>mixopseqno</i>) is the starting pair-wise join leg in MIXOPSEQNO; otherwise, blank.	G
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. Y Yes N No	G
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. Y Yes N No	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. Y Yes N No	G
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. Y Yes N No	G
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. Y Yes N No	G
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. Y Yes N No	G
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. Y Yes N No	G
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. Y Yes N No	G
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. Y Yes N No	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
TSLOCKMOD	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: IS Intent share lock IX Intent exclusive lock S Share lock U Update lock X Exclusive lock SIX Share with intent exclusive lock N UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. NS For UR isolation, no lock; for CS, RS, or RR, an S lock. NIS For UR isolation, no lock; for CS, RS, or RR, an IS lock. NSS For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. SS For UR, CS, or RS isolation, an IS lock; for RR, an S lock. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
PREFETCH	CHAR(1) NOT NULL	Indication of whether data pages are to be read in advance by prefetch: D Optimizer expects dynamic prefetch S Pure sequential prefetch L Prefetch through a page list blank Unknown or no prefetch	G
COLUMN_FN_EVAL	CHAR(1) NOT NULL	When an SQL aggregate function is evaluated: R While the data is being read from the table or index S While performing a sort to satisfy a GROUP BY clause blank After data retrieval and after any sorts	G
MIXOPSEQ	SMALLINT NOT NULL	The sequence number of a step in a multiple index operation. 1, 2, ... n For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), or the sequence number of range list access (ACCESSTYPE is 'NR'). 0 For any other rows.	G
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
ACCESS_PGROUP_ID	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
JOIN_PGROUP_ID	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTC_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTN_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
PARALLELISM_MODE	CHAR(1)	The kind of parallelism, if any, that is used at bind time: I Query I/O parallelism C Query CP parallelism This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
MERGE_JOIN_COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
CORRELATION_NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. Y Yes blank No	G
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: F FULL OUTER JOIN L LEFT OUTER JOIN P Pair-wise join S Star join blank INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type. Possible values include: SELECT SELECT INSERT INSERT UPDATE UPDATE MERGE MERGE DELETE DELETE SELUPD SELECT with FOR UPDATE OF DELCUR DELETE WHERE CURRENT OF CURSOR UPDCUR UPDATE WHERE CURRENT OF CURSOR CORSUB Correlated subselect or fullselect TRUNCA TRUNCATE NCOSUB Noncorrelated subselect or fullselect TABLEX Table expression TRIGGR WHEN clause on CREATE TRIGGER UNION UNION UNIONA UNION ALL INTERS INTERSECT INTERA INTERSECT ALL EXCEPT EXCEPT EXCEPTA EXCEPT ALL	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates Indication of whether direct row access is attempted first: D Db2 tries to use direct row access with a rowid column. If Db2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE. T The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed. blank Db2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.	G
PARENT_QBLOCKNO	SMALLINT NOT NULL	A number that indicates the QBLOCKNO of the parent query block.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
TABLE_TYPE	CHAR(1)	The type of new table: B Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement. C Common table expression F Table function I The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table. M Materialized query table Q Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed. R Recursive common table expression S Subquery (correlated or non-correlated) T Table W Work file The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.	G
TABLE_ENCODE	CHAR(1)	The encoding scheme of the table. The possible values are: A ASCII E EBCDIC U Unicode M The table contains multiple CCSID sets	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.	G
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.	I
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.	G
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.	G

Table 367. SYSIBM.SYSQUERYPLAN table column descriptions (continued)

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, Db2 implicitly adds certain syntax to the statement. This column indicates whether the query contains this implicit query transformation and why. This column can have one of the following values: A The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. B The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation. Related information “GET_ARCHIVE built-in global variable” on page 337 “CURRENT TEMPORAL BUSINESS_TIME special register” on page 212 “CURRENT TEMPORAL SYSTEM_TIME special register” on page 214 BIND and REBIND options for packages, plans, and services (Db2 Commands)	G

SYSQUERYPREDICATE catalog table

The SYSQUERYPREDICATE table contains information about predicates for queries in the SYSQUERY table that have been identified for extended optimization. It correlates to the SYSQUERY table by the QUERYID column. The schema is SYSIBM.

Table 368. SYSIBM.SYSQUERYPREDICATE table column descriptions

Column name	Data type	Description	Use
QUERYID	BIGINT	Identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.	S

Table 368. SYSIBM.SYSQUERYPREDICATE table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'OR' • 'EQUAL' • 'RANGE' • 'BETWEEN' • 'IN' • 'LIKE' • 'NOT LIKE' • 'EXISTS' • 'NOTEXIST' • 'SUBQUERY' • 'HAVING' • 'OTHERS'	S
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LEFT_HAND_PNO	INTEGER NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LHS_TABNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S

Table 368. SYSIBM.SYSQUERYPREDICATE table column descriptions (continued)

Column name	Data type	Description	Use
LHS_QBNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	If the RHS of the predicate is a table column (RHS_TABNO > 0), then this column indicates the column name. Other possible values are: 'VALUE' 'COLEXP' 'NONCOLEXP' 'CORSUB' 'NONCORSUB' 'SUBQUERY' 'EXPRESSION' - Blanks	S
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.	S
RHS_TABNO	SMALLINT NOT NULL	If the RHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
RHS_QBNO	SMALLINT NOT NULL	If the RHS of the predicate is a subquery, then this column indicates a number which uniquely identifies the corresponding query block within a query.	S
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.	S
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.	S
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.	S
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.	S
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: 'A' After join 'D' During join blank Not applicable	S

Table 368. SYSIBM.SYSQUERYPREDICATE table column descriptions (continued)

Column name	Data type	Description	Use
ADDED_PRED	CHAR(1) NOT NULL	Whether it is generated by transitive closure, which means Db2 can generate additional predicates to provide more information for access path selection, when the set of predicates that belong to a query logically imply other predicates.	S
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.	S
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.	S
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by Db2.	S
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
CATEGORY	SMALLINT NOT NULL,	IBM internal use only.	S
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.	S
TEXT	VARCHAR(2000) NOT NULL	The transformed predicate text; truncated if exceeds 2000 characters.	S
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.	S
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.	S
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.	S
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.	S

Table 368. SYSIBM.SYSQUERYPREDICATE table column descriptions (continued)

Column name	Data type	Description	Use
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: 'HAVING ' The HAVING clause 'ON ' The ON clause 'WHERE ' The WHERE clause SELECT The SELECT clause	S
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.	S
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. Blank Generated by Db2 C Column mask R Row permission U Specified by the user	S
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.	S
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements.	S
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: DSNDYNAMICSQLCACHE The row originates from the dynamic statement cache DSNEXPLAINMODEYES The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. DSNEXPLAINMODEEXPLAIN The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.	S
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.	S

SYSQUERYSEL catalog table

The SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSQUERY table that have been identified for extended optimization. It correlates to the SYSQUERY table by the QUERYID column. The schema is SYSIBM.

Table 369. SYSIBM.SYSQUERYSEL table column descriptions

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL	The identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements.	S

Table 369. SYSIBM.SYSQUERYSEL table column descriptions (continued)

Column name	Data type	Description	Use
COLLID	VARCHAR(128) NOT NULL	The collection ID: DSNDYNAMICSQLCACHE The row originates from the dynamic statement cache DSNEXPLAINMODEYES The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. DSNEXPLAINMODEEXPLAIN The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.	S
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.	S
PREDNO	INTEGER NOT NULL	Identifies the predicate	S
INSTANCE	SMALLINT NOT NULL	The selectivity instance, which is used to group related selectivities.	S
SELECTIVITY	FLOAT NOT NULL	The selectivity of the predicate.	S
WEIGHT	FLOAT (4) NOT NULL	The weight of the selectivity instance. For example, a value of .25 means that 25% of the time when a query is executed the predicate will have this selectivity.	S
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or will be used: One of the following values: 'NORMAL' Estimated using the normal selectivity assumptions. 'OVERRIDE' To be used as input to the Optimizer and override it's selectivity estimation.	S

Table 369. SYSIBM.SYSQUERYSEL table column descriptions (continued)

Column name	Data type	Description	Use
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS AS ROW CHANGE TIMESTAMP	The time when the row was inserted.	S
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
REMARKS	VARCHAR(762)	Internal use only.	S

SYSQUERY_AUX catalog table

The SYSQUERY_AUX table is an auxiliary table for the STMTTEXT column of the SYSQUERY table. The schema is SYSIBM.

Table 370. SYSIBM.SYSQUERY_AUX table column descriptions

Column name	Data type	Description	Use
STMTTEXT	CLOB(2M)	The full text of the query.	G

SYSRELS catalog table

The SYSRELS table contains one row for every referential constraint. The schema is SYSIBM.

Table 371. SYSIBM.SYSRELS table column descriptions

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	The schema of the dependent table of the referential constraint.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the dependent table of the referential constraint.	G

Table 371. SYSIBM.SYSRELS table column descriptions (continued)

Column name	Data type	Description	Use
RELNAME	VARCHAR(128) NOT NULL	Constraint name.	G
REFTBNAME	VARCHAR(128) NOT NULL	Name of the parent table of the referential constraint.	G
REFTBCREATOR	VARCHAR(128) NOT NULL	The schema of the parent table.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the foreign key.	G
DELETERULE	CHAR(1) NOT NULL	Type of delete rule for the referential constraint: A NO ACTION C CASCADE N SET NULL R RESTRICT	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELOBID1	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the parent table.	S
RELOBID2	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the dependent table.	S
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	Date and time the constraint was defined. If the constraint is between catalog tables prior to Version 2 Release 3, the value is '1985-04-01-00.00.00.000000.'	G
IXOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Schema for a unique non-primary index used to enforce the parent key of a referential constraint. Blank or empty string for a primary key used to enforce the parent key of a referential constraint which is a primary key.	G

Table 371. SYSIBM.SYSRELS table column descriptions (continued)

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of a unique non-primary index used to enforce the parent key of a referential constraint. Empty string for a primary index used to enforce the parent key of a referential constraint which is a primary key.	G
ENFORCED	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Enforced by the system or not: Y Enforced by the system N Not enforced by the system (trusted)	G
CHECKEXISTINGDATA	CHAR(1) NOT NULL WITH DEFAULT	Option for checking existing data: I Immediately check existing data. If ENFORCED = 'Y' and this is not a temporal referential constraint, this column will have a value of 'I'. N Never check existing data. If ENFORCED = 'N', this column will have a value of 'N'. T Immediately check existing data for a temporal referential constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSRESAUTH catalog table

The SYSRESAUTH table records CREATE IN and PACKADM ON privileges for collections; USAGE privileges for user-defined types; USE privileges for buffer pools, storage groups, and table spaces; and REVOKE privileges for Java archive (JAR) files. The schema is SYSIBM.

FL 505 SYSIBM.SYSRESAUTH has an associated history table, SYSIBM.SYSRESAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 372. SYSIBM.SYSRESAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G

Table 372. SYSIBM.SYSRESAUTH table column descriptions (continued)

Column name	Data type	Description	Use
QUALIFIER	VARCHAR(128) NOT NULL	Qualifier of the table space (the database name) if the privilege is for a table space (OBTYP='R'). The schema name of the user-defined type if the privilege is for a user-defined type (OBTYP='D'). The schema name of the JAR file if the privilege is for a JAR file (OBTYP='J'). The value is PACKADM if the privilege is for a collection (OBTYP='C') and the authority held is PACKADM. Otherwise, the value is blank.	G
NAME	VARCHAR(128) NOT NULL	Name of the buffer pool, collection, Db2 storage group, JAR file, table space, or user-defined type. This value is ALL when USE OF ALL BUFFERPOOLS is granted.	G
—	CHAR(1) NOT NULL	Internal use only.	I
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable A PACKADM (on collection *) C DBCTRL D DBADM E SECADM G ACCESSCTRL L SYSCTRL M DBMAINT P PACKADM (on a specific collection) S SYSADM T DATAACCESS	G

Table 372. SYSIBM.SYSRESAUTH table column descriptions (continued)

Column name	Data type	Description	Use
OBTYP	CHAR(1) NOT NULL	Type of object: B Buffer pool C Collection D User-defined type R Table space S Storage group J JAR file (Java archive file)	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
USEAUTH	CHAR(1) NOT NULL	Whether the privilege is held with the GRANT option: G Privilege is held with the GRANT option Y Privilege is held without the GRANT option The authority held is PACKADM when the OBTYP is C (a collection) and QUALIFIER is PACKADM. The authority held is CREATE IN when the OBTYP is C and QUALIFIER is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G

Table 372. SYSIBM.SYSRESAUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: blank Authorization ID L Role R Internal use only	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSROLES catalog table

The SYSROLES table contains one row for each role. The schema is SYSIBM.

[FL 505](#) SYSIBM.SYSROLES has an associated history table, SYSIBM.SYSROLES_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables” on page 2851](#).

Table 373. SYSIBM.SYSROLES table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the role.	G
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that defined this role listed in the NAME column.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: L Role blank Authorization ID	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the role is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the role. See Release dependency indicators for the values.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
FL 505 SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
FL 505 SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
FL 505 TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	The transaction-start-ID column, for system-period data versioning..	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSROUTINEAUTH catalog table

The SYSROUTINEAUTH table records the privileges that are held by users on routines. (A routine can be a user-defined function, cast function, or stored procedure.) The schema is SYSIBM.

FL 505 SYSIBM.SYSROUTINEAUTH has an associated history table, SYSIBM.SYSROUTINEAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 374. SYSIBM.SYSROUTINEAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege or the name of a plan or package that uses the privilege. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine. An asterisk (*) if the privilege is held on all routines in the schema.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: F User-defined function or cast function P Stored procedure	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: blank An authorization ID L Role P An application plan or package. The grantee is a package if COLLID is not blank. R Internal use only	G

Table 374. SYSIBM.SYSROUTINEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. blank Not applicable 1 Grantor had privilege on schema.* at time of grant E SECADM G ACCESSCTRL L SYSCTRL S SYSADM T DATAACCESS	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the routine: Y Privilege is held without GRANT option. G Privilege is held with GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G

Table 374. SYSIBM.SYSROUTINEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSROUTINES catalog table

The SYSROUTINES table contains a row for every routine. (A routine can be a user-defined function, cast function, or stored procedure.) The schema is SYSIBM.

Table 375. SYSIBM.SYSROUTINES table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: F User-defined function or cast function P Stored procedure	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the routine.	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S
RETURN_TYPE	INTEGER NOT NULL	Internal identifier of the result data type of the function. The column contains a -2 if the function is a table function.	S
ORIGIN	CHAR(1) NOT NULL	Origin of the routine: E External routine or external SQL procedure N Native SQL procedure Q SQL function S System-generated function U Sourced on user-defined function or built-in function	G
FUNCTION_TYPE	CHAR(1) NOT NULL	Type of function: C Aggregate function S Scalar function T Table function blank For a stored procedure (ROUTINETYPE = 'P')	G
PARAM_COUNT	SMALLINT NOT NULL	Number of parameters for the routine.	G
LANGUAGE	VARCHAR(24) NOT NULL	Implementation language of the routine: • ASSEMBLE • C • COBOL • COMPJAVA • JAVA • PLI • REXX • SQL The value is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
COLLID	VARCHAR(128) NOT NULL	Name of the package collection to be used when the routine is executed. A blank value indicates the package collection is the same as the package collection of the program that invoked the routine.	G
SOURCESHEMA	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the schema of the source user-defined function ('SYSIBM' for a source built-in function). Otherwise, the value is blank.	G
SOURCESPECIFIC	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the specific name of the source user-defined function or source built-in function name. Otherwise, the value is blank.	G
DETERMINISTIC	CHAR(1) NOT NULL	The deterministic option of an external function or a stored procedure: N Indeterminate (results might differ with a given set of input values). Y Deterministic (results are consistent). blank ROUTINETYPE='F' and ORIGIN is not 'E' or not 'Q' (the routine is a function, but not an external function or an SQL function).	G
EXTERNAL_ACTION	CHAR(1) NOT NULL	The external action option of an external function or SQL function: N Function has no side effects. E Function has external side effects so that the number of invocations is important. blank ORIGIN is not 'E' or 'Q' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
NULL_CALL	CHAR(1) NOT NULL	The CALLED ON NOT NULL INPUT option of an external function or stored procedure: N The routine is not called if any parameter has a NULL value. Y The routine is called if any parameter has a NULL value. blank ROUTINETYPE='F' and ORIGIN is not 'E' (the routine is a function, but not an external function).	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: N The routine is not a cast function. Y The routine is a cast function. blank ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P'). A cast function is generated by Db2 for a CREATE TYPE statement.	G
SCRATCHPAD	CHAR(1) NOT NULL	The SCRATCHPAD option of an external function: N This function does not have a SCRATCHPAD. Y This function has a SCRATCHPAD. blank ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
SCRATCHPAD_LENGTH	INTEGER NOT NULL	Length of the scratchpad if the ORIGIN is 'E' for the function (ROUTINETYPE='F') and NO SCRATCHPAD is not specified. Otherwise, the value is 0.	G
FINAL_CALL	CHAR(1) NOT NULL	The FINAL CALL option of an external function: N A final call will not be made to the function. Y A final call will be made to the function. blank ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
PARALLEL	CHAR(1) NOT NULL	The PARALLEL option of an external function: A This function can be invoked by parallel tasks. D This function cannot be invoked by parallel tasks. blank ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
PARAMETER_STYLE	CHAR(1) NOT NULL	The PARAMETER STYLE option of an external function or stored procedure: D DB2SQL. All parameters are passed to the external function or stored procedure according to the DB2SQL standard convention. G GENERAL. All parameters are passed to the stored procedure according to the GENERAL standard convention. N GENERAL CALL WITH NULLS. All parameters are passed to the stored procedure according to the GENERAL WITH NULLS convention. J JAVA. All parameters are passed to the function or procedure according to the conventions for JAVA and SQLJ specifications. blank The column is blank if the ORIGIN is not 'E' or if LANGUAGE is SQL.	G
FENCED	CHAR(1) NOT NULL	Y Indicates that this routine runs separately from the Db2 address space in a WLM managed Db2 address space. All user-defined routines that are not marked with Y in this column run in the Db2 address space. blank ORIGIN is 'Q' or ORIGIN is 'N'.	G
SQL_DATA_ACCESS	CHAR(1) NOT NULL	The SQL statements that are allowed in an external function, SQL function, or stored procedure: C CONTAINS SQL - Only SQL that does not read or modify data is allowed. M MODIFIES SQL DATA - All SQL is allowed, including SQL that reads or modifies data. N NO SQL - SQL is not allowed. R READS SQL DATA - Only SQL that reads data is allowed. blank Not applicable.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
DBINFO	CHAR(1) NOT NULL	The DBINFO option of an external function or stored procedure: N No, the DBINFO parameter will not be passed to the external function or stored procedure. Y Yes, the DBINFO parameter will be passed to the external function or stored procedure. blank ORIGIN is not 'E'.	G
STAYRESIDENT	CHAR(1) NOT NULL	The STAYRESIDENT option of the routine, which determines whether the routine is to be deleted from memory when the routine ends. N The load module is to be deleted from memory after the routine terminates. Y The load module is to remain resident in memory after the routine terminates. blank ORIGIN is not 'E'.	G
ASUTIME	INTEGER NOT NULL	Number of CPU service units permitted for any single invocation of this routine. If ASUTIME is zero, the number of CPU service units is unlimited. The value is 0 if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If a routine consumes more CPU service units than the ASUTIME value allows, Db2 cancels the routine.	G
WLM_ENVIRONMENT	VARCHAR(96) NOT NULL	Name of the WLM environment to be used to run this routine. When ORIGIN = 'N', this is the name of the WLM ENVIRONMENT FOR DEBUG MODE that is to be used when debugging a native SQL procedure. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If the ROUTINETYPE = 'P', the value might be blank. If this value is blank the stored procedure cannot be run.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
WLM_ENV_FOR_NESTED	CHAR(1) NOT NULL	For nested routine calls, indicates whether the address space of the calling stored procedure or user-defined function is used to run the nested stored procedure or user-defined function: N The nested stored procedure or user-defined function runs in an address space other than the specified WLM environment if the calling stored procedure or user-defined function is not running in the specified WLM environment. 'WLM ENVIRONMENT name' was specified. Y The nested stored procedure or user-defined function runs in the environment used by the calling stored procedure or user-defined function. 'WLM ENVIRONMENT(name,*)' was specified. blank WLM_ENVIRONMENT is blank. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
PROGRAM_TYPE	CHAR(1) NOT NULL	Indicates whether the routine runs as a Language Environment main routine or a subroutine: M The routine runs as a main routine. S The routine runs as a subroutine. blank ORIGIN is not 'E'.	G
EXTERNAL_SECURITY	CHAR(1) NOT NULL	Specifies the authorization ID to be used if the routine accesses resources protected by an external security product: D Db2 - The authorization ID associated with the WLM-established stored procedure address space. U SESSION_USER - The authorization ID of the SQL user that invoked the routine. C DEFINER - The authorization ID of the owner of the routine. blank ORIGIN is not 'E'.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
COMMIT_ON_RETURN	CHAR(1) NOT NULL	If ROUTINETYPE = 'P', whether the transaction is always to be committed immediately on successful return (non-negative SQLCODE) from this stored procedure: N The unit of work is to continue. Y The unit of work is to be committed immediately. A The unit of work of the autonomous procedure is committed immediately, but other work of the calling application is not committed. If ROUTINETYPE = 'F', the value is blank.	G
RESULT_SETS	SMALLINT NOT NULL	If ROUTINETYPE = 'P', the maximum number of ad hoc result sets that this stored procedure can return. If no ad hoc result sets exist or ROUTINETYPE = 'F', the value is zero.	G
LOBCOLUMNS	SMALLINT NOT NULL	If ORIGIN = 'E' or 'Q', the number of LOB columns found in the parameter list for this user-defined function. If no LOB columns are found in the parameter list or ORIGIN is not 'E' or not 'Q', the value is 0.	S
CREATEDTS	TIMESTAMP NOT NULL	Time when the routine was created or re-created.	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the last ALTER statement was executed for this routine.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
PARM1	SMALLINT NOT NULL	Internal use only.	I
PARM2	SMALLINT NOT NULL	Internal use only.	I
PARM3	SMALLINT NOT NULL	Internal use only.	I
PARM4	SMALLINT NOT NULL	Internal use only.	I

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
PARM5	SMALLINT NOT NULL	Internal use only.	I
PARM6	SMALLINT NOT NULL	Internal use only.	I
PARM7	SMALLINT NOT NULL	Internal use only.	I
PARM8	SMALLINT NOT NULL	Internal use only.	I
PARM9	SMALLINT NOT NULL	Internal use only.	I
PARM10	SMALLINT NOT NULL	Internal use only.	I
PARM11	SMALLINT NOT NULL	Internal use only.	I
PARM12	SMALLINT NOT NULL	Internal use only.	I
PARM13	SMALLINT NOT NULL	Internal use only.	I
PARM14	SMALLINT NOT NULL	Internal use only.	I
PARM15	SMALLINT NOT NULL	Internal use only.	I
PARM16	SMALLINT NOT NULL	Internal use only.	I
PARM17	SMALLINT NOT NULL	Internal use only.	I
PARM18	SMALLINT NOT NULL	Internal use only.	I
PARM19	SMALLINT NOT NULL	Internal use only.	I
PARM20	SMALLINT NOT NULL	Internal use only.	I

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
PARM21	SMALLINT NOT NULL	Internal use only.	I
PARM22	SMALLINT NOT NULL	Internal use only.	I
PARM23	SMALLINT NOT NULL	Internal use only.	I
PARM24	SMALLINT NOT NULL	Internal use only.	I
PARM25	SMALLINT NOT NULL	Internal use only.	I
PARM26	SMALLINT NOT NULL	Internal use only.	I
PARM27	SMALLINT NOT NULL	Internal use only.	I
PARM28	SMALLINT NOT NULL	Internal use only.	I
PARM29	SMALLINT NOT NULL	Internal use only.	I
PARM30	SMALLINT NOT NULL	Internal use only.	I
IOS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/Os that required to execute the routine. The value is -1 if the estimated number is not known.	S
INSTS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that required to execute the routine. The value is -1 if the estimated number is not known.	S
INITIAL_IOS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/O's that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S
INITIAL_INSTS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
CARDINALITY	FLOAT NOT NULL WITH DEFAULT -1	The predicted cardinality of the routine, -1 to trigger the use of the default value (10,000).	S
RESULT_COLS	SMALLINT NOT NULL DEFAULT 1	For a table function, the number of columns in the result table. Otherwise, the value is 1.	S
EXTERNAL_NAME	VARCHAR(762) NOT NULL	The path/module/function that Db2 should load to execute the routine. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
—	VARCHAR(150) NOT NULL FOR BIT DATA	Internal use only.	I
RUNOPTS	VARCHAR(762) NOT NULL	The Language Environment run time options to be used for this routine. An empty string indicates that the installation default Language Environment run time options are to be used. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
JAVA_SIGNATURE	VARCHAR(3072) NOT NULL WITH DEFAULT	The signature of the JAR file. blank When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
CLASS	VARCHAR(384) NOT NULL WITH DEFAULT	The class name contained in the JAR file. blank When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JARSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of the JAR file. blank When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JAR_ID	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the JAR file. blank When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
SPECIAL_REGS	CHAR(1) NOT NULL WITH DEFAULT 'I'	The SPECIAL REGISTER option for a routine. I INHERIT SPECIAL REGISTERS D DEFAULT SPECIAL REGISTERS blank ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is 0 if the row does not describe a user-defined table function, or if no materialized query tables are defined on the table function.	G
MAX_FAILURE	SMALLINT NOT NULL WITH DEFAULT -1	Allowable failures for this routine (0-32767). If zero is specified, the routine will never be stopped. If no value is specified for this routine, the default will be -1 to indicate that the Db2 installation parameter (STORMXAB) will be used.	G
PARAMETER_CCSID	INTEGER NOT NULL WITH DEFAULT	A CCSID that specifies how character, graphic, date, time, and timestamp data types for system generated parameters to the routine such as message tokens and DBINFO should be passed. The value is dependent on the encoding scheme specified implicitly or explicitly for the PARAMETER CCSID clause defined at the system for that encoding scheme. The following list describes the CCSID for each encoding scheme: ASCII If mixed data is allowed, this CCSID is for mixed ASCII data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this CCSID is for SBCS ASCII data. EBCDIC If mixed data is allowed, this CCSID is for mixed EBCDIC data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this is the CCSID for SBCS EBCDIC data. Unicode This CCSID is for mixed data (1208). A value of zero means that the CCSIDs used are those CCSIDs for the encoding scheme of other string or datetime parameters in the parameter list or RETURNS clause CCSID clauses, or the value in the DEF ENCODING SCHEME on installation panel DSNTIPF.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for a native SQL procedure (indicated by the value 'N' in the column ORIGIN) or a non-inline SQL scalar function (indicated by the value 'Q' in the column ORIGIN and 'N' in the column INLINE). A zero length string for the rows that are created prior to Version 9 and for the rows that correspond to neither native SQL procedures or non-inline SQL scalar functions.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	The consistency token for the routine. The column is set to X'20' if the value of ORIGIN is not 'N'	G
ACTIVE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the active version of the routine: Y This version is active. N This version is not active. blank The value of ORIGIN is not 'N' or the row was created prior to Version 9.	G
DEBUG_MODE	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether or not this routine is enabled for debugging: 1 This routine is enabled for debugging and can be debugged in a client debug session using the Db2 Unified Debugger. 0 This routine is not enabled for debugging. N This routine can never be enabled for debugging. blank The LANGUAGE is not specified as JAVA, the value of ORIGIN is not 'N', or the row was created prior to Version 9.	G
TEXT_ENVID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the environment. The column value is 0 if the value of ORIGIN is not 'N' or 'Q', or if the row was created prior to Version 9.	G
TEXT_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID to support LOB columns for source text.	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the statement that created the SQL routine, including the body of the routine. In some cases, this column might instead contain the text of a statement that altered the SQL routine. In many cases, changes to routines or to objects on which routines are dependent do not update this value. The value is a zero-length string if the value of ORIGIN is not 'N' or if the row was created prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
PARAMETER_ VARCHARFORM	INTEGER NOT NULL WITH DEFAULT	A non-zero value that indicates the actual representation, to a LANGUAGE C routine, of any varying length string parameter that appears in the parameter list or RETURNS clause for that routine.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
PACKAGEPATH	VARCHAR(4096)	The value of the PACKAGE PATH option of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement that created or last changed the routine. PACKAGE PATH identifies the package path to use when the routine is executed. A blank value indicates the package path is the same as the package path of the program that invoked the routine.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the routine is secured: N The routine is not secured Y The routine is secured	G
INLINE	CHAR(1) NOT NULL WITH DEFAULT	Specifies if the SQL function is inline: Y The SQL function is inline when referenced. No package is associated with this type of routine. N The SQL function has an associated package. blank Not an SQL function (the ORIGIN column has a value other than 'Q')	G

Table 375. SYSIBM.SYSROUTINES table column descriptions (continued)

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I
SYSTEM_DEFINED	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether this routine is system defined: blank This routine is not system defined S This routine is system defined	G
WRAPPED	CHAR(1)	'Y' The routine text is obfuscated. Obfuscating source code of SQL procedures, SQL functions, and triggers (Db2 Administration Guide) . blank The routine text is not obfuscated.	G
REGENERATEDTS	TIMESTAMP(12) NOT NULL	The time when the object was regenerated. The value is valid only for objects that can be regenerated. If no regeneration has occurred, this column contains the same value as the CREATEDTS column.	G

SYSROUTINESTEXT catalog table

The SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data. The schema is SYSIBM.

Table 376. SYSIBM.SYSROUTINESTEXT table column descriptions

Column name	Data type	Description	Use
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	See the description of the TEXT column in “SYSROUTINES catalog table” on page 2699 .	G

SYSROUTINES_OPTS catalog table (deprecated)

The SYSROUTINES_OPTS table Contains a row for each generated routine, such as one created by Db2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine. The schema is SYSIBM.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see [Creating native SQL procedures \(Db2 Application programming and SQL\)](#) and [Migrating an external SQL procedure to a native SQL procedure \(Db2 Application programming and SQL\)](#).

Rows in this table can be inserted, updated, and deleted.

Table 377. SYSIBM.SYSROUTINES_OPTS table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G

Table 377. SYSIBM.SYSROUTINES_OPTS table column descriptions (continued)

Column name	Data type	Description	Use
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's options is the current version.	G
BUILDSchema	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
PRECOMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	SQL processing (precompiler or coprocessor) options used to build the routine.	G
COMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Compiler options used to build the routine.	G
PRELINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Prelink-edit options used to build the routine.	G
LINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Link-edit options used to build the routine.	G

Table 377. SYSIBM.SYSROUTINES_OPTS table column descriptions (continued)

Column name	Data type	Description	Use
BIND_OPTS	VARCHAR(3072) NOT NULL WITH DEFAULT	Bind options used to build the routine.	G
SOURCEDSN	VARCHAR(765) NOT NULL WITH DEFAULT	Name of the source data set.	G
DEBUG_MODE	CHAR(1) NOT NULL	Debugging is on or off for this object. 0 Debugging is off. Default and value on migration are both 0. 1 Debugging is on.	G

SYSROUTINES_TREE catalog table

The SYSROUTINES_TREE table is an auxiliary table for the PTREE column of the SYSROUTINES table. The schema is SYSIBM.

Table 378. SYSIBM.SYSROUTINES_TREE table column descriptions

Column name	Data type	Description	Use
PTREE	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSROUTINES_SRC catalog table (deprecated)

The SYSROUTINES_SRC table contains source for generated routines, such as those created by Db2 for z/OS Procedure Processor DSNTPSMP. The schema is SYSIBM.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see [Creating native SQL procedures \(Db2 Application programming and SQL\)](#) and [Migrating an external SQL procedure to a native SQL procedure \(Db2 Application programming and SQL\)](#).

Rows in this table can be inserted, updated, and deleted.

Table 379. SYSIBM.SYSROUTINES_SRC table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G

Table 379. SYSIBM.SYSROUTINES_SRC table column descriptions (continued)

Column name	Data type	Description	Use
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's source is the current version.	G
SEQNO	INTEGER NOT NULL	Number of the source statement piece in CREATESTMT.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
CREATESTMT	VARCHAR(7500) NOT NULL	Routine source statement.	G

SYSSCHEMAAUTH catalog table

The SYSSCHEMAAUTH table contains one or more rows for each user that is granted a privilege on a particular schema in the database. The schema is SYSIBM.

FL 505 SYSIBM.SYSSCHEMAAUTH has an associated history table, SYSIBM.SYSSCHEMAAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables” on page 2851](#).

Table 380. SYSIBM.SYSSCHEMAAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges or SYSADM.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group who holds the privileges. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMANAME	VARCHAR(128) NOT NULL	Name of the schema or '*' for all schemas.	G

Table 380. SYSIBM.SYSSCHEMAAUTH table column descriptions (continued)

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. 1 Grantor had privilege on all schemas at time of grant E SECADM G ACCESSCTRL L SYSCTRL S SYSADM	G
CREATEINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds CREATEIN privilege on the schema: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
ALTERINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTERIN privilege on the schema: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
DROPINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds DROPIN privilege on the schema: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G

Table 380. SYSIBM.SYSSCHEMAAUTH table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: blank Authorization ID L Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSSEQUENCEAUTH catalog table

The SYSSEQUENCEAUTH table records the privileges that are held by users over sequences. The schema is SYSIBM.

[FL 505](#) SYSIBM.SYSSEQUENCEAUTH has an associated history table, SYSIBM.SYSSEQUENCEAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables” on page 2851](#).

Table 381. SYSIBM.SYSSEQUENCEAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group that holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the sequence.	G
NAME	VARCHAR(128) NOT NULL	Name of the sequence.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: blank An authorization ID. L Role P An application plan or package. The grantee is a package if COLLID is not blank. R Internal use only.	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor: blank Not applicable E SECADM G ACCESSCTRL L SYSCTRL S SYSADM T DATAACCESS	G

Table 381. SYSIBM.SYSSEQUENCEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
ALTERAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTER privilege on the sequence: blank Privilege is not held. G Privilege is held with the GRANT option. Y Privilege is held without the GRANT option.	G
USEAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds USAGE privilege on the sequence: blank Privilege is not held. G Privilege is held with the GRANT option. Y Privilege is held without the GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, a string of length zero.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, blank.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G

Table 381. SYSIBM.SYSSEQUENCEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSSEQUENCES catalog table

The SYSSEQUENCES table contains one row for each identity column or user-defined sequence. The schema is SYSIBM.

Table 382. SYSIBM.SYSSEQUENCES table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the alias, identity column, or sequence. The name for an identity column is generated by Db2.	G
SEQTYPE	CHAR(1) NOT NULL	Type of sequence object: A Alias for a sequence I An identity column S A user-defined sequence X An implicitly created DOCID column for a base table that contains XML data.	G
SEQUENCEID	INTEGER NOT NULL	Internal identifier of the alias, identity column, or sequence.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the alias, identity column, or sequence.	G
INCREMENT	DECIMAL(31,0) NOT NULL	Increment value (positive or negative, within INTEGER scope). The value is 0 if the row describes an alias.	G

Table 382. SYSIBM.SYSSEQUENCES table column descriptions (continued)

Column name	Data type	Description	Use
START	DECIMAL(31,0) NOT NULL	Start value. The value is 0 if the row describes an alias.	G
MAXVALUE	DECIMAL(31,0) NOT NULL	Maximum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G
MINVALUE	DECIMAL(31,0) NOT NULL	Minimum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G
CYCLE	CHAR(1) NOT NULL	Whether cycling will occur when a boundary is reached: N No Y Yes, cycling will occur blank The row describes an alias	G
CACHE	INTEGER NOT NULL	Number of sequence values to preallocate in memory for faster access. A value of 0 indicates that values are not to be preallocated. The value is 0 if the row describes an alias.	G
ORDER	CHAR(1) NOT NULL	Whether the values must be generated in order: Y Yes N No R The values must be generated in pseudo-random order for an XML document ID column that was created when subsystem parameter XML_RANDOMIZE_DOCID was set to YES. blank The row describes an alias	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. The value is 0 if the row describes an alias.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. The value is 0 if the row describes an alias.	S
CREATEDTS	TIMESTAMP NOT NULL	Timestamp of the creation of the alias, identity column, or sequence.	G

Table 382. SYSIBM.SYSSEQUENCES table column descriptions (continued)

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL	Timestamp when the last ALTER statement was executed for this alias, identity column, or sequence.	G
MAXASSIGNEDVAL	DECIMAL(31,0)	Last possible assigned value. MAXASSIGNEDVAL is updated each time that the next chunk of <i>n</i> values is cached. <i>n</i> is the CACHE column value. MAXASSIGNEDVAL is initialized to null when the object is created or when it is altered to restart the sequence. The value is also null when the object is an alias. The LOAD utility updates MAXASSIGNEDVAL for identity columns in the following ways: • For sequence or identity column values that are generated by the Db2 database manager, LOAD updates MAXASSIGNEDVAL each time that the next chunk of <i>n</i> values is cached. <i>n</i> is the CACHE column value. • For identity column values that are generated by the user, LOAD updates MAXASSIGNEDVAL with the MAXVALUE column value or MINVALUE column value. MAXVALUE is used if the INCREMENT column value is positive. MINVALUE is used if the INCREMENT column value is negative. • LOAD with REPLACE sets MAXASSIGNEDVAL to null before loading any data. • LOAD with FORMAT INTERNAL does not update MAXASSIGNEDVAL if the data that is being loaded is in basic row format. The value is 0 if the row describes an alias.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	Character string provided by user with the COMMENT statement. The value is blank for an identity column.	G
PRECISION	SMALLINT NOT NULL WITH DEFAULT	The precision defined for a sequence with a decimal or numeric type. The value is 5 for SMALLINT, 10 for INTEGER, 19 for BIGINT, or the actual precision specified by the user for the decimal data type. The value is 0 for rows created prior to Version 8. The value is 0 if the row describes an alias.	G

Table 382. SYSIBM.SYSSEQUENCES table column descriptions (continued)

Column name	Data type	Description	Use
RESTARTWITH	DECIMAL(31,0) NULLABLE WITH DEFAULT	The sequence RESTART value for an ALTER SEQUENCE statement. The value is NULL for the following: - There have been no ALTER statements with the RESTART option. - The row describes an alias	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
SEQSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	For a sequence alias, identifies the schema of the sequence for which the alias is defined. Otherwise, the value is blank.	G
SEQNAME	VARCHAR(128) NOT NULL WITH DEFAULT	For a sequence alias, identifies the name of the sequence for which the alias is defined. Otherwise, the value is blank.	G

SYSSEQUENCESDEP catalog table

The SYSSEQUENCESDEP table records the dependencies of identity columns and sequences. The schema is SYSIBM.

Table 383. SYSIBM.SYSSEQUENCEDEP table column descriptions

Column name	Data type	Description	Use
BSEQUENCEID	INTEGER NOT NULL	Internal identifier of the identity column or sequence.	G
DCREATOR	VARCHAR(128) NOT NULL	The owner of the object that is dependent on this identity column or sequence.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that is dependent on this identity column or sequence.	G

Table 383. SYSIBM.SYSSEQUENCEDEP table column descriptions (continued)

Column name	Data type	Description	Use
DCOLNAME	VARCHAR(128) NOT NULL	Name of the identity column. Blank for SQL function rows.	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT 'I'	The type of object that is dependent on this sequence: F SQL function I Identity column X Implicit DOCID column that is created on a base table with XML blank Represents an identity column created prior to Version 8	G
BSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the sequence, will be a string of length zero for an object created prior to Version 8.	G
BNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The sequence name (generated by Db2 for an identity column), will be a string of length zero for an object created prior to Version 8.	G
DSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The qualifier of the object that is dependent on this sequence, will be a string of length zero for an object created prior to Version 8.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	The owner of the object that is dependent on this sequence. This will be a string of length zero for an object that was created prior to Version 9.	G
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of owner: Blank An authorization ID L A role	G

SYSSESSION catalog table

The SYSSESSION table stores the session token that generated by the server and associated session data. The schema is SYSIBM.

Table 384. SYSIBM.SYSSESSION table column descriptions

Column name	Data type	Description	Use
TOKEN	CHAR(40) FOR BIT DATA NOT NULL	Session token for the session.	
CORRTKN	VARCHAR(256) FOR BIT DATA	Extended client correlation token in use.	

Table 384. SYSIBM.SYSSESSION table column descriptions (continued)

Column name	Data type	Description	Use
GV_FLAGS	CHAR(2) FOR BIT DATA	Flags for internal classification of global variables (such as whether it contains arrays or LOBs.)	
TOTAL	CHAR(4) FOR BIT DATA NOT NULL	The number of entries in the SYSIBM.SYSSESSION_EX table that correspond to the session token.	
SPECIAL_REGISTERS	VARCHAR(16000) FOR BIT DATA NOT NULL	Special register values (as chained SQLSTTs).	
GLOBAL_VARIABLES	BLOB(2G)	global variable values(as GLBVRB). Arrays/lobs are stores as locator values that reference a row in the SYSIBM.SYSSESSION_EX table.	
ROWID	ROWID NOT NULL GENERATED ALWAYS	Generated ROWID.	

SYSSESSION_EX catalog table

The SYSSESSION_EX table contains global variable data of LOB or array type that corresponds to the locator stored in the GLOBAL_VARIABLES column of the SYSSESSION table. The schema is SYSIBM.

Table 385. SYSIBM.SYSSESSION_EX table column descriptions

Column name	Data type	Description	Use
TOKEN	CHAR(40) FOR BIT DATA NOT NULL	Session token representing the session.	
LOCATOR	CHAR(8) FOR BIT DATA NOT NULL	Locator value corresponding to one of the global variables with DATATYPE as array of lob.	
HEADER	CHAR(89) FOR BIT DATA NOT NULL	Array static descriptor header when locator value corresponds to array type.	
GVID	CHAR(8) FOR BIT DATA NOT NULL	Global variable identifier.	
DATATYPE	CHAR(2) FOR BIT DATA NOT NULL	Data type of the global variable.	
CCSID	CHAR(2) FOR BIT DATA NOT NULL	CCSID of the global variable.	
GVSHEMA	VARCHAR(130) FOR BIT DATA	Schema name of the global variable.	
GVNAME	VARCHAR(130) FOR BIT DATA	Name of the global variable.	
DATA	BLOB(2G)	Data value stored in the global variable.	

SYSSESSION_STATUS catalog table

The SYSSESSION_STATUS table contains session token and timestamp values for when the corresponding session data was last referenced. The schema is SYSIBM.

Table 386. SYSIBM.SYSSESSION_STATUS table column descriptions

Column name	Data type	Description	Use
TOKEN	CHAR(40) FOR BIT DATA NOT NULL	Session token representing the session.	
TOKEN_TS	CHAR(16) FOR BIT DATA NOT NULL	Timestamp value when row was last referenced.	
TOKEN_MEMBER	CHAR(16) FOR BIT DATA	Member where row was last accessed.	
STATUS	CHAR(2) FOR BIT DATA	Status of session corresponding to the token (such as timed-out/clean disconnect).	

SYSSTATFEEDBACK catalog table

The SYSSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements. The schema is SYSIBM.

The following values control the collection of statistics feedback data in the SYSSTATFEEDBACK catalog table:

- The STATFDBK_SCOPE subsystem parameter controls whether the data is collected, and whether it is collected only for static SQL statements, only for dynamic SQL statements, or for both.
- The STATSINT subsystem parameter controls when and how frequently the data is externalized.
- The STATS_FEEDBACK column of the SYSTABLES catalog table controls whether the data is collected for a particular table.

The RUNSTATS utility removes data from the SYSSTATFEEDBACK catalog table when the recommended statistics are collected.

Tip: The SYSSTATFEEDBACK table might contain rows that recommend collection of statistics for DEFINE NO objects, or empty table space partitions. However, statistics cannot be collected for such objects until after data is inserted and the underlying data sets are created. For more information, see [Effect of utilities on objects that have the DEFINE NO attribute \(Db2 Utilities\)](#).

Table 387. SYSIBM.SYSSTATFEEDBACK table column descriptions

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128)	The creator of the table.	S
TBNAME	VARCHAR(128)	The name of the table.	S
IXCREATOR	VARCHAR(128)	The creator of the index.	S
IXNAME	VARCHAR(128)	The name of the index.	S
COLNAME	VARCHAR(128)	The name of the column.	S
NUMCOLUMNS	SMALLINT	The number of columns in the column group.	S

Table 387. SYSIBM.SYSSTATFEEDBACK table column descriptions (continued)

Column name	Data type	Description	Use
COLGROUPCOLNO	VARCHAR(254) FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.	S
TYPE	CHAR(1)	The type of statistic to collect: 'C' Cardinality. 'F' Frequency. 'H' Histogram. 'I' Index. 'T' Table.	I
DBNAME	VARCHAR(24)	The name of the database.	S
TSNAME	VARCHAR(24)	The name of the table space.	S

Table 387. SYSIBM.SYSSTATFEEDBACK table column descriptions (continued)

Column name	Data type	Description	Use
REASON	CHAR(8)	The reason for the statistics collection recommendation: 'BASIC' A basic statistical value for a column table or index is missing. 'CONFLICT' Another statistic conflicts with this statistic. 'COMPFFIX' Multi-column cardinality statistics are needed for an index compound filter factor. 'DEFAULT' A predicate references a value that is probably a default value. 'KEYCARD' The cardinalities of index key columns are missing. 'LOWCARD' The cardinality of the column is a low value, which indicates that data skew is likely. 'NULLABLE' Distribution statistics are not available for a nullable column. 'RNGPRED' Histogram statistics are not available for a range predicate. 'PARALLEL' Parallelism could be improved by uniform partitioning of key ranges. 'STALE' A statistic appears likely to be out of sync with other statistics, based on comparison of the time that it was collected to statistics collection times for related objects.	S
BLOCK_RUNSTATS	CHAR(1)	Whether the row is used when optimization tools collect statistics based on the recommendations. Db2 inserts a blank value in this column for all new rows. Db2 does not refer to or change the value of this column. This is an updatable column.	S
REMARKS	VARCHAR(254)	Free form text for extensibility.	S
LASTDATE	DATE	The last date that this statistics recommendation was updated by Db2.	S

[SYSTABLES catalog table](#)

The SYSTABLES table contains one row for each table, view, or alias. The schema is SYSIBM. Each SYSTABLES table row indicates whether the object that it describes is a table, view, or alias, its name, who created it, the database that it belongs to, the table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

[RUNSTATS \(Db2 Utilities\)](#)

SYSSTMT catalog table

The SYSSTMT table contains one or more rows for each SQL statement of each DBRM. The schema is SYSIBM.

Table 388. SYSIBM.SYSSTMT table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
SEQNO	INTEGER NOT NULL	Sequence number of this row with respect to a statement of the plan. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use. The numbering starts with zero.	G
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero. If the value is zero, see STMTNOI for the statement number. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
TEXT	VARCHAR(3800) NOT NULL FOR BIT DATA	Text or portion of the text of the SQL statement.	S

Table 388. SYSIBM.SYSSTMT table column descriptions (continued)

Column name	Data type	Description	Use
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: R RR (repeatable read) T RS (read stability) S CS (cursor stability) U UR (uncommitted read) L RS isolation, with a <i>lock-clause</i> X RR isolation, with a <i>lock-clause</i> blank The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G

Table 388. SYSIBM.SYSSTMT table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: A Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. B Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. C Compiled - statement was bound successfully using defaults for input variables during access path selection. D Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. E Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. F Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. G Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. H Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. I Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Table 388. SYSIBM.SYSSTMT table column descriptions (continued)

Column name	Data type	Description	Use
STATUS		J Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. K Control - CALL statement. L Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. M Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. blank The statement is non-executable, or was bound in a Db2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints. A value of 'H' indicates that optimization hints were used. A blank value indicates that the access path was determined without the use of optimization hints, or that there is no access path associated with the statement. For dynamic statements, the value is blank.	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	If the value of STMTNOI is not zero, the column contains the statement number of the statement in the source program.	G
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement.	G
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: Y Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. N Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. blank Indicates that the SQL statement was bound prior to Version 7.	G

Table 388. SYSIBM.SYSSTMT table column descriptions (continued)

Column name	Data type	Description	Use
QUERYNO	INTEGER NOT NULL WITH DEFAULT -1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of -1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, and DECLARE CURSOR statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G

SYSTOGROUP catalog table

The SYSTOGROUP table contains one row for each storage group. The schema is SYSIBM.

Table 389. SYSIBM.SYSTOGROUP table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of the integrated catalog facility catalog.	G
VPASSWORD	VARCHAR(24) NOT NULL	Not used.	N
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the storage group as determined by the last execution of the STOSPACE utility.	G
SPCDATE	CHAR(5) NOT NULL	Not used.	N
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Table 389. SYSIBM.SYSTOGROUP table column descriptions (continued)

Column name	Data type	Description	Use
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the storage group.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If the STOSPACE utility was executed for the storage group, date and time when STOSPACE was last executed.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the storage group.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER STOGROUP statement was executed for the storage group. If no ALTER STOGROUP statement has been applied, ALTEREDTS has the value of CREATEDTS.	G
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DATACLAS	VARCHAR(24) NOT NULL	Name of the SMS data class. Blank if data class is not used.	G
MGMTCLAS	VARCHAR(24) NOT NULL	Name of the SMS management class. Blank if management class is not used.	G
STORCLAS	VARCHAR(24) NOT NULL	Name of the SMS storage class. Blank if storage class is not used.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
KEYLABEL	VARCHAR(192) NOT NULL WITH DEFAULT	The default key label that is used for encrypting all the table spaces and index spaces using the storage group. Otherwise the value is an empty string	

SYSSTRINGS catalog table

The SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another. The schema is SYSIBM.

Also refer to Building and using Dynamic Link Libraries (DLLs) ([XL C/C++ Programming Guide](#)) for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. Db2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see [How an entry in SYSIBM.SYSSTRINGS works with character conversion \(Db2 Installation and Migration\)](#).

Db2 has two methods for character conversions and applies them in the following order:

1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see [z/OS Unicode Services User's Guide and Reference](#).

If neither of these methods can be used for a particular character conversion, Db2 returns an error.

Table 390. SYSIBM.SYSSTRINGS table column descriptions

Column name	Data type	Description	Use
INCCSID	INTEGER NOT NULL	The source CCSID for the character conversion represented by this row. The value of the source CCSID must be in the range of 1 to 65533 and must not be the same as the value for the OUTCCSID column.	G
OUTCCSID	INTEGER NOT NULL	The target CCSID for the character conversion represented by this row. The value of the target CCSID must be in the range of 1 to 65533 and must not be the same as the value for the INCCSID column.	G
TRANSTYPE	CHAR(2) NOT NULL	Indicates the nature of the conversion. Values can be: GG GRAPHIC to GRAPHIC MM EBCDIC MIXED to EBCDIC MIXED MS EBCDIC MIXED to SBCS PM ASCII MIXED to EBCDIC MIXED PS ASCII MIXED to SBCS SM SBCS to EBCDIC MIXED SS SBCS to SBCS MP EBCDIC MIXED to ASCII MIXED PP ASCII MIXED to ASCII MIXED SP SBCS to ASCII MIXED	G

Table 390. SYSIBM.SYSSTRINGS table column descriptions (continued)

Column name	Data type	Description	Use
ERRORBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as an error byte. Any non-null value that is specified for the ERRORBYTE column must not be the same as the value that is specified for the SUBBYTE column. Null indicates the absence of an error byte.	S
SUBBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as a substitution character. Any non-null value that is specified for the SUBBYTE column must not be the same as the value that is specified for the ERRORBYTE column. Null indicates the absence of a substitution character.	S
TRANSPROC	VARCHAR(24) NOT NULL WITH DEFAULT	The name of a module or blanks. A nonblank value must conform to the rules for z/OS program names. If IBMREQD is 'N', a nonblank value is the name of a conversion procedure provided by the user. The first five characters of the name of a user-provided conversion procedure must not be 'DSNXV'; these characters are used to distinguish user-provided conversion procedures from Db2 modules that contain DBCS conversion tables. If IBMREQD is 'Y', a nonblank value is the name of a Db2 module that contains DBCS conversion tables.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
TRANSTAB	VARCHAR(256) FOR BIT DATA NOT NULL WITH DEFAULT	Either a 256-byte conversion table or an empty (0 length) string.	S

SYSSYNONYMS catalog table

The SYSSYNONYMS table contains one row for each synonym of a table or view. The schema is SYSIBM.

Table 391. SYSIBM.SYSSYNONYMS table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Synonym for the table or view.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the synonym.	G

Table 391. SYSIBM.SYSSYNONYMS table column descriptions (continued)

Column name	Data type	Description	Use
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the synonym.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the synonym. The value is '0001-01.01.00.00.00.000000' for synonyms created in a Db2 release prior to Version 5.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSTABAUTH catalog table

The SYSTABAUTH table records the privileges that users hold on tables and views. The schema is SYSIBM.

FL 505 SYSIBM.SYSTABAUTH has an associated history table, SYSIBM.SYSTABAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables”](#) on page 2851.

Table 392. SYSIBM.SYSTABAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: blank An authorization ID L Role P An application plan or a package. The grantee is a package if COLLID is not blank.	G
DBNAME	VARCHAR(24) NOT NULL	If the privileges were received from a user with DBADM, DBCTRL, or DBMAINT authority, DBNAME is the name of the database on which the GRANTOR has that authority. Otherwise, DBNAME is blank.	G
SCREATOR	VARCHAR(128) NOT NULL	If the SYSIBM.SYSTABAUTH row was created as the result of a CREATE VIEW statement or CREATE TABLE statement for a materialized query table, SCREATOR is the schema of the table or view referenced in the fullselect of the CREATE VIEW or CREATE TABLE statement. Otherwise, SCREATOR is the same as TCREATOR.	G
STNAME	VARCHAR(128) NOT NULL	If the SYSIBM.SYSTABAUTH row was created as the result of a CREATE VIEW statement or CREATE TABLE statement for a materialized query table, STNAME is the name of the table or view referenced in the fullselect of the CREATE VIEW or CREATE TABLE statement. Otherwise, STNAME is the same as TTNAME.	G
TCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
TTNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable B System DBADM C DBCTRL D DBADM E SECADM G ACCESSCTRL K SQLADM L SYSCTRL M DBMAINT S SYSADM T DATAACCESS	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
UPDATECOLS	CHAR(1) NOT NULL	The value of this column is blank if the value of UPDATEAUTH applies uniformly to all columns of the table or view. The value is an asterisk (*) if the value of UPDATEAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with matching timestamps and PRIVILEGE = blank. These rows list the columns on which update privileges have been granted.	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
ALTERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can alter the table: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
DELETEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can delete rows from the table or view: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
INDEXAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create indexes on the table: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
INSERTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can insert rows into the table or view: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
SELECTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can select rows from the table or view: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
UPDATEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can update rows of the table or view: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
GRANTEELOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S
CAPTUREAUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
REFERENCESAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create or drop referential constraints in which the table is a parent. blank Privilege is not held G Privilege held with the GRANT option Y Privilege held without the GRANT option	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
REFCOLS	CHAR(1) NOT NULL WITH DEFAULT	The value of this column is blank if the value of REFERENCESAUTH applies uniformly to all columns of the table. The value is an asterisk(*) if the value of REFERENCESAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with PRIVILEGE = R and matching timestamps that list the columns on which reference privileges have been granted.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
TRIGGERAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create triggers in which the table is named as the subject table: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G

Table 392. SYSIBM.SYSTABAUTH table column descriptions (continued)

Column name	Data type	Description	Use
UNLOADAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can use the UNLOAD utility to unload data: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSTABCONST catalog table

The SYSTABCONST table contains one row for each unique constraint (primary key or unique key) created in DB2 version 7 or later. The schema is SYSIBM.

Table 393. SYSIBM.SYSTABCONST table column descriptions

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID under which the constraint was created.	G
TYPE	CHAR(1) NOT NULL	Type of constraint: F Foreign key P Primary key U Unique key	G
IXOWNER	VARCHAR(128) NOT NULL	The schema of the index enforcing the constraint or blank if index has not been created yet.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index enforcing the constraint or blank if index has not been created yet.	G

Table 393. SYSIBM.SYSTABCONST table column descriptions (continued)

Column name	Data type	Description	Use
CREATEDTS	TIMESTAMP NOT NULL	Time when the statement to create the constraint was executed.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to DB2 9. See Release dependency indicators for all other values.	G

SYSTABLEPART catalog table

The SYSTABLEPART table contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space. The schema is SYSIBM.

Table 394. SYSIBM.SYSTABLEPART table column descriptions

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the partitioning index. This column is blank unless the table uses index-controlled partitioning.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the partitioning index. This column is blank unless the table uses index-controlled partitioning.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. However, unlike PQTY, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: E Explicit (storage group not used) I Implicit (storage group used) This column is not used for rows that represent catalog table spaces. Catalog data sets are managed by Db2	G
STORNAME	VARCHAR(128) NOT NULL	Name of storage group used for space allocation. Blank if storage group not used. This column is not used for rows that represent catalog table spaces. Catalog data sets are managed by Db2	G
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation. This column is not used for rows that represent catalog table spaces. Catalog data sets are managed by Db2	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
CARD	INTEGER NOT NULL	Number of rows in the table space or partition or, if the table space is a LOB table space, the number of LOBs in the table space. The value is '2147483647' if the number of rows is greater than or equal to '2147483647'. The value is -1 if statistics were not gathered.	G
FARINDREF	INTEGER NOT NULL	Number of rows that are relocated far from their original page. The value is -1 if statistics were not gathered. Not applicable if the table space is a LOB table space.	S
NEARINDREF	INTEGER NOT NULL	Number of rows that are relocated near their original page. The value is -1 if statistics were not gathered. Not applicable if the table space is a LOB table space.	S
PERCACTIVE	SMALLINT NOT NULL	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics were not gathered. The value is -2 if the table space is a LOB table space. This value is not applicable for understanding data distribution in tables that are organized for hash access.	S
PERCDROP	SMALLINT NOT NULL	Percentage of space that rows of dropped tables occupy. The value is -1 if statistics were not gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
LIMITKEY	VARCHAR(765) NOT NULL	The high value of the partition in external format. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If the table is not in a partition-by-range table space, the value is an empty string. This column can contain a mixture of values with differing formats: • Date and time values are delimited by single quotation marks (for example, '2001-01-01'). However, values that were added before Db2 11 do not contain these delimiters. • When comma decimal point indicators are used, a space follows any comma delimiter in the value. The comma decimal point indicator is used when the DECIMAL POINT IS field setting is , (comma) or a COBOL program that executes the ALTER statement uses the COMMA processing option. No spaces follow comma delimiters when period decimal point indicators are used, or for values added before Db2 11.	S
FREEPAGE	SMALLINT NOT NULL	Number of pages loaded before a page is left as free space.	G
PCTFREE	SMALLINT NOT NULL	Percentage of each page that is left as free space.	G
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	blank The table space is not a partition, or does not contain rows that might violate referential constraints, check constraints, or both. C The table space partition is in a check-pending status and the table contains rows that can violate referential constraints, check constraints, or both. D The inline length of the LOB column that is associated with this LOB table space was decremented when the inline length was altered. I The inline length of the LOB column that is associated with this LOB table space was incremented when the inline length was altered.	G
CHECKRID	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	Not used.	N

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage that is allocated to the table space partition, as determined by the last execution of the STOSPACE utility or RUNSTATS utility. 0 The STOSPACE or RUNSTATS utility was not run. -1 The table space was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into one of the partitions, and data has yet to be inserted. -2 The value exceeds the maximum size for an integer value. See the SPACEF column value. Nonzero or nonnegative value An auxiliary table in the LOB table space. The STOSPACE utility updates this value if the table space is related to a storage group. The RUNSTATS utility updates this value when RUNSTATS TABLESPACE is run with UPDATE(ALL) or UPDATE(SPACE).	G
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT	- For a table space partition, indicates the COMPRESS attribute for the partition. - For a nonpartitioned table space, indicates the COMPRESS attribute for the table space. Values for the column can be: Y The table space or partition is defined to use compression. If the table space is not a LOB table space, the compression algorithm is determined by the TS_COMPRESSION_TYPE subsystem parameter. F The table space or partition is defined to use fixed-length compression. H The table space or partition is defined to use Huffman compression. blank The table space or partition is not defined to use compression.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
PAGESAVE	SMALLINT NOT NULL WITH DEFAULT	Percentage of pages that are saved in the table space or partition as a result of defining the table space with compression. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics were not gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected.	G
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option that is specified for this table space or table space partition. A Changed and unchanged pages are cached in the group buffer pool. N No data is cached in the group buffer pool. S Only changed system pages, such as space map pages that do not contain actual data values, are cached in the group buffer pool. blank Only changed pages are cached in the group buffer pool.	G
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	Blank if the table or partition is not in a check-pending status (CHECKFLAG is blank), or if the table space is not partitioned. Otherwise, the RID of the first row of the table space partition that can violate referential constraints, check constraints, or both; or the value is X'0000000000', indicating that any row can violate referential constraints.	S

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
TRACKMOD	CHAR(1) NOT NULL WITH DEFAULT	Whether to track the page modifications in the space map pages: N No blank Yes This column is not applicable for LOB table spaces.	G
EPOCH	INTEGER NOT NULL WITH DEFAULT	A number that increments whenever a utility operation that changes the location of rows in a table occurs.	G
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBs in the table space. The value is -1 if statistics were not gathered.	G
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for the data set name for the table space or partition. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space or partition. If no ALTER TABLESPACE statement was applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	DASD storage in KB. The value is -1 if statistics were not gathered. The value might be nonzero for an auxiliary table in the LOB table space. This column can be updated.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics were not gathered. This column can be updated.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics were not gathered. This column can be updated. This value is only for the last DSNUM for the object.	G
LOGICAL_PART	SMALLINT NOT NULL WITH DEFAULT	The logical partition number (logical ascending or descending order) for partitioned table spaces. The physical partition number is kept in column PARTITION. LOGICAL_PART is 0 for nonpartitioned table spaces. For partitioned table spaces that were created before Version 8, LOGICAL_PART is originally 0, but might be changed later to a nonzero value by processes such as conversion to table-controlled partitioning.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
LIMITKEY_INTERNAL	VARCHAR(512) NOT NULL WITH DEFAULT FOR BIT DATA	The highest value of the limit key of the partition in an internal format. If the table uses index-controlled partitioning instead of table-controlled partitioning or the table is not partitioned, the value is an empty string. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If any column of the key has a field procedure, the internal format is the encoded form of the value.	S
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table part and any image copies at the part level.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the partition was created.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics were not gathered.	G
FORMAT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the format of the rows in the table space or partition: R Indicates reordered row format. blank Indicates basic row format or a LOB table space.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created before Version 9. See Release dependency indicators for all other values.	G
REORG_LR_TS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the REORG or LOAD REPLACE utility last occurred. The default value is '0001-01-01.00.00.00.000000'.	G
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	For partition-by-range (UTS) table spaces, the amount of space, in KB, specified at the partition level to override the space specification at the table level. If no override is provided it is the same as the value of HASHSPACE in the SYSIBM.SYSTABLESPACE catalog table. For partition-by-growth table spaces, this value is zero.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	For partition-by-range table spaces, the number of hash data pages that correspond to the value of the HASHSPACE column for each partition. The value is 0 for table spaces that are changed to use hash access but not reorganized. For partition-by-growth table spaces, the value is zero.	G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The RBA and LRSN format for the page sets of the table partition: B The page sets are still in the basic 6-byte format. E The page sets are converted to the extended 10-byte format. U The format is undefined because DEFINE NO was specified when the table space was created. blank The page sets are still in the basic 6-byte format, the table partition was created before Db2 11 new-function mode (NFM), and no utility that sets the RBA_FORMAT value was run for the table partition in Db2 11 NFM or higher.	G
PCTFREE_UPD	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, as defined when the object as created or altered.	G
PCTFREE_UPD_CALC	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, which are calculated by Db2 or utilities.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) WITH DEFAULT NULL	The type of partition. blank The table space was created without the LOB or MEMBER CLUSTER options. If the DSSIZE column is zero, the table space is not greater than 64 gigabytes. G The table space was defined with the MAXPARTITIONS option (a partitioned-by-growth table space) with the underlying structure of a universal table space. L The table space can be greater than 64 gigabytes. O The table space was defined with the LOB option (the table space is a LOB table space). P Implicit table space created for XML columns. R partition-by-range table space. This value might be NULL for table spaces that were created before Db2 12. In that case, Db2 uses the value from the SYSTABLESPACE.TYPE column.	G
PAGENUM	CHAR(1) NOT NULL WITH DEFAULT 'A'	Format of pages for the table space and indexes created on tables in the table space, indicating absolute or relative page numbering. A Indicates absolute addressing so that PAGENUM contains the embedded partition number. R Indicates relative addressing so that PAGENUM contains only the relative page number.	G
BPOOL	CHAR(8) WITH DEFAULT NULL	Name of the buffer pool used for the partition. The value might be NULL for table spaces that were created before Db2 12. In that case, Db2 uses the value in the SYSTABLESPACE.BPOOL column.	G
PGSIZE	SMALLINT WITH DEFAULT NULL	Size of pages in the table space in kilobytes. The value might be NULL for table spaces that were created before Db2 12. In that case, Db2 uses the value in the SYSTABLESPACE.PGSIZE column.	G
DSSIZE	INTEGER WITH DEFAULT NULL	Maximum size on a partitioned table space data set. 0 for a nonpartitioned table space. The value might be NULL for table spaces that were created before Db2 12. In that case, Db2 uses the value in SYSTABLESPACE.DSSIZE column.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
MEMBER_CLUSTER	CHAR(1) WITH DEFAULT NULL	Indicates whether MEMBER CLUSTER is specified for the table space. Y MEMBER CLUSTER is specified for the table space. blank MEMBER CLUSTER is not specified for the table space. The value might be NULL for table spaces that were created before Db2 12. In that case, Db2 uses the value in the SYSTABLESPACE.MEMBER_CLUSTER column.	G
COMPRESSRATIO	SMALLINT NOT NULL WITH DEFAULT	Average percentage of bytes saved by compression on each compressed data record in the partition when the table space is defined with compression. This calculation includes overhead bytes for each row. The value is based on an average row length and varies depending on the actual length of the data rows. For example, a value of 25 indicates that the average compressed record size is approximately 75% the size of the uncompressed record. The value is -1 or 0 in the following cases: -1 This value is not collected. 0 No compression exists or the average compressed record length is the same as or longer than the uncompressed record length.	G

Table 394. SYSIBM.SYSTABLEPART table column descriptions (continued)

Column name	Data type	Description	Use
COMPRESS_USED	CHAR(1) WITH DEFAULT NULL	For a partitioned table space, this column indicates whether the partition is compressed. If the partition is compressed, the column indicates which compression algorithm is used. For a nonpartitioned table space, this column indicates whether the table space is compressed. If the table space is compressed, the column indicates which compression algorithm is used. In rare cases, this column is not updated when compression occurs. For more information, see Determining the effectiveness of compression (Db2 Performance). F Indicates that the table space or partition is compressed with fixed-length compression H Indicates that the table space or partition is compressed with Huffman compression blank If the table space is a LOB table space and COMPRESS is Y, zEnterprise data compression (zEDC) hardware manages compression, if the hardware is available. Otherwise the table space or partition is not compressed. NULL The object was created before catalog level V12R1M509, and the value is unknown. The LOAD, REORG, RUNSTATS, RECOVER, or REPAIR CATALOG utility can be used to update this column for objects with a COMPRESS_USED value of NULL.	G

SYSTABLEPART_HIST catalog table

The SYSTABLEPART_HIST table contains rows from the SYSTABLEPART table. The schema is SYSIBM.

Rows are added or changed in the SYSTABLEPART_HIST catalog table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 395. SYSIBM.SYSTABLEPART_HIST table column descriptions

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G

Table 395. SYSIBM.SYSTABLEPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G
FARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated far from their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
NEARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated near their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S

Table 395. SYSIBM.SYSTABLEPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
PERCACTIVE	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics have not been gathered. The value is -2 if the table space is a LOB table space.	S
PERCDROP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of dropped tables. The value is -1 if statistics have not been gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the table space partition. The value is -1 if statistics have not been gathered.	G
PAGESAVE	SMALLINT NOT NULL	Percentage of pages saved in the table space or partition as a result of defining the table space with compression. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics have not been gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBS in the table space. The value is '-1' if statistics have not been gathered.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is '-1' if statistics have not been gathered. This value is only for the last DSNUM for the object.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space. The value is '-1' if statistics have not been gathered.	G

Table 395. SYSIBM.SYSTABLEPART_HIST table column descriptions (continued)

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is '-1' if statistics have not been gathered.	G

SYSTABLES catalog table

The SYSTABLES table contains one row for each table, view, or alias. The schema is SYSIBM. Each SYSTABLES table row indicates whether the object that it describes is a table, view, or alias, its name, who created it, the database that it belongs to, the table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

For an example query for the SYSTABLES catalog table, see [Retrieving catalog information about a table \(Db2 Administration Guide\)](#).

Table 396. SYSIBM.SYSTABLES table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	Type of object: A Alias C Clone table D Accelerator-only table G Created global temporary table H History table M Materialized query table P Table that was implicitly created for XML columns R Archive table T Table V View X Auxiliary table	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space that is named in TSNAME. For a created temporary table, an alias, or a view of a view, the value is DSND06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a created temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database; 0 if the row describes a view or alias. Non-zero if the view has an INSTEAD OF trigger defined.	S
OBID	SMALLINT NOT NULL	Internal identifier of the table; 0 if the row describes a view, an alias, or a created temporary table. Non-zero if the view has an INSTEAD OF trigger defined.	S
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
EDPROC	VARCHAR(24) NOT NULL	Name of the edit procedure; blank if the row describes a view or alias or a table without an edit procedure.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
VALPROC	VARCHAR(24) NOT NULL	Name of the validation procedure; blank if the row describes a view or alias or a table without a validation procedure.	G
CLUSTERTYPE	CHAR(1) NOT NULL	Whether RESTRICT ON DROP applies: blank No Y Yes. You cannot drop the table or any table space or database that contains the table.	G
CLUSTERRID	INTEGER NOT NULL	1 The table is a system-period temporal table with versioning, and the table is defined with the ON DELETE ADD EXTRA ROW clause. 0 All other tables.	N
CARD	INTEGER NOT NULL	Db2 utilities might populate this column value, but its use is not recommended in DB2 version 5 and later. For best results use its replacement, the CARDF column.	N
NPAGES	INTEGER NOT NULL	Total number of pages that include rows of the table. The value is -1 if statistics have not been gathered, or the row describes a view, an alias, a created temporary table, an accelerator-only table, or an auxiliary table. This column can be updated.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments that are assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, an accelerator-only table, or auxiliary table. This column can be updated.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided by the user with the COMMENT statement.	G
PARENTS	SMALLINT NOT NULL	Number of relationships in which the table is a dependent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
CHILDREN	SMALLINT NOT NULL	Number of relationships in which the table is a parent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G
KEYCOLUMNS	SMALLINT NOT NULL	Number of columns in the primary key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G
RECLENGTH	SMALLINT NOT NULL	For user tables, the maximum length of any record in the table. Length is $8+N+L$, where: - The number 8 accounts for the header (6 bytes) and the ID map entry (2 bytes). N is 10 if the table has an edit procedure, or 0 otherwise. L is the sum of the maximum column lengths. In determining the maximum length of a column, take into account whether the column allows nulls and the data type of the column. If the column can contain nulls and is not a LOB or ROWID column, add 1 byte for a null indicator. Use 4 bytes for the length of a LOB column and 19 bytes for the length of a ROWID column. If the column has a varying-length data type (for example, VARCHAR, CLOB, or BLOB), add 2 bytes for a length indicator. For more information about column lengths, see “Data types in Db2 for z/OS” on page 98. The value is 0 if the row describes a view, alias, or auxiliary table. For maximum row and record sizes, see the note on the maximum record size in “CREATE TABLE statement” on page 1695.	G
STATUS	CHAR(1) NOT NULL	Indicates the status of the table definition: I The definition of the table is incomplete. The TABLESTATUS column indicates the reason why the table definition is incomplete. R An error occurred when an attempt was made to regenerate the internal representation of the view. X The table has a unique constraint (primary key or unique key) and the table definition is complete. blank The table has no unique constraint (primary key or unique key), the table is a catalog table, or the row describes a view or alias. The definition of the table, view, or alias is complete.	G
KEYOBID	SMALLINT NOT NULL	Internal Db2 identifier of the index that enforces uniqueness of the primary key of the table; 0 if not applicable.	S

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
LABEL	VARCHAR(90) NOT NULL	The label as given by a LABEL statement; otherwise, the value is an empty string.	G
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	C The table space that contains the table is in CHECK-pending status. One of the following conditions is true: • There are rows in the table that violate referential constraints, check constraints, or both • The table is a materialized query table that might contain inconsistent data blank Indicates one of the following conditions: • The table contains no rows that violate referential constraints, check constraints, or both • The table is a materialized query table that contains consistent data • The row describes a view, an alias, or a temporary table	G
CHECKRID	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	A value of 'FFFFFF00' in this column indicates that the edit procedure on this table is defined without row attribute sensitivity. Any other value indicates that the edit procedure is defined with row attribute sensitivity.	G
AUDITING	CHAR(1) NOT NULL WITH DEFAULT	Value of the audit option: A AUDIT ALL C AUDIT CHANGE blank AUDIT NONE, or the row describes a view, an alias, or a created temporary table.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table, view, or alias.	G
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Location name of the object of an alias. The value is blank for a table, a view, an alias that was not defined with a three-part object name, or a materialized query table.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	- For an alias, the schema of the referenced table or view - For a base table that is involved in a clone relationship, the name of the creator of the clone table - For a clone table that is involved in a clone relationship, the name of the creator of the base table - Otherwise, TBCREATOR is blank	G
TBNAME	VARCHAR(128) NOT NULL WITH DEFAULT	- For an alias, the name for the referenced table or view - For a base table that is involved in a clone relationship, the name of the clone table - For a clone table that is involved in a clone relationship, the name of the base table - Otherwise, TBNAME is blank	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table, view, or alias	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	For a table, the time when the latest ALTER TABLE statement was applied. If no ALTER TABLE statement was applied, or if the row is for an alias, ALTEREDTS has the value of CREATEDTS. For a view, the time when the last ALTER VIEW REGENERATE statement was applied.	G
DATA_CAPTURE	CHAR(1) NOT NULL WITH DEFAULT	Records the value of the DATA CAPTURE option for a table: blank No Y Yes For a created temporary table, DATA_CAPTURE is always blank.	G
RBA1	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was created. Otherwise, RBA1 is X'00000000000000000000', indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. In a data sharing environment, RBA1 is the LRSN (Log Record Sequence Number) value.	S
RBA2	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was last altered. Otherwise, RBA2 is X'00000000000000000000' indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. RBA1 equals RBA2 if the table has not been altered. In a data sharing environment, RBA2 is the LRSN (Log Record Sequence Number) value.	S

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are compressed within the total number of active rows in the table. This number includes any row in a table space that is defined with compression. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, an accelerator-only table, or auxiliary table. This column can be updated.	S
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated. For a created temporary table, the value of STATSTIME is always the default value.	G
CHECKS	SMALLINT NOT NULL WITH DEFAULT	Number of check constraints that are defined on the table. The value is 0 if either of the following conditions are true: • The row describes a view, an alias, a created temporary table, or a materialized query table. • No constraints are defined on the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, accelerator-only table, or created temporary table. This column can be updated.	S
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	RID of the first row of the table space partition that can violate referential constraints, check constraints, or both. The value of X'0000000000' indicates that any row can violate referential constraints. The value is blank if any of the following conditions are true: • The table or partition is not in CHECK-pending status (CHECKFLAG is blank) • The table space is not partitioned • The table is a created temporary table	S

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Encoding scheme for a table, view, or the table or view that is referred to by a local alias: E EBCDIC. This value is 'E' even if the table contains a Unicode column. A ASCII M Multiple CCSID set or multiple encoding schemes U Unicode blank For remote aliases The value is 'E' for tables in non-work file databases. The value is blank for tables in work file databases that were created before Version 5 or in the default database, DSNDB04. This column is not applicable for objects that were created before Db2 for z/OS Version 5. This field contains the default encoding scheme for table columns for which a CCSID is not explicitly defined. The ENCODING_SCHEME column in SYSIBM.SYSCOLUMNS table contains the encoding schemes for columns for which a CCSID is explicitly defined.	G
TABLESTATUS	VARCHAR(30) NOT NULL WITH DEFAULT	Indicates the reason for an incomplete table definition: F The table lacks a required BUSINESS_TIME WITHOUT OVERLAPS index on a foreign key. L An auxiliary table or auxiliary index has not been defined for a LOB column. P The table lacks a primary index. R The table lacks a required index on a row ID. U The table lacks a required index on a unique key. V An error occurred when an attempt was made to regenerate the internal representation of the view. blank Definition is complete.	G
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages that are used by the table. The value is -1 if statistics have not been gathered or the table is an auxiliary table or accelerator-only table. This column can be updated.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This column can be updated.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space. If the table space is compressed, the value is the compressed row length. If the table space is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is zero if the row describes an alias or a created temporary table, or if no materialized query tables are defined on the table.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this table. • A value of zero indicates that an alter operation that creates a new version has never occurred for this table. • A value of -1 indicates that the view has been regenerated because a column of the base table has been altered. • A value of 800 indicates that a successful CREATE VIEW or ALTER VIEW statement has occurred against this view in Version 8 or later. • A value of 900 indicates that a successful ALTER TABLE statement with a DROP COLUMN clause has occurred against this view.	G
PARTKEYCOLNUM	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the partitioning key. This value is zero for tables that do not have partitioning or use index-controlled partitioning. The value is non-zero for tables that use table-controlled partitioning.	G
SPLIT_ROWS	CHAR(1) NOT NULL WITH DEFAULT	This column is blank except for volatile tables. For volatile table, this column contains 'Y' to indicate to Db2 to use index access on this table whenever possible.	G
SECURITY_LABEL	CHAR(1) NOT NULL	This column is only meaningful if the TYPE column is a T (for table) or M (for materialized query table). The value indicates whether the table has multilevel security: Blank The table does not have multilevel security. R The table has multilevel security with row granularity.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table, view, or alias. This column is blank for tables, views, or aliases that were created before Db2 for z/OSDB2 9.	G
APPEND	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the APPEND option is specified for the table. Y The APPEND option is specified. N The APPEND option is not specified.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
CONTROL	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether access to the table is enforced by using row or column access control: blank No access control enforcement B The table is enforced by using both row and column access control C The table is enforced by using column access control R The table is enforced by using row access control	G
VERSIONING_SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the schema name of the history table if the table is a system-period temporal table with versioning. Indicates the schema name of the system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
VERSIONING_TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the table name of the history table if the table is a system-period temporal table with versioning. Indicates the table name of system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
HASHKEYCOLUMNS	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the hash key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G

Table 396. SYSIBM.SYSTABLES table column descriptions (continued)

Column name	Data type	Description	Use
ARCHIVING_SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a schema name as follows: - If the table is an archive-enabled table, this column contains the schema name of the archive table. - If the table is an archive table, this column contains the schema name of the archive-enabled table. - If the table is not an archive-enabled table or an archive table, the value is blank.	G
ARCHIVING_TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a table name as follows: - If the table is an archive-enabled table, this column contains the table name of the archive table. - If the table is an archive table, this column contains the table name of the archive-enabled table. - If the table is not an archive-enabled table or an archive table, the value is blank.	G
STATS_FEEDBACK	CHAR (1) NOT NULL WITH DEFAULT	When a query qualifies for statistics collection based on DSNZPARM STATFDBK_SCOPE, this column controls whether statistics recommendations for this table are placed in SYSIBM.SYSSTATFEEDBACK. You can update this flag to 'Y' or 'N' to enable or disable collection for the table. The default value is 'Y'.	G
REGENERATETS	TIMESTAMP(12) NOT NULL	The time when the object was regenerated. The value is valid only for objects that can be regenerated. If no regeneration has occurred, this column contains the same value as the CREATEDTS column.	G
KEYLABEL	VARCHAR(192) NOT NULL WITH DEFAULT	The key label that is specified at the table level. Otherwise, the value is an empty string.	

SYSTABLESPACE catalog table

The SYSTABLESPACE table contains one row for each table space. The schema is SYSIBM.

Table 397. SYSIBM.SYSTABLESPACE table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the table space.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database which contains the table space.	S

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
OBID	SMALLINT NOT NULL	Internal identifier of the table space file descriptor.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the table space.	G
PARTITIONS	SMALLINT NOT NULL	Number of partitions of the table space; 0 if the table space is not partitioned.	G
LOCKRULE	CHAR(1) NOT NULL	Lock size of the table space: A Any L Large object (LOB) P Page R Row S Table space T Table X implicitly created XML table space	G
PGSIZE	SMALLINT NOT NULL	Size of pages in the table space in kilobytes.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are to be erased when dropped. The value is meaningless if the table space is a partition-by-range table space. N No erase Y Erase	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL	Availability status of the table space: A Available C Definition is incomplete because the table space does not use table-controlled partitioning and a partitioning index has not been created. P Table space is in a check pending status. S Table space is in a check pending status with the scope less than the entire table space. T Definition is incomplete because no table has been created.	G
IMPLICIT	CHAR(1) NOT NULL	Whether the table space was created implicitly: N No Y Yes	G
NTABLES	SMALLINT NOT NULL	Number of tables defined in the table space.	G
NACTIVE	INTEGER NOT NULL	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is 0 if statistics have not been gathered. This is an updatable column.	S
	VARCHAR(24) NOT NULL	Not used	N
CLOSERULE	CHAR(1) NOT NULL	The priority for closure of data sets for this table space when the limit on the number of open data sets is reached. N The data sets for this table space are eligible for closing after all eligible data sets for table space with CLOSERULE='Y'. Y The data sets for this table space are eligible for closing before data sets for tables spaces with CLOSERULE='N'. Db2 always uses CLOSE NO behavior for tables spaces in work file databases.	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the table space, as determined by the last execution of the STOSPACE utility. The value is 0 if the table space is not related to a storage group, or if STOSPACE has not been run. If the table space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are storage group defined.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. If ALTER TABLESPACE changes the DSSIZE value to 128G or 256G, this column value is changed to O, which is the release dependency indicator for Version 10. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
—	VARCHAR(54) NOT NULL	Internal use only.	I
—	VARCHAR(24) NOT NULL	Internal use only.	I
SEGSIZE	SMALLINT NOT NULL WITH DEFAULT	Number of pages in each segment of a segmented table space. The value is 0 if the table space is not segmented.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table space.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
LOCKMAX	INTEGER	The maximum number of locks per user to acquire for the table or table space before escalating to the next locking level. 0 Lock escalation does not occur. n <i>n</i>, where <i>n</i> > 0, is the maximum number of locks (row, page, or LOB locks for the table or table space) an application process can acquire before lock escalation occurs. -1 Indicates that LOCKMAX SYSTEM is in effect for the table space.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of table space: G Partition-by-growth table space (PBG UTS) R Partition-by-range table space (PBR UTS) O LOB table space P XML table space L Partitioned (non-UTS) table space created with the LARGE option (deprecated) blank One of the following deprecated types: • Partitioned (non-UTS) table space • Segmented (non-UTS) table space • Simple table space	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table space. If the table space was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space. If no ALTER TABLESPACE statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the table space: E EBCDIC A ASCII U Unicode blank For table spaces in a work file database or a TEMP database (a database that was created AS TEMP, which is for declared temporary tables.) The value is 'E' for tables in non work file databases and blank for tables in work file databases created prior to Version 5 or the default database, DSND04.	G
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MAXROWS	SMALLINT NOT NULL DEFAULT 255	The maximum number of rows that Db2 will place on a data page. The default value is 255. For a LOB table space, the value is 0 to indicate that the column is not applicable.	G
LOCKPART	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
LOG	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Whether the changes to a table space are to be logged. N This table space has the NOT LOGGED attribute. Undo and redo logging for the table space and all indexes for tables in the table space is suppressed. Logging is also suppressed for the auxiliary indexes for all auxiliary tables associated with tables in the table space. Y This table space has the LOGGED attribute. Normal logging is associated with modifications to this table space, all indexes for tables in this table space, and all auxiliary indexes for all auxiliary tables associated with tables in the table space. X This LOB or XML table space has the NOT LOGGED attribute. Undo and redo logging for the table space is suppressed. Also, the logging attribute for this LOB or XML table space is linked to the logging attribute of the associated base table space and might not be able to be altered independently. If the logging attribute of the base table space is altered to LOGGED, the logging attribute of the LOB or XML table space will also be altered to LOGGED.	G
NACTIVEF	FLOAT NOT NULL WITH DEFAULT -1	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is -1 if statistics have not been gathered. This is an updatable column.	S
DSSIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in kilobytes. The value might be 0 if the table space was created prior to DB2 10, but will contain the actual value after the table space is converted to a partitioned by growth table space.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table space and any image copies.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the table space. A zero indicates that the table space has never had versioning. After the version number reaches the maximum value, the number wraps back to one.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to DB2 9. See Release dependency indicators for all other values.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT	INSTANCE indicates the data set instance number of the current base object (table and index).	G
CLONE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the table space contains any objects that are involved in a clone relationship: Y Table space contains objects that are involved in a clone relationship N Table space does not contain any objects that are involved in a clone relationship	G
MAXPARTITIONS	SMALLINT NOT NULL WITH DEFAULT	Identifies the maximum number of partitions to which the table space can grow. 0 if the table space is not a partition-by-growth table space.	G
MEMBER_CLUSTER	CHAR(1) NOT NULL WITH DEFAULT	Whether MEMBER CLUSTER is specified for the table space: Y MEMBER CLUSTER is specified for the table space blank MEMBER CLUSTER is not specified for the table space	G
ORGANIZATIONTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of table space organization: blank Not known. Blank is the default. H Hash organization	G
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	The amount of space, in KB, that is to be allocated to the table space or partition as hash space. For partition-by-growth table spaces, the space applies to the whole table space. For partition-by-range table spaces, the space is applicable for each partition.	G

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	The total number of hash data pages to preallocate for hash space. For partition-by-growth table spaces, this includes all pages in the fixed part of the table space. For partition-by-range table spaces, this is the number of pages in the fixed hash space in each partition unless it is overridden by providing hash space at the partition level. This is calculated by Db2 from the value specified with the HASH SPACE option or when the REORG utility is run with automatic estimation of space. The calculated value is used in the hash algorithm. The value is 0 for non-hash table spaces. The value is also 0 for table spaces which have been changed to use hash access but have not been reorganized.	G
PAGENUM	CHAR(1) NOT NULL WITH DEFAULT 'A'	Format of pages for the table space and indexes created on tables in the table space, indicating absolute or relative page numbering. A Indicates absolute addressing so that PAGENUM contains the embedded partition number. R Indicates relative addressing so that PAGENUM contains only the relative page number.	G
INSERTALG	SMALLINT NOT NULL WITH DEFAULT	The insert algorithm level for tables in this table space. 0 The insert algorithm level for tables in this table space is determined by the DEFAULT_INSERT_ALGORITHM subsystem parameter. 0 is the default value. 1 The insert algorithm level for tables in this table space is the basic insert algorithm. 2 The insert algorithm level for tables in this table space is the fast insert algorithm when the MEMBER CLUSTER option is specified.	

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
PQTY	INTEGER WITH DEFAULT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY accepts space in 1 KB units. A value of -1 indicates that one of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
STORTYPE	CHAR(1) WITH DEFAULT NULL	Type of storage allocation: E Explicit (storage group not used) I Implicit (storage group used) This column is not used for rows representing catalog table spaces. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
STORNAME	VARCHAR(128) WITH DEFAULT NULL	Name of storage group used for space allocation. Blank if storage group not used. This column is not used for rows representing catalog table spaces. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
VCATNAME	VARCHAR(24) WITH DEFAULT NULL	Name of integrated catalog facility catalog used for space allocation. This column is not used for rows representing catalog table spaces. Catalog data sets are managed by Db2 This column contains the null value when the value is unknown for objects created prior to Db2 12.	
FREEPAGE	SMALLINT WITH DEFAULT NULL	Number of pages loaded before a page is left as free space. This column contains the null value when the value is unknown for objects created prior to Db2 12.	

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
PCTFREE	SMALLINT WITH DEFAULT NULL	Percentage of each page left as free space. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
COMPRESS	CHAR(1) WITH DEFAULT NULL	Indicates the COMPRESS attribute for the table space. The following values are valid for the column: Y The table space is defined to use compression. If the table space is not a LOB table space, the compression algorithm is determined by the TS_COMPRESSION_TYPE subsystem parameter. F The table space or partition is defined to use fixed- length compression H The table space or partition is defined to use Huffman compression blank The table space or partition is not defined to use compression. This column contains the null value when the value is unknown for objects created prior to Db2 12.	G
GBPCACHE	CHAR(1) WITH DEFAULT NULL	Group buffer pool cache option specified for this table space or table space partition. A Changed and unchanged pages are cached in the group buffer pool. N No data is cached in the group buffer pool. S Only changed system pages, such as space map pages that do not contain actual data values, are cached in the group buffer pool. Blank Only changed pages are cached in the group buffer pool. This column contains the null value when the value is unknown for objects created prior to Db2 12.	

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
TRACKMOD	CHAR(1) WITH DEFAULT NULL	Whether to track the page modifications in the space map pages: N No blank Yes This column contains the null value when the value is unknown for objects created prior to Db2 12. This column is not applicable for LOB table spaces.	
SECQTYI	INTEGER WITH DEFAULT NULL	Secondary space allocation in units of 4 KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4 KB blocks. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
PCTFREE_UPD	SMALLINT WITH DEFAULT NULL	The percentage of free space that is reserved for updates to variable length records, as defined when the object as created or altered. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
PCTFREE_UPD_CALC	SMALLINT WITH DEFAULT NULL	The percentage of free space that is reserved for updates to variable length records, calculated by Db2 or utilities. This column contains the null value when the value is unknown for objects created prior to Db2 12.	
COMPRESSRATIO	SMALLINT NOT NULL WITH DEFAULT	Average percentage of bytes saved by compression on each compressed data record in the table space when the table space is defined with compression. This calculation includes overhead bytes for each row. The value is based on an average row length and varies depending on the actual length of the data rows. For example, a value of 25 indicates that the average compressed record size is approximately 75% the size of the uncompressed record. The value is -1 or 0 in the following cases: -1 This value has not been collected 0 No compression exists or the average compressed record length is the same as or longer than the uncompressed record length.	G
KEYLABEL	VARCHAR(192) NOT NULL WITH DEFAULT	The key label that is specified at the table level. Otherwise, the value is an empty string.	

Table 397. SYSIBM.SYSTABLESPACE table column descriptions (continued)

Column name	Data type	Description	Use
<u>FL 508</u> USAGE	CHAR(1) NOT NULL WITH DEFAULT	For work file table spaces only, whether the table space is designed for use by sort or declared global temporary table (DGTT) processing: D The work file table space is used for DGTT or scrollable cursors. S The table space is used for all other sort operations blank The use of the table space is unknown because neither FOR SORT nor FOR DGTT were specified for the table space or it is not a work file table space.	G

SYSTABLESPACESTATS catalog table

The SYSTABLESPACESTATS table contains real time statistics for table spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted. However, the following columns cannot be updated: SYS_START, SYS_END, and TRANS_START.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

In data sharing environments, the values in SYSIBM.SYSTABLESPACESTATS can be negative for short periods of time for certain situations.

SYSIBM.SYSTABLESPACESTATS has an associated history table, SYSIBM.SYSTABSPACESTATS_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be inserted, updated, and deleted with proper authorization. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 catalog tables” on page 2849](#).

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSTABLESPACESTATS table is inserted or updated.	G
NACTIVE	INTEGER	The number of active pages in the table space or partition.	G
NPAGES	INTEGER	The number of distinct pages with active rows in the partition or table space. This is an updatable column. This column can be used to calculate an estimate of the size of LOB data in a table space. To produce an estimate, use the following formula: $\text{value of NPAGES} * \text{page size} = \text{approximate size of LOB data}$	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
EXTENTS	INTEGER	The number of extents in the table space. For multi-piece table spaces, this value is the number of extents for the last data set. For a data set that is striped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the table space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the table space or partition or that the timestamp is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp the REORG utility was last run on the table space or partition, or when the REORG utility has not been run, the time when the table space or partition was created. A null value indicates that the timestamp is unknown.	G
REORGINSERTS	BIGINT	The number of rows or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted rows or LOBs is unknown.	G
REORGDELETES	BIGINT	The number of rows or LOBs that have been deleted from the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted rows or LOBs is unknown.	G
REORGUPDATES	BIGINT	The number of rows that have been updated in the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of updated rows is unknown.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
REORGUNCLUSTINS	INTEGER	The number of rows that were inserted that are not well-clustered with respect to the clustering index since the last REORG or LOAD REPLACE, or since the object was created. A record is well-clustered if the record is inserted into a page that is within 16 pages of the ideal candidate page. The clustering index determines the ideal candidate page. A null value indicates that the number of pages that are not well clustered is unknown. For a table space that has the MEMBER CLUSTER attribute, the clustering index is not used to identify the ideal candidate page. Therefore, this value is not updated.	G
REORGDISORGLOB	INTEGER	The number of LOBs that were inserted that are not perfectly chunked since the last REORG or LOAD REPLACE, or since the object was created. A LOB is perfectly chunked if the allocated pages are in the minimum number of chunks. A null value indicates that the number of not perfectly chunked LOBs is unknown.	G
REORGMASDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
REORGNEARINDREF	INTEGER	The number of overflow rows that are created and relocated near the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is near the present page if the two page numbers differ by 16 or less. For segmented table spaces, a page is near the present page if the two page numbers differ by SEGSIZE*2 or less. A null value indicates that the number of overflow rows that are near the pointer record is unknown.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
REORGFARINDREF	INTEGER	The number of overflow rows that are created and relocated far from the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is far from the present page if the two page numbers differ by more than 16. For segmented table spaces, a page is far from the present page if the two page numbers differ by at least (SEGSIZE*2)+1. A null value indicates that the number of overflow rows that are near the pointer record is unknown.	G
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the table space or partition, or the time that table space or partition was created.	G
STATSINSERTS	BIGINT	The number of rows or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of inserted rows or LOBs is unknown.	G
STATSDELETES	BIGINT	The number of rows or LOBs that have been deleted from the table space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of deleted rows or LOBs is unknown.	G
STATSUPDATES	BIGINT	The number of rows that have been updated in the table space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of updated rows is unknown.	G
STATSMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of tables that are dropped from a segmented table space, since the last time the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
COPYLASTTIME	TIMESTAMP	The timestamp of the last full or incremental image copy of the table space or partition. A null value indicates that the COPY utility has never been run on the table space or partition. A null value can also indicate that the timestamp of the last image copy is unknown.	G
COPYUPDATEDPAGES	INTEGER	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the number of distinct pages that have been updated since the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the total number of distinct pages that were updated during the time that the last COPY utility was run, and since the last time that the COPY utility was run. A null value indicates that the number of updated pages is unknown.	G
COPYCHANGES	BIGINT	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the number of insert, update, and delete operations, or the number of rows loaded, since the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the total number of insert, update, and delete operations, or the number of rows loaded, during the time that the last COPY utility was run, and since the last time that the COPY utility was run. This value does not include operations that result in no change to the data, such as an update that sets the value of a column to its existing value. A null value indicates that the number of insert, update, and delete operations or the number of rows loaded is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run. A null value indicates that the LRSN or RBA is unknown.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
COPYUPDATETIME	TIMESTAMP	If the COPY utility was run with a SHRLEVEL value other than CHANGE, this value is the timestamp of the first update that occurred after the last time that the COPY utility was run. If the COPY utility was run with SHRLEVEL CHANGE, this value is the timestamp of the first update that occurred during the time that the last COPY utility was run, or since the last time that the COPY utility was run. A null value indicates that the timestamp is unknown.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database. This column is used to map a DBID to its statistics.	G
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor. This column is used to map a PSID to its statistics.	G
PARTITION	SMALLINT NOT NULL	The data set number within the table space. This column is used to map a data set number in a table space to its statistics. For partitioned table spaces, this value corresponds to the partition number for a single partition. For non-partitioned table spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set instance 1 or 2. This is an updatable column.	G
SPACE	BIGINT	The amount of space, in KB, that is allocated to the table space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G
TOTALROWS	BIGINT	The number of rows or LOBs that are in the table space or partition, calculated from the in-memory counters for inserts and deletes. For XML, this column contains the number of physical rows in the table space or partition. Each XML document might have more than one physical record in a table space or partition.	G
DATASIZE	BIGINT	The total number of bytes that row data occupy. For LOB table spaces this column is always 0. This is an updatable column.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
UNCOMPRESSED DATASIZE	BIGINT	This column is not used. The value is always set to 0.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database. This column is used to map a database to its statistics.	G
NAME	VARCHAR(24) NOT NULL	The name of the table space. This column is used to map a table space to its statistics.	G
REORGSCANACCESS	BIGINT	The number of times data is accessed for SELECT, FETCH, searched UPDATE, or searched DELETE since the last CREATE, LOAD REPLACE or REORG, or since the object was created. A null value indicates that the number of times data is accessed is unknown.	G
REORGHASHACCESS	BIGINT	The number of times data is accessed using hash access for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints since the last CREATE, LOAD REPLACE or REORG, or since the object was created. A null value indicates that the number of times data is accessed is unknown.	G
HASHLASTUSED	DATE	The date when hash access was last used for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints.	G
REORGCLUSTERSENS	BIGINT	The number of times that data has been read by SQL statements that are sensitive to the clustering sequence of the data since the last REORG or LOAD REPLACE, or since the object was created. For a table space that has the MEMBER CLUSTER attribute, when records are inserted, the clustering index is not used. Therefore, this value is not updated.	G
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the table space or table space partition data set is defined. HDD Hard Disk Drive SSD Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used. This is an updatable column.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
LPFACILITY	CHAR(1)	Whether the disk control unit has the high performance list prefetch facility. N No Y Yes A NULL value indicates that it is unknown whether the disk control unit has the high performance list prefetch facility. This is an updatable column.	G
	BIGINT	Reserved for future IBM use.	R
UPDATESIZE	BIGINT	The net number of bytes that were added or removed by UPDATE operations since the object was created, or since the last REORG or LOAD REPLACE operation. Valid values can be positive or negative.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
LASTDATACHANGE	TIMESTAMP	The timestamp when one of the following events occurred: - The last utility operation affected the data in a table space or partition, and Db2 did not log the changes. Some utility operations that update this column are: - REORG with the DISCARD option - REORG with the REBALANCE option - A REORG operation that moves data across partitions of a partition-by-growth table space that has more than one partition. (A REORG operation that reorders data within the same partition does not result in an update of this column.) - An SQL statement affected the data in a table space or partition. SQL statements that update this column are INSERT, UPDATE, DELETE, MERGE, and TRUNCATE. The timestamp reflects the time at which the real-time statistics table was updated, and not the time at which the data in the table space or partition was modified. This value can also be updated when an -ACCESS DATABASE command is issued with the MODE(STATS) keyword, but an object in UTRO or UTRW state prevents the externalization of real-time statistics. In such cases, Db2 preserves the in-memory statistics until next possible externalization cycle.	G
GETPAGES	BIGINT	The number of getpage requests for the table space since the object was created, or since the last REORG or LOAD REPLACE was run. The value wraps if it exceeds the largest possible BIGINT value, 9223372036854775807.	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G

Table 398. SYSIBM.SYSTABLESPACESTATS table column descriptions (continued)

Column name	Data type	Description	Use
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	The transaction-start-ID column, for system-period data versioning.	G

SYSTABLES_HIST catalog table

The SYSTABLES_HIST table contains rows from the SYSTABLES table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 399. SYSIBM.SYSTABLES_HIST table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space named in TSNAME. For a temporary table, an alias, or a view of a view, the value is DSND06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
PCTPAGES	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.	S

Table 399. SYSIBM.SYSTABLES_HIST table column descriptions (continued)

Column name	Data type	Description	Use
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of rows compressed within the total number of active rows in the table. This includes any row in a table space that is defined with compression. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.	G
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated. For a temporary table, the value of STATSTIME is always the default value.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, accelerator-only table, or temporary table.	S
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of pages on which rows of the partition appear. The value is -1 if statistics have not been gathered.	S
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average row length of the table specified in the table space. The value is -1 if statistics have not been gathered.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSTABLES_PROFILES catalog table

The SYSTABLES_PROFILES table contains one row for each profile that is associated with a table in SYSIBM.SYSTABLES. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Table 400. SYSIBM.SYSTABLES_PROFILES table column descriptions

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	The schema (qualifier) for the table.	G

Table 400. SYSIBM.SYSTABLES_PROFILES table column descriptions (continued)

Column name	Data type	Description	Use
TBNAME	VARCHAR(128) NOT NULL	The table name.	G
PROFILE_TYPE	VARCHAR(32) NOT NULL	The type of profile. Allowed values are 'RUNSTATS'.	G
—	VARCHAR(32)	Internal use only.	I
PROFILE_TEXT	CLOB(1M)	The text of the profile.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the LOB column of this table.	G
PROFILE_UPDATE	TIMESTAMP NOT NULL	The last time the profile was updated, or the timestamp for when the profile was inserted into the table.	G
—	TIMESTAMP	Internal use only.	I

SYSTABLES_PROFILE_TEXT catalog table

The SYSTABLES_PROFILE_TEXT table is an auxiliary table for the PROFILE_TEXT column of the SYSIBM.SYSTABLES_PROFILES table and is required to hold LOB data. The schema is SYSIBM.

Table 401. SYSIBM.SYSTABLES_PROFILE_TEXT table column descriptions

Column name	Data type	Description	Use
PROFILE_TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the profile that the row represents.	G

SYSTABSTATS catalog table

The SYSTABSTATS table contains one row for each partition of a partitioned table space. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Table 402. SYSIBM.SYSTABSTATS table column descriptions

Column name	Data type	Description	Use
CARD	INTEGER NOT NULL	Total number of rows in the partition.	S
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of total active pages in the partition that contain rows of the table.	S
NACTIVE	INTEGER NOT NULL	Number of active pages in the partition.	S
PCTROWCOMP	SMALLINT NOT NULL	Percentage of rows compressed within the total number of active rows in the partition. This includes any row in a table space that is defined with compression.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the partition.	S

SYSTABSTATS_HIST catalog table

The SYSTABSTATS_HIST table contains rows from the SYSTABSTATS table.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Table 403. SYSIBM.SYSTABSTATS_HIST table column descriptions

Column name	Data type	Description	Use
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This column can be updated.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the partition. The value is -1 if statistics have not been gathered.	S
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSTRIGGERS catalog table

The SYSTRIGGERS table contains one row for each trigger. The schema is SYSIBM.

Table 404. SYSIBM.SYSTRIGGERS table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trigger and trigger package.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the trigger. This implicit or explicit qualifier for the trigger name is also used for the collection ID of the trigger package.	G
SEQNO	SMALLINT NOT NULL	Not used.	N
DBID	SMALLINT NOT NULL	Internal identifier of the database for the trigger.	G
OBID	SMALLINT NOT NULL	Internal identifier of the trigger.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the trigger.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the trigger.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBOWNER	VARCHAR(128) NOT NULL	Qualifier of the name of the table or view to which this trigger applies.	G
TRIGTIME	CHAR(1) NOT NULL	Time when triggered actions are applied to the base table, relative to the event that activated the trigger: A Trigger is applied after the event. B Trigger is applied before the event. I Trigger is applied instead of the event	G
TRIGEVENT	CHAR(1) NOT NULL	Operation that activates the trigger: I Insert D Delete U Update	G

Table 404. SYSIBM.SYSTRIGGERS table column descriptions (continued)

Column name	Data type	Description	Use
GRANULARITY	CHAR(1) NOT NULL	Trigger is executed once per: S Statement R Row	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the trigger was created, the existing trigger version was replaced, or the new trigger version was added.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
TEXT	VARCHAR(6000) NOT NULL	Not used.	N
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
TRIGNAME	VARCHAR(128) NOT NULL	Not used.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: blank Authorization ID L Role	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the trigger is secured: N The trigger is not secured Y The trigger is secured	G
ALTEREDTS	TIMESTAMP NOT NULL	Indicates when the trigger was last changed.	G

Table 404. SYSIBM.SYSTRIGGERS table column descriptions (continued)

Column name	Data type	Description	Use
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
SQLPL	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the trigger supports SQL PL: Y Advanced trigger that supports SQL PL. blank Basic trigger that does not support SQL PL.	G
DEBUG_MODE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the trigger is enabled for debugging: 1 This trigger is enabled for debugging, and can be debugged in a client debug session using the Db2 Unified Debugger. 0 This trigger is not enabled for debugging. N This trigger can never be enabled for debugging. blank This trigger is a basic trigger that cannot be debugged.	G
ASUTIME	INTEGER NOT NULL	Number of CPU service units that are allowed for a single invocation of this trigger. If ASUTIME is zero, the number of CPU service units is unlimited. If the trigger consumes more CPU service units than the ASUTIME value allows, Db2 cancels the trigger.	G
WLM_ENVIRONMENT	VARCHAR(96) NOT NULL	The WLM ENVIRONMENT FOR DEBUG MODE value in the trigger definition. This value is the name of the WLM environment that is used when a trigger is debugged. If this value is blank, the trigger cannot be debugged.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G
VERSION	VARCHAR(122) NOT NULL	The version identifier for a trigger. A zero length string for a basic trigger.	G
ORIGINAL_CONTOK	CHAR(8) NOT NULL FOR BIT DATA	The consistency token for the trigger. For triggers created before Db2 12, this column value is X'20'.	G
REGENERATETS	TIMESTAMP NOT NULL	The time when the object was regenerated. The value is valid only for objects that can be regenerated. If no regeneration has occurred, this column contains the same value as the CREATEDTS column.	G

Table 404. SYSIBM.SYSTRIGGERS table column descriptions (continued)

Column name	Data type	Description	Use
ACTIVE	CHAR(1) NOT NULL	Identifies the active version of the trigger: Y The version is the active version. N The version is not the active version. blank The value of VERSION is a zero length string.	G
WRAPPED	CHAR(1) NOT NULL	'Y' The trigger text is obfuscated. blank The trigger text is not obfuscated.	G

SYSTRIGGERS_STMT catalog table

The SYSTRIGGERS_STMT table is an auxiliary table for the STATEMENT column of the SYSTRIGGERS table and contains LOB data. The schema is SYSIBM.

Table 405. SYSIBM.SYSTRIGGERS_STMT table column descriptions

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G

SYSUSERAUTH catalog table

The SYSUSERAUTH table records the system privileges that are held by users. The schema is SYSIBM.

FL 505 SYSIBM.SYSUSERAUTH has an associated history table, SYSIBM.SYSUSERAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables” on page 2851](#).

Table 406. SYSIBM.SYSUSERAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user that holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: blank Authorization ID L Role	N
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. blank Not applicable. AUTHHOWGOT is also blank when the privilege that is held is BINDAGENT. C DBCTRL D DBADM E SECADM G ACCESSCTRL K SQLADM L SYSCTRL M DBMAINT O SYSOPR S SYSADM	G
ALTERBPAUTH	CHAR(1) NOT NULL	Not used.	N
BINDADDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND subcommand with the ADD option: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
BSDSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the RECOVER BSDS command: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
CREATEDBAAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create databases and automatically receive DBADM authority over the new databases: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
CREATEDBCAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE DATABASE statement to create new databases and automatically receive DBCTRL authority over the new databases: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
CREATESGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE STOGROUP statement to create new storage groups: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
DISPLAYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DISPLAY commands: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
RECOVERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER INDOUBT command: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
STOPALLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOP command: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
STOSPACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOSPACE utility: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
SYSADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system administration authority: blank Privilege is not held G Privilege was granted with the GRANT option Y Privilege was granted without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
SYSOPRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system operator authority: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
TRACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the START TRACE and STOP TRACE commands: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
MON1AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC serviceability data: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
MON2AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC data: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
CREATEALIASAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can execute the CREATE ALIAS statement: blank Privilege is not held G Privilege held with the GRANT option Y Privilege held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
SYSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SYSCTRL authority: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
BINDAGENTAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has BINDAGENT privilege: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
ARCHIVEAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE is privileged to use the ARCHIVE LOG command: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
CAPTURE1AUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
CAPTURE2AUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed. The value is '1985-04-01.00.00.00.000000' for the one installation row.	G
CREATETMTABAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has CREATETMTABAUTH privilege: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: blank Authorization ID L Role	G
DEBUGSESSIONAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DEBUGSESSION privilege: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
EXPLAINAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can explain and prepare statements: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
SQLADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SQLADM authority: blank Privilege is not held G Privilege is held with the GRANT option Y Privilege is held without the GRANT option	G
SDBADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has system DBADM authority: blank Privilege is not held Y Privilege is held without the GRANT option	G
DATAACCESSAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DATAACCESS authority: blank Privilege is not held Y Privilege is held without the GRANT option	G

Table 406. SYSIBM.SYSUSERAUTH table column descriptions (continued)

Column name	Data type	Description	Use
ACCESSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has ACCESSCTRL authority: blank Privilege is not held Y Privilege is held without the GRANT option	G
CREATESECUREAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create secured objects (triggers and user-defined functions): blank Privilege is not held Y Privilege is held without the GRANT option	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	FL 505 The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	FL 505 The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	FL 505 The transaction-start-ID column, for system-period data versioning.	G
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSUTILITIES catalog table

The SYSUTILITIES table contains one row for each utility executed if collection of utility history information is active. The schema is SYSIBM.

[FL 501](#)

Rows in this table can be updated, inserted, and deleted.

Table 407. SYSIBM.SYSUTILITIES table column descriptions

Column name	Data type	Description	Use
EVENTID	BIGINT NOT NULL	Unique identifier for the utility execution. See “Db2-supplied sequences” on page 2848 for information about how this value is generated.	G

Table 407. SYSIBM.SYSUTILITIES table column descriptions (continued)

Column name	Data type	Description	Use
NAME	VARCHAR(60) NOT NULL	Utility name.	G
INSERTEDBY	VARCHAR(9) NOT NULL	Identifies how the row was added: DB2 Indicates that the row was inserted by IBM Db2 Utilities. blank or identifiable value Indicates that the row was inserted by a user or utility other than IBM Db2 Utilities.	G
JOBNAME	VARCHAR(24) NOT NULL	Job name of the utility.	G
UTLID	VARCHAR(48) NOT NULL	Utility ID	G
USERID	VARCHAR(24) NOT NULL	User ID of the utility invoker.	G
STARTTS	TIMESTAMP NOT NULL WITH DEFAULT	A local timestamp that indicates the start of utility execution.	G
ENDTS	TIMESTAMP	A local timestamp that indicates the end of utility execution.	G
ELAPSEDTIME	BIGINT	Elapsed time in microseconds.	G
CPUTIME	BIGINT	Total general processor CPU time in microseconds. Does not include zIIP time (if applicable).	G
ZIIPTIME	BIGINT	Total zIIP time in microseconds. When applicable and accounting class 1 trace is active.	G
RETURNCODE	INTEGER	Final return code from utility execution.	G
CONDITION	CHAR(1) NOT NULL WITH DEFAULT ' '	Condition of the utility execution: blank Default value. Indicates an active or stopped utility. E Indicates utility execution ended. F Indicates utility execution was terminated by the -START DATABASE SPACENAM ACCESS(FORCE) command. T Indicates utility execution was terminated by the -TERM UTILITY command.	G

Table 407. SYSIBM.SYSUTILITIES table column descriptions (continued)

Column name	Data type	Description	Use
RESTART	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether utility execution was restarted: N Default value. Utility execution was not restarted. Y Utility execution was restarted.	G
NUMOBJECTS	INTEGER	The number of objects processed during utility execution (utility specific). For partitioned objects, each partition is counted. For the following utilities, each data set is counted when the utility is run at the data set level on non-partitioned table spaces: COPY COPYTOCOPY MERGECOPY MODIFY RECOVERY REPORT RECOVERY	G
LISTNAME	VARCHAR(18)	Name of the LISTDEF list, if applicable	G
STARTLOGPOINT	CHAR(10) FOR BIT DATA	Current log point at the start of the utility execution. The log point is an RBA for a non-data-sharing subsystem and an LRSN for a data sharing subsystem.	G
GROUP_MEMBER	VARCHAR(24)	Member name of the Db2 data sharing subsystem where the utility started. Column is null for a non-data-sharing subsystem	G
SORTNAME	VARCHAR(24)	DFSORT or DB2SORT, if applicable.	G
SORTCPU TIME	BIGINT	Sort CPU time in microseconds, if applicable and provided by the sort program.	G
SORTZIIPTIME	BIGINT	Sort zIIP time in microseconds, if applicable and provided by the sort program.	
The table also contains one set of phase columns for each utility phase, with the following names and data types, where <i>n</i> is 1 to 14.			
PHASE n NAME VARCHAR(24) PHASE n ET BIGINT PHASE n CPUT BIGINT PHASE n ZIIPT BIGINT PHASE n DATA BIGINT			
Reserved for future IBM use.			

SYSVARIABLEAUTH catalog table

The SYSVARIABLEAUTH table contains one row for each privilege of each authorization ID that has privileges on a global variable. The schema is SYSIBM.

FL 505 SYSIBM.SYSVARIABLEAUTH has an associated history table, SYSIBM.SYSVARIABLEAUTH_H, which provides temporal versioning of the catalog table. Both tables contain the same columns, with the

same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be deleted by using the REORG TABLESPACE DISCARD option. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 security-related catalog tables” on page 2851.](#)

Table 408. SYSIBM.SYSVARIABLEAUTH table column descriptions

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	The grantor of the privilege.	G
GRANTORTYPE	CHAR(1) NOT NULL	The type of grantor: blank Grantor is an authorization ID L Grantor is a role	G
GRANTEE	VARCHAR(128) NOT NULL	The holder of the privilege.	G
GRANTEETYPE	CHAR(1) NOT NULL	The type of grantee: blank Grantee is an authorization ID L Grantee is a role P Grantee is a package. The grantee is a package if COLLID is a value other than blank. R Internal use only	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
COLLID	VARCHAR(128) NOT NULL	If the grantee is a package, this value is the COLLID of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the grantee is a package, this value is the consistency token of the DBRM from which the package is derived. Otherwise, this value is blank.	G
READAUTH	CHAR(1) NOT NULL	The privilege to read the global variable: blank The READ privilege is not held G The READ privilege is held with the GRANT option Y The READ privilege is held without the GRANT option	G

Table 408. SYSIBM.SYSVARIABLEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
WRITEAUTH	CHAR(1) NOT NULL	The privilege to write to the global variable: blank The WRITE privilege is not held G The WRITE privilege is held with the GRANT option Y The WRITE privilege is held without the GRANT option	G
AUTHHOWGOT	CHAR(1) NOT NULL	The authorization level of the user who granted the privileges: blank Not applicable E SECADM G ACCESSCTRL S SYSADM T DATAACCESS This authorization level is not necessarily the highest authority level of the grantor.	G
GRANTEDTS	TIMESTAMP NOT NULL	The time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
FL 505 SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	The row-begin column of the SYSTEM_TIME period, for system-period data versioning.	G
FL 505 SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	The row-end column of the SYSTEM_TIME period, for system-period data versioning.	G
FL 505 TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	The transaction-start-ID column, for system-period data versioning.	G

Table 408. SYSIBM.SYSVARIABLEAUTH table column descriptions (continued)

Column name	Data type	Description	Use
FL 505 GEN_SESSION_USER	VARCHAR(128) GENERATED ALWAYS AS (SESSION_USER)	.The value of the SESSION_USER special register. This column contains a null value when the value is unknown for the existing rows prior to catalog level V13R1M505.	G

SYSVARIABLES catalog table

The SYSVARIABLES table contains one row for each global variable that is created. The schema is SYSIBM.

Table 409. SYSIBM.SYSVARIABLES table column descriptions

Column name	Data type	Description	Use
VARID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The identifier of the global variable.	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
OWNER	VARCHAR(128) NOT NULL	The authorization ID of the owner of the global variable.	G
OWNERTYPE	CHAR(1) NOT NULL	The type of owner of the global variable: L The owner is a role blank The owner is an authorization ID	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for all other values.	G
CREATEDTS	TIMESTAMP NOT NULL	Time at which the global variable was created.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	The schema name of the data type. For built-in data types, this value is SYSIBM.	G
TYPENAME	VARCHAR(128) NOT NULL	The unqualified name of the data type.	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a user-defined type, the internal ID of the user-defined type.	S

Table 409. SYSIBM.SYSVARIABLES table column descriptions (continued)

Column name	Data type	Description	Use
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a user-defined type, the internal ID of the built-in data type on which the user-defined type is based.	S
LENGTH	INTEGER NOT NULL	The maximum length of the global variable. If the variable is an array type, the value is 0.	G
SCALE	SMALLINT NOT NULL	The scale of the global variable.	G
CCSID	INTEGER NOT NULL	If the variable is an array type, the value is 0. Otherwise, the CCSID of the global variable.	G

Table 409. SYSIBM.SYSVARIABLES table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULT	CHAR(3) NOT NULL	The default value of the global variable. This column can contain one of the following values: N The global variable does not have a default value. If the variable is an array type, the value is N. S The default value is the value of the SQL authorization ID of the process at the time that a default value is used. 1 The default value is a string constant. 2 The default value is a floating-point constant. 3 The default value is a decimal constant. 4 The default value is an integer constant. 5 The default value is a hexadecimal character string. 6 The default value is a UX string. 7 The global variable has a graphic data type and has a default value that is a character string constant. 8 The global variable has a character data type and has a default value that is a character string constant. 9 The default value is a DECFLOAT constant If this column contains one of the following values, the default value of the global variable is the value of the indicated special register at the time that a default value is used: AES CURRENT APPLICATION ENCODING SCHEME ACT CURRENT CLIENT_ACCTNG APN CURRENT CLIENT_APPLNAME CID CURRENT CLIENT_USERID	G

Table 409. SYSIBM.SYSVARIABLES table column descriptions (continued)

Column name	Data type	Description	Use
DEFAULT (continued)		WSN CURRENT CLIENT_WRKSTNNAME DAT CURRENT DATE DBG CURRENT DEBUG MODE DEC CURRENT DECFLOAT ROUNDING MODE DEG CURRENT DEGREE EXP CURRENT EXPLAIN MODE LCT CURRENT LOCALE LC_CTYPE MTT CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION MEM CURRENT MEMBER HNT CURRENT OPTIMIZATION HINT CPP CURRENT PACKAGE PATH CPS CURRENT PACKAGESET PTH CURRENT PATH PRC CURRENT PRECISION RFA CURRENT REFRESH AGE RVS CURRENT ROUTINE VERSION RUL CURRENT RULES SCH CURRENT SCHEMA SVR CURRENT SERVER TIM CURRENT TIME TST CURRENT TIMESTAMP STZ SESSION TIME ZONE U SESSION_USER	

Table 409. SYSIBM.SYSVARIABLES table column descriptions (continued)

Column name	Data type	Description	Use
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the lob columns in this table.	G
DEFAULTTEXT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the default value of the global variable.	G
—	BLOB(2M) NOT NULL	Reserved for future IBM use.	I
ENVID	INTEGER NOT NULL	Internal environment identifier.	G
REMARKS	VARCHAR(762) NOT NULL	A character string about this global variable that is provided by using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

SYSVARIABLES_DESC catalog table

The SYSVARIABLES_DESC table is an auxiliary table for the SYSIBM.SYSVARIABLES table. The schema is SYSIBM.

Table 410. SYSIBM.SYSVARIABLES_DESC table column descriptions

Column name	Data type	Description	Use
—	BLOB(2M)	Internal use only.	I

SYSVARIABLES_TEXT catalog table

The SYSVARIABLES_TEXT table is an auxiliary table for the DEFAULTTEXT column of the SYSVARIABLES table. The schema is SYSIBM.

Table 411. SYSIBM.SYSVARIABLES_TEXT table column descriptions

Column name	Data type	Description	Use
DEFAULTTEXT	CLOB(2M)	The text of the default value of the global variable.	G

SYSVIEWDEP catalog table

The SYSVIEWDEP table records the dependencies of views, SQL function tables, and materialized query tables on other objects. The schema is SYSIBM.

Table 412. SYSIBM.SYSVIEWDEP table column descriptions

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the view, SQL function, or materialized query table is dependent. If the object type is a function (BTYP='F'), the name is the specific name of the function.	G
BCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of BNAME.	G
BTYP	CHAR(1) NOT NULL	Type of object: F Function G Created global temporary table M Materialized query table T Table V View W SYSTEM_TIME period Z BUSINESS_TIME period	G
DNAME	VARCHAR(128) NOT NULL	Name of the view.	G
DCREATOR	VARCHAR(128) NOT NULL	The schema of the view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G
BSHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of BNAME.	G

Table 412. SYSIBM.SYSVIEWDEP table column descriptions (continued)

Column name	Data type	Description	Use
DTYPE	CHAR(1) NOT NULL	Type of dependent object: F SQL function M Materialized query table V View	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the dependent object. Blank for views that were created in a Db2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
SYS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN	Reserved for future IBM use.	G
SYS_END	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END	Reserved for future IBM use.	G
TRANS_START	TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID	Reserved for future IBM use.	G

SYSVIEWS catalog table

The SYSVIEWS table contains one or more rows for each view, materialized query table, or user-defined SQL function. The schema is SYSIBM.

Table 413. SYSIBM.SYSVIEWS table column descriptions

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the object.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the object.	G

Table 413. SYSIBM.SYSVIEWS table column descriptions (continued)

Column name	Data type	Description	Use
SEQNO	SMALLINT NOT NULL	Not used.	N
CHECK	CHAR(1) NOT NULL	Whether the WITH CHECK OPTION clause was specified in the CREATE VIEW statement: N No C Yes with the <i>cascaded</i> semantic Y Yes with the <i>local</i> semantic The value is N if the view has no WHERE clause, or the object is not a view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
TEXT	VARCHAR(1500) NOT NULL	Not used.	N
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path at the time the object was defined. The path is used to resolve unqualified data type and function names used in the object definition.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
TYPE	CHAR(1) NOT NULL	Type of table: F SQL function M Materialized query table V View	G
REFRESH	CHAR(1) NOT NULL WITH DEFAULT	Refresh mode: D A materialized query table with a deferred refresh mode blank Not a materialized query table	G

Table 413. SYSIBM.SYSVIEWS table column descriptions (continued)

Column name	Data type	Description	Use
ENABLE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether query optimization is enabled: Y Enabled N Disabled blank Not a materialized query table	G
MAINTENANCE	CHAR(1) NOT NULL WITH DEFAULT	Maintenance mode: S For a REFRESH = 'D', a materialized query table that is maintained by the system. U For a REFRESH = 'D', a materialized query table that is maintained by the user. blank Not a materialized query table.	G
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	For REFRESH = 'D' and MAINTENANCE = 'S', the timestamp of the REFRESH TABLE statement that last refreshed the data. Otherwise, this is the default timestamp ('0001-01-01.00.00.000000').	G
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level when the materialized query table is created or altered from a base table: R RR (repeatable read) S CS (cursor stability) T RS (read stability) U UR (uncommitted read) blank Not a materialized query table	G
SIGNATURE	VARCHAR(1024) NOT NULL WITH DEFAULT FOR BIT DATA	Contains an internal description. Used for materialized query tables.	G
APP_ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the current application encoding scheme at the time the object was created. For objects created prior to Version 8 of Db2, the value is 0.	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the view, blank for views that were created in a Db2 release prior to Version 9.	G

Table 413. SYSIBM.SYSVIEWS table column descriptions (continued)

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: blank Authorization ID L Role	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the statement that created the view. In some cases, this column might instead contain the text of a statement that altered the view. In many cases, changes to views or to objects on which views are dependent do not update this value.	G
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSVIEWS_STMT catalog table

The SYSVIEWS_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSVIEWS table and is required to hold LOB data. The schema is SYSIBM.

Table 414. SYSIBM.SYSVIEWS_STMT table column descriptions

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	See the description of the STATEMENT column in “SYSVIEWS catalog table” on page 2816	G

SYSVIEWS_TREE catalog table

The SYSVIEWS_TREE table is an auxiliary table for the PARSETREE column of the SYSVIEWS table and is required to hold LOB data. The schema is SYSIBM.

Table 415. SYSIBM.SYSVIEWS_TREE table column descriptions

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSVOLUMES catalog table

The SYSVOLUMES table contains one row for each volume of each storage group. The schema is SYSIBM.

Table 416. SYSIBM.SYSVOLUMES table column descriptions

Column name	Data type	Description	Use
SGNAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
SGCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group. To determine the type of authorization ID for the storage group creator, see the CREATORTYPE column of the SYSIBM.SYSTOGROUP catalog table.	G
VOLID	VARCHAR(18) NOT NULL	Serial number of the volume or * if SMS-managed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSXMLRELS catalog table

The SYSXMLRELS table contains one row for each XML table that is created for an XML column. The schema is SYSIBM.

Table 417. SYSIBM.SYSXMLRELS table column descriptions

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the XML column in the base table.	G
XMLTBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the XML table.	G
XMLTBNAME	VARCHAR(128) NOT NULL	Name of the XML table.	G

Table 417. SYSIBM.SYSXMLRELS table column descriptions (continued)

Column name	Data type	Description	Use
XMLRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the XML table.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the XML table was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSXMLSTRINGS catalog table

Each row of the SYSXMLSTRINGS table contains a single string and its unique ID that are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a namespace URI. The schema is SYSIBM.

Table 418. SYSIBM.SYSXMLSTRINGS table column descriptions

Column name	Data type	Description	Use
STRINGID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Unique ID for the string.	G
STRING	VARCHAR(1000) NOT NULL	The string data.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies.	G

SYSXMLTYPMOD catalog table

The SYSXMLTYPMOD table contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated and deleted. The schema is SYSIBM.

Table 419. SYSIBM.SYSXMLTYPMOD table column descriptions

Column name	Data type	Description	Use
XML_TYPEMOD_ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	An id generated for the XML type modifier, it is an identity column and primary key.	G
TYPE_ANNOTATION	CHAR(1) NOT NULL	Indicate whether there is type annotation. Y WITH type annotation N with no type annotation.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the database.	G

SYSXMLTYPMSHEMA catalog table

The SYSXMLTYPMSHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier. The schema is SYSIBM.

Table 420. SYSIBM.SYSXMLTYPMSHEMA table column descriptions

Column name	Data type	Description	Use
XML_TYPEMOD_ID	INTEGER NOT NULL	The id for the XML type modifier.	G
XSOBJECTID	INTEGER NOT NULL	The id for an XML schema registered in XSR.	G

Table 420. SYSIBM.SYSXMLTYPMSHEMA table column descriptions (continued)

Column name	Data type	Description	Use
ELEMENT_NAMESPACE	INTEGER NOT NULL	String id for the namespace name of the root element node. By default, it is the TARGETNAMESPACE of the XML schema. It would be 0 if it is NO NAMESPACE.	G
ELEMENT_NAME	INTEGER NOT NULL	String id for the local name of the root element node. It would be 0 if it is not specified.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators . The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

USERNAMES table

Each row in the USERNAMES table is used to carry out one outbound ID translation or inbound ID translation and "come from" checking. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Table 421. SYSIBM.USERNAMES table column descriptions

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	How the row is to be used: I For inbound translation and "come from" checking. O For outbound translation. S For outbound system AUTHID to establish a trusted connection.	G
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID to be translated. Applies to any authorization ID if blank.	G

Table 421. SYSIBM.USERNAMES table column descriptions (continued)

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM or TCP/IP network locations associated with this row. A blank value in this column indicates this name translation rule applies to any TCP/IP or SNA partner. If a non-blank LINKNAME is specified, one or both of the following statements must be true: - A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the VTAM site associated with this name translation rule. - A row exists in SYSIBM.IPNames whose LINKNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the TCP/IP host associated with this name translation rule. Inbound name translation and "come from" checking are not performed for TCP/IP clients.	G
NEWAUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Translated value of AUTHID. Blank specifies no translation. NEWAUTHID can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of AUTHID across a network, one of the encryption security options in the SYSIBM.IPNames table should be specified.	G
PASSWORD	VARCHAR(255) NOT NULL WITH DEFAULT	Password to accompany an outbound request, if passwords are not encrypted by RACF. If passwords are encrypted, or the row is for inbound requests, the column is not used. PASSWORD can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of PASSWORD across a network, one of the encryption security options in the SYSIBM.IPNames table should be specified.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row was provided with the Db2 product code. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Catalog indexes

Indexes are defined on most catalog tables to improve catalog access.

The following table identifies the Db2 catalog tables on which indexes are defined, the columns that are in each of the indexes, and the data types of those columns.

Table 422. Indexes on Db2 catalog tables

Table	Index (type ^{"1"} on page 2848)	Columns (data type)
IPLIST	DSNDUX01 (U)	LINKNAME (CHAR(8)) IPADDR (VARCHAR(254))
IPNAMES	DSNFPX01 (UC)	LINKNAME (CHAR(8))
LOCATIONS	DSNFCX01 (UC)	LOCATION (VARCHAR(128))
LULIST	DSNFLX01 (UC)	LINKNAME (CHAR(8)) LUNAME (VARCHAR(24))
	DSNFLX02 (U)	LINKNAME (CHAR(8))
LUNAMES	DSNFNX01 (UC)	LUNAME (VARCHAR(24))
LUMODES	DSNFMX01 (UC)	LUNAME (VARCHAR(24)) MODENAME (VARCHAR(24))
MODESELECT	DSNFDX01 (UC)	LUNAME (VARCHAR(24)) AUTHID (VARCHAR(128)) PLANNAME (CHAR(8))
SYSAUDITPOLICIES	DSNAPX03 (UC)	AUDITPOLICYNAME (VARCHAR(128))
SYSAUTOALERTS	DSNALX01 (UC)	ALERT_ID (BIGINT)
	DSNALX02 (N)	HISTORY_ENTRY_ID (BIGINT)
	DSNALX03 (N)	RETURN_CODE (INTEGER) ACTION (VARCHAR(32))
	DSNALX04 (N)	TARGET_QUALIFIER (VARCHAR(128)) TARGET_OBJECT (VARCHAR(128)) TARGET_PARTITION (SMALLINT)

Db2-supplied sequences

You or certain tools might need to reference specific Db2-supplied sequences to ensure consistent, unique values in some catalog table columns.

DSNSEQ_EVENTID

[FL 501](#)

A sequence that is intended to be used to generate a value for the EVENTID column when a row is inserted into the SYSIBM.SYSUTILITIES catalog table.

This sequence has the following characteristics:

- The schema is SYSIBM
- The type is BIGINT
- The START WITH value is 1000
- Use of this sequence is granted to PUBLIC

Sequence name	Attributes	Use	Authorization required	New, Changed, or Dropped
SYSIBM.DSNSEQ_EVENTID	BIGINT START WITH 1000 INCREMENT BY 1 MINVALUE 1000 NO MAXVALUE CYCLE CACHE 100 NO ORDER	Generates the next value for the SYSIBM.SYSUTILITIES EVENTID column.	Use privilege is granted to PUBLIC. No other authorization is required.	New

The SYSUTILITIES table contains one row for each utility executed if collection of utility history information is active. The schema is SYSIBM.

Temporal versioning for Db2 catalog tables

Db2 13 can use temporal versioning to record historical information for certain catalog tables. You can use the historical information in statistics-related catalog tables to analyze, predict, and help prevent specific conditions in a subsystem, and you can use the historical information in security-related catalog tables for security auditing purposes.

Db2 provides support for two types of catalog tables: statistic-related catalog tables and security-related catalog tables.

Temporal versioning for Db2 statistics-related catalog tables

You can use the historical information in Db2 13 statistics-related catalog tables to analyze, predict, and help prevent specific conditions in a subsystem.

The historical information for real-time statistics catalog tables can be used to analyze the rate of change in size, organization, and activity for table space and index space partitions. This information can then be used to develop an automated response to conditions such as table spaces and index spaces running out of space or becoming too disorganized.

The following table lists the statistics-related catalog tables that have an associated history table for system-period temporal versioning.

Catalog table	History table
SYSINDEXSPACESTATS	SYSIBM.SYSIXSPACESTATS_H
SYSTABLESPACESTATS	SYSIBM.SYSTABSPACESTATS_H

Enabling the temporal relationship

The temporal relationship between a history table and its associated catalog table must be enabled before the history table can be used to record historical information. Each member Db2 externalizes rows whenever the interval specified by the STATSINT subsystem parameter is reached.

Tip: It is best to develop and test an aggregation and purge strategy before enabling the temporal relationship.

To enable the temporal relationship for SYSIBM.SYSINDEXSPACESTATS and its associated history table, SYSIBM.SYSIXSPACESTATS_H, issue the following statement:

```
ALTER TABLE SYSIBM.SYSINDEXSPACESTATS
ADD VERSIONING
USE HISTORY TABLE SYSIBM.SYSIXSPACESTATS_H;
```

To enable the temporal relationship for SYSIBM.SYSTABLESPACESTATS and its associated history table, SYSIBM.SYSTABSPACESTATS_H, issue the following statement:

```
ALTER TABLE SYSIBM.SYSTABLESPACESTATS
ADD VERSIONING
USE HISTORY TABLE SYSIBM.SYSTABSPACESTATS_H;
```

If the temporal relationship between a catalog table and its associated history table later needs to be removed, you can issue the ALTER TABLE statement with the DROP VERSIONING clause on the catalog table.

Multiple inserts into a temporal history table for one insert into a real-time statistics table

In rare cases, statistics-related catalog history tables might contain multiple rows that correspond to a single insert into a real-time statistics table. This can happen when real-time statistics are externalized to one of the real-time statistics tables, and the real-time statistics table is unavailable.

When temporal versioning is enabled, and Db2 inserts a row into a real-time statistics table, Db2 also inserts a row into the corresponding temporal history table. If the insert operation for the real-time statistics table fails because the table is unavailable, Db2 does not delete the row from the temporal history table. Db2 makes additional attempts to insert the row into the real-time statistics table, and with the each attempt, Db2 inserts another row into the temporal history table. When the real-time statistics table becomes available, and the insert into the real-time statistics table is successful, Db2 writes another row into the temporal history table.

The following example shows the contents of the SYS_START and SYS_END columns in system-period temporal table SYSIBM.SYSTABSPACESTATS_H when two unsuccessful attempts and one

successful attempt are made to insert rows into a real-time statistics table. All column values other than SYS_END are the same. The first row corresponds to the successful attempt to insert into SYSIBM.SYSTABLESPACESTATS, and the second and third rows correspond to the unsuccessful attempts.

SYS_START	SYS_END
2020-05-13-13.03.42.279115	2020-05-13-13.39.04.139589

Temporal versioning for Db2 security-related catalog tables

FL 505 You can use the historical information in Db2 13 security-related catalog tables for auditing and reporting purposes.

The historical information for security-related catalog tables can be used to provide auditing data that is related to privilege management and security object management. Typical examples include providing point-in-time evidence that a user held administrative authority or that the appropriate authorities were in place for a particular table during the previous month.

The following table lists the security-related catalog tables that have an associated history table for system-period temporal versioning and the operations that cause a history table to be updated.

Catalog table	History table	Operations that can result in an update
SYSAUDITPOLICIES	SYSIBM.SYSAUDITPOLICIES_H	UPDATE or DELETE an existing record
SYSCOLAUTH	SYSIBM.SYSCOLAUTH_H	TRANSFER OWNERSHIP REVOKE table privileges DROP TABLE or VIEW DROP TRIGGER (instead of trigger) RENAME TABLE
SYSCONTEXTAUTHIDS	SYSIBM.SYSCONTEXTAUTHIDS_H	ALTER or DROP TRUSTED CONTEXT
SYSCONTEXT	SYSIBM.SYSCONTEXT_H	ALTER or DROP TRUSTED CONTEXT
SYSCONTROLS	SYSIBM.SYSCONTROLS_H	ALTER or DROP PERMISSION ALTER or DROP MASK
SYSCONTROLS_DESC	SYSIBM.SYSCONTROLS_DESC_H	ALTER or DROP PERMISSION ALTER or DROP MASK
SYSCONTROLS_RTXT	SYSIBM.SYSCONTROLS_RTXT_H	ALTER or DROP PERMISSION ALTER or DROP MASK

Catalog table	History table	Operations that can result in an update
SYSCTXTTRUSTATTR S	SYSIBM.SYSCTXTTRUSTATTR_H	ALTER or DROP TRUSTED CONTEXT
SYSDBAUTH	SYSIBM.SYSDBAUTH_H	TRANSFER OWNERSHIP REVOKE database privileges DROP DATABASE
SYSPACKAUTH	SYSIBM.SYSPACKAUTH_H	BIND or REBIND PACKAGE OWNER change REVOKE package privileges DROP or FREE PACKAGE CREATE OR REPLACE PROCEDURE when replacing procedure ALTER PROCEDURE (SQL native) PACKAGE OWNER change DROP PROCEDURE (SQL native) ALTER FUNCTION (compiled SQL scalar) PACKAGE OWNER change DROP FUNCTION (compiled SQL scalar) CREATE OR REPLACE TRIGGER (advanced) when replacing trigger DROP TRIGGER
SYSPLANAUTH	SYSIBM.SYSPLANAUTH_H	BIND or REBIND PLAN OWNER change REVOKE plan privileges FREE PLAN
SYSRESAUTH	SYSIBM.SYSRESAUTH_H	TRANSFER OWNERSHIP of STOGROUP REVOKE - Collection privileges - Type of JAR file privileges - USE of buffer pool - STOGROUP - Table space privileges DROP Distinct Type, STOGROUP, or table space SQLJ.REMOVE_JAR stored procedure
SYSROLES	SYSIBM.SYSROLES_H	DROP ROLE
SYSROUTINEAUTH	SYSIBM.SYSROUTINEAUTH_H	REVOKE function or procedure privileges CREATE or REPLACE PROCEDURE DROP FUNCTION or PROCEDURE
SYSSCHEMAAUTH	SYSIBM.SYSSCHEMAAUTH_H	REVOKE schema privileges
SYSSEQUENCEAUTH	SYSIBM.SYSSEQUENCEAUTH_H	REVOKE sequence privileges DROP SEQUENCE
SYSTABAUTH	SYSIBM.SYSTABAUTH_H	TRANSFER OWNERSHIP REVOKE table privileges DROP TABLE or VIEW DROP TRIGGER (instead of trigger) RENAME TABLE

Catalog table	History table	Operations that can result in an update
SYSUSERAUTH	SYSIBM.SYSUSERAUTH_H	REVOKE system privileges
SYSVARIABLEAUTH	SYSIBM.SYSVARIABLEAUTH_H	REVOKE variable privileges DROP VARIABLE

Insert behavior

During the operations listed in the previous table, if an INSERT operation into a history table fails, the SQL statement or command that triggered the INSERT operation will also fail. For example, if an SQL REVOKE statement triggered an INSERT into a catalog history table, and the INSERT operation fails, the REVOKE statement will also fail.

In addition to the operations that are listed in the previous table, the CATMAINT utility options SCHEMA SWITCH and OWNER FROM can also add entries to the catalog history tables based on the objects that are being updated.

Db2 13 internal authorization dependency records that have a GRANTEETYPE value of P or R in the following catalog tables are not written to their corresponding history tables except for SQL DROP operations and FREE commands:

- SYSCOLAUTH
- SYSTABAUTH
- SYSPACKAUTH
- SYSRESAUTH
- SYSROUTINEAUTH
- SYSSEQUENCEAUTH
- SYSVARIABLEAUTH

The TEMPORAL_LOGICAL_TRANSACTION_TIME global variable, which allows applications to control the scope of temporal logical transactions, is ignored for updates to catalog history tables.

Enabling the temporal relationship

The temporal relationship between a history table and its associated catalog table must be enabled before the history table can be used to record historical information. To enable temporal support, issue the ALTER TABLE statement with the ADD VERSIONING clause and specify the corresponding history table.

Tip: Develop and test an aggregation and purge strategy before you enable the temporal relationship.

For example, to enable the temporal relationship for SYSIBM.SYSUSERAUTH and its associated history table, SYSIBM.SYSUSERAUTH_H, issue the following statement:

```
ALTER TABLE SYSIBM.SYSUSERAUTH
  ADD VERSIONING
  USE HISTORY TABLE SYSIBM.SYSUSERAUTH_H;
```

Disabling the temporal relationship

If the temporal relationship between a catalog table and its associated history table later needs to be removed, issue the ALTER TABLE statement with the DROP VERSIONING clause on the catalog table. The following example disables the temporal relationship on SYSIBM.SYSUSERAUTH:

```
ALTER TABLE SYSIBM.SYSUSERAUTH
  DROP VERSIONING;
```

Auditing the REVOKE privilege on a table

The following scenario demonstrates how to obtain records about the SELECT privileges that were in place for a table at a point in time in the past.

1. A security administrator enables temporal support on the SYSIBM.SYSTABAUTH catalog table and also adds the ON DELETE ADD EXTRA ROW clause to audit the IDs that revoke privileges.

```
ALTER TABLE SYSIBM.SYSTABAUTH
  ADD VERSIONING
  USE HISTORY TABLE SYSIBM.SYSTABAUTH_H
  ON DELETE ADD EXTRA ROW;
```

2. A user then grants the SELECT privilege on the CUSTOMER.INVOCE table to the SELGRP01 user ID. This GRANT statement is issued on 2023/04/10.
3. The user then revokes this SELECT privilege from user SELGRP01. This REVOKE statement is issued on 2023/05/10. Db2 13 removes the corresponding GRANT record from SYSTABAUTH and adds an entry in SYSTABAUTH_H.
4. Because temporal support was enabled on SYSTABAUTH, an auditor is able to determine the privileges that were in place for CUSTOMER.INVOICE for a specific time period by issuing the following query:

```
SELECT GRANTOR, GRANTORTYPE, GRANTEE, GRANTEETYPE, GEN_SESSION_USER
FROM SYSIBM.SYSTABAUTH
FOR SYSTEM_TIME BETWEEN '2023-01-01-00.00.00.000000000000'
                        AND '2023-06-01-00.00.00.000000000000'
WHERE TCREATOR = 'CUSTOMER' AND TTNAME = 'INVOICE'
AND GRANTEETYPE <> 'P';
```

Deleting records from a history table

Based on the data retention policies of your organization, the history tables will likely need to be cleaned out on a regular basis. The following example shows that how a security administrator can delete all records from the SYSIBM.SYSTABAUTH_H table by using the REORG utility. In this example, SYSTABAUTH_H resides in the DSNDB06.SYSTSTBH table space, and all records with an end timestamp of greater than six months are deleted.

```
REORG TABLESPACE DSNDB06.SYSTSTBH
SHRLEVEL CHANGE COPYDDN SYSCOPY
DISCARD FROM TABLE SYSIBM.SYSTABAUTH_H
WHEN (SYS_END < CURRENT_TIMESTAMP - 6 MONTHS)
```

Maintaining the Db2 catalog and directory

For best results, periodically check the integrity of Db2 catalog, and especially before you update the Db2 catalog for a version migration function level activation.

Procedure

To ensure the health of the Db2 catalog, use the following approaches. For best results, do these the actions before and after each Db2 version migration, and periodically outside of the migration process, such as when you update the Db2 catalog for new function levels in continuous delivery.

- Use the DSN1COPY and CHECK INDEX utilities to verify the integrity of the Db2 directory and catalog table spaces on the subsystem, by completing the following steps:

- a) Run the DSN1COPY utility with the CHECK option on all catalog table spaces to ensure that the table space pages are physically correct and that the catalog table spaces are clustered. For more information, see [DSN1COPY \(Db2 Utilities\)](#).

When you run this utility on segmented table spaces or LOB table spaces, you can ignore message DSN1985I for objects of these types.

- b) Run the CHECK DATA and CHECK INDEX utilities for the Db2 catalog objects. For more information about these utilities, see [CHECK DATA \(Db2 Utilities\)](#) and [CHECK INDEX \(Db2 Utilities\)](#).
- c) Back up the Db2 catalog and directory routinely, and before and after a catalog update for a Db2 version migration or function level activation. For more information, see [“Backing up the Db2 catalog and directory” on page 2856](#).
- d) Run the following query on catalog tables to ensure that you do not have a storage group that is defined with both specific and non-specific volume IDs.

GUPI

```
SELECT * FROM SYSIBM.SYSVOLUMES V1
WHERE VOLID = '*' AND
      EXISTS (SELECT * FROM SYSIBM.SYSVOLUMES V2
              WHERE V1.SGNAME = V2.SGNAME AND
                    V2.VOLID = '*')
```

GUPI

If the preceding query returns any rows, the identified storage groups have both specific and non-specific volume IDs. Table spaces in databases that use these storage group cannot be image-copied or recovered until ALTER STOGROUP is used to remove volumes, so that the storage group has either specific or non-specific volume IDs.

- Check for consistency between catalog tables by completing the following steps:
 - a) Run the queries that are not commented out in member DSNTESEQ of the *prefix.SDSNSAMP* library.

If you are completing this task before migration to a new Db2 version, use the DSNTESEQ member *prefix.SDSNSAMP* library that is provided with the release you are migrating from.

 - You can execute the SQL statements in DSNTESEQ from SPUFI or from a dynamic SQL program like DSNTEP2.
 - You can run the queries on the actual catalog tables or on "mirror" copies of the catalog tables. If you run the queries on the copies, use the comment lines in member DSNTESEQ for guidance. By running queries on copies of the catalog table, you reduce contention on the catalog.
- Any time that you tailor the Db2 catalog for a new Db2 version or Db2 13 function level, use the following process to check the integrity of the catalog:
 - a) Run the CHECK INDEX utilities on all the indexes in the catalog and directory by using the DSN1JCX and DSN1JCX2 jobs that were generated when you last ran the Db2 installation CLIST.
 - b) Run the queries in member DSNTESEQ of the *prefix.SDSNSAMP* member.
 - c) Run the DSN1COPY utility with the CHECK option on the catalog table spaces.

Related information

[DSN1985I \(Db2 Messages\)](#)

Backing up the Db2 catalog and directory

You can take periodic image copies of your Db2 catalog and directory for backup purposes.

About this task

You can reduce the amount of time that is required for recovering the Db2 directory or catalog by routinely taking image copies of the Db2 catalog and directory. The copied data and log data sets are needed for recovery.

For best results, make plans to periodically run the DSNTIJC job that is provided with Db2 against the directory and catalog after migration, perhaps daily or weekly, and do this before updating the Db2 catalog for version migrations or function level activation.

Procedure

To create an image copy of the directory and catalog, complete the following steps with a DSNTIJC job that was generated when you last ran the Db2 installation CLIST. If you are backing up the catalog during migration to a new Db2 version, use the DSNTIJC job from the version you are migrating from.

1. Examine job DSNTIJC for the following items, and modify it as needed. For example, you might need to update the following items in the job:
 - The tape unit name. The job lists the tape unit name as TAPE. If this is incorrect for your site, correct it. The name TAPE is also used as the unit name for the default archive log data sets.
 - Expiration date or retention period. You can add a retention period or an expiration date to the job.
 - The user on the JOB statement. Ensure that the user is authorized. If Db2 is started under ACCESS(MAINT), this must be the same user that you specified for either the SYSTEM ADMIN 1 option or the SYSTEM ADMIN 2 option on installation panel DSNTIPP1.
2. Run the DSNTIJC job.
3. If the DSNTIJC job fails or an abend occurs, look for problems with the tape that is set up for image copy. If you do not find a problem, examine the log for problems. For example, look for incorrect size or I/O errors.

Reorganizing the Db2 catalog and directory

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

For detailed information about completing this task and other important consideration, see [Reorganizing the catalog and directory \(Db2 Utilities\)](#).

For best results, also run the REORG TABLESPACE utility for any altered Db2 catalog objects that a CATMAINT utility job places in REORG-pending (AREO*) advisory status.

The REORG TABLESPACE utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:

- DSNDB06.SYSDDF
- DSNDB06.SYSGPAUT
- DSNDB06.SYSGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSJAUXA
- DSNDB06.SYSJAUXB
- DSNDB06.SYSSEQ
- DSNDB06.SYSSEQ2
- DSNDB06.SYSSTATS
- DSNDB06.SYSTSCHX
- DSNDB06.SYSTSCKD
- DSNDB06.SYSTSCKS
- DSNDB06.SYSTSCPY
- DSNDB06.SYSTSSRG
- DSNDB06.SYSUSER
- DSNDB01.SCT02
- DSNDB01.SPT01

[REORG TABLESPACE \(Db2 Utilities\)](#)

[ALTER INDEX statement](#)

The ALTER INDEX statement changes the description of an index at the current server.

SQL statements allowed on the catalog

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

Table 423. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables

SQL statement	Index	Allowable clauses and usage notes
ALTER INDEX	IBM-defined	Only these clauses are allowed: CLOSE COPY FREEPAGE GBPCACHE NOT PADDED PADDED PCTFREE PIECESIZE You cannot alter the GBPCACHE value for indexes DSNDX01, DSNDX02, and DSNDX03, which are on catalog table SYSIBM.SYSINDEXES.
ALTER INDEX	User-created	All clauses are allowed, except for the following: BUFFERPOOL REGENERATE COMPRESS YES Any partitioning clause
ALTER SEQUENCE		The only clause allowed is MAXVALUE. You can only change the MAXVALUE value of the catalog sequence DSNSEQ_IMPLICITDB. The only value specific must be an integer in the range 1–60000, inclusive.
ALTER TABLE		Only these clauses are allowed: DATA CAPTURE CHANGES ADD VERSIONING DROP VERSIONING ADD PERIOD The ADD VERSIONING, DROP VERSIONING, and ADD PERIOD clauses can be specified on only the following tables: • SYSIBM.SYSTABLESPACESTATS • SYSIBM.SYSINDEXSPACESTATS

Table 423. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes																																		
ALTER TABLESPACE		Only these clauses are allowed: • CLOSE • FREEPAGE • GBPCACHE • LOCKMAX • MAXROWS • PCTFREE • TRACKMOD For DSNDB06.SYSSEQ, MAXROW can be specified only with a value of 1. You can specify the LOCKSIZE keyword on the ALTER TABLESPACE statement for any catalog table spaces that are not LOB table spaces. You cannot alter the GBPCACHE or MAXROWS value of some catalog table spaces. Do not specify GBPCACHE for the following table spaces: <table><tr><th>Table spaces</th><th>Table spaces</th></tr><tr><td>• DSNDB06.SYSTSCOL</td><td>• DSNDB06.SYSTSPKS</td></tr><tr><td>• DSNDB06.SYSTSDBA</td><td>• DSNDB06.SYSTSPKX</td></tr><tr><td>• DSNDB06.SYSTSDBR</td><td>• DSNDB06.SYSTSPKY</td></tr><tr><td>• DSNDB06.SYSTSDBU</td><td>• DSNDB06.SYSTSPLA</td></tr><tr><td>• DSNDB06.SYSTSFAU</td><td>• DSNDB06.SYSTSPLD</td></tr><tr><td>• DSNDB06.SYSTSFLD</td><td>• DSNDB06.SYSTSPLN</td></tr><tr><td>• DSNDB06.SYSTSFOR</td><td>• DSNDB06.SYSTSPLY</td></tr><tr><td>• DSNDB06.SYSTSIPT</td><td>• DSNDB06.SYSTSPVR</td></tr><tr><td>• DSNDB06.SYSTSIXR</td><td>• DSNDB06.SYSTSREL</td></tr><tr><td>• DSNDB06.SYSTSIXS</td><td>• DSNDB06.SYSTSSTM</td></tr><tr><td>• DSNDB06.SYSTSIXT</td><td>• DSNDB06.SYSTSSYN</td></tr><tr><td>• DSNDB06.SYSTSKEY</td><td>• DSNDB06.SYSTSTAB</td></tr><tr><td>• DSNDB06.SYSTSPKA</td><td>• DSNDB06.SYSTSTAU</td></tr><tr><td>• DSNDB06.SYSTSPKD</td><td>• DSNDB06.SYSTSTPT</td></tr><tr><td>• DSNDB06.SYSTSPKG</td><td>• DSNDB06.SYSTSTSP</td></tr><tr><td>• DSNDB06.SYSTSPKL</td><td></td></tr></table>	Table spaces	Table spaces	• DSNDB06.SYSTSCOL	• DSNDB06.SYSTSPKS	• DSNDB06.SYSTSDBA	• DSNDB06.SYSTSPKX	• DSNDB06.SYSTSDBR	• DSNDB06.SYSTSPKY	• DSNDB06.SYSTSDBU	• DSNDB06.SYSTSPLA	• DSNDB06.SYSTSFAU	• DSNDB06.SYSTSPLD	• DSNDB06.SYSTSFLD	• DSNDB06.SYSTSPLN	• DSNDB06.SYSTSFOR	• DSNDB06.SYSTSPLY	• DSNDB06.SYSTSIPT	• DSNDB06.SYSTSPVR	• DSNDB06.SYSTSIXR	• DSNDB06.SYSTSREL	• DSNDB06.SYSTSIXS	• DSNDB06.SYSTSSTM	• DSNDB06.SYSTSIXT	• DSNDB06.SYSTSSYN	• DSNDB06.SYSTSKEY	• DSNDB06.SYSTSTAB	• DSNDB06.SYSTSPKA	• DSNDB06.SYSTSTAU	• DSNDB06.SYSTSPKD	• DSNDB06.SYSTSTPT	• DSNDB06.SYSTSPKG	• DSNDB06.SYSTSTSP	• DSNDB06.SYSTSPKL

Table 423. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes
CREATE INDEX	User-created	All clauses are allowed, except for: CLOSE YES CLUSTER UNIQUE DEFER YES (only on tables SYSINDEXES, SYSINDEXPART, and SYSKEYS) COMPRESS YES Any partitioning clause The USING clause is ignored. Indexes that are created with <i>key-expressions</i> are not allowed on the catalog. The only value allowed for BUFFERPOOL is BP0. You can create up to 500 indexes on the catalog.
DROP INDEX	User-created	The statement has no clauses.

Appendix I. Db2 directory tables

Db2 for z/OS maintains a set of tables (in database DSNDB01) called the Db2 directory. Authorized users can query the directory; however, it is primarily intended for use by Db2 and is therefore subject to change.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Authorization for SELECT for Db2 directory tables

Users must have one of the following privileges to execute SELECT statements on the directory tables:

- Installation SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSNDB01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are not, in most cases, updated as part of Db2 operations.

The following table lists restrictions on SQL statements that reference directory tables:

SQL statement	Restriction
ALTER TABLE	<i>table-name</i> cannot specify a directory table.
ALTER TABLESPACE	The table space cannot be altered if it is associated with a directory table.
CREATE INDEX	ON <i>table-name</i> or <i>aux-table-name</i> cannot specify a directory table.
CREATE TRIGGER (basic)	ON <i>table-name</i> cannot specify a directory table.
CREATE TRIGGER (advanced)	ON <i>table-name</i> cannot specify a directory table.
DELETE	FROM <i>table-name</i> cannot specify a directory table.
DROP	<i>table-name</i> cannot specify a directory table.
INSERT	INTO <i>table-name</i> cannot specify a directory table.
MERGE	INTO <i>table-name</i> cannot specify a directory table.
RENAME	<i>source-table-name</i> cannot specify a directory table.
TRANSFER OWNERSHIP	TABLE <i>table-name</i> cannot specify a directory table.
UPDATE	<i>table-name</i> cannot specify a directory table.

Programming interface information

None of the directory table columns are part of the general-use programming interface. The column labeled "Use" in the table that describes the column indicates whether the column is part of the product-sensitive interface or is for internal, IBM use, only. The values that "Use" can assume are as follows:

Value

Meaning

S

Column is part of the product-sensitive interface

I

Column is for internal use only

For columns for which "Use" is I, the name of the column and its description do not appear in the explanation of the column.

Db2 directory table spaces and indexes

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

The directory table space, tables, and indexes are primarily intended for use by Db2 and are therefore subject to change.

Table 424. Table spaces and indexes for the directory tables

TABLE SPACE DSNDB01. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DBD01	DBDR	DSNDB01X	DBID.SECTION
SYSDBDXA	SYSDBD_DATA	DSNDB1XA	DBD_DATA
SCT02	SCTR	DSNSCT02	SCTNAME.SCTSEC. SPTSEQ
SPT01	SPTR	DSNSPT01	SPTPID.SPTSEC. SPTSEQ
		DSNSPT02	version.SPTID. SPTSEC.SPTSEQ
SYSSPUXA	SYSSPTSEC_DATA	DSNSPDXA	SPTSEC_DATA

SYSLGRNX	SYSLGRNX	DSNLLX01	LGRDBID.LGRPSID. LGRPART.LGRMEMB. LGRSLRSN
		DSNLLX02	LGRDBID.LGRPSID. LGRSLRSN
SYSUTILX	SYSUTIL	DSNLUX01	USUID
SYSUTILX	SYSUTILX	DSNLUX02	UTILID.SEQNO

SYSIBM.DBDR table

The DBDR table stores one row for each DBD section. The schema is SYSIBM.

Table 425. SYSIBM.SYSDBDR table column descriptions

Column name	Data type	Description	Use
	INTEGER	Not used	S
DBID	SMALLINT	DBID of the database	S
SECTION	SMALLINT	DBD section number	S
DBD_ROWID	ROWID	ID that is used to support the DBD_DATA column	S
DBD_DATA	BLOB(2G)	DBD data for the section	I

SYSIBM.SYSDBD_DATA table

The SYSDBD_DATA table is an auxiliary table for the SYSIBM.DBDR table. The schema is SYSIBM.

Table 426. SYSIBM.SYSDBD_DATA table column descriptions

Column name	Data type	Description	Use
DBD_DATA	BLOB(2G)	Contents of the DBD section.	I

SYSIBM.SCTR table

The SCTR table stores Skeleton Cursor Tables (SKCT) information. The schema is SYSIBM.

Table 427. SYSIBM.SCTR table column descriptions

Column name	Data type	Description	Use
SCTLL	CHAR (4) FOR BIT DATA	The length of the record.	S
SCTNAME	CHAR (14) FOR BIT DATA	The plan name, section number, and sequence number.	S
SCTDAT	VARCHAR(4028)	SKCT data.	I

SYSIBM.SPTR table

The SPTR table stores skeleton package table (SKPT) information. The schema is SYSIBM.

Table 428. SYSIBM.SPTR table column descriptions

Column name	Data type	Description	Use
SPTLL	INTEGER	The length of the record.	S
SPTLOCID	VARCHAR(128)	Package location.	S
SPTCOLID	VARCHAR(128)	Package collection ID.	S
SPTNAME	VARCHAR(128)	Package name.	S

Table 428. SYSIBM.SPTR table column descriptions (continued)

Column name	Data type	Description	Use
SPTCONID	CHAR(8) FOR BIT DATA	Package consistency token.	S
SPTRESV	CHAR(2) FOR BIT DATA	Internal use only.	I
SPTSEC	CHAR(4) FOR BIT DATA	Section number.	S
SPTSEQ	CHAR(2) FOR BIT DATA	Sequence number within the section.	S
SPTBODY	VARCHAR(1)	Reserved for future IBM use.	I
SPTVER	VARCHAR(64)	Package version.	S
SPT_ROWID	ROWID	ROWID that Db2 creates for the LOB columns in this table.	S
SPT_DATA	BLOB(2G)	Internal use only.	I
SPT_EXPLAIN	BLOB(2G)	Internal use only.	I

SYSIBM.SYSSPTSEC_DATA table

The SYSSPTSEC_DATA table is an auxiliary table that contains package data for the SPTR table. The schema is SYSIBM.

Table 429. SYSIBM.SYSSPTSEC_DATA table column descriptions

Column name	Data type	Description	Use
SPT_DATA	BLOB(2G)	Contents of the SKPT section	I

SYSIBM.SYSSPTSEC_EXPL table

The SYSSPTSEC_EXPL table is an auxiliary table that contains static package explain data for the SPTR table. The schema is SYSIBM.

Table 430. SYSIBM.SYSSPTSEC_EXPL table column descriptions

Column name	Data type	Description	Use
SPT_EXPLAIN	BLOB(2G)	Contents of the SKPT section explain block	I

SYSIBM.SYSLGRNX table

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for Db2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table. The schema is SYSIBM.

Table 431. SYSIBM.SYSLGRNX table column descriptions

Column name	Data type	Description	Use
LGRDBID	CHAR(2) FOR BIT DATA	DBID of the modified object	S
LGRPSID	CHAR(2) FOR BIT DATA	OBID of the modified object	S
LGRUCDT	CHAR(6)	Modification date in the form <i>mmdyy</i>	S
LGRUCTM	CHAR(8)	Modification time in the form <i>hhmmssst</i>	S
LGRSRBA	CHAR(10) FOR BIT DATA	Starting RBA	S
LGRSPBA	CHAR(10) FOR BIT DATA	Stopping RBA	S
LGRPART	SMALLINT	Partition number in the table space or index space	S
LGRSLRSN	CHAR(10) FOR BIT DATA	Starting LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the first update log record.	S
LGRELRSN	CHAR(10) FOR BIT DATA	Ending LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the last update log record.	S
LGRMEMB	CHAR(2)	Data sharing member ID of the modifying Db2 subsystem. X'0000' for a non-data-sharing environment.	S

SYSIBM.SYSUTIL table

The SYSUTIL table stores status information about Db2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted. The schema is SYSIBM.

Table 432. SYSIBM.SYSUTIL table column descriptions

Name	Data type	Description	Use
USUUID	CHAR(16)	UTILID value that was passed in a JOB statement parameter	S
USUJOBNM	CHAR(8)	Job name from the JOB statement	S
USUAUID	CHAR(8)	Authorization ID of the invoker	S
USURDATE	CHAR(4) FOR BIT DATA	Date of the utility	S
USUREL	CHAR(3)	Utility release level at restart time	S
USUIRQD	CHAR(1)	IBM required field	S

Table 432. SYSIBM.SYSUTIL table column descriptions (continued)

Name	Data type	Description	Use
USULSIZE	CHAR(4) FOR BIT DATA	List size	S
USULCUR	CHAR(4) FOR BIT DATA	The object that is currently being processed or was last processed	S
USUUTNAM	CHAR(8)	Name of the currently executing utility	S
USUPHASE	CHAR(8)	Current phase of the currently executing utility	S
USUDSNU	CHAR(2) FOR BIT DATA	Data set or piece number	S
USUDSNU2	CHAR(2) FOR BIT DATA	Ending number of the partition range	S
USUSTATU	CHAR(1)	Reserved	I
USUTREQ	CHAR(1)	Termination requested (Y or N)	S
USUFORCE	CHAR(1)	Element of USO forced (Y or N)	S
USURLOK	CHAR(1)	Reload was successful (Y or N)	S
USUCMPOK	CHAR(1)	Compatibility check passed (Y or N)	S
USURSFLG	BIT(8)	Utility restriction flags	S
USURTF LG	BIT(8)	Term settings	S
USURSFLG2	BIT(8)	Utility flags	S
USUPOS	CHAR(4) FOR BIT DATA	Relative USM position in the SYSIN DD statement	S
USUDONE	CHAR(8) FOR BIT DATA	Number of objects processed	S
USUCKSUM	CHAR(4) FOR BIT DATA	USU checksum	S
USUDBOB	CHAR(2) FOR BIT DATA	DBID for the table space	S
USUPSID	CHAR(2) FOR BIT DATA	PSID for the table space or index space	S
USUPSDD	CHAR(2) FOR BIT DATA	Secondary PSID for RECOVER INDEX data page set	S
USUCATMGFRM	CHAR(1) FOR BIT DATA	Saved catalog level for the release from which migration is done, from the DBD01 header page	S

Table 432. SYSIBM.SYSUTIL table column descriptions (continued)

Name	Data type	Description	Use
USUOFLAG	CHAR(1) FOR BIT DATA	Flags for object properties	S
USUDBNAM	CHAR(8)	Database name	S
USUSPNAM	CHAR(8)	Table space or index space name	S
USUMEMBR	CHAR(8)	Member name	S
USUOCATR	CHAR(1) FOR BIT DATA	Saved catalog release level, from the DBD01 header page	S
USUOCATV	CHAR(1) FOR BIT DATA	Saved catalog version level, from the DBD01 header page	S
USUOCATCV	CHAR(1) FOR BIT DATA	Saved migration mode, from the DBD01 header page	S
USUOCATH	CHAR(1) FOR BIT DATA	Saved highest version of the catalog	S
USUUDA	CHAR(150) FOR BIT DATA	Utility-dependent data	S
USURTIME	CHAR(4) FOR BIT DATA	Latest utility start time	S
USURLSN	CHAR(6) FOR BIT DATA	Latest utility start LRSN	S
USURDATO	CHAR(4) FOR BIT DATA	Original utility start date	S
USURTIMO	CHAR(4) FOR BIT DATA	Original utility start time	S
USURLSNO	CHAR(4) FOR BIT DATA	Original utility start LRSN	S
USUR5	CHAR(10) FOR BIT DATA	Reserved	I
USURCNTR	CHAR(31) FOR BIT DATA	Generic counter or value holder	S
USURLSNX	CHAR(10) FOR BIT DATA	Latest utility start LRSN value	S

Table 432. SYSIBM.SYSUTIL table column descriptions (continued)

Name	Data type	Description	Use
USURLSOX	CHAR(10) FOR BIT DATA	Original utility start LRSN value	S
USUR6		Reserved	I
USUSTRN	CHAR(27000) FOR BIT DATA	Utility-dependent restart information	S

SYSIBM.SYSUTILX table

The SYSUTILX table is a dependent of the SYSUTIL table. A record is created in the SYSUTILX table when the amount of information in the parent record exceeds the record size of SYSUTIL. The rows in SYSUTILX are uniquely identified by the utility identifier and sequence number.

Table 433. SYSIBM.SYSUTILX table column descriptions

Column name	Data type	Description	Use
UTILID	CHAR(16)	The utility ID that identifies the parent record in SYSIBM.SYSUTIL	S
SEQNO	SMALLINT	The sequence number of this row	S
	CHAR(12)	Reserved	I
CHECKPOINT	VARCHAR(32000)	The overflow checkpoint/restart information	S

Appendix J. Performance information for SQL application programming

Efficient applications are an important first step to good system and application performance. As you code applications that access data in Db2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in Db2 for z/OS.

Concurrency and programming

The goal is to program and prepare applications in a way that:

- Protects the integrity of the data that is being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about data concurrency in Db2 and recommendations for improving concurrency in your application programs, see the following topics:

- [Programming for concurrency \(Db2 Performance\)](#)
- [Designing databases for concurrency \(Db2 Performance\)](#)
- [Concurrency and locks \(Db2 Performance\)](#)
- [Improving concurrency \(Db2 Performance\)](#)
- [Improving concurrency in data sharing environments \(Db2 Data Sharing Planning and Administration\)](#)

Writing efficient queries

The predicates, subqueries, and other structures in SQL statements affect the access paths that Db2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- [Ways to improve query performance \(Introduction to Db2 for z/OS\)](#)
- [Writing efficient SQL queries \(Db2 Performance\)](#)

Analyzing access paths

By analyzing the access path that Db2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

Tip: Query tuning capabilities that can help you with this task, such as *visual explain* and *statistics advisor*, are available in [IBM Db2 Administration Foundation for z/OS](#) and [IBM Db2 for z/OS Developer Extension](#).

For information about how you can use EXPLAIN tables to analyze the access paths for your SQL statements, see the following topics:

- [Investigating access path problems \(Db2 Performance\)](#)
- [00C200A4 \(Db2 Codes\)](#)
- [Investigating SQL performance by using EXPLAIN \(Db2 Performance\)](#)
- [Interpreting data access by using EXPLAIN \(Db2 Performance\)](#)
- [EXPLAIN tables \(Db2 Performance\)](#)
- [“EXPLAIN statement” on page 1964](#)

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- [Ways to reduce network traffic \(Introduction to Db2 for z/OS\)](#)
- [Managing Db2 threads \(Db2 Performance\)](#)
- [Improving performance for applications that access distributed data \(Db2 Performance\)](#)
- [Improving performance for SQL statements in distributed applications \(Db2 Performance\)](#)

Stored procedures performance

For information about stored procedures and Db2 performance, see the following topics:

- [Implementing Db2 stored procedures \(Stored procedures provided by Db2\)](#)
- [Improving the performance of stored procedures and user-defined functions \(Db2 Performance\)](#)

Related concepts

[SQL: The language of Db2](#)

The language that you use to access the data in Db2 tables is the *structured query language (SQL)*. SQL is a standardized language for defining and manipulating data in a relational database.

Appendix K. Db2 XML schema repository tables

The Db2 for z/OS XML schema repository (XSR) is a set of Db2 tables where you can store XML schemas. Db2 creates the XSR tables during installation or migration. After you add XML schemas to the Db2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the Db2 XSR, you register XML schema documents to Db2. The XML schema documents must be in the Unicode encoding scheme.

Programming interface information

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the row that describes the table column. The meaning of the values for the "Use" column is indicated in the following table.

Table 434. Meaning of values in the "Use" column if table descriptions

Value	Meaning
G	Column is part of the general-use programming interface
S	Column is part of the product-sensitive interface
I	Column is for IBM use only
N	Column is not used

For columns for which "Use" is N or I, the name of the column and its description do not appear in the explanation of the column.

XML schema repository (XSR) table spaces and indexes

Db2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 435. Table spaces and indexes for the DSNXSR database tables

Table space DSNXSR. ...	Table SYSIBM. ...	Index SYSIBM. ...	Index fields
SYSXSR	XSROBJECTS	XSROBJ01	XSROBJECTID
		XSROBJ02	XSROBJECTSCHEMA.XSROBJECTNAME
		XSROBJ03	TARGETNAMESPACE.SCHEMALOCATION

Table 435. Table spaces and indexes for the DSNXSR database tables (continued)

Table space DSNXSR. ...	Table SYSIBM. ...	Index SYSIBM. ...	Index fields
		XSROBJ04	SCHEMALOCATION
	XSROBJECT- COMPONENTS	XSRCOMP01	XSRCOMPONENTID
		XSRCOMP02	TARGETNAMESPACE.SCHEMALOCATION
	XSROBJECT- HIERARCHIES	XSRHIER01	XSROBJECTID.TARGETNAMESPACE. SCHEMALOCATION
		XSRHIER02	XSROBJECTID.TARGETNAMESPACE
SYSXSRA1	XSROBJECTGRAMMAR	XSRXOG01	GRAMMAR
SYSXSRA2	XSROBJECTPROPERTY	XSRXOP01	PROPERTIES
SYSXSRA3	XSRCOMPONENT	XSRXCC01	COMPONENT
SYSXSRA4	XSRPROPERTY	XSRXCP01	PROPERTIES

Note: Index field is in descending order

XSRRANNOTATIONINFO table

The XSRRANNOTATIONINFO table contains one row for each annotation in an XML schema to record the table and column information for the annotation. The schema is SYSIBM.

Table 436. SYSIBM.XSRRANNOTATIONINFO table column descriptions

Column name	Data type	Description	Use
XSROBJECTID	INTEGER	Internal identifier of the XML schema	G
ANNID	INTEGER	Internal identifier of the XML schema annotation	G
TABSCHEMA	VARCHAR(128)	Schema of the table for which annotation information is recorded	G
TABNAME	VARCHAR(128)	Name of the table for which annotation information is recorded	G
ROWSET	INTEGER	Name of the rowset for this annotation	G
COLNAME	VARCHAR(30)	Name of the column for this annotation	G
COLTYPE	INTEGER	Data type of the column for this annotation	G

Table 436. SYSIBM.XSRANNOTATIONINFO table column descriptions (continued)

Column name	Data type	Description	Use
INSTANCETYPE	INTEGER	Type of data that is provided by the parser during decomposition: 2 Decimal 4 Long integer 5 Integer 6 Short integer 16 String 30 Datetime 41 Float 42 Double	G
TRUNCATE	INTEGER	Indication of whether data can be truncated: 0 Data cannot be truncated 1 Data can be truncated	G
EXPRESSION	VARCHAR(1024)	Expression to be applied to data on insert by Db2	G
CONDITION	VARCHAR(1024)	Condition to be applied before any data is inserted by Db2	G
CASTEXPRESSION	VARCHAR(20)	Cast expression to be applied when the column data is inserted by Db2 during decomposition.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See the information on release dependency indicators in Db2 catalog tables for the values.	G

XSRCOMPONENT table

The XSRCOMPONENT table is an auxiliary table for the BLOB column COMPONENT in the SYSIBM.XSROBJECTCOMPONENTS table. It is in LOB table space SYSXSRA3. The schema is SYSIBM.

Table 437. SYSIBM.XSRCOMPONENT table column descriptions

Column name	Data type	Description	Use
COMPONENT	BLOB(30M)	Contents of the XML schema document	G

XSROBJECTS table

The XSROBJECTS table contains one row for each registered XML schema. The schema is SYSIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Table 438. SYSIBM.XSROBJECTS table column descriptions

Column name	Data type	Description	Use
XSROBJECTID	INTEGER NOT NULL	Internal identifier of the XML schema. XSROBJECTID is generated as an identity column.	G
XSROBJECTSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the XML schema name. This is always set to 'SYSXSR'.	G
XSROBJECTNAME	VARCHAR(128) NOT NULL	Name of the XML schema.	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
GRAMMAR	BLOB(250M)	The internal binary representation of the XML schema.	G
PROPERTIES	BLOB(5M)	Additional property information of the entire XML schema.	G
CREATEDBY	VARCHAR(128) NOT NULL	Authorization ID under which the XML schema was created.	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the Db2-supplied stored procedure XSR_REGISTER was executed for the XML schema.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: C Complete I Incomplete T Temporary	G

Table 438. SYSIBM.XSROBJECTS table column descriptions (continued)

Column name	Data type	Description	Use
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
	CHAR(1)	Not used.	N
	VARCHAR(128)	Not used.	N
REMARKS	VARCHAR(762)	Character string that contains comments about this XML schema.	G

XSROBJECTCOMPONENTS table

The XSROBJECTCOMPONENTS table contains one row for each component (document) in an XML schema. The schema is SYIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Table 439. SYSIBM.XSROBJECTCOMPONENTS table column descriptions

Column name	Data type	Description	Use
XSRCOMPONENTID	INTEGER NOT NULL	Internal identifier of the XML schema document. XSRCOMPONENTID is generated as an identity column.	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
COMPONENT	BLOB(30M) NOT NULL	Contents of the XML schema document.	G
PROPERTIES	BLOB(5M)	If available, additional property information of the XML schema document	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the XML schema document was registered.	G

Table 439. SYSIBM.XSROBJECTCOMPONENTS table column descriptions (continued)

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: C Complete I Incomplete	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

XSROBJECTGRAMMAR table

The XSROBJECTGRAMMAR table is an auxiliary table for the BLOB column GRAMMAR in SYSIBM.XSROBJECTS. It is in LOB table space SYSXSRA1. The schema is SYSIBM.

Table 440. SYSIBM.XSROBJECTGRAMMAR table column descriptions

Column name	Data type	Description	Use
GRAMMAR	BLOB(250M)	Internal binary representation of the XML schema	G

XSROBJECTHIERARCHIES table

The XSROBJECTHIERARCHIES table contains one row for each component (document) in an XML schema to record the XML schema document hierarchy relationship. The schema is SYSIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Table 441. SYSIBM.XSROBJECTHIERARCHIES table column descriptions

Column name	Data type	Description	Use
XSROBJECTID	INTEGER	Internal identifier of the XML schema.	G
XSRCOMPONENTID	INTEGER	Internal identifier of the XML schema document.	G
HTYPE	CHAR(1)	Hierarchy type: D Document P Primary document	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G

Table 441. SYSIBM.XSROBJECTHIERARCHIES table column descriptions (continued)

Column name	Data type	Description	Use
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

XSROBJECTPROPERTY table

The XSROBJECTPROPERTY table is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.XSROBJECTS. It is in LOB table space SYSXSRA2. The schema is SYSIBM.

Table 442. SYSIBM.XSROBJECTPROPERTY table column descriptions

Column name	Data type	Description	Use
PROPERTIES	BLOB(5M)	Contents of the additional property information of the entire XML schema.	G

XSRPROPERTY table

The XSRPROPERTY table is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.XSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA4. The schema is SYSIBM.

Table 443. SYSIBM.XSRPROPERTY table column descriptions

Column name	Data type	Description	Use
COMPONENT	BLOB(5M)	Contents of the additional property information of the XML schema document.	G

Appendix L. EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on Db2 for z/OS.

You can create and maintain a set of *EXPLAIN tables* to capture and analyze information about the performance of SQL statements and functions that run on Db2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. Db2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.
- At BIND or REBIND with the EXPLAIN(YES) or (ONLY) bind options. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.

Important: It is best to convert EXPLAIN tables to Db2 13 format during migration, or soon after migration. In Db2 13, the EXPLAIN function supports tables in Db2 13 or Db2 12 formats only. However, Db2 12 format EXPLAIN tables are deprecated. If you invoke EXPLAIN and Db2 12 tables are used, Db2 issues SQL code +20520. If tables of an unsupported format are found, Db2 issues SQL code -20008 and the EXPLAIN operation fails. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Related reference

[BIND and REBIND options for packages, plans, and services \(Db2 Commands\)](#)

[EXPLAIN statement](#)

[ADMIN_EXPLAIN_MAINT stored procedure](#)

You can use the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade the tables to the format for the current Db2 version, and complete other administrative tasks.

PLAN_TABLE

The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

Tip: You can generate diagrams of the access paths used for your SQL statements by using the *visual explain* capability in tools such as [IBM Db2 Administration Foundation for z/OS](#) and [IBM Db2 for z/OS Developer Extension](#).

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Optional PLAN_TABLE formats

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

Db2 13 format

All columns shown in the sample CREATE TABLE statement, up to and including the AP_PLANID column (COLCOUNT=68).

Db2 12 format

All columns shown in the sample CREATE TABLE statement, up to and including the PER_STMT_ID column (COLCOUNT=67).

Important: If the EXPLAIN tables have any format older than the Db2 12 format, Db2 returns an error for any operation that tries to insert rows in the EXPLAIN tables. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

Table 444. Descriptions of columns in PLAN_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: 0 The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. 1 A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. 2 A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. 3 Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. 4 A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Table • Materialized query table • Created or declared temporary table • Materialized view • Materialized table expression • Any of the following object names that identify intermediate results: 'DSNWFQB(qblockno)' The intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. 'DSN_DIM_TBLX(qblockno)' The work file of a star join dimension table. 'DSN_SPIX_TBLX(qblockno)' A sparse index used for a sideways table reference. The value is blank if METHOD is 3.
TABNO	SMALLINT NOT NULL	Values are for IBM use only.
ACCESSTYPE ^{"1" on page 2898}	CHAR(2) NOT NULL	The method of accessing the new table. ^{"4" on page 2898}
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, IN, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(<i>mixopseqno</i>) is the starting pair-wise join leg in MIXOPSEQ; otherwise, blank.
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. Y Yes N No

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. Y Yes N No
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. Y Yes N No
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. Y Yes N No
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. Y Yes N No
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. Y Yes N No
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. Y Yes N No
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. Y Yes N No

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. Y Yes N No
TSLOCKMODE	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: IS Intent share lock IX Intent exclusive lock S Share lock U Update lock X Exclusive lock SIX Share with intent exclusive lock N UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. NS For UR isolation, no lock; for CS, RS, or RR, an S lock. NIS For UR isolation, no lock; for CS, RS, or RR, an IS lock. NSS For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. SS For UR, CS, or RS isolation, an IS lock; for RR, an S lock. Continues in next row.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TSLOCKMODE (continued)		Continued from previous row. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.
TIMESTAMP	CHAR(16) NOT NULL	This column is deprecated. Use EXPLAIN_TIME instead.
REMARKS	VARCHAR(762) NOT NULL	A field into which you can insert any character string of 762 or fewer characters. Db2 inserts a value into this column in certain situations. “6” on page 2900, “7” on page 2901
PREFETCH	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether data pages are to be read in advance by prefetch: 'D' Optimizer expects dynamic prefetch 'S' Pure sequential prefetch 'L' Prefetch through a page list 'U' List prefetch with an unsorted RID list blank Unknown or no prefetch

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
COLUMN_FN_EVAL	CHAR(1) NOT NULL WITH DEFAULT	When an SQL aggregate function is evaluated: 'R' While the data is being read from the table or index 'S' While performing a sort to satisfy a GROUP BY clause 'X' While data is read from a table or index, for aggregate functions when an OFFSET clause is specified 'Y' While performing a sort, for aggregate functions when an OFFSET clause is specified blank After data retrieval and after any sorts
MIXOPSEQ	SMALLINT NOT NULL WITH DEFAULT	The sequence number of a step in a multiple index operation. 1, 2, ... n For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), the sequence number of the OR predicate in the SQL statement. (ACCESSTYPE is 'NR'). 0 For any other rows.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package, to a statement that is explained when binding a package, or to a manually created PLAN_TABLE row for an optimization hint. If the value is not blank, the value is the same as one of the following: • The VERSION value for the package that was used to create this EXPLAIN table row. • For a manually created EXPLAIN table row, the VERSION value that identifies the statement for which the hint is used. For a row that is created by execution of an EXPLAIN statement or by binding a package with the EXPLAIN option, the version is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNDYNAMICSQLCACHE' The row originates from the dynamic statement cache. 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
ACCESS_PGROUP_ID ^{"2"} on page 2898	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
JOIN_PGROUP_ID ^{"2"} on page 2898	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTC_PGROUP_ID ^{"3"} on page 2898	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTN_PGROUP_ID ^{"3"} on page 2898	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PARALLELISM_ MODE“2” on page 2898	CHAR(1)	The kind of parallelism, if any, that is used at bind time: C Query CP parallelism. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns, if the method that it refers to does not apply, or if the plan or package was bound prior to DB2 10.
MERGE_ JOIN_ COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
CORRELATION_ NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. Y Yes blank No
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: F FULL OUTER JOIN L LEFT OUTER JOIN P Pair-wise join S Star join blank INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
IBM_SERVICE_DATA	VARCHAR(254) FOR BIT DATA	This column contains values that are for IBM use only.
WHEN_OPTIMIZE	CHAR(1) NOT NULL WITH DEFAULT	When the access path was determined: blank At bind time, using a default filter factor for any host variables, parameter markers, or special registers. B At bind time, using a default filter factor for any host variables, parameter markers, or special registers; however, the statement is re-optimized at run time using input variable values for input host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for reoptimization to occur. R At run time, using input variables for any host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for this to occur.
QBLOCK_TYPE “1” on page 2898	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type. “5” on page 2899
BIND_TIME	TIMESTAMP NOT NULL WITH DEFAULT	This column is deprecated. Use EXPLAIN_TIME instead.
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	A string that you use to identify this row as an optimization hint for Db2. Db2 uses this row as input when choosing an access path.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
HINT_USED	VARCHAR(128) NOT NULL WITH DEFAULT	One of the following values: 'APREUSE' When an access path was successfully reused because the APREUSE option was specified at bind or rebind. 'opthint-value' When PLAN_TABLE access path hints are used. <i>opthint-value</i> is the value of the OPTHINT column for the hint that was used. 'SYSQUERYPLAN query-id' When statement-level access path hints are used. <i>query-id</i> is the value of the QUERYID column in the SYSQUERYPLAN catalog table for the hint. 'SYSQUERYSEL query-id' When a predicate selectivity override is used. <i>query-id</i> is the value of the QUERYID column of the SYSQUERYSEL catalog table row for the hint. 'EXPLAIN PACKAGE: COPY copy-id' When the row is the result of an EXPLAIN PACKAGE statement. <i>copy-id</i> is one of the following values: CURRENT The current copy of the package. PREVIOUS The previous copy of the package. ORIGINAL The original copy of the package. 'EXPLAIN SDQ: copy-id-number' The string <i>copy-id-number</i> can have one of the following values: CURRENT The current copy. INVALID The invalid copy.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether direct row access is attempted first: 'D' Db2 tries to use direct row access with a rowid column. If Db2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE. 'P' Db2 used data partitioned secondary index and a part-level operation to access the data. 'S' Db2 used sparse index access for a sideways table reference. 'T' The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed. blank Db2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.
PARENT_QBLOCKNO	SMALLINT NOT NULL WITH DEFAULT	A number that indicates the QBLOCKNO of the parent query block.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TABLE_TYPE	CHAR(1)	The type of new table: 'B' Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement. 'C' Common table expression 'F' Table function 'I' The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table. 'M' Materialized query table 'Q' Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed. 'R' Recursive common table expression 'S' Subquery (correlated or non-correlated) 'T' Table 'W' Work file The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.
TABLE_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	The encoding scheme of the table. The possible values are: 'A' ASCII 'E' EBCDIC 'U' Unicode 'M' The table contains multiple CCSID sets

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.
ROUTINE_ID	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.
STMTTOKEN	VARCHAR(240)	User-specified statement token.
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.
BIND_EXPLAIN_ONLY	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether the row was inserted because a command specified the EXPLAIN(ONLY) option.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MERGC	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the composite table is consolidated before the join. 'Y' Yes 'N' No
MERGN	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the new table is consolidated before the join, or whether access that used a data partitioned secondary index (DPSI) involved a merge operation. 'Y' Yes, the new table is consolidated before the join. 'N' No, the new table is not consolidated before the join 'D' Access through a DPSI involved a merge operation. 'U' Access through a DPSI that did not involve a merge operation.
SCAN_DIRECTION	CHAR(1)	For index access, the direction of the index scan: 'F' Forward 'R' Reverse blank Index scan is not used

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES
EXPANSION_REASON (continued)		This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.

Table 444. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

Notes:

1. For PLAN_TABLE rows in which ACESSTYPE='A' and QBLOCK_TYPE='SELECT', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:
 - PARALLELISM_MODE
 - ACCESS_PGROUP_ID
 - JOIN_PGROUP_ID
3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
 - SORTN_PGROUP_ID
 - SORTC_PGROUP_ID
4. The ACESSTYPE column contains the following values:
 - 'A'
The query is sent to an accelerator server.
 - 'DI'
By an intersection of multiple DOCID lists to return the final DOCID list
 - 'DU'
By a union of multiple DOCID lists to return the final DOCID list
 - 'DX'
By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list
 - 'E'
By direct row access using a row change timestamp column.
 - 'H'
By hash access. IF an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.
 - 'HN'
By hash access using an IN predicate, or an IN predicate that Db2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.
 - 'I'
By an index (identified in ACCESSCREATOR and ACCESSNAME)

'IN'

By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.

'I1'

By a one-fetch index scan

'M'

By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:

- 'DI'
- 'DU'
- 'MH'
- 'MI'
- 'MU'
- 'MX'

'MH'

By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.

'MI'

By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.

'MU'

By a union of multiple indexes. A row that contains this value always follows a row that contains M.

'MX'

By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.

'N'

One of the following types:

- By an index scan when the matching predicate contains the IN keyword
- By an index scan when Db2 rewrites a query using the IN keyword

'O'

Use of a work file was avoided when processing the result of a subquery, table expression, view, or intermediate result table.

'NR'

Range list access.

'P'

By a dynamic pair-wise index scan

'R'

By a table space scan

'RW'

By a work file scan of the result of a materialized user-defined table function

'V'

By buffers for an INSERT statement within a SELECT

blank

Not applicable to the current row

5. The QBLOCK_TYPE column contains the following values:

'SELECT'

SELECT

'INSERT'

INSERT

'UPDATE'

UPDATE

'MERGE'

MERGE

'DELETE'

DELETE

'SELUPD'

SELECT with FOR UPDATE OF

'DELCUR'

DELETE WHERE CURRENT OF CURSOR

'UPDCUR'

UPDATE WHERE CURRENT OF CURSOR

'CORSUB'

Correlated subselect or fullselect

'COTBLX'

A table expression with a sideways reference.

'TRUNCA'

TRUNCATE

'NCOSUB'

Noncorrelated subselect or fullselect

'TABLEX'

Table expression

'TRIGGR'

WHEN clause on CREATE TRIGGER

'UNION'

UNION

'UNIONA'

UNION ALL

'INTERS'

INTERSECT

'INTERA'

INTERSECT ALL

'EXCEPT'

EXCEPT

'EXCPTA'

EXCEPT ALL

'PRUNED'

Db2 does not generate an access path for the query because the query is guaranteed to qualify zero rows, such as the case of an always-false WHERE clause. For example: WHERE 0=1

6. Db2 inserts a value into the REMARKS column at bind or rebind when the EXPLAIN(ONLY) option is specified and reuse or comparison fails for an access path. The value might include the following information:

- A reason code that corresponds to the reason codes in [SQLCODE +395](#) when reuse fails
- The name of the unmatched PLAN_TABLE column for which comparison failed
- The string 'UNMATCHED ROW(S)', which indicates that there are extra rows in addition to the rows in the original access path, or there are fewer rows than in the original access path.

The values that are in the REMARKS column as a result of a reuse or comparison failure do not describe all the access path differences. The REMARKS values are not sufficient to determine if an access path change is acceptable. They are an indication that further analysis might be necessary to determine how the access path has changed, and whether the changes warrant any further action.

7. Db2 inserts a value into the REMARKS column when selectivity overrides cannot be used for a statement. The value contains a reason code that indicates why the selectivity override was not used. The value might also contain additional diagnostic information.

The reason code values correspond to [SQLCODE +395](#) reason codes:

'1'-'41'

Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

'42'

Indicates that the structure of the selectivity override is not valid. Generate the selectivity override again.

'43'

The selectivity override cannot be applied because of an unexpected error. If the problem persists, you might need to contact IBM Support.

'44'-'99'

Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for statement-level access paths and optimization parameters. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.

The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTEESC member of the SDSNSAMP library.

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

DSN_COLDIST_TABLE

The column distribution table contains non-uniform column group statistics that are obtained dynamically by Db2 from non-index leaf pages.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

PSPI

The following table shows the descriptions of the columns in the DSN_COLDIST_TABLE table.

Table 445. Descriptions of columns in DSN_COLDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SCHEMA	VARCHAR(128) NOT NULL	The schema of the table that contains the column.

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
TBNAME	VARCHAR(128) NOT NULL	The name of the table that contains the column.
NAME	VARCHAR(128) NOT NULL	Name of the column. If the value of NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value in the column. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. This column might contain values that depend on the value of the type column: TYPE='T' One of the following values: • 'E3C2C1C3C1D9C4C6' for TBACARDF • 'E3C2C1D5C1C3E3C6' for TBANPAGF • 'E3C2C1D5D7C1C7C6' for TBANACTF TYPE='L' 'C3C1E3C6D3C4C3C6' for CATFLDCF TYPE='P' One of the following values: • 'D7C3C1D7D5D9E6C6' for PCAPNRWF • 'D7C3C1D7D5D7C7C6' for PCAPNPGF
TYPE	CHAR(1) NOT NULL	The type of statistics: C Cardinality F Frequent value H Histogram T Real-time table cardinality L Real-time column cardinality (unique index only) P real-time partition cardinality

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='T', a value related to real-time statistics table values that are determined by the COLVALUE column. For TYPE='L', a value related to a real-time statistics column value that is determined by the COLVALUE column. The QUANTILENO column contains the column number. The NAME column contains the column name. For TYPE='P' a value related to real-time statistics partition value that is determined by the COLVALUE column. The QUANTILENO column contains the partition number.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	The identity of the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column. This is an updatable column.
NUMCOLUMNS	SMALLINT NOT NULL	Identifies the number of columns associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable. For TYPE='L', this column contains the column number. For TYPE='P', the column contains the partition number.
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES

Table 445. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON (continued)		This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

DSN_DETCOST_TABLE

The detailed cost table, DSN_DETCOST_TABLE, contains information about detailed cost estimation of the mini-plans in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

Table 446. DSN_DETCOST_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each mini-plan with a query block.
OPENIO	FLOAT(4) NOT NULL	The Do-at-open IO cost for non-correlated subquery.
OPENCPU	FLOAT(4) NOT NULL	The Do-at-open CPU cost for non-correlated subquery.
OPENCOST	FLOAT(4) NOT NULL	The Do-at-open total cost for non-correlated subquery.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
DMIO	FLOAT(4) NOT NULL	IBM internal use only.
DMCPU	FLOAT(4) NOT NULL	IBM internal use only.
DMTOT	FLOAT(4) NOT NULL	IBM internal use only.
SUBQIO	FLOAT(4) NOT NULL	IBM internal use only.
SUBQCOST	FLOAT(4) NOT NULL	IBM internal use only.
BASEIO	FLOAT(4) NOT NULL	IBM internal use only.
BASECPU	FLOAT(4) NOT NULL	IBM internal use only.
BASETOT	FLOAT(4) NOT NULL	IBM internal use only.
ONECOMPROWS	FLOAT(4) NOT NULL	The number of rows qualified after applying local predicates.
IMLEAF	FLOAT(4) NOT NULL	The number of index leaf pages scanned by Data Manager.
IMIO	FLOAT(4) NOT NULL	IBM internal use only.
IMPREFH	CHAR(2) NOT NULL	IBM internal use only.
IMMPRED	INTEGER NOT NULL	IBM internal use only.
IMFF	FLOAT(4) NOT NULL	The filter factor of matching predicates only.
IMSRPRED	INTEGER NOT NULL	IBM internal use only.
IMFFADJ	FLOAT(4) NOT NULL	The filter factor of matching and screening predicates.
IMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
IMROWCST	FLOAT(4) NOT NULL	IBM internal use only.
IMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
IMRIDSORT	FLOAT(4) NOT NULL	IBM internal use only.
IMMERGCST	FLOAT(4) NOT NULL	IBM internal use only.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
IMCPU	FLOAT(4) NOT NULL	IBM internal use only.
IMTOT	FLOAT(4) NOT NULL	IBM internal use only.
IMSEQNO	SMALLINT NOT NULL	IBM internal use only.
DMPEREFH	FLOAT(4) NOT NULL	IBM internal use only.
DMCLUDIO	FLOAT(4) NOT NULL	IBM internal use only.
DMPREDS	INTEGER NOT NULL	IBM internal use only.
DMSROWS	FLOAT(4) NOT NULL	IBM internal use only.
DMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
DMCOLS	FLOAT(4) NOT NULL	The number of data manager columns.
DMROWS	FLOAT(4) NOT NULL	The number of data manager rows returned (after all stage 1 predicates are applied).
RDSROWCST	FLOAT(4) NOT NULL	IBM internal use only.
DMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATACPU	FLOAT(4) NOT NULL	IBM internal use only.
DMDATATOT	FLOAT(4) NOT NULL	IBM internal use only.
RDSROW	FLOAT(4) NOT NULL	The number of RDS rows returned (after all stage 1 and stage 2 predicates are applied).
SNCOLS	SMALLINT NOT NULL	The number of columns as sort input for new table.
SNROWS	FLOAT(4) NOT NULL	The number of rows as sort input for new table.
SNRECSZ	INTEGER NOT NULL	The record size for new table.
SNPAGES	FLOAT(4) NOT NULL	The page size for new table.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
SNRUNS	FLOAT(4) NOT NULL	The number of runs generated for sort of new table.
SNMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort.
SNIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SNSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SNCCOLS	FLOAT(4) NOT NULL	The number of columns as sort input for Composite table.
SCROWS	FLOAT(4) NOT NULL	The number of rows as sort input for Composite Table.
SCRECSZ	FLOAT(4) NOT NULL	The record size for Composite table.
SCPAGES	FLOAT(4) NOT NULL	The page size for Composite table.
SCRUNS	FLOAT(4) NOT NULL	The number of runs generated during sort of composite.
SCMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort of composite.
SCIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCARD	FLOAT(4) NOT NULL	The total composite cardinality.
COMPIOCOST	FLOAT(4) NOT NULL	IBM internal use only.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
COMPCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCOST	FLOAT(4) NOT NULL	The total cost.
JOINCOLS	SMALLINT NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
COSTBLK	INTEGER NOT NULL	IBM internal use only.
COSTSTOR	INTEGER NOT NULL	IBM internal use only.
MPBLK	INTEGER NOT NULL	IBM internal use only.
MPSTOR	INTEGER NOT NULL	IBM internal use only.
COMPOSITES	INTEGER NOT NULL	IBM internal use only.
CLIPPED	INTEGER NOT NULL	IBM internal use only.
TABREF	VARCHAR(64) NOT NULL FOR BIT DATA	IBM internal use only.
MAX_COMPOSITES	INTEGER NOT NULL	IBM internal use only.
MAX_STOR	INTEGER NOT NULL	IBM internal use only.
MAX_CPU	INTEGER NOT NULL	IBM internal use only.
MAX_ELAP	INTEGER NOT NULL	IBM internal use only.
TBL_JOINED_THRESH	INTEGER NOT NULL	IBM internal use only.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
STOR_USED	INTEGER NOT NULL	IBM internal use only.
CPU_USED	INTEGER NOT NULL	IBM internal use only.
ELAPSED	INTEGER NOT NULL	IBM internal use only.
MIN_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCOST	FLOAT(4) NOT NULL	IBM internal use only.
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of inner table index access. It is aggregated from uncertainty of inner table probing predicates. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
UNCERTAINTY_1T	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of ONECOMPROWS column of the table. It is aggregated from all local predicates on the table. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(128) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
IMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
DMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJBC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
CRED	INTEGER NOT NULL WITH DEFAULT	IBM internal use only.
IXSCAN_SKIP_DUPS	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether duplicate index key values are skipped during an index scan. 'Y' Duplicate key values are skipped. 'N' Duplicate key values are not skipped.
IXSCAN_SKIP_SCREEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether key ranges that are disqualified by index screening predicates are skipped during an index scan. 'Y' Disqualified key ranges are skipped. 'N' Key ranges are not skipped.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
EARLY_OUT	CHAR(1) NOT NULL WITH DEFAULT ''	Whether fetching from the table stops after the first qualified row. 'Y' Internal fetching stops after the first qualified row 'N' Internal fetching continues after the first qualified row. blank The EXPLAIN information was captured in a previous release, or the EXPLAIN information was captured for a package that was bound in a previous release.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.

Table 446. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
BLOCK_FETCH	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether block fetch was used for the query. 'Y' Block fetch was used. 'N' Block fetch was not used.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

DSN_FILTER_TABLE

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading

EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_FILTER_TABLE.

Table 447. DSN_FILTER_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 447. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
ORDERNO	INTEGER NOT NULL	The sequence number of evaluation. Indicates the order in which the predicate is applied within each stage
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.
STAGE	CHAR(9) NOT NULL	The processing stage in which the predicate is evaluated: MATCHING During the index matching stage. SCREENING During the index screening stage. PAGERANGE Db2 used page range screening to limit the number of partitions that were accessed to evaluate the predicate in a join context. STAGE1 During stage 1 processing, after data page access. STAGE2 During stage 2 processing on the returned data rows.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MIXOPSEQNO	SMALLINT NOT NULL	IBM internal use only.
REEVAL	CHAR(1) NOT NULL	IBM internal use only.

Table 447. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
PUSHDOWN	CHAR(1) NOT NULL WITH DEFAULT	Whether the predicate is pushed down the Index Manager or Data Manager subcomponents for evaluation: 'I' The Index Manager subcomponent evaluates the predicate. 'D' The Data Manager subcomponent evaluates the predicate. blank The predicate is not pushed down for evaluation.

Table 447. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

DSN_FUNCTION_TABLE

The function table, DSN_FUNCTION_TABLE, contains descriptions of functions that are used in specified SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

PSPI

The following table describes the columns of DSN_FUNCTION_TABLE.

Table 448. Descriptions of columns in DSN_FUNCTION_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 448. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNDYNAMICSQLCACHE' The row originates from the dynamic statement cache. 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SCHEMA_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the function invoked in the explained statement.
FUNCTION_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the function invoked in the explained statement.
SPEC_FUNC_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The specific name of the function invoked in the explained statement.
FUNCTION_TYPE	CHAR(2) NOT NULL WITH DEFAULT	The type of function invoked in the explained statement. Possible values are: CU Column function SU Scalar function TU Table function

Table 448. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
VIEW_CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the creator of the view. Otherwise, blank.
VIEW_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the name of the view. Otherwise, blank.
PATH	VARCHAR(2048) NOT NULL WITH DEFAULT	The value of the SQL path that was used to resolve the schema name of the function.
FUNCTION_TEXT	VARCHAR(1500) NOT NULL WITH DEFAULT	The text of the function reference (the function name and parameters). If the function reference is over 100 bytes, this column contains the first 100 bytes. For functions specified in infix notation, FUNCTION_TEXT contains only the function name. For example, for a function named /, which overloads the SQL divide operator, if the function reference is A/B, FUNCTION_TEXT contains only /.
FUNC_VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	For a version of a non-inline SQL scalar function, this column contains the version identifier. For all other cases, this column contains a zero length string. A version of a non-inline SQL scalar function is defined in the SYSIBM.SYSROUTINES table with ORIGIN='Q', FUNCTION_TYPE='S', INLINE='N', and VERSION column containing the version identifier.
SECURE	CHAR(1) NOT NULL WITH DEFAULT	Whether the user-defined function is secure.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 448. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	Used to uniquely identify the BIND or PREPARE optimizations for a SQL statement. Contains an extended timestamp value.

Related tasks

Checking how Db2 resolves functions by using DSN_FUNCTION_TABLE (Db2 Application programming and SQL)

DSN_KEYTGTDIST_TABLE

The key-target distribution table contains non-uniform index expression statistic that are obtained dynamically by the Db2 optimizer.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. COLUMN descriptions

The following table shows the descriptions of the columns in the DSN_KEYTGTDIST_TABLE table.

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
KEYSEQ	VARCHAR(128) NOT NULL	The numeric position of the key-target in the index.

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
KEYVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. When the value of the TYPE column contains 'I', this column contains one of the following values: • 'C9C4E7C6E4D3D2C6' for IDXFULKF • 'C9C4E7D3C5C1C6C6' for IDXLEAFF • 'C9C4E7D5D3E5D3C6' for IDXNLVLF
TYPE	CHAR(1) NOT NULL	The type of statistics: C Cardinality F Frequent value H Histogram I Real-time index statistics
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='I', a value related to real-time index statistics values determined by the KEYVALUE column.
KEYGROUPKEYNO	VARCHAR(254) NOT NULL FOR BIT DATA	Contains a value that identifies the set of keys that are associated with the statistics. If the statistics are associated with more than a single key, it contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS. If the statistics are only associated with a single key, it contains 0.
NUMKEYS	SMALLINT NOT NULL	The number of keys that are associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES

Table 449. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON (continued)		This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

Related concepts

[Dynamic collection of index filtering estimates \(Db2 Performance\)](#)

DSN_PGRANGE_TABLE

The page range table, DSN_PGRANGE_TABLE, contains information about qualified partitions for all page range scans in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_PGRANGE_TABLE.

Table 450. DSN_PGRANGE_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
RANGE	SMALLINT NOT NULL	The sequence number of the current page range.
FIRSTPART	SMALLINT NOT NULL	The starting partition in the current page range.
LASTPART	SMALLINT NOT NULL	The ending partition in the current page range.
NUMPARTS	SMALLINT NOT NULL	The number of partitions in the current page range.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 450. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 450. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 450. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.

Table 450. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

DSN_PGROUP_TABLE

The parallel group table, DSN_PGROUP_TABLE, contains information about the parallel groups in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_PGROUP_TABLE

Table 451. DSN_PGROUP_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNAME	VARCHAR(24) NOT NULL	The application plan name.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 451. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
GROUPID	SMALLINT NOT NULL	The parallel group identifier within the current query block.
FIRSTPLAN	SMALLINT NOT NULL	The plan number of the first contributing mini-plan associated within this parallel group.
LASTPLAN	SMALLINT NOT NULL	The plan number of the last mini-plan associated within this parallel group.

Table 451. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
CPUCOST	REAL NOT NULL	The estimated total CPU cost of this parallel group in milliseconds.
IO COST	REAL NOT NULL	The estimated total I/O cost of this parallel group in milliseconds.
BESTTIME	REAL NOT NULL	The estimated elapsed time for each parallel task for this parallel group.
DEGREE	SMALLINT NOT NULL	The degree of parallelism for this parallel group determined at bind time. Max parallelism degree if the Table space is large is 255, otherwise 64.
MODE	CHAR(1) NOT NULL	The parallel mode: 'I' I/O parallelism 'C' CPU parallelism 'N' No parallelism
REASON	SMALLINT NOT NULL	The reason code for downgrading parallelism mode.
LOCALCPU	SMALLINT NOT NULL	The number of CPUs currently online when preparing the query.
TOTALCPU	SMALLINT NOT NULL	The total number of CPUs in sysplex. LOCALCPU and TOTALCPU are different only for the Db2 coordinator in a sysplex.
FIRSTBASE	SMALLINT	The table number of the table that partitioning is performed on.
LARGETS	CHAR(1)	'Y' if the TableSpace is large in this group.
PARTKIND	CHAR(1)	The partitioning type: 'L' Logical partitioning 'P' Physical partitioning
GROUPTYPE	CHAR(3)	Determines what operations this parallel group contains: table Access, Join, or Sort 'A' 'AJ' 'AJS'
ORDER	CHAR(1)	The ordering requirement of this parallel group : 'N' No order. Results need no ordering. 'T' Natural Order. Ordering is required but results already ordered if accessed via index. 'K' Key Order. Ordering achieved by sort. Results ordered by sort key. This value applies only to parallel sort.

Table 451. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
STYLE	CHAR(4)	The Input/Output format style of this parallel group. Blank for IO Parallelism. For other modes: 'RIRO' Records IN, Records OUT 'WIRO' Work file IN, Records OUT 'WIWO' Work file IN, Work file OUT
RANGEKIND	CHAR(1)	The range type: 'K' Key range 'L' IN-list elements partitioning 'P' Page range 'R' Record range partitioning
NKEYCOLS	SMALLINT	The number of interesting key columns, that is, the number of columns that will participate in the key operation for this parallel group.
LOWBOUND	VARCHAR(40) FOR BIT DATA	The low bound of parallel group.
HIGHBOUND	VARCHAR(40) FOR BIT DATA	The high bound of parallel group.
LOWKEY	VARCHAR(40) FOR BIT DATA	The low key of range if partitioned by key range.
HIGHKEY	VARCHAR(40) FOR BIT DATA	The high key of range if partitioned by key range.
FIRSTPAGE	CHAR(4) FOR BIT DATA	The first page in range if partitioned by page range.
LASTPAGE	CHAR(4) FOR BIT DATA	The last page in range if partitioned by page range.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HOST_REASON	SMALLINT	IBM internal use only.
PARA_TYPE	CHAR(4)	IBM internal use only.
PART_INNER	CHAR(1)	IBM internal use only.
GRNU_KEYRNG	CHAR(1)	IBM internal use only.
OPEN_KEYRNG	CHAR(1)	IBM internal use only.

Table 451. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
STRAW_MODEL	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.

Table 451. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.

Table 451. DSN_PGROUPE_TABLE description (continued)

Column name	Data type	Description
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

DSN_PREDICAT_TABLE

The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query. It is also used as input when you issue a BIND QUERY command to override the selectivity of predicates for matching SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of the DSN_PREDICAT_TABLE

Table 452. DSN_PREDICAT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'BETWEEN' • 'EQUAL' • 'EXISTS' • 'COMPOUND' • 'HAVING' • 'IN' • 'LIKE' • 'NOT LIKE' • 'NOTEXIST' • 'OTHERS' • 'OR' • 'RANGE' • 'SUBQUERY' • 'XEXISTS' • 'NXEXISTS'
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the left side of the predicate. If the left side of the predicate is a table column, this value indicates the name of that column. This column can also contain the following values or blank values. 'VALUE' The left side is a literal value. 'COLEXP' The left side is column expression. 'NONCOLEXP' The left side is a non-column expression. 'SUBQUERY' The left side is a subquery. 'CORSUB' The left side is a correlated subquery. 'NONCORSUB' The left side is a non-correlated subquery. 'EXPRESSION' The left side is some type of expression.
LEFT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the first child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
LHS_TABNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
LHS_QBNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the right side of the predicate. If the right side of the predicate is a table column, this value column indicates the column name. This column can also contain the following values or blank values. 'VALUE' The right side is a literal value. 'COLEXP' The right side is column expression. 'NONCOLEXP' The right side is a non-column expression. 'SUBQUERY' The right side is a subquery. 'CORSUB' The right side is a correlated subquery. 'NONCORSUB' The right side is a non-correlated subquery. 'INDEXED-VALUE' FL 506 The right side is organized for hash access. 'EXPRESSION' The right side is some type of expression.
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.
RHS_TABNO	CHAR(1) NOT NULL	If the right side of the predicate is a table column or a column expression in an index on expression, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
RHS_QBNO	CHAR(1) NOT NULL	If the right side of the predicate is a subquery or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: 'A' After join 'D' During join blank Not applicable
ADDED_PRED	CHAR(1) NOT NULL	Whether the predicate is generated by Db2, and the reason why the predicate is added: blank Db2 did not add the predicate. 'B' For bubble up. 'C' For correlation. 'J' For join. 'K' For LIKE for expression-based index. 'L' For localization. 'P' For push down. 'R' For page range. 'S' For simplification. 'T' For transitive closure.
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by Db2.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
CATEGORY	SMALLINT NOT NULL	IBM internal use only.
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.
TEXT	VARCHAR(2000) NOT NULL	The text of the transformed predicate text. If the text of the predicate contains more than 2000 characters, it is truncated.
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: 'HAVING ' The HAVING clause 'ON ' The ON clause 'WHERE ' The WHERE clause SELECT The SELECT clause

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. Blank Generated by Db2 C Column mask R Row permission U Specified by the user
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 452. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

Related concepts

[Predicates](#)

A *predicate* specifies a condition that is true, false, or unknown about a given value, row, or group.

[BIND QUERY subcommand \(DSN\) \(Db2 Commands\)](#)

DSN_PREDICATE_SELECTIVITY table

The predicate selectivity table contains information about the selectivity of predicates that are used for access path selection. It is used as an input table for the BIND QUERY command when selectivity overrides are specified.

PSPI

When selectivity overrides are not specified, or specified selectivity overrides cannot not be used by Db2, the DSN_PREDICATE_SELECTIVITY table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values.

DSN_PREDICATE_SELECTIVITY does not contain rows from DSN_PREDICAT_TABLE for predicates that are not used for access path selection.

When selectivity overrides are specified and used by Db2, this table also contains one row for each selectivity override that was used. These rows contain ASSUMPTION='OVERRIDE' values.

Additionally, if the sum of the weights for all specified selectivity override instances is less than one, this table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values and WEIGHT values equal to one minus the sum of the specified override weight values.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in the DSN_PREDICATE_SELECTIVITY table.

Table 453. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.

Table 453. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 453. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a specific predicate within a query.
INSTANCE	SMALLINT NOT NULL	The selectivity instance. Used to group related selectivities.
SELECTIVITY	FLOAT NOT NULL	The selectivity estimate.
WEIGHT	FLOAT(4) NOT NULL	The percentage of executions that have the specified selectivity. For example, a value of 0.25 means that 25% of the time when query is executed it has this selectivity.
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or is used. One of the following values: 'NORMAL' Selectivity is estimated by using the normal selectivity assumptions. 'OVERRIDE' Selectivity is based on an override.
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS FOR EACH ROW ON UPDATE AS ROW CHANGE TIMESTAMP	The time when the row was inserted or updated.

Table 453. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
REMARKS	VARCHAR(762)	IBM internal use only.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES

Table 453. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
EXPANSION_REASON (continued)		This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.

DSN_PTASK_TABLE

The parallel tasks table, DSN_PTASK_TABLE, contains information about all of the parallel tasks in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_PTASK_TABLE.

Table 454. DSN_PTASK_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PGDNO	SMALLINT NOT NULL	The parallel group identifier within the current query block. This value corresponds to the value of the GROUPID column in DSN_PGROUP_TABLE table rows.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
LPTNO	SMALLINT NOT NULL	The parallel task number.
KEYCOLID	SMALLINT	The key column ID (KEY range only).
DPSI	CHAR(1) NOT NULL	Indicates if a data partition secondary index (DPSI) is used.

Table 454. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
LPTLOKEY	VARCHAR(40) FOR BIT DATA	The low key value for this key column for this parallel task (KEY range only).
LPTHIKEY	VARCHAR(40) FOR BIT DATA	The high key value for this key column for this parallel task (KEY range only).
LPTLOPAG	CHAR(4) FOR BIT DATA	The low page information if partitioned by page range.
LPTLHIPAG	CHAR(4) FOR BIT DATA	The high page information if partitioned by page range.
LPTLOPG ^{“1” on page 2967}	CHAR(4) FOR BIT DATA	The lower bound page number for this parallel task (Page range or DPSI enabled only).
LPTHIPG ^{“1” on page 2967}	CHAR(4) FOR BIT DATA	The upper bound page number for this parallel task (Page range or DPSI enabled only).
LPTLOPT ^{“1” on page 2967}	SMALLINT	The lower bound partition number for this parallel task (Page range or DPSI enabled only).
LPTHIPT ^{“1” on page 2967}	SMALLINT	The upper bound partition number for this parallel task (Page range or DPSI enabled only).
KEYCOLDT	SMALLINT	The data type for this key column (KEY range only).
KEYCOLPREC	SMALLINT	The precision/length for this key column (KEY range only).
KEYCOLSCAL	SMALLINT	The scale for this key column (KEY range with Decimal datatype only).
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 454. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 454. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

Notes:

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.

DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

userID

You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

Table 455. Descriptions of columns in DSN_QUERYINFO_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
QINAME1	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A': - When REASON_CODE=0, this value is the name of the accelerator server to which the statement is sent. - When REASON_CODE<>0, the statement was not sent to an accelerator server. The REASON_CODE value indicates why the statement was not sent to the accelerator server. When TYPE='ACCELMDDL', this statement used accelerator modeling. For static queries, the value in this field might be the name of the accelerator server that is available at execution time.
QINAME2	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A' and REASON_CODE=0, this value is the name of the location name of the accelerator server to which the statement is sent. For static queries, the value in this field might be the name of the accelerator server that is available at execution time.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.

Table 455. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 455. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
SEQNO	INTEGER NOT NULL WITH DEFAULT	The sequence number for this row if QI_DATA exceeds the size of its column.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
TYPE	CHAR(8) NOT NULL WITH DEFAULT	The type of the output for this row: A This row is for a statement that Db2 attempts to run on an accelerator server. The value in column REASON_CODE indicates the outcome.
REASON_CODE	SMALLINT NOT NULL WITH DEFAULT	The reason code for the row when TYPE='A'. For a description of the meaning, see “REASON_CODE values” on page 2972. You can also check the QI_DATA column value, which might contain more specific information.
QI_DATA	CLOB(2M) NOT NULL WITH DEFAULT	When TYPE='A': - For REASON_CODE values other than 0, this value is a description of the REASON_CODE value. For more information, see “REASON_CODE values” on page 2972. - For a REASON_CODE value of 0, this value is the statement text, after it is converted for processing by the accelerator.
SERVICE_INFO	BLOB(2M) NOT NULL WITH DEFAULT	IBM internal use only.
QB_INFO_ROWID	ROWID NOT NULL GENERATED ALWAYS	IBM internal use only.

Table 455. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

REASON_CODE values

The REASON_CODE values correspond in most cases to the *reason-code* values that are returned with SQL code [-4742](#).

For rows with non-zero REASON_CODE values, the QI_DATA column contains a description of reason code, sometimes with specific values included.

0

The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.

For example, for version 1 of IBM Db2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: *data-mart-name@accelerator-name@digits*.

The QI_DATA column contains the statement text, after it is converted for processing by the accelerator.

- 1** No active accelerator server was found or the table was not enabled for query acceleration when the statement was executed.
- 2** The CURRENT QUERY ACCELERATION special register is set to NONE.
- 3** Db2 classified the query as a short-running query, or Db2 determined that sending the query to an accelerator server provided no performance advantage.
- 4** The query is not read-only.
- 6** The cursor is defined as scrollable or is a rowset-positioned cursor.
- 7** The query references objects with multiple encoding schemes.
- 8** The FROM clause of the query specifies a *data-change-table-reference*.
- 9** The query contains a table expression with one or more correlated references to other tables in the same FROM clause.
- 10** The query contains a recursive reference to a common table expression.
- 11** The query contains an unsupported expression. The text of the expression is in QI_DATA.
- 12** The query references a table that has any of the following characteristics:
 - Is not defined in the accelerator server
 - Is defined in a different accelerator server from another table in the query
 - Is defined in the accelerator server, but is not enabled for query acceleration
- 13** The accelerator server that contains the tables that are referenced in the query is not started.
- 14** A column that is referenced in the query was altered in Db2 after the data was loaded in the accelerator server.
- 15** The query uses functionality that is available only in DB2 10 or later, and the functionality is not supported by the accelerator server.
- 17** The query is an INSERT from SELECT statement. Subsystem parameter QUERY_ACCEL_OPTIONS does not specify option 2 to enable the acceleration of INSERT from SELECT statements.
- 18** The query uses functionality that is available only in Db2 11 or later, and the functionality is not supported by the accelerator server.

19

The accelerator server is not at the correct level and does not support a function in the SQL statement. The QI_DATA column contains the function text or expression text that is using the unsupported function for the accelerator server.

20

The query is a rowset cursor that is declared WITH RETURN, executes remotely, or executes under an SQL PL routine.

21

The query contains a correlated subquery that is not supported for acceleration.

22

The statement references an accelerator-only table, but the statement cannot run on the accelerator. For example:

- MERGE statement references an accelerator-only table.
- UPDATE or DELETE statement references an accelerator-only table, but the target table of the UPDATE, DELETE is a normal Db2 table: UPDATE DB2_TABLE SET .. (SELECT .. FROM ACCEL_ONLY_TABLE).
- INSERT, UPDATE or DELETE of a *row-fullselect* with subselect. UPDATE ACCEL_ONLY_TABLE SET (C1, C2) = (SELECT C3, C4 FROM TABLE2);
- INSERT, UPDATE or DELETE statement references an accelerator-only table containing one or more LOB columns.

23

The SELECT INTO statement is bound for acceleration but is run as a remote SELECT INTO statement, which is not supported for acceleration.

24

The DDL or DML statement cannot run on the accelerator because the connection to the accelerator server does not allow updates. This problem can occur when a two-phase commit requester (for example, a Db2 for z/OS requester) connects to a Db2 for z/OS server to run a DDL or DML statement on an accelerator.

25

The statement contains a reference to a column with an unsupported data type.

26

The CREATE TABLE statement clause IN ACCELERATOR specifies an accelerator alias that resolves to more than one accelerator and at least one of the following conditions is true:

- Your Db2 function level is lower than V12R1M509.
- The SYSACCEL.SYSACCELERATEDTABLES table does not have the FEATURE column.

27

The DROP TABLE statement specifies a referencing accelerator-only table, which cannot be removed by using the DROP TABLE statement.

28

The SQL INSERT, UPDATE, or DELETE statement references a high availability accelerator-only table (AOT) that is defined in multiple accelerators and one of the following conditions is true:

- Neither the CURRENT ACCELERATOR special register nor the ACCELERATOR bind option is used.
- The CURRENT ACCELERATOR special register or the ACCELERATOR bind option specifies one of the following values:
 - An alias that resolves to multiple accelerators. The alias must resolve to one V7 or later accelerator.
 - An accelerator that is not a V7 or later accelerator. A V7 or later accelerator is required to execute the SQL statement.
 - An accelerator that does not exist or is not available when the SQL statement is executed.
 - An accelerator that is not qualified to execute the SQL statement for a high availability AOT.

29

During a Db2 for z/OS special runtime incremental bind of a static query that was originally bound for acceleration with the QUERYACCELERATION bind option value of ELIGIBLE or ENABLE (not ENABLEWITHFAILBACK), the query cannot be bound for acceleration to the target accelerator that Db2 has selected for this particular run of the query. This special incremental bind usually occurs for one of the following reasons:

- The user table has been dropped and re-created in Db2 for z/OS but has not been refreshed in the target accelerator since the last time the static query was bound for acceleration.
- The archive status of the user table in the target accelerator has changed since the last time the static query was bound for acceleration.

Failure to bind the static query for acceleration during this incremental bind can occur if the user table in the target accelerator is down-level from the current definition of that table in the Db2 for z/OS catalog. This failure might also occur due to other reasons.

30

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The Db2 change might or might not be related to the Db2 accelerated table that is referenced in the query.

31

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query that specifies both an accelerator-only table (AOT) and a Db2 accelerated table. The query will not be accelerated and cannot be run in Db2. The same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The change might or might not be related to the Db2 accelerated table that is referenced in the query.

32

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted accelerator-only table (AOT) change. This uncommitted change resulted in the creation of an accelerator database *snapshot isolation* (SI) for this unit of work before the query was run. This accelerator database SI can prevent committed and replicated Db2 changes, made either by this transaction or by a different transaction, from being available to the accelerated query, even if the Db2 changes are replicated to the accelerator before the query is run there.

33

The query could not run on the accelerator due to different reasons on different versions of the accelerator.

34

The statement included an expression that can run on an accelerator server only when the CURRENT QUERY ACCELERATION special register is set to ALL, ENABLE, or ELIGIBLE. However, the CURRENT QUERY ACCELERATION special register is set to NONE or ENABLE WITH FAILBACK.

See the programmer responses for the two different REASON_CODE values for the corresponding version of the accelerator.

35

The query uses functionality that is available only in Db2 12 or later, and the accelerator server does not support the functionality.

36

The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES; however, either an active V7 or later accelerator was not found or the table was not enabled for query acceleration in the V7 or later accelerator when the statement was executed.

37

The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator that contains the tables of the query is not started.

38

The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator is not at the correct level.

39

The query uses functionality that is available only in Db2 13 or later, and the accelerator server does not support the functionality.

40

FL 503 Query acceleration is requested for a query that specifies an IN list predicate that has more than 32,767 (32K) elements, but no version 7 accelerator exists or is active using version 7 behavior for this Db2 for z/OS subsystem. The query cannot be run on an accelerator. An IN list predicate that has more than 32K elements is an accelerator-only function, so the query also cannot run in Db2 for z/OS.

41

FL 503 A query references a view that was created with a *fullselect* that specified an IN list predicate that contained more than 32,767 (32K) elements, which is supported as an accelerator-only function, but use of the view is disabled due to one of the following conditions:

- The query acceleration value for the query was NONE. For more information, see [Enabling acceleration of SQL queries \(Db2 Performance\)](#).
- Option 12 was not specified in the list of values for the [QUERY_ACCEL_OPTIONS subsystem parameter](#).
- The query did not run at application V13R1M503 or higher.
- No version 7 accelerator that uses V7 behavior currently exists for the Db2 for z/OS subsystem.
- The failing SQL statement with the view reference is an INSERT, UPDATE, or DELETE statement. These statements are not supported by Db2 for z/OS or an accelerator for a view that contains an IN list predicate with more than 32,767 (32K) elements.

The QI_DATA column contains a description of reason code 41 followed by the *unqualified-view-name* that identifies the first of any views that could not be used due the preceding conditions.

42

The SYSACCEL.SYSACCELERATORS or SYSACCEL.SYSACCELERATEDTABLES tables are not found.

43

Accelerator-shadow table for a Db2 table is not at the correct SUPPORTLEVEL value for LOB columns. Db2 table name is: *table-name*

A query result contains a LOB column or expression in the output select list, but the associated accelerator-shadow table is not at a SYSACCELERATEDTABLES.SUPPORTLEVEL of 8 or higher, which indicates that the shadow table has LOB support enabled. The ENABLE_LARGE_OBJECT_DATATYPE_SUPPORT accelerator configuration must be 'true' for an Accelerator before the accelerator-shadow table is loaded.

44

The value of the CURRENT rules special register must be set to 'STD' to define an accelerator-only table that contains a LOB column.

900-999

For IBM internal use only.

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

DSN_QUERY_TABLE

The query table, DSN_QUERY_TABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

PSPI

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_QUERY_TABLE.

Table 456. DSN_QUERY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
TYPE	CHAR(8) NOT NULL	The type of the data in the NODE_DATA column.
QUERY STAGE	CHAR(8) NOT NULL WITH DEFAULT	The stage during query transformation when this row is populated.
SEQNO	NOT NULL	The sequence number for this row if NODE_DATA exceeds the size of its column.
NODE_DATA	CLOB(2M)	The XML data containing the SQL statement and its query block, table, and column information.
EXPLAIN_TIME	TIMESTAMP	The EXPLAIN timestamp.
QUERY_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
GROUP MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 subsystem that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HASHKEY	INTEGER NOT NULL	The hash value of the contents in NODE_DATA
HAS_PRED	CHAR(1) NOT NULL	When NODE_DATA contains an SQL statement, this column indicates if the statement contains a parameter marker literal, non-parameter marker literal, or no predicates.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 456. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 456. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.

PSPI

DSN_SORTKEY_TABLE

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_SORTKEY_TABLE.

Table 457. DSN_SORTKEY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.

Table 457. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort
ORDERNO	SMALLINT NOT NULL	The sequence number of the sort key
EXPTYPE	CHAR(3) NOT NULL	The type of the sort key. The possible values are: • 'COL' • 'EXP' • 'QRY'
TEXT	VARCHAR(128) NOT NULL	The sort key text, can be a column name, an expression, or a scalar subquery, or 'Record ID'.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
COLNO	SMALLINT NOT NULL	The column number, a number which uniquely identifies the corresponding column within a query. Only applicable when the sort key is a column.

Table 457. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
DATATYPE	CHAR(18)	The data type of sort key. The possible values are • 'HEXADECIMAL' • 'CHARACTER' • 'PACKED FIELD ' • 'FIXED(31)' • 'FIXED(15)' • 'DATE' • 'TIME' • 'VARCHAR' • 'PACKED FLD' • 'FLOAT' • 'TIMESTAMP' • 'UNKNOWN DATA TYPE'
LENGTH	INTEGER NOT NULL	The length of sort key.
CCSID	INTEGER NOT NULL	IBM internal use only.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 457. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 457. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

DSN_SORT_TABLE

The sort table, DSN_SORT_TABLE, contains information about the sort operations required by a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_SORT_TABLE.

Table 458. DSN_SORT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 458. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
SORTC	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the composite table. The reasons are shown as a series of bytes: • Byte 1 is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • Byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTN	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the new table. The reasons are shown as a series of bytes: • The first byte is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • The third byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort.
KEYSIZE	SMALLINT NOT NULL	The sum of the lengths of the sort keys.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 458. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 458. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

DSN_STATEMENT_CACHE_TABLE

The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE

Column name	Data Type	Description
STMT_ID	INTEGER NOT NULL	The statement ID; this value is the EDM unique token for the statement.
STMT_TOKEN	VARCHAR(240)	The statement token; you provide this value as an identification string.
COLLID	VARCHAR(128) NOT NULL	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
PROGRAM_NAME	VARCHAR(128) NOT NULL	The name of the package that performed the initial PREPARE for the statement.
INV_DROPALT	CHAR(1) NOT NULL	This column is not used.
INV_REVOKE	CHAR(1) NOT NULL	This column is not used.
INV_LRU	CHAR(1) NOT NULL	This column is not used.
INV_RUNSTATS	CHAR(1) NOT NULL	This column is not used.
CACHED_TS	TIMESTAMP NOT NULL	The timestamp when the statement was stored in the dynamic statement cache. “3” on page 3001
USERS	INTEGER NOT NULL	The number of current users of the statement. This number indicates the users that have prepared or run the statement during their current unit of work. “1” on page 3001 , “3” on page 3001
COPIES	INTEGER NOT NULL	The number of copies of the statement that are owned by all threads in the system. “1” on page 3001 , “3” on page 3001
LINES	INTEGER NOT NULL	The precompiler line number from the initial PREPARE of the statement. “1” on page 3001
PRIMAUTH	VARCHAR(128) NOT NULL	The primary authorization ID that did the initial PREPARE of the statement.
CURSQLID	VARCHAR(128) NOT NULL	The CURRENT SQLID that did the initial PREPARE of the statement.
BIND_QUALIFIER	VARCHAR(128) NOT NULL	The BIND qualifier. For unqualified table names, this is the object qualifier.
BIND_ISO	CHAR(2) NOT NULL	The value of the ISOLATION BIND option that is in effect for this statement. The value will be one of the following values: 'UR' Uncommitted read 'CS' Cursor stability 'RS' Read stability 'RR' Repeatable read
BIND_CDATA	CHAR(1) NOT NULL	The value of the CURRENTDATA BIND option that is in effect for this statement. The value will be one of the following values: 'Y' CURRENTDATA(YES) 'N' CURRENTDATA(NO)

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
BIND_DYNRL	CHAR(1) NOT NULL	The value of the DYNAMICRULES BIND option that is in effect for this statement. The value will be one of the following values: 'B' DYNAMICRULE(BIND) 'R' DYNAMICRULES(RUN)
BIND_DEGRE	CHAR(1) NOT NULL	The value of the CURRENT DEGREE special register that is in effect for this statement. The value will be one of the following values: 'A' CURRENT DEGREE = ANY '1' CURRENT DEGREE = 1
BIND_SQLRL	CHAR(1) NOT NULL	The value of the CURRENT RULES special register that is in effect for this statement. The value will be one of the following values: 'D' CURRENT RULES = DB2 'S' CURRENT RULES = SQL
BIND_CHOLD	CHAR(1) NOT NULL	The value of the WITH HOLD attribute of the PREPARE for this statement. The value will be one of the following values: 'Y' Initial PREPARE specified WITH HOLD 'N' Initial PREPARE specified WITHOUT HOLD
STAT_TS	TIMESTAMP NOT NULL	Timestamp of the statistics. This is the timestamp when IFCID 318 is started. “2” on page 3001
STAT_EXEC	INTEGER NOT NULL	This column is deprecated. Use STAT_EXECB instead.
STAT_GPAG	INTEGER NOT NULL	This column is deprecated. Use STAT_GPAGB instead. “1” on page 3001
STAT_SYNR	INTEGER NOT NULL	This column is deprecated. Use STAT_SYNRB instead. “1” on page 3001
STAT_WRIT	INTEGER NOT NULL	This column is deprecated. Use STAT_WRITB instead. “1” on page 3001
STAT_EROW	INTEGER NOT NULL	This column is deprecated. Use STAT_EROWB instead. “1” on page 3001
STAT_PROW	INTEGER NOT NULL	This column is deprecated. Use STAT_PROWB instead. “1” on page 3001
STAT_SORT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead. “1” on page 3001

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_INDX	INTEGER NOT NULL	This column is deprecated. Use STAT_INDXB instead.
STAT_RSCN	INTEGER NOT NULL	This column is deprecated. Use STAT_RSCNB instead.
STAT_PGRP	INTEGER NOT NULL	This column is deprecated. Use STAT_PGRPB instead.
STAT_ELAP	FLOAT NOT NULL	The accumulated elapsed time that is used for the statement. “2” on page 3001
STAT_CPU	FLOAT NOT NULL	The accumulated CPU time that is used for the statement. “2” on page 3001
STAT_SUS_SYNIO	FLOAT NOT NULL	The accumulated wait time for synchronous I/O operations for the statement. “2” on page 3001
STAT_SUS_LOCK	FLOAT NOT NULL	The accumulated wait time for lock requests for the statement. “2” on page 3001
STAT_SUS_SWIT	FLOAT NOT NULL	The accumulated wait time for synchronous execution unit switch for the statement. “2” on page 3001
STAT_SUS_GLCK	FLOAT NOT NULL	The accumulated wait time for global parent L-locks for this statement. “2” on page 3001
STAT_SUS_OTHR	FLOAT NOT NULL	The accumulated wait time for read activity that is done by another thread. “2” on page 3001
STAT_SUS_OTHW	FLOAT NOT NULL	The accumulated wait time for write activity done by another thread. “2” on page 3001
STAT_RIDLIMT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_RIDSTOR	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
EXPLAIN_TS	TIMESTAMP NOT NULL	The timestamp for when the statement cache table is populated.
SCHEMA	VARCHAR(128) NOT NULL	The value of the CURRENT SCHEMA special register.
STMT_TEXT	CLOB(2M) NOT NULL	The statement that is being explained.
STMT_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
BIND_RO_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The current specification of the REOPT option for the statement “3” on page 3001: 'N' REOPT(NONE) or its equivalent '1' REOPT(ONCE) or its equivalent 'A' REOPT(AUTO) or its equivalent 'O' The current plan is deemed optimal and there is no need for REOPT(AUTO)

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
BIND_RA_TOT	INTEGER NOT NULL WITH DEFAULT	The total number of REBIND commands that have been issued for the dynamic statement because of the REOPT(AUTO) option. “1” on page 3001, “3” on page 3001
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
STAT_EXECB	BIGINT NOT NULL WITH DEFAULT	The number of times this statement has been run. For a statement with a cursor, this is the number of OPENS. “2” on page 3001
STAT_GPAGB	BIGINT NOT NULL WITH DEFAULT	The number of getpage operations that are performed for the statement. “2” on page 3001
STAT_SYNRB	BIGINT NOT NULL WITH DEFAULT	The number of synchronous buffer reads that are performed for the statement. “2” on page 3001
STAT_WRITB	BIGINT NOT NULL WITH DEFAULT	The number of buffer write operations that are performed for the statement. “2” on page 3001
STAT_EROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are examined for the statement. “2” on page 3001
STAT_PROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are processed for the statement. “2” on page 3001
STAT_SORTB	BIGINT NOT NULL WITH DEFAULT	The number of sorts that are performed for the statement. “2” on page 3001
STAT_INDXB	BIGINT NOT NULL WITH DEFAULT	The number of index scans that are performed for the statement. “2” on page 3001
STAT_RSCNB	BIGINT NOT NULL WITH DEFAULT	The number of table space scans that are performed for the statement. “2” on page 3001
STAT_PGRPB	BIGINT NOT NULL WITH DEFAULT	The number of parallel groups that are created for the statement. “2” on page 3001
STAT_RIDLIMTB	BIGINT NOT NULL WITH DEFAULT	The number of times a RID list was not used because the number of RIDs would have exceeded Db2 limits. “2” on page 3001
STAT_RIDSTORB	BIGINT NOT NULL WITH DEFAULT	The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs. “2” on page 3001

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
LITERAL_REPL	CHAR(1) NOT NULL WITH DEFAULT	Identifies cached statements where the literal values are replaced by the '&' symbol: “3” on page 3001 'R' The statement is prepared with CONCENTRATE STATEMENTS WITH LITERALS behavior and the literal constants in the statement have been replaced with '&' . 'D' This statement is a duplicate statement instance with different literal reusability criteria. blank Literal values are not replaced.
STAT_SUS_LATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for latch requests for the statement.
STAT_SUS_PLATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for page latch requests for the statement.
STAT_SUS_DRAIN	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for drain lock requests for the statement.
STAT_SUS_CLAIM	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for claim count requests for the statement.
STAT_SUS_LOG	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for log writer requests for the statement.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
ACCELERATED	CHAR(10)	Identifies whether a cached dynamic statement was prepared for acceleration to an accelerator server. Possible values are: 'NO' The cached statement was not prepared for acceleration. This is the default value. This value also applies to cached statements under the following conditions: • The query acceleration behavior was not specified or was explicitly set to NONE when the dynamic statement was prepared. • A query acceleration behavior other than ALL was specified when the dynamic statement was prepared. Db2 did not prepare the statement for acceleration because it did not qualify for acceleration based on the query acceleration behavior that was specified. 'YES' The cached statement was prepared for acceleration to an accelerator server based on the query acceleration behavior that was specified. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation. 'NEVER' The cached statement was not prepared for acceleration to an accelerated server, because the statement can never be accelerated. • If the query acceleration behavior is set to ENABLE, ENABLE WITH FAILBACK, or ELIGIBLE for the prepare of the statement, Db2 considers this cache entry first as a possible cache match during the prepare operation. This action verifies whether the statement was cached previously as one that can never be accelerated. (Continued in the following row.)

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
ACCELERATED (continued)		(Continued from the previous row.) 'NEVER' (continued) • If the query acceleration behavior is set to ALL for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation. • If the query acceleration behavior is not specified, or is explicitly set to NONE for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation. 'ACCEL_ONLY' The cached statement was prepared for acceleration to an accelerator. The statement references at least one accelerator-only table and can only be prepared to execute in the accelerator server. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation. Query acceleration behavior is specified by either the QUERY_ACCELERATION subsystem parameter, the QUERYACCELERATION bind option, or the CURRENT QUERY ACCELERATION special register, and depends on their order of precedence. The order of precedence (lowest to highest) is: • The QUERY_ACCELERATION subsystem parameter • The QUERYACCELERATION bind option, if specified • An explicit SET CURRENT QUERY ACCELERATION statement
STAT_ACC_ELAP	BIGINT	The accumulated elapsed time for the accelerator.
STAT_ACC_CPU	BIGINT	The accumulated CPU time for the accelerator.
STAT_ACC_ROW	BIGINT	The accumulated number of rows that are returned from the accelerator.
STAT_ACC_BYTE	BIGINT	The accumulated number of bytes that are returned from the accelerator.
STAT_ACC_1ROW	BIGINT	The time waited for the first row of the query result to be available from the accelerator.
STAT_ACC_DB2	BIGINT	The total time the accelerator waited for Db2 to request query results.
STAT_ACC_EXEC	BIGINT	The accumulated execution time for the accelerator.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_ACC_WAIT	BIGINT	The accumulated queue wait time for the accelerator.
ACCEL_OFFLOAD_ELIGIBLE	CHAR(1)	'NO' The statement is not eligible for acceleration. This is the default value. 'YES' The statement is a candidate for acceleration when an accelerator server is available to the Db2 subsystem.
ACCELERATOR_NAME	VARCHAR(128)	The concatenated name of the accelerator server that processed the query.
PER_STMT_ID	BIGINT NOT NULL	The statement identifier of the stabilized dynamic SQL statement. This value is set if this entry was stabilized to or loaded from the SYSIBM.SYSDNQRY catalog table
STBLGRP	VARCHAR(128) NOT NULL	The stabilization group name specified in a START DYNQRY command. This value is set if this entry was stabilized to or loaded from the SYSIBM.SYSDNQRY catalog table.
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the statement text.
QUERY_HASH_VERSION	INTEGER NOT NULL	The version of QUERY_HASH.
STABILIZED	CHAR(1) NOT NULL	Indicates whether the statement was stabilized.
APPLCOMPAT	VARCHAR(10) NOT NULL	The application compatibility level of a dynamic SQL statement.
CNO	BIGINT NOT NULL	The command number for the dynamic query capture monitor if applicable. Otherwise 0.
STAT_SUS_CHILDLLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for child L-locks for the statement.
STAT_SUS_OTHERLLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for other L-locks for the statement.
STAT_SUS_PAGESETPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for global pageset or partition L-locks for the statement.
STAT_SUS_PAGEPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for page P-locks for the statement.
STAT_SUS_OTHERPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for other P-locks for the statement.
STAT_SUS_PIPE	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for pipe requests for the statement.
STAT_SUS_PQSYNC	FLOAT NOT NULL WITH DEFAULT	The accumulated waittime for parallel query waits for the statement.
STAT_ACC_TWDP	BIGINT	The accumulated wait time for the accelerator delay protocol.
STAT_ACC_NWDP	BIGINT	The accumulated number of statements for which the wait time for the accelerator delay protocol has expired.

Table 459. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STMT_HASHID2	CHAR(8) FOR BIT DATA	Used to identify an SQL statement. Based on normalized SQL statement text. - Includes certain BIND options for static SQL, and PREPARE attributes for dynamic SQL. - Includes COLLID and PACKAGE name for static SQL. - Excludes COLLID and PACKAGE name for dynamic SQL. - Excludes VERSION name for static SQL.
STMT_HASH2VER	INTEGER	Used to identify the version of the hash algorithm that is used to compute the STMT_HASHID2 value.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.
AP_PLANHASH	CHAR(16) FOR BIT DATA	Used to identifier an access path based on selected columns of the PLAN_TABLE that contribute to the access path. This value excludes columns that do not affect the access path, such as APPLNAME, PROGNAME, VERSION, and others.
AP_PLANHASHVER	INTEGER	Used to identify the version of the hash algorithm that is used to compute the AP_PLANHASH value.
CONNECTION_TYPE	CHAR(8)	Connection type which did the PREPARE or BIND for the statement.
CLIENT_USERID	VARCHAR(128)	The client user ID name information.
CLIENT_APPLNAME	VARCHAR(255)	The client application name information.
CLIENT_WRKSTNNAME	VARCHAR(255)	The client workstation name information.
STAT_ZIIP_CPU	FLOAT	Accumulated CPU time that was consumed by execution of SQL on an IBM specialty engine.

Notes:

1. If the specified value exceeds 2147483647, the column contains the value 2147483647.
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQLCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.
3. The column is not applicable when the value of the COLLID column is 'DSNEXPLAINMODEYES' or 'DSNEXPLAINMODEEXPLAIN'

PSPI

DSN_STATEMNT_TABLE

The statement table, DSN_STATEMNT_TABLE, contains information about the estimated cost of specified SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNDYNAMICSQLCACHE' The row originates from the dynamic statement cache. 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
STMT_TYPE	CHAR(6) NOT NULL WITH DEFAULT	The type of statement being explained. Possible values are: SELECT SELECT INSERT INSERT UPDATE UPDATE MERGE MERGE DELETE DELETE TRUNCA TRUNCATE SELUPD SELECT with FOR UPDATE OF DELCUR DELETE WHERE CURRENT OF CURSOR UPDCUR UPDATE WHERE CURRENT OF CURSOR PRUNED A query that always returns 0 rows. blank None of the above statement types.
COST_CATEGORY	CHAR(1) NOT NULL WITH DEFAULT	Indicates if Db2 was forced to use default values when making its estimates. Possible values: A Indicates that Db2 had enough information to make a cost estimate without using default values. B Indicates that some condition exists for which Db2 was forced to use default values. See the values in REASON to determine why Db2 was unable to put this estimate in cost category A.
PROCMS	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in milliseconds, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 milliseconds, which is equivalent to approximately 24.8 days. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, the difference is reflected in this value.
PROCSU	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in service units, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 service units. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, this value represents the estimated cost including any impact of acceleration.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
REASON	VARCHAR(254) WITH DEFAULT	A string that indicates the reasons for putting an estimate into cost category B. ACCELMODEL ELIGIBLE The query is eligible for acceleration. ACCELMODEL NOT ELIGIBLE The query is not eligible for acceleration. HAVING CLAUSE A subselect in the SQL statement contains a HAVING clause. HOST VARIABLES The statement uses host variables, parameter markers, or special registers. OPTIMIZATION HINTS An statement-level access path, or PLAN_TABLE access path hint is applied to the statement, or APREUSE(ERROR/WARN) is applied for the package. PROFILEID value When profile monitoring is used for the statement, the value of the PROFILEID column in SYSIBM.DSN_PROFILE_TABLE. REFERENTIAL CONSTRAINTS Referential constraints of the type CASCADE or SET NULL exist on the target table of a DELETE statement. TABLE CARDINALITY The cardinality statistics are missing for one or more of the tables that are used in the statement, or the statement used materialized views or table expressions. TRIGGERS Triggers are defined on the target table of an insert, update, or delete operation. UDF The statement uses user-defined functions.
STMT_ENCODE	CHAR(1) WITH DEFAULT	Encoding scheme of the statement. If the statement represents a single CCSID set, the possible values are: A ASCII E EBCDIC U Unicode If the statement has multiple CCSID sets, the value is M.
TOTAL_COST	FLOAT NOT NULL WITH DEFAULT	The overall estimated cost of the statement. If an accelerator is used, the benefit is reflected in this value. . Use this value for reference purposes only. Db2 does not always choose the access path that has the lowest TOTAL_COST value. Db2 also uses other factors during access path selection, such as the reliability of the filter factor estimates.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
APCOMPARE_STATUS	CHAR(1) NOT NULL WITH DEFAULT	The status of the access path comparison operation for the APCOMPARE option of a BIND or REBIND command. 'S' Access path comparison succeeded, and the structure of the new access path matches the previous access path. 'F' The structure of the new access path does not match the previous access path, or the access path comparison operation failed. 'N' No match was found. blank This is the default value. APCOMPARE is not used, APCOMPARE was used prior to Db2 12, or APCOMPARE was used before this column was added to the table.
APREUSE_STATUS	CHAR(1) NOT NULL WITH DEFAULT	The status of the access path reuse operation for the APREUSE option of a BIND or REBIND command. 'S' Access path reuse succeeded. 'F' Access path reuse failed. 'N' No match was found. blank This is the default value. APREUSE was not used, APREUSE was used prior to Db2 12, or APREUSE was used before this column was added to the table.
APREUSE_VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. The value is the bind version of the package whose access path is reused. The default value blank is used when APREUSE_STATUS is blank.
APREUSE_COPYID	INTEGER NOT NULL WITH DEFAULT	The copy number of identifier for the package. The value is the copy number of the package whose access plan is being taken to be reused. The default value -1 blank is used when APREUSE_STATUS is blank.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
EXPLAIN_TYPE	CHAR(1)	The type of action that created the row: 'A' Automatic bind 'B' BIND command 'C' EXPLAIN STATEMENT CACHE statement 'D' Dynamic EXPLAIN statement 'R' REBIND command 'S' EXPLAIN STABILIZED DYNAMIC QUERY statement. blank The row existed before this column was added to the table. This is the default value.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key that is generated by the statement text. This value is not unique for each statement. Other columns for the collection ID, package name, section number, and query number can be used with the hash key for uniqueness.
FUNCTION_LVL	VARCHAR(10) NOT NULL WITH DEFAULT	The function level of the Db2 subsystem when the access path was selected for the statement.
STMT_HASHID2	CHAR(8) FOR BIT DATA	Used to identify an SQL statement. Based on normalized SQL statement text. • Includes certain BIND options for static SQL, and PREPARE attributes for dynamic SQL. • Includes COLLID and PACKAGE name for static SQL. • Excludes COLLID and PACKAGE name for dynamic SQL. • Excludes VERSION name for static SQL.
STMT_HASH2VER	INTEGER	Used to identify the version of the hash algorithm that is used to compute the STMT_HASHID2 value.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

Table 460. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
AP_PLANHASH	CHAR(16) FOR BIT DATA	Used to identify an access path. Based on selected columns of the PLAN_TABLE which contribute to the access path. Excludes cols that don't affect the access path, such as APPLNAME, PROGNAME, VERSION, etc.
AP_PLANHASHVER	INTEGER	Used to identify the version of the hash algorithm that is used to compute the AP_PLANHASH value.
AP_SERVICE_DATA	VARCHAR(512) FOR BIT DATA	Used to save optimizer-sensitive environment variables at the time of optimization.
CONNECTION_TYPE	CHAR(8)	Connection type which did the PREPARE or BIND for the statement.
CLIENT_USERID	VARCHAR(128)	The client user ID name information.
CLIENT_APPLNAME	VARCHAR(255)	The client application name information.
CLIENT_WRKSTNNAME	VARCHAR(255)	The client workstation name information.

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

DSN_STAT_FEEDBACK

The DSN_STAT_FEEDBACK table contains recommendations for capturing missing or conflicting statistics that are defined during EXPLAIN.

Collecting these statistics by the RUNSTATS utility might improve the performance of the query.

The values in this table are updated only at EXPLAIN time, and are not modified by the RUNSTATS utility.

Information is captured in this table only for EXPLAIN operations that use the access path selection process. The access path selection process is not used when you issue an EXPLAIN statement with the STMTCACHE or PACKAGE options.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNDESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNDESC of the *prefix.SDSNSAMP* library. To upgrade the EXPLAIN tables to the format of the current Db2, you can

call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 791 for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table contains descriptions of the columns in the DSN_STAT_FEEDBACK table.

Table 461. Descriptions of columns in the DSN_STAT_FEEDBACK table

Column name	Data Type	Descriptions
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 461. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 461. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
TBCREATOR	VARCHAR(128) NOT NULL	The creator of the table.
TBNAME	VARCHAR(128) NOT NULL	The name of the table.
IXCREATOR	VARCHAR(128) NOT NULL	The creator of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
COLNAME	VARCHAR(128) NOT NULL	The name of the column.
NUMCOLUMNS	SMALLINT NOT NULL	The number of columns in the column group.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.

Table 461. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
TYPE	CHAR(1) NOT NULL	The type of statistic to collect: 'C' Cardinality. 'F' Frequency. 'H' Histogram. 'I' Index. 'T' Table.
DBNAME	VARCHAR(24) NOT NULL	The name of the database.
TSNAME	VARCHAR(24) NOT NULL	The name of the table space.
REASON	CHAR(8) NOT NULL	The reason for the statistics collection recommendation: 'BASIC' A basic statistic value for a column, table, or index is missing. No statistics were collected for the identified object. 'CONFLICT' Another statistic contains a value that conflicts with the value of this statistic. Such conflicts usually occur because statistics were collected for related objects at different times. 'COMPFFIX' Multi-column cardinality statistics are needed for an index compound filter factor. 'DEFAULT' A predicate references a value that is probably a default value, which indicates that data might be skewed. 'KEYCARD' The cardinalities of index key columns are missing. 'LOWCARD' The cardinality of the column is a low value, which indicates that data might be skewed. 'NULLABLE' Distribution statistics are not available for a nullable column, which indicates that data might be skewed. 'RANGEPRD' Histogram statistics are not available for a range predicate. 'PARALLEL' Parallelism might be improved by uniform partitioning of key ranges. 'STALE' A statistic appears likely to be out of sync with other statistics, based on comparison of the time that it was collected to statistics collection times for related objects.

Table 461. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
REMARKS	VARCHAR(254) NOT NULL	Free form text for extensibility.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

Column descriptions

The following table describes the columns of DSN_STRUCT_TABLE

Table 462. DSN_STRUCT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.
PARENT	SMALLINT NOT NULL	The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE.
TIMES	FLOAT NOT NULL	The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed.
ROWCOUNT	INTEGER NOT NULL	The estimated number of rows returned by RDS (Query Cardinality).

Table 462. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
ATOPEN	CHAR(1) NOT NULL	Whether the query block is moved up for do-at-open processing; 'Y' if done-at-open; 'N': otherwise.
CONTEXT	CHAR(10) NOT NULL	This column indicates what the context of the current query block is. The possible values are: • 'TOP LEVEL' • 'UNION' • 'UNION ALL' • 'PREDICATE' • 'TABLE EXP' • 'UNKNOWN'
ORDERNO	SMALLINT NOT NULL	Not currently used.
DOATOPEN_PARENT	SMALLINT NOT NULL	The parent query block number of the current query block; Do-at-open parent if the query block is done-at-open, this may be different from the PARENT_QBLOCKNO in PLAN_TABLE.
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	This column indicates the type of the current query block. The possible values are • 'SELECT' • 'INSERT' • 'UPDATE' • 'DELETE' • 'SELUPD' • 'DELCUR' • 'UPDCUR' • 'CORSUB' • 'NCOSUB' • 'TABLEX' • 'TRIGGR' • 'UNION' • 'UNIONA' • 'CTE' It is equivalent to QBLOCK_TYPE column in PLAN_TABLE, except for CTE.

Table 462. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
QUERY_STAGE	CHAR(8) NOT NULL	IBM internal use only.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the query block: Blank Generated by Db2 C Column mask R Row permission U Specified by the user
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.

Table 462. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.

Table 462. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
PER_STMT_ID	BIGINT NOT NULL	The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements: • STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages. • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

DSN_VIEWREF_TABLE

The view reference table, DSN_VIEWREF_TABLE, contains information about all of the views and materialized query tables that are used to process a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. To upgrade the EXPLAIN tables to the format of the current Db2, you can call the ADMIN_EXPLAIN_MAINT stored procedure. ADMIN_EXPLAIN_MAINT can also create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [“ADMIN_EXPLAIN_MAINT stored procedure” on page 791](#) for information about using the *action* input parameter to request each of these tasks. Alternatively, to perform only the task of upgrading EXPLAIN tables to the format of the current Db2, you can run job DSNTIJXA. DSNTIJXA invokes REXX exec DSNTXTA to perform the upgrade. See [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#) for more information on running DSNTIJXA.

Column descriptions

The following table describes the columns of DSN_VIEWREF_TABLE.

Table 463. DSN_VIEWREF_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.

Table 463. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. If the value is not blank, the value is the same as the VERSION value for the package that was used to create this EXPLAIN table row. The value is blank for a statement in: • A package for a basic trigger (TYPE='T') • A package for an application that was precompiled without SQL processing option VERSION • A package that was precompiled with an empty string for the VERSION value (TYPE=blank) When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object.
NAME	VARCHAR(128)	Name of the object.
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of the object: 'V' View 'R' MQT that has been used to replace the base table for rewrite 'M' MQT
MQTUSE	SMALLINT WITH DEFAULT	IBM internal use only.

Table 463. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: All cached statements When the statement entered the cache, in the form of a full-precision timestamp value. Non-cached static statements When the statement was bound, in the form of a full precision timestamp value. Non-cached dynamic statements When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 463. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.
AP_PLANID	CHAR(16) FOR BIT DATA	A unique identifier for BIND or PREPARE optimizations for an SQL statement, in the form of an extended timestamp value.

PSPI

Appendix M. Tables that support query acceleration

To interact with accelerator servers, Db2 requires several tables that record characteristics of accelerated servers and tables.

The following table lists these tables, the table spaces and indexes for these tables, and the index fields for each index. The indexes are in ascending order, except where noted.

Table 464. Tables, table spaces, and indexes for tables that support acceleration of queries

Table	Description	Table space*	Indexes	Index fields
“SYSACCEL.SYSACCELERATORS table” on page 3027	Records the characteristics of accelerator servers.	SYSTSACC	DSNACC01	ACCELERATORNAME
“SYSACCEL.SYSACCELERATEDTABLES table” on page 3028	Records the characteristics of each table that is marked for acceleration.	SYSTSACT	DSNACT01	CREATOR, NAME, ACCELERATORNAME
“SYSACCEL.SYSACCELERATEDPACKAGES table” on page 3030	Records the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.	SYSTSACP	DSNACP01	LOCATION, COLLID, NAME, VERSION
			DSNACP02	LOCATION, COLLID, NAME, CONTOKEN
“SYSACCEL.SYSACCELERATEDTABLESAUTH table” on page 3030	Records the privileges that are held by user users over tables that are enabled for acceleration.	SYSTSATA	DSNATA01	TCREATOR, TNAME, ACCELERATORNAME, GRANTEE

* The table spaces listed in this table are universal table spaces (UTSs). Prior to these table spaces being migrated to type UTS, all of the catalog tables for accelerated queries used the SYSACCEL segmented table space. SYSACCEL is still supported; however, segmented table spaces have been deprecated. If you want to migrate from the single SYSACCEL segmented table space, see [Migrating query acceleration tables to universal table spaces \(Db2 Installation and Migration\)](#).

Related tasks

[Creating database objects that support query acceleration \(Db2 Installation and Migration\)](#)

SYSACCEL.SYSACCELERATORS table

The SYSACCEL.SYSACCELERATORS table contains rows that describe the characteristics of each accelerator server.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
ACCELERATOR-NAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G

Column name	Data type	Description	Use
LOCATION	VARCHAR(128)	Identifies the location name that is associated with the accelerator server.	G
ACCELERATORSRL	CHAR(64) FOR BIT DATA	Internal use only	I
ACCELERATOR_TYPE	SMALLINT NOT NULL	The type of accelerator: 1 Indicates Version 5 or earlier of IBM Db2 Analytics Accelerator for z/OS (an <i>on-premises</i> accelerator hardware appliance based on IBM PureData® System for Analytics and IBM Netezza® technology). 2 Indicates Version 7 of IBM Db2 Analytics Accelerator for z/OS. The default value is 1.	G

SYSACCEL.SYSACCELERATEDTABLES table

The SYSACCEL.SYSACCELERATEDTABLES table contains rows that describe the characteristics of each table that is marked for acceleration.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the table.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G
REMOTENAME	VARCHAR(128) NOT NULL	The name of the base alias object.	G
REMOTECREATOR	VARCHAR(128) NOT NULL	The owner of the base alias object.	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the remote table is enabled or disabled for query acceleration: Y Enabled N Disabled T Transition state. Queries are not sent to an accelerator server.	G

Column name	Data type	Description	Use
CREATEDBY	VARCHAR(128) NOT NULL	The primary authorization ID of the user who created the table.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the CREATE statement was executed for the table.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the table was last altered.	G
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the data was last refreshed. If the data was not refreshed, this column contains the default timestamp ('0001-01-01.00.00.00.000000').	G
SUPPORTLEVEL	SMALLINT NOT NULL	Internal use only.	I
ARCHIVE	CHAR(1)	The archive status of the table in the accelerator database: A The table is archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server contains active and archived data. B The table is partially archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server can answer queries that contain active data. C The table is archived in other accelerator servers. The accelerator server that is specified by the ACCELERATORNAME value contains only active data. X The table was restored on another accelerator server. The accelerator server that is specified by the ACCELERATORNAME value cannot answer queries. blank The table is not archived in an accelerator server.	G
REMOTELocation	VARCHAR(128) NOT NULL WITH DEFAULT	The location of the owner table of the referenced accelerator-only table. For tables that are not referenced accelerator-only tables, this column is blank.	G
FEATURE	INTEGER NOT NULL	Indicates additional features of the table: 0 The table does not have any of the additional features that are indicated by the other values. 0 is the default value. 1 The table is a high availability accelerator-only table.	G

SYSACCEL.SYSACCELERATEDTABLESAUTH table

The SYSACCEL.SYSACCELERATEDTABLESAUTH table records the privileges that are held by users over tables that are enabled for acceleration.

Column name	Data type	Description	Use
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Grantee who holds the privileges to access the table in the accelerator. Currently, only a location name for a referencing Db2 for z/OS subsystem is supported. The location name must be the name of a Db2 for z/OS subsystem that was paired to the accelerator when the ACCEL_GRANT_TABLES_REFERENCE stored procedure granted the privilege.	G
GRANTEETYPE	CHAR(1) NOT NULL	Indicates the type of grantee: S Subsystem location name	G
TCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
TNAME	VARCHAR(128) NOT NULL	The name of the table.	G
SELECTAUTH	CHAR(1) NOT NULL	Indicates whether the GRANTEE can select rows from the table or view: blank Privilege is not held. Y Privilege is held without the GRANT option.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the GRANT statement was executed for the table.	G

SYSACCEL.SYSACCELERATEDPACKAGES table

The SYSACCEL.SYSACCELERATEDPACKAGES table contains rows that describe the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.

Do not modify the definition of the SYSACCEL.SYSACCELERATEDPACKAGES table or its indexes unless directed by IBM Support.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks.	S
COLLID	VARCHAR(128) NOT NULL	The name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	The name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package.	S
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the creator of the package version.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
RELBOUND	CHAR(1) NOT NULL	The Db2 release when the package was bound or rebound.	G
TYPE	CHAR(1) NOT NULL	Type of package. Identifies how the package is created: F A CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. N A CREATE PROCEDURE or ALTER PROCEDURE statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. blank A BIND PACKAGE command created the package.	G
COPYID	INTEGER NOT NULL	Internal use only. The value is zero.	I

Column name	Data type	Description	Use
QUERYACCELERATION	CHAR(1) NOT NULL	Indicates the query acceleration behavior that is specified for the static SQL queries in the package. This behavior can also apply to dynamic queries in the package if the package does not issue an explicit SET for the CURRENT QUERY ACCELERATION special register. The QUERYACCELERATION bind option does not have a default value. N NONE. No static SQL query in the package is bound for acceleration or will be accelerated when the package runs. NONE is not a default value. E ENABLE. A static SQL query is bound for acceleration if it satisfies the acceleration criteria, including the cost and heuristics criteria. The query is routed to an accelerator when the application runs. If a static query does not satisfy the acceleration criteria, the query is bound for execution in Db2. F ENABLEWITHFAILBACK. Same behavior as ENABLE, except if an error occurs on the first OPEN of the accelerated static query when the application runs. In this case, instead of failing the query and returning a negative SQL code to the application, Db2 performs a temporary <i>statement-level</i> incremental bind of the query and runs the query in Db2. L ELIGIBLE. A static SQL query is bound for acceleration if the query meets the basic acceleration criteria, regardless of the cost or heuristics criteria. The query is routed to the accelerator when the application runs. A ALL. All static SQL queries in the application are to be bound for acceleration and routed to the accelerator when the application runs. If Db2 determines that a static query cannot be bound to run on the accelerator and the query references a user base table or view, Db2 fails the BIND or REBIND PACKAGE operation with an error message for that query.	G

Column name	Data type	Description	Use
GETACCELARCHIVE	CHAR(1) NOT NULL	Indicates whether a static SQL query should retrieve archived data from the accelerator instead of active data from the accelerator. This behavior can also apply to dynamic queries in the package if the package does not issue an explicit SET for the CURRENT GET_ACCEL_ARCHIVE special register. The GETACCELARCHIVE bind option does not have a default value. N NO. No static SQL query is bound to retrieve archived data from the accelerator. If the static query also is not bound for acceleration, the query is bound to run in Db2. If the static query is bound for acceleration because the QUERYACCELERATION bind option is specified, when the application is run the query is routed to the accelerator. However, the query retrieves only active data on the accelerator. Archived data is not retrieved. Y YES. If the static query is bound for acceleration, the query retrieves archived data on the accelerator when the application runs if the following criteria is met: • The QUERYACCELERATION bind option is also specified. • The static SQL query references an accelerated table that has partitioned data archived on an accelerator. If the static query cannot be bound for acceleration, Db2 fails the BIND or REBIND PACKAGE operation with an error message for that query.	G
ACCELERATOR	VARCHAR(128) NOT NULL	Indicates the preferred target accelerator or accelerators to be used for queries accelerated from this Db2 package: <i>accelerator-name</i> An unqualified name that identifies an accelerator. An accelerator name can consist of 1–8 uppercase characters or numbers. The name must be unique within the Db2 subsystem or data sharing group. This name can be a physical accelerator name or a logical name (alias) that maps to a physical accelerator name or a group of physical accelerator names. blank If the ACCELERATOR bind option not specified, this is the default value, which indicates that no preferred target accelerator will be used and Db2 will determine the target accelerator.	G

Column name	Data type	Description	Use
ACCELERATION_WAITFOR RDATA	DECIMAL(5,1) NOT NULL	Indicates the maximum amount of time, if any, that the accelerator will delay a query while the accelerator waits for the replication of committed Db2 data changes that occurred prior to Db2 running the query. nnnn.m If the ACCELERATIONWAITFORDATA bind option is specified, this value indicates the maximum decimal number of seconds that the accelerator will delay the query when needed. -1.0 If the ACCELERATIONWAITFORDATA bind option is not specified, this is the default value of this catalog column. Db2 considers this as the default value of 0.0. No accelerator delay is requested, and static queries accelerated from this Db2 package will not be delayed.	G

Appendix N. Tables that are used for program authorization

For program authorization, a table is provided to record the authorization for a program to execute a plan.

Table spaces and indexes for program authorization

Tables that are used for program authorization are contained in certain table spaces and have indexes. The following table lists the table space and index for the table that is used for program authorization, and lists the index fields for the index. The index is in ascending order.

Table 465. Table spaces and indexes for the tables that are used for program authorization			
TABLE SPACE DSNMDCDB. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DSNMDCTS	DSNPROGAUTH	DSNPROGAUTH_IDX 1	PROGNAME.PLANNAME

SYSIBM.DSNPROGAUTH table

The SYSIBM.DSNPROGAUTH table enables program authorization with or without program data integrity checking.

Column name	Data type	Description	Use
PROGNAME	VARCHAR(24) NOT NULL	Name of the application program that can run the plan.	G
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan for the application program.	G
PROGMDCVAL	CHAR(16) NOT NULL FOR BIT DATA WITH DEFAULT X'0000000000000000 0- 0000000000000000 0'	Reserved.	G
PROGMDCPAD	CHAR(1) NOT NULL WITH DEFAULT	Reserved.	G
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT CURRENT SQLID	The authorization ID under which the row was inserted or most recently updated.	G

Column name	Data type	Description	Use
ENABLED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether program authorization is enabled: Y Program authorization is enabled. N Program authorization is disabled.	
CREATETS	TIMESTAMP NOT NULL WITH DEFAULT	The time at which the row was inserted or most recently updated.	G
REMARKS	VARCHAR(762)	A user-specified character string.	G

Appendix O. Sample user-defined functions

Some sample user-defined functions are provided with Db2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions.

All REST functions are created by installation job DSNTIJRF or the `createUDFzOS.sql` script and can be used to allow applications to access REST-based services through SQL. For all other sample functions, the following points apply:

- To use these functions in your applications: Use the functions only if installation job DSNTIJRF, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written in C and C++, the installation job requires that your site has IBM C/C++ for z/OS. For information, see [Job DSNTIJRF \(Db2 Installation and Migration\)](#).
- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set `prefix.SDSNSAMP` contains the code for the sample functions.
- The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.

ALTDATE

The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.

►► ALTDATE(input-date, input-format, *output-format*) ►►

The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

D MONTH YY	D MONTH YYYY	DD MONTH YY	DD MONTH YYYY
D.M.YY	D.M.YYYY	DD.MM.YY	DD.MM.YYYY
D-M-YY	D-M-YYYY	DD-MM-YY	DD-MM-YYYY
D/M/YY	D/M/YYYY	DD/MM/YY	DD/MM/YYYY
M/D/YY	M/D/YYYY	MM/DD/YY	MM/DD/YYYY
YY/M/D	YYYY/M/D	YY/MM/DD	YYYY/MM/DD
YY.M.D	YYYY.M.D	YY.MM.DD	YYYY.MM.DD
	YYYY-M-D		YYYY-MM-DD
	YYYY-D-XX		YYYY-DD-XX
	YYYY-XX-D		YYYY-XX-DD

where:

D: Suppress leading zero if the day is less than 10
DD: Retain leading zero if the day is less than 10
M: Suppress leading zero if the month is less than 10
MM: Retain leading zero if the month is less than 10
MONTH: Use English-language name of month
XX: Use a capital Roman numeral for month

YY: Use a year format without century
 YYYY: Use a year format with century

The ALTDAT function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDAT function has two forms.

Form 1: ALTDAT(output-format)

This form of the function converts the current date into the specified format.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

Form 2: ALTDAT(input-date, input-format, output-format)

This form of the function converts a date (input-date) in one user-specified format (input-format) into another format (output-format).

input-date

The argument must be a date or a character string representation of a date in the format specified by input-format. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

input-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

Table 466. External program and specific names for ALTDAT			
Conversion type	Input arguments	External name	Specific name
Current date	output-format (VARCHAR)	DSN8DUAD	DSN8.DSN8DUADV
User-specified date	input-date (VARCHAR) input-format (VARCHAR) output-format (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDVVV
	input-date (DATE) input-format (VARCHAR) output-format (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDVVV

Example 1: Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

```
VALUES DSN8.ALTDAT( 'DD MONTH YY' );
```

Example 2: Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

```
VALUES DSN8.ALTDAT( 'D.M.YYYY' );
```

Example 3: Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.

```
VALUES DSN8.ALTDAT( 'YYYY-XX-DD' );
```

Example 4: Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

```
VALUES DSN8.ALTDAT( '11 November 1918',
                    'DD MONTH YYYY',
                    'YYYY/MM/DD' );
```

The result of the above example is '1918/11/18'.

Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

```
SELECT FIRSTNAME || ' ' ||
       || LASTNAME || ' was hired on '
       || DSN8.ALTDAT( HIREDATE,
                       'YYYY-MM-DD',
                       'D.M.YY' )
FROM EMP
WHERE EMPNO = '000130';
```

Assuming that the HIREDATE is '1971-07-28', the above example returns: 'DELORES QUINTANA was hired on 28.7.71'.

ALTTIME

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.

➡ ALTTIME(input-time, input-format, output-format) ➡

The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

H:MM AM/PM	HH:MM AM/PM
HH:MM:SS AM/PM	HH:MM:SS
H.MM	HH.MM
H.MM.SS	HH.MM.SS

where:

- H: Suppress leading zero if the hour is less than 10
- HH: Retain leading zero if the hour is less than 10
- M: Suppress leading zero if the minute is less than 10
- MM: Retain leading zero if the minute is less than 10
- AM/PM: Return time in 12-hour clock format, else 24-hour

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

Form 1: ALTTIME(output-format)

This form of the function converts the current time into the specified format.

output-format

A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

Form 2: ALTTIME(input-time, input-format, output-format)

This form of the function converts a time (*input-date*) in one user-specified format (*input-format*) into another format (*output-format*).

input-time

The argument must be a time or a character string representation of a time in the format specified by *input-format*. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

input-format

A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

output-format

A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

Table 467. External and specific names for ALTTIME

Conversion type	Input arguments	External name	Specific name
Current time	<i>output-format</i> (VARCHAR)	DSN8DUAT	DSN8.DSN8DUATV
User-specified time	<i>input-time</i> (VARCHAR) <i>input-format</i> (VARCHAR) <i>output-format</i> (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTVVV
	<i>input-time</i> (TIME) <i>input-format</i> (VARCHAR) <i>output-format</i> (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTTVV

Example 1: Convert the current time into a 12-hour clock format without seconds, 'H.MM AM/PM'.

```
VALUES DSN8.ALTTIME( 'H:MM AM/PM' );
```

Example 2: Convert the current time into a 24-hour clock format without seconds, 'HH.MM'.

```
VALUES DSN8.ALTTIME( 'HH.MM' );
```

Example 3: Convert the current time into a 24-hour clock format with seconds, 'HH.MM.SS'.

```
VALUES DSN8.ALTTIME( 'HH.MM.SS' );
```

Example 4: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

```
VALUES DSN8.ALTTIME( '00:00:00', 'HH:MM:SS', 'HH:MM AM/PM' );
```

The function returns '12:00 AM'.

Example 5: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

```
VALUES DSN8.ALTTIME( '06.42.37', 'HH.MM.SS', 'H:MM AM/PM' );
```

The function returns '6:42 AM'.

BASE64ENCODE and BASE64DECODE

The BASE64ENCODE and BASE64DECODE helper REST functions complete Base64 encoding or decoding of the provided text.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```
graph LR; A[BASE64ENCODE] --- B[BASE64DECODE]; B --- C["(text)"]
```

The schema is DB2XML.

text

Specifies the text to encode or decode. For BASE64ENCODE, this argument is provided as a VARCHAR(2732) value and the function returns a Base64-encoded string. For BASE64DECODE, this argument is provided as a Base64-encoded VARCHAR(4096) value and the function returns the data as binary.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

CURRENCY

The CURRENCY function returns a value that is formatted as an amount with a user-specified currency symbol and, if specified, one of three symbols that indicate debit or credit.

```
graph LR; A["CURRENCY( — input-amount, currency-symbol"] --- B["— , credit/debit-indicator"]; B --- C[")"]
```

The schema is DSN8.

input-amount

An expression that specifies the value to be formatted. The expression must be a floating-point value.

currency-symbol

A character string that specifies the currency symbol. The string must have a data type of VARCHAR and an actual length that is not greater than 2 bytes.

credit/debit-indicator

A character string that specifies the symbol that is included with the result to indicate whether the value is negative or positive. The string must have a data type of VARCHAR and an actual length that is not greater than 5 bytes. If *credit/debit-indicator* is not specified or is the value null, the result is formatted without an indicator symbol. You can specify the following symbols:

CR/DB

Bank style. Negative input values are appended with 'DB'; positive input values are appended with 'CR'.

+/-

Arithmetic style. Negative input values are prefixed with a minus sign '-'; positive values are formatted without symbols.

(/)

Accounting style. Negative input values are enclosed in parentheses '('; positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions `strfmon` to facilitate formatting of money amounts and `setlocale` to initialize `strfmon` for local conventions. If `setlocale` fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for CURRENCY. The specific names differ depending on the input to the function.

Table 468. External program and specific names for CURRENCY

Input arguments	External name	Specific name
<i>input-amount</i> <i>currency-symbol</i>	DSN8DUCY	DSN8.DSN8DUCYFV
<i>input-amount</i> <i>currency-symbol</i> <i>credit/debit-indicator</i>	DSN8DUCY	DSN8.DSN8DUCYFVV

Example 1: Express '-1234.56' as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56, '$', 'CR/DB' );
```

The result of the function is '\$1,234.56 DB'.

Example 2: Express '-1234.56' as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56, 'DM', '(/)' );
```

The result of the function is '(DM 1,234.56)'.

Example 3: Express '-1234.56' as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56, 'CD', '+/-' );
```

The result of the function is '-CD 1,234.56'.

DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.

►► DAYNAME(*input-date*) ◄◄

The schema is DSN8.

input-date

A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ class `IDate`.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

Table 469. External and specific names for DAYNAME

Input arguments	External name	Specific name
<i>input-date</i> (VARCHAR)	DSN8EUDN	DSN8.DSN8EUDNV
<i>input-date</i> (DATE)	DSN8EUDN	DSN8.DSN8EUDND

Example 1: For the current date, find the day of the week.

```
VALUES DSN8.DAYNAME( CURRENT DATE );
```

Example 2: Find the day of the week on which leap year falls in the year 2008.

```
VALUES DSN8.DAYNAME( '2008-02-29' );
```

The result of the function is 'Friday'.

Example 3: Find the day of the week on which Delores Quintana, employee number 000130, was hired.

```
SELECT FIRSTNAME || ' '
      || LASTNAME || ' was hired on '
      || DSN8.DAYNAME( HIREDATE ) || ', '
      || CHAR( HIREDATE )
FROM EMP
WHERE EMPNO = '000130';
```

The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

HDFS_READ

The HDFS_READ function reads data from a delimiter-separated file in the Hadoop Distributed File System (HDFS).

►► HDFS_READ(*file-url*, *options*) ◀◀

The schema is SYSFUN.

file-url

An expression that specifies the server address and path of the input file in HDFS. *file-url* is a VARCHAR(512) value.

options

An expression that specifies a list of *name=value* pairs. Each pair must be separated from the following pair by a space character. *options* is a VARCHAR(256) value. *options* can contain any of the following name and value pairs:

delimiter=delimiter-value

Identifies the character that is used as the delimiter in the input file that is specified by *file-url*.

user=user-value

Specifies an IBM InfoSphere® BigInsights® user name that has access to the input file that is specified by *file-url*.

password=password-value

Specifies the password for the IBM InfoSphere BigInsights user that is identified by *user=user-value*.

authport=authport-value

Specifies the port for form-based authentication of the input. The default is 8080.

The HDFS_READ function returns a table with one row for each record in the input file. HDFS_READ is a generic table function, which means that the columns in the returned table are defined when the table is referenced, instead of when the table is defined.

Example 1: Read an HDFS file whose URL is `http://hdfssrv.svl.ibm.com:8080`. The input file delimiter is a comma. Use the default authorization port. The records in the input file have two fields: a DECIMAL(8,3) field, and an INTEGER field.

```
SELECT * FROM TABLE(
  HDFS_READ(
    'http://hdfssrv.svl.ibm.com:8080',
    'delimiter=', user=biadmin password=passw0rd'))
AS T1(C1 DECIMAL(8,3), C2 INTEGER);
```

Example 2: Read an HDFS file whose URL is the location to which the output of a successful Jaql query is written. That location is specified by the *return-string* parameter of the JAQL_SUBMIT invocation that submits the Jaql query.

```
SELECT * FROM TABLE(
  HDFS_READ(
    JAQL_SUBMIT(
      '[[15.3, 16],[170.99,180]]->
      write(del(location=\'/tmp/test1.csv\'));',
      'http://hdfssrv.svl.ibm.com:14000/webhdfs/v1/tmp/test1.csv',
      'http://jaqlsrv.svl.ibm.com:8080',
      'timeout=60 user=biadmin', password=passw0rd'),
      'user=biadmin password=passw0rd'))
AS T1(C1 DECIMAL(8,3), C2 INTEGER);
```

Related reference

JAQL_SUBMIT

The JAQL_SUBMIT function invokes an IBM InfoSphere BigInsights Jaql query from a Db2 application.

HTTPBLOB

The HTTPBLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as BLOB data.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

►► HTTPBLOB — (*url,method*, , ) ◀◀

The schema is DB2XML.

url

Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method

Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute

Specify any of the following optional attributes:

connectTimeout

Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout

Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

responseMsgFormat

Specifies the header attribute value `errorTagged`, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name

The header name.

value

The header value.

<input>

Specifies the data to update at the specified URL. This argument is defined as BLOB(5M).

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

HTTPCLOB

The HTTPCLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as CLOB data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

►► HTTPCLOB — (*url,method*, , ) ►►

The schema is DB2XML.

url

Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method

Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute

Specify any of the following optional attributes:

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

responseMsgFormat

Specifies the header attribute value `errorTagged`, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the `headerAttribute`. Separate `headerAttribute` and `headerAttributeValue` combinations with single spaces.

name

The header name.

value

The header value.

Examples

The examples in this section assume that the following requirements have been met:

- db2restudf.jar is defined in your CLASSPATH.
- The REST user-defined function (UDF) has been created.
- The server that is specified in the SQL statement is running.

In most cases, the results that are shown are truncated to include only the relevant parts of the output.

Example 1. The following SQL statement retrieves data from the www.ibm.com web page.

```
SELECT DB2XML.HTTPGETCLOB(
  CAST ('https://www.ibm.com' AS VARCHAR(2048)),
  CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1
```

The output is similar to the following:

```
<!doctype html>
<html lang="en-US">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width"/>
  <meta charset="utf-8"/><title>IBM - United States</title>
  <link rel="canonical" href="https://www.ibm.com/us-en"/>
  <meta name="robots" content="index,follow"/>
  <meta name="description" content="For more than a century IBM has been dedicated ..."/>
  <meta name="keywords" content="IBM"/>
  ...
</html>
```

Example 2. The following SQL statement retrieves information that is in JSON format, about a book based on its ISBN identifier:

```
SELECT DB2XML.HTTPGETCLOB(
  CAST ('https://www.googleapis.com/books/v1/volumes?q=isbn:9781583478608' AS VARCHAR(255)),
  CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1
```

The output is similar to the following:

```
{
  "kind": "books#volumes",
  "totalItems": 1,
  "items": [
    {
      "kind": "books#volume",
      "id": "7qGQvgAACAAJ",
      "etag": "qov9fok2EyI",
      "selfLink": "https://www.googleapis.com/books/v1/volumes/7qGQvgAACAAJ",
      "volumeInfo": {
        "title": "DB2 12 for Z/OS--The #1 Enterprise Database",
        "subtitle": "SECURE, SEAMLESS INTEGRATION for an Analytics, Mobile and Cloud World",
        "authors": [
          "Surekha Parekh"
        ],
        "publisher": "MC Press",
        "publishedDate": "2016-11-01",
        ...
      }
    }
  ]
}
```

Example 3. The following SQL statement retrieves information from the www.geonames.org web site. The results are in XML format.

```
SELECT DB2XML.HTTPGETCLOB(
  CAST('http://www.geonames.org/countryInfo?lang=' ||
```

```

DB2XML.URLENCODE('en','') ||
'&country=' ||
DB2XML.URLENCODE('us','') ||
'&type=XML' AS VARCHAR(255)),
CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1

```

This statement returns output that is similar to the following:

```

<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<geonames>
  <country>
    <countryCode>US</countryCode>
    <countryName>United States</countryName>
    <isoNumeric>840</isoNumeric>
    <isoAlpha3>USA</isoAlpha3>
    <fipsCode>US</fipsCode>
    <continentName>North America</continentName>
    <capital>Washington</capital>
    <areaInSqKm>9629091.0</areaInSqKm>
    <population>327167434</population>
    <currencyCode>USD</currencyCode>
    <languages>en-US,es-US,haw,fr</languages>

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

HTTPGETBLOBFILE and HTTPGETCLOBFILE

The HTTPGETBLOBFILE and HTTPGETCLOBFILE REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. The resource is stored in a temporary file, and the path of the temporary file is returned as VARCHAR data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url

Specifies the URL of the resource that is being accessed. This argument is defined as a VARCHAR(2048) value.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```

<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>

```

headerAttribute

Specify any of the following optional attributes:

connectTimeout

Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout

Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

responseMsgFormat

Specifies the header attribute value `errorTagged`, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name

The header name.

value

The header value.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

HTTPHEAD

The HTTPHEAD REST function verifies the HTTP header for the specified resource through an HTTP HEAD request. The HTTP header is returned as CLOB or XML data.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```

  HTTPHEAD (url, httpHeader)
  
```

The schema is DB2XML.

url

Specifies the URL of the resource. This argument is defined as a VARCHAR(2048) value.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute

Specify any of the following optional attributes:

connectTimeout

Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout

Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

headerAttributeValue

Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name

The header name.

value

The header value.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

HTTPPOSTBLOB and HTTPPOSTCLOB

The HTTPPOSTBLOB and HTTPPOSTCLOB REST functions update a binary or text-based resource under the specified URL through an HTTP POST request. Response messages from the server are returned as BLOB for HTTPPOSTBLOB or as CLOB for HTTPPOSTCLOB. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url

Specifies the URL at which to update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute

Specify any of the following optional attributes:

connectTimeout

Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout

Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

responseMsgFormat

Specifies the header attribute value `errorTagged`, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the `headerAttribute`. Separate `headerAttribute` and `headerAttributeValue` combinations with single spaces.

name

The header name.

value

The header value.

<input>

Specifies the data to update at the specified URL. This argument is defined as BLOB(5M) for HTTPPOSTBLOB or CLOB(5M) for HTTPPOSTCLOB.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

HTTPPUTBLOB and HTTPPUTCLOB

The HTTPPUTBLOB and HTTPPUTCLOB REST functions create or update a binary or text-based resource under the specified URL through an HTTP PUT request. Response messages from the server are returned as BLOB for HTTPPUTBLOB or as CLOB for HTTPPUTCLOB. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url

Specifies the URL at which to create or update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute

Specify any of the following optional attributes:

connectTimeout

Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout

Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects

Specifies whether redirects should be followed. This is a boolean value.

useCaches

Specifies whether caches should be used. This is a boolean value.

responseMsgFormat

Specifies the header attribute value `errorTagged`, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name

The header name.

value

The header value.

<input>

Specifies the data to create or update at the specified URL. This argument is defined as BLOB(5M) for HTTPPUTBLOB or CLOB(5M) for HTTPPUTCLOB.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

JAQL_SUBMIT

The JAQL_SUBMIT function invokes an IBM InfoSphere BigInsights Jaql query from a Db2 application.

```
►► JAQL_SUBMIT( jaql-script ,return-string ,url,options ) ►◄
```

The schema is SYSFUN.

jaql-script

Specifies a script that contains one or more Jaql queries, with or without parameter declarations. *jaql-script* is a VARCHAR(8000) value.

return-string

Specifies a string that is used as the returned value when the Jaql script completes successfully. *return-string* is a VARCHAR(512) value.

url

Specifies the URL of a Jaql server that accepts requests from the Db2 client, runs the queries that are specified in *jaql-script*, and returns results. *url* is a VARCHAR(512) value.

options

An expression that specifies a list of *name=value* pairs. Each pair must be separated from the following pair by a space character. *options* is a VARCHAR(256) value. *options* can contain any of the following name and value pairs:

timeout=timeout-value

Specifies the maximum time in seconds to wait for results to be returned from the Jaql server that is specified in the *url* parameter.

user=user-value

Specifies an IBM InfoSphere BigInsights user name that has access to the Jaql server.

password=password-value

Specifies the password for the IBM InfoSphere BigInsights user that is identified by *user=user-value*.

The JAQL_SUBMIT function returns a VARCHAR(512) string that contains the results of executing the Jaql script.

Example 1: Submit a Jaql script to a Jaql server. The Jaql script writes an array to a file, in delimited format. The URL of the Jaql server is <http://jaqlsrv.svl.ibm.com:8080>. Do not specify the string that is to be returned if the script completes successfully. Wait for a maximum of 60 seconds for output to be returned.

```
SELECT SYSFUN.JAQL_SUBMIT(
  '[[15.3, 16],[170.99,180]]->
  write(del(location='/tmp/test1.csv'))';',
  'http://jaqlsrv.svl.ibm.com:8080',
  'timeout=60 user=biadmin password=passw0rd')
FROM SYSIBM.SYSDUMMY1;
```

Related information

[Db2 11 for z/OS Technical Overview \(IBM Redbooks\)](#)

MONTHNAME

The MONTHNAME function returns the calendar name of the month in which a given date falls. The name is returned in English.

►► MONTHNAME(*input-date*) ►◄

The schema is DSN8.

input-date

A valid date or valid character string representation of a date. A character string representation must have a data type of VARCHAR and an actual length that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class `IDate`.

The following table shows the external and specific names for MONTHNAME. The specific names differ depending on the data type of the input argument.

Table 470. External and specific names for MONTHNAME

Input arguments	External name	Specific name
<i>input-date</i> (VARCHAR)	DSN8EUMN	DSN8.DSN8EUMNV
<i>input-date</i> (DATE)	DSN8EUMN	DSN8.DSN8EUMND

Example 1: For the current date, find the name of the month.

```
VALUES DSN8.MONTHNAME( CURRENT DATE );
```

Example 2: Find the month of the year in which Delores Quintana, employee number 000130, was hired.

```
SELECT FIRSTNAME || ' ' ||
       || LASTNAME || ' was hired in the month of '
       || DSN8.MONTHNAME( HIREDATE )
       || CHAR( HIREDATE )
FROM EMP
WHERE EMPNO = '000130';
```

The result of the function is 'DELORES QUINTANA was hired in the month of July'.

TABLE_LOCATION

The TABLE_LOCATION function searches for an object and returns the location name of the object after any alias chains have been resolved.

► TABLE_LOCATION(— *object-name* — , *object-schema* — , *location-name* —) ►

The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location-name*. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

object-name

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema

A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name

A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(16). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_LOCATION. The specific names differ depending on the number of input arguments to the function.

Table 471. External and specific names for TABLE_LOCATION

Input arguments	External name	Specific name
<i>object-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR) <i>location-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVVV

Example: Assume that:

- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.

Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.

```
VALUES DSN8.TABLE_LOCATION( 'ALIAS_RS_SYSTABLES' );
```

The result of the function is 'REMOTE_SITE'.

TABLE_NAME

The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.

►► TABLE_NAME(— *object-name* — , *object-schema* — , *location-name* —) ►

The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location name*. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

object-name

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema

A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name

A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

Table 472. External and specific names for TABLE_NAME

Input arguments	External name	Specific name
<i>object-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR) <i>location-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVVV

Example: Assume that:

- DSN8.VIEW_OF_SYSTABLES is a view of SYSIBM.SYSTABLES.
- DSN8.ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSTABLES.
- The CURRENT SQLID is DSN8.

Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.

```
VALUES DSN8.TABLE_NAME( 'ALIAS_OF_VIEW' );
```

The result of the function is 'VIEW_OF_SYSTABLES'.

TABLE_SCHEMA

The TABLE_SCHEMA function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.

►► TABLE_SCHEMA(— *object-name* — , *object-schema* — , *location-name* —) ►►

The schema is DSN8.

The starting point of the resolution is the object that is specified by *objectname* and *objectschema*. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

object-name

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema

A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name

A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR (and an actual length that is no greater than 16 bytes).

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_SCHEMA. The specific names differ depending on the number of input arguments.

Table 473. External and specific names for function TABLE_SCHEMA

Input arguments	External name	Specific name
<i>object-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISVV
<i>object-name</i> (VARCHAR) <i>object-schema</i> (VARCHAR) <i>location-name</i> (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISVVV

Example: Assume that:

- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

Find the name of the schema of the base table for ALIAS_OF_SYSTABLES.

```
VALUES DSN8.TABLE_SCHEMA( 'ALIAS_OF_SYSTABLES' );
```

The result of the function is 'SYSIBM'.

URLENCODE and URLDECODE

The URLENCODE and URLDECODE helper REST functions complete URL encoding or decoding of the provided text.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

text

Specifies the text to encode or decode. This argument is defined as a VARCHAR(2048) value.

encoding

Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

Related tasks

[Creating REST user-defined functions \(Db2 Installation and Migration\)](#)

WEATHER

The WEATHER function returns information from a TSO data set as a Db2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.

The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

input-data-set-name

The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.

The result of the function is a Db2 table with the following columns. Each column can be null.

name-of-city

VARCHAR(30)

temperature-in-fahrenheit

INTEGER

percent-humidity

INTEGER

wind-direction

VARCHAR(5)

wind-velocity

INTEGER

barometer

FLOAT

forecast

VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is DSN8.DSN8DUWF.

Example: Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```
SELECT CITY, FORECAST
FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
WHERE TEMP_IN_F < 25
ORDER BY CITY;
```

This example returns:

Bessemer, MI	Slight chance of snow
Cheyenne, WY	Continued cooling
Helena, MT	Heavy snow
Pierre, SD	Continued cold

Information resources for Db2 for z/OS and related products

You can find the online product documentation for Db2 13 for z/OS and related products in IBM Documentation.

For all online product documentation for Db2 13 for z/OS, see [IBM Documentation](https://www.ibm.com/docs/en/db2-for-zos/13) (<https://www.ibm.com/docs/en/db2-for-zos/13>).

Programming interface information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by Db2 13 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by Db2 13 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of Db2 13 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

 Product-sensitive Programming Interface and Associated Guidance Information... 

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek

your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Statement at <http://www.ibm.com/privacy>.

Glossary

The glossary is available in IBM Documentation

For definitions of Db2 for z/OS terms, see [Db2 glossary \(Db2 Glossary\)](#).

Index

Special Characters

- [_ \(underscore character\) as escape character 315](#)
