

Db2 13 for z/OS

Codes

Last updated: 2026-03-12

Notes

Before using this information and the product it supports, be sure to read the general information under "Notices" at the end of this information.

Subsequent editions of this PDF will not be delivered in IBM Publications Center. Always download the latest edition from [IBM Documentation](#).

2026-03-12 edition

This edition applies to Db2® 13 for z/OS® (product number 5698-DB2), Db2 13 for z/OS Value Unit Edition (product number 5698-DBV), and to any subsequent releases until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

Specific changes are indicated by a vertical bar to the left of a change. A vertical bar to the left of a figure caption indicates that the figure has changed. Editorial changes that have no technical significance are not noted.

About this information

This information helps you to understand the codes that you could receive while working with Db2 13 for z/OS (Db2 for z/OS). The topics provide detailed descriptions of the codes that are issued by Db2, with explanations and user responses for the situations that are associated with these codes.

Throughout this content, "Db2" means "Db2 13 for z/OS." References to other Db2 products use complete names or more-specific abbreviations.

Important: To find the most up to date content for Db2 13 for z/OS, always use [IBM® Documentation](#) or download the latest PDF file from [PDF format manuals for Db2 13 for z/OS \(Db2 for z/OS in IBM Documentation\)](#).

This Db2 13 for z/OS product documentation generally assumes that the highest available function level is activated and that your applications are running with the highest available application compatibility level, with the following exceptions:

- The following documentation sections describe the Db2 13 migration process and how to activate new capabilities in function levels:
 - [Migrating to Db2 13 \(Db2 Installation and Migration\)](#)
 - [What's new in Db2 13 \(Db2 for z/OS What's New?\)](#)
 - [Adopting new capabilities in Db2 13 continuous delivery \(Db2 for z/OS What's New?\)](#)
- [FL 500](#) Labels like this one usually mark new content or changes for Db2 function levels. The label is also a link to the description of the function level that introduces the changes. For more information, see [How Db2 function levels are documented \(Db2 for z/OS What's New?\)](#).

Continuous delivery in Db2 13

The availability of most new-function application capabilities in Db2 13 depends on the type of enhancement, the activated function level, and the application compatibility levels of each application. For a list of all available function levels that are currently available in Db2 13, see [Db2 13 function levels \(Db2 for z/OS What's New?\)](#).

Many new-function enhancements take effect at any function level when you apply a PTF in each Db2 subsystem or data sharing member. For more information, see [New-function APARs for Db2 13 \(Db2 for z/OS What's New?\)](#).

Availability of virtual storage and optimization enhancements

Some virtual storage and optimization enhancements take effect in function level 100. Optimization enhancements become available after full prepare of the SQL statements, depending on the statement type:

- For static SQL statements, after bind or rebind of the package.
- For non-stabilized dynamic SQL statements, immediately, unless the statement is in the dynamic statement cache.
- For stabilized dynamic SQL statements, after invalidation, free, or changed application compatibility level.

Who should read this information

Db2 Codes lists codes that are issued by Db2, with explanations and suggested responses. This information is intended for users and system programmers who might encounter Db2 messages and codes.

Db2 Utilities Suite for z/OS

Important: Db2 Utilities Suite for z/OS is available as an optional product. You must separately order and purchase a license to such utilities, and discussion of those utility functions in this publication is not intended to otherwise imply that you have a license to them.

Db2 13 utilities can use the DFSORT program regardless of whether you purchased a license for DFSORT on your system. For more information about DFSORT, see <https://www.ibm.com/support/pages/dfsorth>.

Db2 utilities can use IBM Db2 Sort for z/OS as an alternative to DFSORT for utility SORT and MERGE functions. Use of Db2 Sort for z/OS requires the purchase of a Db2 Sort for z/OS license. For more information about Db2 Sort for z/OS, see [Db2 Sort for z/OS documentation](#).

Related concepts

Terminology and citations

When referring to a Db2 product other than Db2 for z/OS, this information uses the product's full name to avoid ambiguity.

The following terms are used as indicated:

Db2

Represents either the Db2 licensed program or a particular Db2 subsystem.

IBM OMEGAMON® for Db2 Performance Expert on z/OS

Refers to any of the following products:

- IBM IBM OMEGAMON for Db2 Performance Expert on z/OS
- IBM Db2 Performance Monitor on z/OS
- IBM Db2 Performance Expert for Multiplatforms and Workgroups
- IBM Db2 Buffer Pool Analyzer for z/OS

C, C++, and C language

Represent the C or C++ programming language.

CICS®

Represents CICS Transaction Server for z/OS.

IMS

Represents the IMS Database Manager or IMS Transaction Manager.

MVS

Represents the MVS element of the z/OS operating system, which is equivalent to the Base Control Program (BCP) component of the z/OS operating system.

RACF®

Represents the functions that are provided by the RACF component of the z/OS Security Server.

Accessibility features for Db2 for z/OS

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

Accessibility features

The following list includes the major accessibility features in z/OS products, including Db2 for z/OS. These features support:

- Keyboard-only operation.
- Interfaces that are commonly used by screen readers and screen magnifiers.
- Customization of display attributes such as color, contrast, and font size

Tip: [IBM Documentation](#) (which includes information for Db2 for z/OS) and its related publications are accessibility-enabled for the IBM Home Page Reader. You can operate all features using the keyboard instead of the mouse.

Keyboard navigation

For information about navigating the Db2 for z/OS ISPF panels using TSO/E or ISPF, refer to the *z/OS TSO/E Primer*, the *z/OS TSO/E User's Guide*, and the *z/OS ISPF User's Guide*. These guides describe how to navigate each interface, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Related accessibility information

Online documentation for Db2 for z/OS is available in IBM Documentation. For more information, see [IBM Db2 for z/OS documentation](#).

IBM and accessibility

For more information about the commitment that IBM has to accessibility, see the *IBM Accessibility Center* at <http://www.ibm.com/able>.

How to send your comments about Db2 for z/OS documentation

Your feedback helps IBM to provide quality documentation.

Send any comments about Db2 for z/OS and related product documentation by email to db2zinfo@us.ibm.com.

To help us respond to your comment, include the following information in your email:

- The product name and version
- The address (URL) of the page, for comments about online documentation
- The book name and publication date, for comments about PDF manuals
- The topic or section title
- The specific text that you are commenting about and your comment

How to interpret code numbers

Db2 issues SQL execution codes, reason codes, abend reason codes, and Db2 instrumentation facility interface reason codes to communicate about normal and error situations. The format of the code numbers can help you understand what the code applies to.

Db2 SQL return code format

SQL return codes have the following format:

-418

sign

With the exception of the return code 000, SQL return codes are prefixed with either a + or - sign. The sign represents either success (+) or error (-).

Regardless of whether the application program provides an SQLCA or a stand-alone variable, SQLCODE is set by Db2 after each SQL statement is executed.

number

The length of the numeric portion of an SQL return code is three to five digits.

Db2 reason code format

All Db2 reason codes, including subsystem termination reason codes, are four bytes long and have the following format:

00E50041

00

The first byte is always 00, which is the *high-order byte*.

E5

The second byte is the *hexadecimal identifier* (hex ID), which identifies the Db2 subcomponent. In this example, E5 identifies the Db2 agent services manager. For more information, see [Subcomponent identifiers in Db2 messages and codes \(Db2 Messages\)](#).

0041

The last two bytes are the *numeric identifier*, which is unique within the subcomponent.

The Db2 reason codes are grouped by hexadecimal identifier and listed in numeric order.

Related concepts

[SQL codes](#)

When Db2 executes an SQL statement, it returns information about the statement execution. This information includes the SQL return code (SQLCODE) and the SQLSTATE, which indicate whether statement execution was successful.

[Db2 reason codes](#)

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

Subcomponent identifiers in Db2 messages and codes

The identifiers for messages or reason codes in Db2 indicate the associated Db2 subcomponent or functional area.

The following table lists the Db2 subcomponents and functional areas and the identifiers that are associated with each one. Some message identifiers are shared by more than one subcomponent or functional area. Also, subcomponents can call each other, so one subcomponent might return messages with reason codes from another.

Table 1. Subcomponent identifiers used in Db2 messages and reason codes

Subcomponent or functional area	Identifier for messages	Identifier for reason codes
Call attachment facility and some Db2 supplied stored procedures	A	X'C1'
Buffer manager	B	X'C2'
TSO attachment facility	E	X'C5'
Message generator	F	X'C6'
Database descriptor manager	G	n/a
Precompiler, DSNH CLIST	H	X'C8'
Data manager	I	X'C9'
Recovery log manager	J	X'D1'
Distributed data facility	L	X'D3'

Table 1. Subcomponent identifiers used in Db2 messages and reason codes (continued)

Subcomponent or functional area	Identifier for messages	Identifier for reason codes
IMS attachment facility	M	X'D4'
XML manager	n/a	X'D5'
Data space manager	P	X'D7'
MQListener	Q	n/a
Recovery manager	R	X'D9'
Storage manager	S	X'E2'
Service controller, install	T	X'E3'
Utilities	U	X'E4'
Agent services manager	V	X'E5'
Instrumentation facility	W	X'E6'
Relational data system	X	X'E7'
Initialization procedures	Y	X'E8'
System parameter manager	Z	X'E9'
Service facilities	1	X'F1'
Subsystem support subcomponent	3	X'F3'
Group manager	7	X'F7'
Db2 Accessories Suite for z/OS	5	n/a
Sample applications	8	X'F8'
General command processor	9	X'F9'

Messages with DSNB and DSN2 identifiers and codes in the X'C3' range were previously used to display CICS messages. For information about CICS messages, see the information in the [Search the online product documentation for CICS](#).

Related concepts

[How to interpret code numbers](#)

[How to interpret message numbers \(Db2 Messages\)](#)

How to find additional information about messages

When you are working with Db2, you might encounter messages issued by other IBM products, such as IMS, CICS, or z/OS. Information about messages issued by these and other IBM products is available in IBM Documentation.

CICS

Information for multiple versions of CICS are available as part of the CICS library. [Search the online product documentation for CICS](#).

IMS

IMS messages are available in [IMS messages and codes](#).

IRLM

Messages and codes related to the IRLM, which were previously part of this information, are now provided in [IRLM messages and codes \(IRLM messages and codes\)](#). IRLM messages have the prefix dxr.

- [IRLM return and reason codes \(IRLM messages and codes\)](#)
- [IRLMabend codes \(IRLM messages and codes\)](#)
- [DXR messages \(IRLM messages and codes\)](#)

z/OS

Information for multiple versions of z/OS is available as part of the z/OS library. [Search the z/OS library](#).

Part 1. SQL codes

When Db2 executes an SQL statement, it returns information about the statement execution. This information includes the SQL return code (SQLCODE) and the SQLSTATE, which indicate whether statement execution was successful.

SQLCODE

The SQLCODE value is set by Db2 after each statement is executed, as shown in the following table.

SQLCODE value	Meaning	SQLCODE descriptions
SQLCODE = 0	Successful execution, if SQLWARN0 is blank. If SQLWARN0 = 'W', successful execution with warning.	<u>000</u>
SQLCODE = 100	No data was found. For example, a FETCH statement returned no data because the cursor was positioned after the last row of the result table.	<u>+100</u>
SQLCODE > 0 and not = 100	Successful execution with a warning.	<u>+sqlcode-num</u>
SQLCODE < 0	Execution was not successful.	<u>-sqlcode-num</u>

For PDF format descriptions of the SQL codes that Db2 13 might issue, see  [Codes](#).

How applications receive SQL codes

An application program that contains executable SQL statements must do one of the following things:

- Declare SQLCODE and SQLSTATE (SQLCOD and SQLSTA in Fortran) as stand-alone host variables. If you specify the STDSQL(YES) precompiler or SQL statement coprocessor option, these host variables receive the return codes, and you should not include an SQLCA in your program.
- Provide a structure named SQLCA. The SQLCA includes the SQLCODE and SQLSTATE, in addition to other status information. You can provide an SQLCA by using the INCLUDE SQLCA statement. You can call the DSNTIAR sample subroutine from your application program to format the contents of the SQLCA, or you can retrieve fields from the SQLCA yourself.

Regardless of whether the application program provides an SQLCA or a stand-alone variable, SQLCODE is set by Db2 after each SQL statement is executed.

Tokens in SQL code message text

In this section, the italicized phrases in the SQL return code message text corresponds to the tokens that are returned in the SQLERRMC field of the SQLCA. If Db2 returns several tokens, they appear sequentially in SQLERRMC in the order that they appear in the message text. At most, 70 bytes are returned for a message token because the SQLERRMC field of the SQLCA is limited to 70 bytes. Use the GET DIAGNOSTICS statement with a DB2_ORDINAL_TOKEN_*n* keyword to obtain the full value of a message token.

In some cases a token is not applicable or available for a specific instance of an error, and *N is returned instead.

Tokens might sometimes refer to the names of objects on accelerators instead of the names of associated objects on Db2.

SQLSTATE

SQLSTATE is also set by Db2 after the execution of each SQL statement. Thus, application programs can check the execution of SQL statements by testing SQLSTATE instead of SQLCODE. SQLSTATE (SQLSTT in FORTRAN) is a 5-byte character string variable in the SQLCA.

SQLSTATE provides application programs with common codes for common error conditions (the values of SQLSTATE are product-specific only if the error or warning is product-specific). Furthermore, SQLSTATE is designed so that application programs can test for specific errors or classes of errors. The coding scheme is the same for all IBM relational database products.

Related concepts

[SQLSTATE values and common error codes](#)

Db2 produces SQLSTATE values when it works as an application server or requester.

[SQLCODE \(Db2 SQL\)](#)

Chapter 1. Success (0) and warning (+) SQL codes

SQL return codes that are preceded by a plus sign (+) indicate that the SQL statement execution was successful.

Some interfaces that return SQL conditions, such as SPUFI, might return the final SQLCODE condition first, followed by any prior SQLCODE conditions incurred as a SQL statement was executed. If the final SQLCODE is an error, most prior SQLCODE warning conditions can be ignored.

Successful SQL execution codes for Java programs

For information on SQL execution codes in the range +4200 to +4299, and +4450 to +4499, see [Error codes issued by the IBM Data Server Driver for JDBC and SQLJ \(Db2 Application Programming for Java\)](#).

List of success and warning SQL codes

The following SQL codes indicate successful execution of the SQL statement or successful execution with a warning.

Related reference

[SQLCODE \(Db2 SQL\)](#)

000 SUCCESSFUL EXECUTION

Explanation

Unqualified successful execution or successful execution with one or more warnings.

If SQLWARN0 is blank, there are no warnings. If SQLWARN0 = W, at least one of the other warning indicators in the SQLCA has been set to indicate a warning condition. For example, SQLWARN1 is used to indicate that a value of a string column was truncated when assigned to a host variable.

SQLSTATE

00000 (unqualified successful execution)

01003, 01004, 01503, 01504, 01505, 01506, 01507, 01517, 01524 (successful execution with warning)

Related concepts

[SQL communication area \(SQLCA\) \(Db2 SQL\)](#)

Related reference

[Description of SQLCA fields \(Db2 SQL\)](#)

it does identify a column of a table or view in a FROM clause at a higher level in the statement.

System action

The column name is interpreted as a correlated reference.

Programmer response

If Db2 interpretes the column name differently than you intended, rewrite the SQL statement and submit it again. If you intend the column name to refer to a table named at a higher level, we advise rewriting the statement anyway, using a table name or correlation name as a qualifier for the column name. The unqualified column name could be interpreted differently if you do a rebind after altering one of the tables to which you refer.

SQLSTATE

01545

+012 THE UNQUALIFIED COLUMN NAME *column-name* WAS INTERPRETED AS A CORRELATED REFERENCE

Explanation

The column name does not identify a column of a table or view in the FROM clause of the subquery. However,

+020 BIND, REBIND, OR PRECOMPILE OPTION *option-name* IS NOT SUPPORTED BY THE TARGET SERVER AND WILL BE IGNORED.

Explanation

At least one option specified at bind, rebind, or precompile time is not supported by the target server.

option-name

The name of the first unsupported option.

System action

Processing continues, but the unsupported options are ignored.

User response

Ensure that the specification of bind, rebind, or precompile option names or the associated option values was intended while connected to this server.

SQLSTATE

01615

Related reference

[BIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#)

[REBIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#)

**+098 A DYNAMIC SQL STATEMENT
 ENDS WITH A SEMICOLON.**

Explanation

The statement string of a PREPARE or EXECUTE IMMEDIATE statement is a valid dynamic SQL statement, but it ends with a semicolon.

System action

The semicolon and any subsequent text are ignored.

Programmer response

Check that the semicolon is being used as a statement terminator.

SQLSTATE

01568

**+100 ROW NOT FOUND FOR FETCH,
 UPDATE OR DELETE, OR THE
 RESULT OF A QUERY IS AN EMPTY
 TABLE**

Explanation

One of the following conditions occurred:

- No row met the search conditions specified in an UPDATE or DELETE statement.
- The result of a SELECT INTO statement was an empty table.

- The result of the subselect of an INSERT statement is empty.
- A FETCH statement was executed when the cursor was positioned after the last row of the result table.
- No available rows qualified for return when SKIP LOCKED DATA was specified with isolation level CS or RS.
- A FETCH statement that returns a rowset was issued, but there were not enough rows after the current cursor position to reposition the cursor on a full rowset. The cursor has been positioned on a partial rowset. If a target was specified, data was returned only for the number of rows that were actually fetched for the partial rowset. The number of rows that were returned is in field SQLERRD3 of the SQLCA.

When a SELECT statement is executed using SPUFI, this SQLCODE indicates normal completion.

This SQLCODE is also issued when LOB data cannot be returned. This situation can occur when an application is running with isolation level UR and another application has locked the LOB table space.

System action

No data was retrieved, updated, or deleted.

SQLSTATE

02000

**+110 SQL UPDATE TO A DATA
 CAPTURE TABLE NOT SIGNALLED
 TO ORIGINATING SUBSYSTEM**

Explanation

IMS DataPropagator exit routine issued an SQL data change statement to a table defined with DATA CAPTURE CHANGES. Since data capture is already in progress, notification is not sent back to the originating IMS subsystem.

System action

Db2 changes the data and records the change in the log. Db2 does not notify IMS DataPropagator's exit routine of the change, because doing so might cause the same change to be made again.

SQLSTATE

01561

**+111 THE SUBPAGES OPTION IS NOT
 SUPPORTED FOR TYPE 2 INDEXES**

Explanation

You cannot use the SUBPAGES option for type 2 indexes.

System action

The option is ignored and processing continues.

Programmer response

Remove the SUBPAGES option to get rid of the warning.

SQLSTATE

01590

+117	THE NUMBER OF INSERT VALUES IS NOT THE SAME AS THE NUMBER OF OBJECT COLUMNS
-------------	--

Explanation

The number of insert values in the value list of the insert operation is not the same as the number of object columns specified.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, specify one and only one value for each of the specified object columns.

SQLSTATE

01525

+162	TABLESPACE <i>database-name.tablespace-name</i> HAS BEEN PLACED IN CHECK PENDING
-------------	---

Explanation

The indicated table space is in check pending status because the ALTER TABLE statement was used to specify either of the following:

- A referential constraint
- A check constraint, when the CURRENT RULES special register is set to 'DB2'

The table space is not generally available until the check pending status is removed from the table space.

System action

The table space was placed in check pending status.

Programmer response

Run the CHECK DATA utility. The enforcement of the referential constraint or the check constraint is deferred until the CHECK DATA utility is run.

SQLSTATE

01514

+203	THE QUALIFIED COLUMN NAME <i>column-name</i> WAS RESOLVED USING A NON-UNIQUE OR UNEXPOSED NAME
-------------	---

Explanation

The table designator selected to resolve a qualified column name is one of the following:

- An unexposed name
- An exposed name that has an exposed duplicate in the same FROM clause
- An exposed name that has an unexposed duplicate which appears before the selected name in the ordered list of names to which the qualifier is compared

Therefore, the statement does not conform to the guidelines for using only unique exposed names as qualifiers or it is possible that the column reference was not resolved to the intended instance of the table or view.

System action

Db2 uses the selected name to resolve the reference.

Programmer response

If Db2 did not resolve of the qualifier how you intended, rewrite the SQL statement and submit it again.

SQLSTATE

01552

Related concepts

[Resolution of column name qualifiers and column names \(Db2 SQL\)](#)

[Qualified column names \(Db2 SQL\)](#)

+204 ***name IS AN UNDEFINED NAME***

Explanation

The object identified by *name* is not defined in the Db2 subsystem. This return code can be generated for any type of Db2 object.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine that the object name was correctly specified in the SQL statement (including any required qualifiers). If so, ensure that the object exists in the system before resubmitting the statement.

SQLSTATE

01532

+205 ***column-name IS NOT A COLUMN
OF TABLE *table-name****

Explanation

For ALTER TABLE ALTER COLUMN, column *column-name* is not a column in table *table-name*.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

Verify that the column and table names are specified correctly (including any required qualifiers) in the SQL statement.

SQLSTATE

01533

+206 ***column-name IS NOT A COLUMN
OF AN INSERTED TABLE,
UPDATED TABLE, MERGED TABLE,
OR ANY TABLE IDENTIFIED IN A
FROM CLAUSE***

Explanation

This return code is used to report one of these errors:

- In the case of an INSERT or UPDATE statement, or SELECT FROM INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.
- In the case a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
- There is a correlated reference in GROUP BY.
- There is an unresolved qualified reference in HAVING.
- In the case of a MERGE statement or SELECT from MERGE statement, the specified column is not a column in the target-table. Also, it is not a column specified in the include-columns clause.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

SQLSTATE

01533

+217 ***THE STATEMENT WAS NOT
EXECUTED AS ONLY EXPLAIN
INFORMATION REQUESTS ARE
BEING PROCESSED.***

Explanation

The current value of the EXPLAIN MODE special register has been set to EXPLAIN. This value allows dynamic SQL statements to be prepared and explained but prevents any dynamic statement from being executed.

System action

The statement was not executed because only information requests from EXPLAIN are being processed.

Programmer response

To execute the statement, change the value of the EXPLAIN MODE special register to a setting other than EXPLAIN. Issue the appropriate SET statement from the interface or application that is encountering this condition.

SQLSTATE

01604

+218	THE SQL STATEMENT REFERENCING A REMOTE OBJECT CANNOT BE EXPLAINED
-------------	--

Explanation

The user has used EXPLAIN(YES) on the bind subcommand to bind an application which has SQL statement referencing a remote object or the user has a static EXPLAIN SQL statement which references a remote object in the application program. EXPLAIN on a remote object is not supported by Db2.

It is issued at BIND time, and only with VALIDATE(RUN).

System action

The plan or package will be bound successfully, but no information will be filled in the user's PLAN_TABLE for the SQL statement referencing a remote object. An SQLCODE -512 will be issued at run time if the EXPLAIN statement is found to explain a remote object.

SQLSTATE

01537

+219	THE REQUIRED EXPLANATION TABLE <i>table-name</i> DOES NOT EXIST
-------------	--

Explanation

The EXPLAIN statement assumes the existence of an EXPLAIN table and it is not defined in the Db2 subsystem as a base table.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine whether the required EXPLAIN table does exist. If not, create the required table.

+220	THE COLUMN <i>column-name</i> IN EXPLANATION TABLE <i>table-name</i> IS NOT DEFINED PROPERLY
-------------	---

Explanation

An error occurred during the insertion of a row into an optional explanation table.

column-name

The name of the column that is the cause of the error. Possible reasons for this error include:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

table-name

The name of the explanation table.

System action

A valid plan or package will be created if no additional errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, correct the definition of the required explanation table.

+222	HOLE DETECTED USING CURSOR <i>cursor-name</i>
-------------	---

Explanation

A *delete hole* or an *update hole* has been detected while processing a FETCH for cursor *cursor-name*. With a SENSITIVE STATIC cursor, a delete hole occurs when Db2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table has been deleted. An update hole occurs when Db2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table no longer satisfies the search condition.

cursor-name

Name of the cursor used for the FETCH statement.

System action

The statement cannot be processed, and no data is fetched. The cursor is repositioned on the hole.

Programmer response

Correct the application program to handle this situation, or change isolation levels so the base row cannot be deleted during the cursor operation.

SQLSTATE

02502

+231	CURRENT POSITION OF CURSOR <i>cursor-name</i> IS NOT VALID FOR THE SPECIFIED FETCH ORIENTATION OF THE CURRENT ROW OR ROWSET
-------------	--

Explanation

The cursor was not positioned on a row or rowset, and one of the following fetch orientations specified that the cursor was to be positioned relative to its current position:

- CURRENT or CURRENT ROWSET
- RELATIVE 0 or ROWSET STARTING AT RELATIVE 0

cursor-name

Name of the cursor used for the FETCH statement.

System action

The statement cannot be processed. No data was fetched, and the cursor position is unchanged.

Programmer response

Correct the application program to establish a valid cursor position before issuing this FETCH statement.

SQLSTATE

02000

+236	SQLDA INCLUDES <i>integer1</i> SQLVAR ENTRIES, BUT <i>integer2</i> ARE REQUIRED FOR <i>integer3</i> COLUMNS
-------------	--

Explanation

The value of the SQLN field of the SQLDA should be at least as large as the number of columns being described. *integer3* is the number of columns being described.

In the case that USING BOTH has been specified, twice as many SQLVAR entries are needed as the number of columns being described.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Attention: In the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System action

The SQLDAID 7th byte has been set to "on" with a value of 2 indicating that 2 SQLVAR entries are needed for each column. Db2 has not set any SQLVAR entries.

Programmer response

Increase the value of the SQLN field in the SQLDA to the value indicated in the message (making sure the SQLDA is large enough to support that amount) and resubmit the statement.

SQLSTATE

01005

+237	SQLDA INCLUDES <i>integer1</i> SQLVAR ENTRIES, BUT <i>integer2</i> ARE REQUIRED BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE
-------------	---

Explanation

Given that at least one of the columns being described is a distinct type, space should be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified (*n* is the number of columns being described):

- With USING BOTH, space should be allocated for $3n$ SQLVAR entries.
- Otherwise, space should be allocated for $2n$ SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Attention: In the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System action

Db2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. Additionally, because there were enough SQLVAR entries for the *base* SQLVARs, Db2 has set the fields of the *base* SQLVAR entries. However, Db2 has not set any *extended* SQLVAR entries.

Programmer response

If there is no need for the additional information about the distinct type(s), then no action is required unless USING BOTH was specified (in which case additional SQLVAR entries must be provided for the labels).

If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to *integer2* (after making sure that the SQLDA is large enough to support that amount) and the statement should be resubmitted.

SQLSTATE

01594

+238	SQLDA INCLUDES <i>integer1</i> SQLVAR ENTRIES, BUT <i>integer2</i> SQLVAR ENTRIES ARE NEEDED FOR <i>integer3</i> COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A LOB
------	---

Explanation

Given that at least one the columns being described is a LOB, space must be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries. One or more of the columns being described may be a distinct type.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (*n* is the number of columns being described which is *integer3*), and whether the columns include any distinct types:

- With USING BOTH, and one or more distinct types, space should be allocated for $3n$ SQLVAR entries.
- Otherwise, space should be allocated for $2n$ SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Important: In the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System action

Db2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. Db2 has not set any SQLVAR entries.

Programmer response

Increase the value of the SQLN field in the SQLDA to *integer2* (after making sure that the SQLDA is large enough to support that amount) and resubmit the statement.

SQLSTATE

01005

+239	SQLDA INCLUDES <i>integer1</i> SQLVAR ENTRIES, BUT <i>integer2</i> ARE REQUIRED FOR <i>integer3</i> COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE
------	--

Explanation

Given that at least one of the columns being described is a distinct type, space should be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates

that there are not enough SQLVAR entries for the base and extended SQLVAR entries.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (*n* is the number of columns being described which is *integer3*),

- With USING BOTH, space should be allocated for *3n* SQLVAR entries.
- Otherwise, space should be allocated for *2n* SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Note: in the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System action

Db2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. Db2 has not set any SQLVAR entries. :elq.

Programmer response

If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to *integer2* (after making sure the SQLDA is large enough to support that amount) and the statement should be resubmitted.

If there is no need for the additional information about the distinct type(s) in the result set, then it is possible to resubmit the statement only providing enough SQLVAR entries to accommodate the number of columns being described (i.e. provide the necessary number of *base* SQL entries).

SQLSTATE

01005

+252	A NON-ATOMIC <i>statement</i> STATEMENT SUCCESSFULLY PROCESSED ALL REQUESTED ROWS, WITH ONE OR MORE WARNING CONDITIONS
------	--

Explanation

A non-atomic *statement* statement successfully processed multiple rows of data. However, one or more warning conditions occurred. Use GET

DIAGNOSTICS to obtain information about the warning conditions that occurred.

System action

The statement was processed.

Programmer response

Analyze the warning conditions to determine whether the statement should be rolled back or not.

SQLSTATE

01659

+304	A VALUE WITH DATA TYPE <i>data-type1</i> CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION <i>position-number</i> WITH DATA TYPE <i>data-type2</i>
------	---

Explanation

A FETCH or SELECT into a host variable list or structure, position number *position-number* failed because the host variable having data type *data-type2* was not large enough to hold the retrieved value having data type *data-type1*.

System action

The FETCH or SELECT could not return the data for the indicated SELECT item, the indicator variable is set to negative two (-2) to indicate a null value returned. Processing continues.

Programmer response

Verify that table definitions are current, and that the host variable has the proper data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

SQLSTATE

01515

+331	THE NULL VALUE HAS BEEN ASSIGNED TO A HOST VARIABLE OR PARAMETER BECAUSE THE STRING CANNOT BE CONVERTED FROM <i>source-ccsid</i> TO <i>target-ccsid</i> . REASON <i>reason-code</i> , POSITION <i>position-number</i>
------	---

Explanation

A string had to be converted from *source-ccsid* to *target-ccsid* and an error occurred during the conversion. The *position-number*, if provided (non-zero), is the ordinality of the host variable or parameter in the SQLDA. See the description of SQLCODE -331 for further information including the meaning of the *reason-code*.

System action

The host variable is unchanged and its indicator variable is set to -2 to indicate that a null value is returned. Execution of the statement continues as if the conversion error had not occurred.

SQLSTATE

01520

+335	DB2 CONVERTED A HOST VARIABLE, PARAMETER, OR COLUMN NUMBER <i>var-num</i> <i>var-name-or-num</i> TO COLUMN NAME, HOST VARIABLE, OR EXPRESSION NUMBER <i>col-name-or-num</i> FROM <i>from ccsid</i> TO <i>to-ccsid</i>, AND RESULTING IN SUBSTITUTION CHARACTERS.
------	---

Explanation

A conversion error occurred during the conversion of a string to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

var-num *var-name-or-num*

The value of the host variable, the parameter, or the column number prior to the conversion process. This value might be the string *N if the column number is not available when this SQLCODE is issued.

col-name-or-num

The value of the host variable, the parameter or the column number after the conversion process. This value might be the string *N if the column number is not available when this SQLCODE is issued.

from ccsid

The input CCSID for the host variable, parameter, or column number.

to-ccsid

The resulting CCSID from the conversion of the host variable, parameter, or column number.

System action

Db2 processes the statement successfully.

Programmer response

This warning can occur in two situations:

- If trace for IFCID 136 or 168 is not active, Db2 processes the SQL statement, but used substitution characters instead of one or more characters as a result of character conversion from *from ccsid* to *to-ccsid*. If substitution is acceptable, no action is necessary. If substitution is not acceptable, issue a ROLLBACK. Ensure that data being provided to Db2 is convertible from *from ccsid* to *to-ccsid* without data loss.
- If trace for IFCID 136 or 168 is active, and the *to-ccsid* token is an EBCDIC CCSID, and system parameter UIFCIDS is OFF, this warning is caused by the conversion to EBCDIC CCSID for IFCID trace record. Use the GET DIAGNOSTICS statement to determine if there are other warnings associated with the original SQL string. If GET DIAGNOSTICS returns no other warnings, no action is required.

SQLSTATE

01517

Related reference

[GET DIAGNOSTICS statement \(Db2 SQL\)](#)

+347	THE RECURSIVE COMMON TABLE EXPRESSION <i>name</i> MAY CONTAIN AN INFINITE LOOP
------	---

Explanation

The recursive common table expression called *name* may not complete. This warning is based on not finding specific syntax as part of the iterative portion of the recursive common table expression. The expected syntax includes:

- incrementing an INTEGER column in the iterative select list by 1.
- a predicate in the where clause of the iterative portion of the form "counter_col < constant" or "counter_col < :hostvar".

The absence of this syntax in the recursive common table expression may result in an infinite loop. The data or some other characteristic of the recursive common table expression may allow the successful completion of the statement anyway.

System action

The statement cannot be executed.

Programmer response

To prevent an infinite loop, include the expected syntax as described.

SQLSTATE

01605

+354	A ROWSET FETCH STATEMENT MAY HAVE RETURNED ONE OR MORE ROWS OF DATA. HOWEVER, ONE OR MORE WARNING CONDITIONS WERE ALSO ENCOUNTERED. USE THE GET DIAGNOSTICS STATEMENT FOR MORE INFORMATION REGARDING THE CONDITIONS THAT WERE ENCOUNTERED
------	--

Explanation:

A rowset FETCH statement encountered one or more warning conditions. Use the GET DIAGNOSTICS statement to obtain information about the conditions that occurred, and to determine if data was returned. It is possible that one or more rows of data were returned. If the row information that was returned for the row that encountered the condition is incomplete, do not use the data for the row that encountered the condition, such as displaying or printing the data.

System action:

Db2 processed the statement successfully, but with a warning that the fetching of some rows might have encountered warnings.

Programmer response

Analyze the conditions to determine whether follow-up actions are needed. The GET DIAGNOSTICS statement can be used to determine which additional actions might be necessary.

Attention: It is also possible that an end of data condition was detected. SQLERRD3 and GET DIAGNOSTICS can be used to determine if all of the requested rows were fetched or if a partial rowset was returned.

SQLSTATE

01668

+361	COMMAND WAS SUCCESSFUL BUT RESULTED IN THE FOLLOWING: <i>msg-token</i>
------	--

Explanation

During the processing of a command such as a BIND PACKAGE or DROP or FREE PACKAGE, a condition occurred, as specified by *msg-token*, and the command needs to be examined.

System action

The request was successful.

User response

Evaluate the information contained in *msg-token* to determine if the results were as expected.

SQLSTATE

0168B

+364	DECFLOAT EXCEPTION <i>exception-type</i> HAS OCCURRED DURING <i>operation-type</i> OPERATION, POSITION <i>position-number</i>
------	--

Explanation

The exception error *exception-type* occurred while performing an ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, or BUILT-IN FUNCTION operation on a field whose data type is DECFLOAT. The error occurred while processing an arithmetic expression. If the error occurred in the SELECT list of an outer SELECT statement, position in the select list is denoted by *position-number*. If not, position number is 0. The possible exception types are UNDERFLOW, OVERFLOW, INEXACT, INVALID OPERATION, DIVISION BY ZERO, or SUBNORMAL. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by Db2.

Any of the exceptions or overflows can occur during the processing of a built-in function. If *operation-type* is FUNCTION, then the error occurred while processing either an input, intermediate, or final value. The cause could be that the value of a parameter is out of range.

Note: Parts of *exception-type*, *operation-type*, and *position-number* might or might not be returned in SQLCA, depending upon when the error was detected.

System action

The resulting data proceeds according to IEEE 754r rules. Execution of the statement continues. If the statement is cursor controlled, then the cursor will remain open.

Programmer response

Examine the expression for which the warning occurred to see if the likely cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time that the error occurred. See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

SQLSTATE

0168C if INEXACT
0168D if INVALID OPERATION
0168E if UNDERFLOW,OVERFLOW
0168F if DIVISION BY ZERO
0168G if SUBNORMAL

+385	ASSIGNMENT TO AN SQLSTATE OR SQLCODE VARIABLE IN AN SQL ROUTINE <i>routine-name</i> MAY BE OVERWRITTEN AND DOES NOT ACTIVATE ANY HANDLER
------	--

Explanation

SQL routine *routine-name* was created, but it contains an assignment statement that specifies the SQLCODE or SQLSTATE variable as the target.

Assignment to an SQLSTATE or SQLCODE variable in an SQL routine only changes the value in the variable, and does not activate any handler. The SQLSTATE and SQLCODE variables are assigned values by processing of SQL statements in the SQL routine. Therefore, any value assigned might be over-written as a result of SQL statement processing.

System action

The routine definition is processed successfully.

User response

No recovery is necessary. If the intent was to signal an error or warning, specify the SIGNAL or RESIGNAL statement instead of the assignment.

To prevent the warning, remove any assignments to the SQLSTATE or SQLCODE special variables.

SQLSTATE

01643

+394	ALL USER SPECIFIED OPTIMIZATION HINTS USED
------	--

DURING ACCESS PATH SELECTION

Explanation

All user specified optimization hints that were found for the statement being optimized are used.

System action

Processing continues normally.

Programmer response

Ensure that the access path is correct and produces the correct results.

Suppressing this SQLCODE:

You can set the value of the SUPPRESS_HINT_SQLCODE_DYN to suppress SQLCODEs +394 and +395 for dynamic SQL statements.

[+395](#)
A USER SPECIFIED OPTIMIZATION HINT IS INVALID (REASON CODE = *reason-code*)

+395	A USER SPECIFIED OPTIMIZATION HINT IS INVALID (REASON CODE = <i>reason-code</i>)
------	---

Explanation

Db2 detected that one or more optimization hints provided for this statement are invalid. You can use the following *reason-code* values to identify why a hint is invalid:

reason-code

The reason why a hint was invalid. Only one *reason-code* is returned even if the hint contains

multiple problems. The following descriptions refer to the of the values in PLAN_TABLE columns for the set of rows that contain the same value in the OPTHINT column.

2

The value of the TABNO column is not valid. Negative values and values greater than the total number of table references are not valid.

The value of the TABNO column is validated only when the combination of the following columns does not identify a particular table reference within a query block: CREATOR, TNAME, CORRELATION_NAME, and QBLOCKNO.

3

A value is not specified for one of the following columns: CREATOR or TNAME

4

The value of the TABNO column was not specified, and the combination of the following columns does not uniquely identify a table reference: CREATOR, TNAME, CORRELATION_NAME, and QBLOCKNO.

5

The value specified for the TABNO column contains a value in the valid range. However, the value does not correctly correspond to the values of the following columns: CREATOR, TNAME, and CORRELATION_NAME.

6

The table identified by the values specified by the following columns cannot be found within the query block that is identified by the QBLOCKNO column: CREATOR, TNAME, CORRELATION_NAME.

7

The PAGE_RANGE column contains an invalid value.

8

The PREFETCH column contains an invalid value.

9

The METHOD column contains an invalid value.

10

The SORTN_JOIN column contains an invalid value.

11

The SORTC_JOIN column contains an invalid value.

12

The ACESSTYPE column contains an invalid value.

13

One of the following columns contains an invalid value: ACCESSCREATOR or ACCESSNAME.

15

The hint specifies an index that cannot be used.

16

The hint specified multi-index access that cannot be used.

17

The hint specifies an invalid combination of ACESSTYPE values.

18

The join method for the inner table of a join was not specified in the METHOD column.

19

The nested-loop join that is specified by the value of the METHOD column cannot be used.

20

The merge join that is specified by the value of the METHOD column cannot be used.

21

The hybrid join that is specified by the value of the METHOD column cannot be used.

22

The mode of parallelism that is specified by the value of the PARALLELISM_MODE column requested cannot be used.

23

The PARALLELISM_MODE column contains an invalid value.

24

One of the following columns contains an invalid value: ACCESS_DEGREE or ACCESS_PGROUP_ID

25

One of the following columns contains an invalid value: JOIN_DEGREE or JOIN_PGROUP_ID

26

A row for a table reference that is required for the hint is missing. For query blocks that reference multiple tables, the hint must contain a row for each table. Required tables might not be mentioned in the statement text because Db2 uses materialization or transformations in the access path.

27

The hint contains a redundant table reference because a table that is identified by a combination of the following columns appears in more than one row for the same query block:

- CREATOR, TNAME, CORRELATION_NAME, TABNO (when required).
- 28** The PRIMARY_ACCESTYPE column contains an invalid value.
- 29** The SORTN_GROUP_ID column contains an invalid value.
- 30** The SORTN_GROUP_ID column contains an invalid value.
- 31** No value is specified in the PARALLELISM_MODE column.
- 32** One of the following columns contains an invalid value: CREATOR or TNAME
- 33** The join sequence is incorrect.
- 34** The column WHEN_OPTIMIZE contains an invalid or inconsistent value.
- 35** The value of the ACCESTYPE column cannot contain 'V' for the specified table.
- 36** The number of dimension tables that are joined before the star join fact table exceeds the maximum number of dimensions that can be joined by a fact table index.
- 37** When the value of the JOIN_TYPE column for the fact table is 'SJ', a nested-loop join must be used.
- 38** The join sequence for dimension tables in a star join is incorrect because it does not match the sequence that is specified by the fact table index.
- 39** The value of ACCESTYPE column is 'O' but the specified access path cannot be used.
- 40** Multiple index access cannot be used with the specified indexes .
- 41** Duplicate hint input records found for the same table.
- 42** Predicate validation failed for a selectivity override, but no matching predicate was found in the statement. You might be able to fix the

problem by recapturing EXPLAIN information and reissuing the BIND QUERY command.

- 43** A selectivity override with multiple instances cannot be applied for the specified SQL statement. You might need to create a selectivity override that uses only a single instance.
- 46 'column-name'** A difference was detected between the access path selected by Db2 and the hinted access path for the PLAN_TABLE column that is identified by *column-name*.
- 48** Access path information for a correlated subquery is missing
- 50** The APREUSE option was specified during a bind or rebind operation and the hint was accepted. However, during access path comparison, Db2 detected that the resulting access path does not match the original access path.
- 99** An unexpected error occurred.

Only one reason-code is returned even if the hint contains multiple problems.

System action

The invalid hint is ignored and Db2 determines the access path without that hint. If other hints are supplied for the statement, Db2 might use those hints, if they are valid.

Programmer response

Examine the EXPLAIN output to determine which hints were used by Db2, and which hints were not used. If needed, correct the problem with the hints that were not used, or disable their use as hints to the optimizer.

Suppressing this SQLCODE:

You can set the value of the SUPPRESS_HINT_SQLCODE_DYN to suppress SQLCODEs +394 and +395 for dynamic SQL statements.

ALL USER SPECIFIED OPTIMIZATION HINTS
USED DURING ACCESS PATH SELECTION

for native SQL procedures. SQLCODE -4705 might be issued instead if the situation occurs with a BIND COPY command that is used to deploy a version of a native SQL procedure that uses a deprecated option, and a package already exists by that name at the server.

For indexes, use type 2 indexes rather than type 1 indexes to avoid any incompatibilities.

System action

Processing continues and the clause is ignored.

User response

No change is required for the current release. However, you should change your SQL statement and remove this clause to prepare for releases when this clause is no longer accepted.

To prevent the warning, remove the deprecated clause from the statement.

SQLSTATE

01608

+402 LOCATION *location* IS UNKNOWN

Explanation

A remote object is referenced and either the table SYSIBM.LOCATIONS is not defined or the referenced 'location' matches no entry in the SYSIBM.LOCATIONS.LOCATION column.

System action

For the CREATE ALIAS statement, the alias is created. For binding a plan or package with the VALIDATE(RUN) option, the plan or package is created.

SQLSTATE

01521

**+403 THE LOCAL OBJECT REFERENCED
BY THE CREATE ALIAS
STATEMENT DOES NOT EXIST**

Explanation

The local object referenced by the CREATE ALIAS statement does not exist when creating the alias.

System action

The alias is created.

SQLSTATE

01522

+434 *clause* IS A DEPRECATED CLAUSE

Explanation

The use of *clause* is accepted for now, but continued use of it is not recommended. However, for native SQL procedures, *clause* is not supported. See the SQL Reference for a list of options that are supported

**+438 APPLICATION RAISED WARNING
WITH DIAGNOSTIC TEXT: *text***

Explanation

This warning occurred as a result of the SIGNAL or RESIGNAL statement.

text

Diagnostic text provided by the SIGNAL or RESIGNAL statement.

System action

The statement was processed, but a warning was encountered.

Programmer response

Use the application-provided diagnostic text, if provided, to determine the cause of the warning.

SQLSTATE

Defined by the application

**+440 NO *routine-type* BY THE
NAME *routine-name* HAVING
COMPATIBLE ARGUMENTS WAS
FOUND**

Explanation

This warning occurs in a reference to routine (stored procedure or function) *routine-name*, when Db2 cannot find a function or stored procedure it can use to implement the reference. Several reasons are present for this warning:

- *routine-name* was incorrectly specified or does not exist in the database.
- A qualified reference was made, and the qualifier was incorrectly spelled.
- A user's SQL path does not contain the schema to which the function belongs, and an unqualified reference was used.
- The wrong number of arguments were included.
- For functions, the data types of one or more of the arguments is incorrect.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

Fix the problem and retry. Change the SQL statement, add new routines, or change the user's SQL path.

SQLSTATE

0168L

+445	VALUE <i>value</i> HAS BEEN TRUNCATED
-------------	--

Explanation

The value *value* was truncated by a cast function, which was called to transform the value in some way. This is a warning situation. The cast function is a result of

- a CAST specification
- a built-in function such as CHAR, VARCHAR, etc.
- a CAST FROM specification on the CREATE FUNCTION statement that created the function
- a user-defined function that is sourced on another function and the result needed to be transformed.

If 'value' has the 'for bit data' subtype, then the 'value' is printed as a hexadecimal string in quotes followed by an X.

System action

The value has been truncated.

Programmer response

Ensure that the output is as expected and that the truncation has not caused any unexpected consequences.

SQLSTATE

01004

+462	EXTERNAL FUNCTION OR PROCEDURE <i>name</i> (SPECIFIC NAME <i>specific-name</i>) HAS RETURNED A WARNING SQLSTATE, WITH DIAGNOSTIC TEXT <i>text</i>
-------------	--

Explanation

An SQLSTATE of the form *01Hxx* was returned to Db2 by user-defined function or procedure *name*, along with message text *text*.

System action

Processing continues.

Programmer response

See your database administrator, or the author of the function or procedure to find out the meaning of the warning. The significance of the bad SQLSTATE to the invoking application can be learned from the author of the function or procedure.

SQLSTATE

01Hxx

+464	PROCEDURE <i>proc</i> RETURNED <i>num</i> QUERY RESULT SETS, WHICH EXCEEDS THE DEFINED LIMIT <i>integer</i>
-------------	--

Explanation

The stored procedure named by *proc* completed normally. However, the stored procedure exceeded the defined limit on the number of query result sets the procedure can return.

- *num* identifies the number of query result sets returned by the stored procedure.
- *integer* identifies the defined limit on the number of query result sets for the stored procedure.

Only the first *integer* query result sets are returned to the SQL program that issued the SQL CALL statement.

The possible causes are as follows:

- The stored procedure is unable to return *num* result sets due to the limit defined for the procedure.
- The stored procedure is unable to return *num* result sets due to the DRDA limitations imposed by the client. The DRDA client establishes this limit with the MAXRSLCNT DDM code point.

System action

The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

SQLSTATE

0100E

+466	PROCEDURE <i>proc</i> RETURNED <i>num</i> QUERY RESULTS SETS
-------------	---

Explanation

The stored procedure named by *proc* completed normally. The procedure returned the number of SQL query result sets specified in *num*.

System action

The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

SQLSTATE

0100C

+494	NUMBER OF RESULT SETS IS GREATER THAN NUMBER OF LOCATORS
-------------	---

Explanation

The number of result set locators specified on the ASSOCIATE LOCATORS statement is less than the number of result sets returned by the stored procedure. The first "n" result set locator values are returned, where "n" is the number of result set locator variables specified on the SQL statement.

System action

The SQL statement is successful. The SQLWARN3 field is set to 'Z'.

Programmer response

Increase the number of result set locator variables specified on the SQL statement.

SQLSTATE

01614

+495	ESTIMATED PROCESSOR COST OF <i>estimate-amount1</i> PROCESSOR SECONDS (<i>estimate-amount2</i> SERVICE UNITS) IN COST CATEGORY <i>cost-category</i> EXCEEDS A RESOURCE LIMIT WARNING THRESHOLD OF <i>limit-amount</i> SERVICE UNITS
-------------	--

Explanation

The prepare of a dynamic INSERT, UPDATE, MERGE, DELETE, or SELECT SQL statement resulted in a cost estimate that exceeded the warning threshold value specified in the resource limit specification table (RLST). This warning is also issued if the Db2 cost category value was "B", and the default action specified in the RLF_CATEGORY_B column in the RLST is to issue a warning.

estimate-amount1

The cost estimate (in processor seconds) if the prepared INSERT, UPDATE, MERGE, DELETE, or SELECT statement were to be executed.

estimate-amount2

The cost estimate (in service units) if the prepared INSERT, UPDATE, MERGE, DELETE, or SELECT statement were to be executed.

cost-category

The Db2 cost-category for this SQL statement. The possible values are A or B.

limit-amount

The warning threshold (in service units) specified in the RLFASUWARN column of the RLST.

If you entered any negative number for the RLFASUWARN column, the value for *limit-amount* defaults to zero.

System action

The prepare of the dynamic INSERT, UPDATE, MERGE, DELETE, or SELECT statement was successful. An SQLCODE -905 might be issued if the execution of the prepared statement exceeds the ASUTIME value specified in the RLST.

User response

If the warning is caused by an SQL statement that is consuming too much processor resource, attempt to rewrite the statement to perform more efficiently. Another option is to ask the administrator to increase the warning threshold value in the RLST.

Programmer response

Ensure that there is application logic to handle the warning to either allow the statement to execute or to stop the statement from being executed. If this SQLCODE was returned because the cost category value is "B", it might be that the statement is using parameter markers or that some statistics are not available for the referenced tables and columns. Make sure the administrator has run the utility RUNSTATS on the referenced tables. It might also be that UDFs will be invoked when the statement is executed, or for INSERT, UPDATE, MERGE, or DELETE statements that triggers are defined on the changed table. Check the DSN_STATEMNT_TABLE or the IFCID 22 record for this statement to find the reasons this SQL statement has been put in cost category "B".

SQLSTATE

01616

+535	THE RESULT OF THE POSITIONED UPDATE OR DELETE MAY DEPEND ON THE ORDER OF THE ROWS
-------------	--

Explanation

A positioned update of a primary key or a delete from a table with a self-referencing constraint was requested.

System action

Db2 executes the UPDATE or DELETE statement and the contents of the table are changed.

SQLSTATE

01591

+541	THE REFERENTIAL OR UNIQUE CONSTRAINT <i>name</i> HAS BEEN IGNORED BECAUSE IT IS A DUPLICATE
-------------	--

Explanation

A FOREIGN KEY clause uses the same key and parent table as another FOREIGN KEY clause, or a UNIQUE clause uses the same column list as another UNIQUE or PRIMARY KEY clause. In either case, the duplicate clause is ignored.

name is either the foreign key name or the unique constraint name.

System action

Db2 continues processing.

Programmer response

If the duplication is an error, correct the statement and execute it again.

SQLSTATE

01543

+551	<i>auth-id</i> DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION <i>operation</i> ON OBJECT <i>object-name</i>
-------------	--

Explanation

Authorization ID *auth-id* has attempted to perform the specified *operation* on object *object-name* without having been granted the proper authority to do so. This error might also occur if the specified object does not exist, or if the object is a read-only view (for UPDATE, INSERT, or MERGE). Additionally, the error may occur if *auth-id* is trying to create a table or view with a schema qualifier that is a value other than *auth-id*. You may create a table or view with a schema qualifier other than *auth-id* other than your own authorization ID if your authorization ID is SYSADM, DBADM, or DBCTRL.

If you are using a trusted context, the token *auth-id* might return a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role, rather than the authorization ID of the session, when the condition was encountered. Otherwise an authorization ID is returned. A role is returned in the following format as a single token:

- ROLE: *role-name*

If this error occurs while Db2 is creating or altering a table involving referential constraints, this code reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, DROP PRIMARY KEY, or DROP UNIQUE operation. The *object-name* identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that *auth-id* has been granted the

authority to perform the operation, that *object-name* exists, and that *auth-id* is not trying to create a table with a schema qualifier other than the authorization ID.

SQLSTATE

01548

+552	<i>auth-id</i> DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION <i>operation</i>
-------------	---

Explanation

Authorization ID *auth-id* has attempted to perform the specified *operation* without having been granted the authority to do so.

If you are using a trusted context, the token *auth-id* might return a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role, rather than the authorization ID of the session, when the condition was encountered. Otherwise an authorization ID is returned. A role is returned in the following format as a single token:

```
ROLE: role-name
```

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that the authorization ID has been granted the authority necessary to perform the operation.

SQLSTATE

01542

+558	THE WITH GRANT OPTION IS IGNORED.
-------------	--

Explanation

The WITH GRANT option was used where it is not valid. It cannot be used in the following cases:

- PUBLIC was within the list of grantee authorization IDs.
- The BINDAGENT privilege was being granted.

- The ANY package privilege on *collection-id*.^{*} was being granted.
- System DBADM authority was being granted.
- ACCESSCTRL authority was being granted.
- DATAACCESS authority was being granted.
- CREATE_SECURE_OBJECT privilege was being granted.

System action

The offending privileges in the authorization specification are granted without the GRANT option. If the grantee is PUBLIC, all the privileges in the authorization specification are granted without the GRANT option.

SQLSTATE

01516

+562	A GRANT OF A PRIVILEGE WAS IGNORED BECAUSE THE GRANTEE ALREADY HAS THE PRIVILEGE FROM THE GRANTOR
-------------	--

Explanation

At least one of the privileges in the GRANT statement was ignored because the privilege was already granted to the grantee by the grantor.

System action

The privileges previously granted are ignored; all others are granted.

SQLSTATE

01560

+585	THE COLLECTION <i>collection-id</i> APPEARS MORE THAN ONCE WHEN SETTING THE <i>special-register</i> SPECIAL REGISTER
-------------	---

Explanation

The SET statement for special register *special-register* includes *collection-id* more than once.

System action

Duplicates are removed from the list, and the first occurrence of *collection-id* is used. The statement is executed.

Programmer response

Verify the list that contains the duplicate. If the error is only in entering a *collection-id* incorrectly that happens to duplicate another entry, enter the *collection-id* correctly and reissue the statement. If the entry is intended to be a duplicate, no action is required.

SQLSTATE

01625

+599	COMPARISON FUNCTIONS ARE NOT CREATED FOR A DISTINCT TYPE BASED ON A LONG STRING DATA TYPE
-------------	--

Explanation

Comparison functions are not created for a distinct type based on a long string data type (BLOB, CLOB, DBCLOB) since the corresponding function are not available for these built-in data types.

System action

The statement is processed successfully.

Programmer response

No action is required.

SQLSTATE

01596

+610	A CREATE/ALTER ON OBJECT <i>object-name</i> HAS PLACED OBJECT IN <i>utility-name</i> PENDING
-------------	---

Explanation

As the result of a CREATE or ALTER action on *object-name*, the object or a related object has been placed in a pending status.

object-name

The name of the object.

utility-name

The name of the utility.

The reason for this error depends on the *utility-name* value and the object type.

REBUILD pending for an index

- The index is in REBUILD PENDING status because CREATE INDEX with DEFER was specified on a populated table.

- The index is in REBUILD PENDING status because ALTER INDEX was used to add a nullable column to an EXCLUDE NULL KEYS index.
- An index on table *object-name* is in REBUILD PENDING status because ALTER TABLE ALTER COLUMN was issued on table *object-name*. The column that was altered is part of the index, and the alter operation caused the index to be placed in REBUILD PENDING status. The table space that contains the table is placed in ADVISORY REORG PENDING status.

The index is not generally available until the index is removed from the REBUILD pending state.

REORG pending for a table space partition

The table space is in REORG pending because ALTER INDEX was used to change the limit key values. The table space partition is not generally available until the REORG pending status is removed.

REORG pending for a table space

The table space is in REORG pending because ALTER TABLE was used to add an identity column to a populated table. The table space is not generally available until the REORG pending status is removed.

ADVISORY REORG pending for a table space

The table space is in ADVISORY REORG pending because an ALTER statement with pending definition changes has been issued. The table space is available, but the definition changes have not yet been applied.

ADVISORY REORG pending for an index

The index is in ADVISORY REORG pending because an ALTER statement with pending definition changes has been issued. The index is available, but the definition changes have not yet been applied.

REORG pending for a table

The table is in REORG pending because an ALTER statement with the INLINE LENGTH option reduced the maximum length for a LOB column.

System action

The object was placed in the indicated pending status.

Programmer response

The response depends on the *utility-name* value and the object type:

REBUILD pending for an index

Use the REBUILD INDEX utility to rebuild the index and remove the REBUILD pending status.

REORG pending for a table space partition

Perform the following steps:

1. Issue a DISPLAY DATABASE command for the table space to identify which partitions are in REORG pending.
2. Run the REORG utility on the partitions that are in REORG pending.

REORG pending for a table space

Run the REORG utility on the table space.

ADVISORY REORG pending for a table space

Run the REORG TABLESPACE utility with SHRLEVEL CHANGE or SHRLEVEL REFERENCE on the entire table space to materialize the pending definition changes.

ADVISORY REORG pending for an index

If pending definition changes do not exist for the table space, run the REORG INDEX utility with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to materialize the pending definition changes for the index.

If pending definition changes exist for the table space, run the REORG TABLESPACE utility with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to materialize the pending definition changes for the table space and associated indexes.

SQLSTATE

01566

+645	WHERE NOT NULL IS IGNORED BECAUSE THE INDEX KEY CANNOT CONTAIN NULL VALUES OR THE INDEX IS AN XML INDEX
-------------	--

Explanation

The WHERE NOT NULL clause is ignored on the CREATE INDEX statement because the index key is defined on columns that cannot contain null values, or, the index is an XML index.

System action

The option is ignored; processing continues.

Programmer response

Remove the WHERE NOT NULL clause to get rid of the warning.

SQLSTATE

01528

+650	THE TABLE BEING CREATED OR ALTERED CANNOT BECOME A DEPENDENT TABLE
-------------	---

Explanation

This table is defined with the maximum number of columns. It cannot be altered to be a dependent table later.

System action

The table is created. Check to see if the table will become a dependent table at a later time. If yes, drop and re-create the table with fewer than 750 columns.

SQLSTATE

01538

+653	TABLE <i>table-name</i> IN PARTITIONED TABLESPACE <i>tspace-name</i> IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED
-------------	---

Explanation

An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System action

A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer response

For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

SQLSTATE

01551

+655 **STOGROUP *stogroup_name* HAS BOTH SPECIFIC AND NON-SPECIFIC VOLUME IDS. IT WILL NOT BE ALLOWED IN FUTURE RELEASES**

Explanation

The CREATE or ALTER STOGROUP statement has caused the STOGROUP with *stogroup_name* to have both specific and non-specific ('*') volume Ids. This warning code is used to specify that the mixing of different types of volume Ids will not be allowed in future releases.

System action

Db2 continues processing.

Programmer response

Plan to use either specific or non-specific volume ids to avoid future release migration impact. ALTER STOGROUP may be used to drop all specific volume ids or all non-specific volume ids.

SQLSTATE

01597

+658 **THE SUBPAGES VALUE IS IGNORED FOR THE CATALOG INDEX *index-name***

Explanation

Only SUBPAGES 1 is allowed for this catalog index.

System action

The index was altered successfully using SUBPAGES 1. If you are also altering the TYPE option to a new value, the index is placed in recovery pending status.

SQLSTATE

01600

+664 **THE INTERNAL LENGTH OF THE LIMIT-KEY FIELDS SPECIFIED IN THE PARTITION CLAUSE OF THE *statement-name* STATEMENT EXCEEDS THE EXISTING INTERNAL LIMIT KEY LENGTH STORED IN CATALOG TABLE *table-name***

Explanation

The sum of the internal lengths of the limit keys specified in the PARTITION clause of the ALTER INDEX or ALTER TABLE statement exceeds the existing internal limit key length stored in catalog table SYSIBM.SYSINDEXPART or SYSIBM.SYSTABLEPART. The limit key was truncated to the existing internal limit key length to ensure the new limit key value has the same internal length as the other partitions.

System action

The specified index or table was altered but the limit key was truncated to be the existing internal limit key length.

SQLSTATE

01540

+738 **DEFINITION CHANGE OF *object object_name* MAY REQUIRE SIMILAR CHANGE ON READ-ONLY SYSTEMS**

Explanation

A change was made to the definition of the specified object that may also require a similar change to any read-only shared systems.

System action

The statement is successfully executed.

Programmer response

Check the read-only shared systems that have the specified object defined, and determine if a change must be made to the object on those systems.

SQLSTATE

01530

+799 **THE STATEMENT *set-stmt* REFERENCES A SPECIAL REGISTER OR BUILT_IN GLOBAL VARIABLE THAT DOES NOT EXIST AT THE SERVER SITE**

Explanation

A Db2 server received an statement that it does not understand.

set-stmt

The statement that contains the unrecognized special register or built-in global variable. This token might be blank for servers other than Db2 for z/OS, or for down-level Db2 for z/OS servers.

System action

The request is ignored.

Programmer response

This SQLCODE can be returned to an application for any SQL statement. This SQLCODE might be masked by other negative SQLCODEs that the SQL statement receives. Processing continues at the server.

SQLSTATE

01527

Related reference

[Special registers \(Db2 SQL\)](#)

[Built-in global variables \(Db2 SQL\)](#)

+802	EXCEPTION ERROR <i>exception-type</i> HAS OCCURRED DURING <i>operation-type</i> OPERATION ON <i>data-type</i> DATA, POSITION <i>position-number</i>
-------------	--

Explanation

The exception error *exception-type* occurred while performing one of the following operations on a field that has a *data-type* of DECIMAL, FLOAT, SMALLINT, or INTEGER:

- ADDITION
- SUBTRACTION
- MULTIPLICATION
- DIVISION
- NEGATION
- BUILT-IN FUNCTION

The error occurred while processing an arithmetic expression in the SELECT list of an outer SELECT statement, and the position in the select list is denoted by *position-number*. The possible exception types are:

DECIMAL OVERFLOW

A decimal overflow exception can occur when one or more nonzero digits are lost because the destination field in any decimal operation is too short to contain the result.

DIVIDE EXCEPTION

A divide exception can occur on a decimal division operation when the quotient exceeds the specified

data-field size. A zero divide exception occurs on any division by zero, except when the data type is DECFLOAT.

EXPONENT OVERFLOW

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, i.e. the magnitude of the result exceeds approximately $7.2E+75$.

FIXED POINT OVERFLOW

A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

INVALID OPERATION

OUT OF RANGE

An error might occur during while processing an input, intermediate, or final value if the value of a parameter is out of range.

OVERFLOW

An overflow can occur during the processing of a built-in function. If the *operation-type* is FUNCTION, then the error occurred while processing an input, intermediate, or final value.

SUBNORMAL

UNDERFLOW

An underflow can occur during the processing of a built-in function. If the *operation-type* is FUNCTION, then the error occurred while processing an input, intermediate, or final value.

ZERO DIVIDE

The data type displayed in the message might indicate the data type of the temporary internal copy of the data. This might differ from the actual column or literal data type due to conversions by Db2.

Attention: Parts of *exception-type*, *data-type*, *operation-type*, and *position-number* might or might not be returned in SQLCA, depending upon when the error was detected.

System action

For each expression in error the indicator variable is set to negative two (-2) to indicate a null value returned. The data variable is unchanged. Execution of the statement continues with all non-error columns and expressions of the outer SELECT list being returned. If the statement is cursor controlled then the cursor will remain open.

Programmer response

Examine the expression for which the warning occurred to see if the cause (or the likely cause) of the problem can be determined. The problem may be

data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

SQLSTATE

01519

+806	BIND ISOLATION LEVEL RR CONFLICTS WITH TABLESPACE LOCKSIZE PAGE OR LOCKSIZE ROW AND LOCKMAX 0
-------------	--

Explanation

The specification of isolation level RR is incompatible with the LOCKSIZE PAGE or LOCKSIZE ROW and LOCKMAX 0 specification for a table space accessed by the application. Table space locking is used to protect the integrity of the application.

System action

A valid package/plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.

Programmer response

If you do not want table space locking, use isolation level UR, CS, or RS.

SQLSTATE

01553

+807	THE RESULT OF DECIMAL MULTIPLICATION MAY CAUSE OVERFLOW
-------------	--

Explanation

An arithmetic expression contains a decimal multiplication that may cause an overflow condition when the statement is executed. The problem may be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression.

System action

A valid package will be created if no errors are detected.

SQLSTATE

01554

Related concepts

[Arithmetic operators in expressions \(Db2 SQL\)](#)
[Precision for operations with decimal numbers \(Db2 Application programming and SQL\)](#)

+863	THE CONNECTION WAS SUCCESSFUL BUT ONLY SBCS WILL BE SUPPORTED
-------------	--

Explanation

The target AS supports only the Db2 SBCS CCSID. The Db2 Mixed CCSID or GRAPHIC CCSID or both are not supported by the target AS. Db2 character data sent to the target AS must be restricted to SBCS.

System action

The CONNECT statement is successful. The release level of the target AS has been placed into the SQLERRP field of the SQLCA.

Programmer response

Do not execute any SQL statements which pass either mixed data or graphic data as input host variables.

SQLSTATE

+883	ROLLBACK TO SAVEPOINT OCCURRED WHEN THERE WERE OPERATIONS THAT CANNOT BE UNDONE, OR AN OPERATION THAT CANNOT BE UNDONE OCCURRED WHEN THERE WAS A SAVEPOINT OUTSTANDING
-------------	---

Explanation

The operations that are referred to are updates (inserts into or deletes from) a created global temporary table. If this SQL warning code is received as the result of a ROLLBACK TO SAVEPOINT statement, the rollback is performed; however, the changes that were made to the temporary table are

not undone. If this SQL warning code is received as the result of an operation to a created global temporary table, the operation is performed; however, be advised that a savepoint is outstanding, and the update will not be backed out if a rollback to the savepoint is performed.

System action

The SQL statement is processed.

Programmer response

Verify that this is what you meant.

SQLSTATE

01640

+904	A RESOURCE IS UNAVAILABLE BUT PROCESSING CONTINUES. REASON <i>reason-code</i> , TYPE OF RESOURCE <i>resource-type</i> , AND RESOURCE NAME <i>resource-name</i>
------	--

Explanation

A resource was unavailable, but the processing of the SQL statement continues.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381.](#)

resource-type

The type of resource that the message identifies. For an explanation of the *resource-type* value, see [Resource types..](#)

resource-name

The name of the resource that the message identifies.

The value in *resource-name* depends on the remote server source of SQLCODE +904. See the following notes for more information.

Notes:

- When *reason-code* is 00E7000E and *resource-type* is 00001080, SQLCODE +904 was issued by IBM Db2 Analytics Accelerator for z/OS, and *resource-name* is message text from the accelerator that indicates the reason for the SQL code.

IBM Db2 Analytics Accelerator for z/OS can return SQLCODE +904 on an SQL OPEN for certain accelerated queries when the CURRENT QUERY ACCELERATION WAITFORDATA special register is used to specify a delay wait time for the

query. See the IBM Db2 Analytics Accelerator for z/OS documentation for information about when SQLCODE +904 is returned for an accelerated query.

System action

Processing of the SQL statement continues.

When SQLCODE +904 is issued by IBM Db2 Analytics Accelerator for z/OS, processing of the SQL statement continues on the accelerator.

Programmer response

No programmer response is needed.

See the IBM Db2 Analytics Accelerator for z/OS documentation for more information about the situations that can result in SQLCODE +904 being issued.

SQLSTATE

01687

+4726	THE STATEMENT WAS SUCCESSFULLY PREPARED, BUT IT CANNOT BE EXECUTED BECAUSE <i>authorization-id</i> DOES NOT HAVE <i>privilege-name</i> PRIVILEGE ON OBJECT <i>object-name</i> BUT HAS EXPLAIN PRIVILEGE
-------	---

Explanation

During prepare, the authorization ID does not have the indicated privilege for an object but has EXPLAIN privilege.

authorization-id

The authorization ID of the process.

object-name

The name of the object that the privilege applies to.

privilege-name

The name of the privilege required to prepare the statement.

The statement that was prepared by using the EXPLAIN privilege cannot be executed, and a cursor cannot be opened for the statement. Only the SQL descriptor information can be obtained from the prepared statement.

The following authorities have implicit EXPLAIN privilege:

- SQLADM
- System DBADM

- SYSADM

System action

The prepared statement was not executed. No cursor was opened for the statement.

Programmer response

Ensure that no OPEN or EXECUTE statements refer to the prepared statement.

SQLSTATE

0168Z

+4745	A SECTION WAS BOUND SUCCESSFULLY, BUT AN ERROR OCCURRED WHEN A STATEMENT IN A RELATED EXTENDED SECTION WAS BOUND. INFORMATION RETURNED: SECTION NUMBER <i>section-number</i>, SQLCODE <i>sqlcode</i>, SQLSTATE <i>sqlstate</i>, AND MESSAGE TOKENS <i>token-list</i>
--------------	---

Explanation

The bind of a section was successful, but an error occurred in one of the statements in the related extended section.

section-number

The section number that is associated with the failing triggered SQL statement.

sqlcode

The SQLCODE that was generated when the failing statement was bound.

sqlstate

The corresponding SQLSTATE for the SQLCODE that was generated when the failing statement was bound

token-list

The list of tokens from the original SQL error. This list might be truncated.

System action

Db2 bound a section successfully and created a package for that section. However, Db2 could not bind the related extended section. A package was not created for the extended section.

Programmer response

Use the section number in the SYSIBM.SYSPACKSTMT table to determine the failing SQL statement. Refer to

the explanation of the reported SQLCODE. Follow the suggested action for that message.

SQLSTATE

01578

+4748	THE <i>statement</i> STATEMENT FOR OBJECT <i>object-name</i> WAS SUCCESSFUL ON THE DB2 SERVER. THE OBJECT MAY NOT HAVE BEEN SUCCESSFULLY PROCESSED ON THE ACCELERATOR SERVER FOR REASON <i>reason-code</i>.
--------------	--

Explanation

The statement for *object-name* was successful, but an error occurred on the accelerator server.

object-name

The name of the object that was specified to be dropped.

reason-code

A numeric value that provides additional information about why the statement cannot be executed in the accelerator server. Possible values are:

1. A row corresponding to the table does not exist in the SYSACCELERATEDTABLES catalog table.
2. The accelerator server is not available for one of the following reasons:
 - The accelerator server has not been started.
 - The accelerator server was started in EXPLAIN ONLY mode.
 - The accelerator server was started in maintenance mode.
 - The accelerator server accelerator does not exist.
3. A DRDA error was encountered.

System action

The object was dropped at the Db2 server. The object might not have been dropped at the associated accelerator server.

Programmer response

Use the reason code to determine the cause of the failure, and take the appropriate action.

1. No action is needed. The table on the accelerator has already been dropped.
2. When the accelerator is available, invoke the accelerator procedure to drop the table on the accelerator.
3. The drop did not get processed on the accelerator because a connection could not be established with the accelerator. When the accelerator is available, invoke the accelerator procedure to drop the table on the accelerator.

+4754	THE ACCELERATOR <i>accelerator-name</i> DOES NOT EXIST.
--------------	--

Explanation

An SQL statement referenced an accelerator server that does not exist or has not been started. The specified accelerator might not be defined to Db2 or it might not have been started since Db2 was last started.

accelerator-name

The name of the accelerator server that does not exist or that has not been started.

System action

Processing continues normally. If an SQL statement references an accelerator server that does not exist, the statement is processed as if no accelerator server is specified.

User response

No change is required. However, the specified accelerator server must be defined to Db2 before it is used during the execution of other SQL statements that require it.

SQLSTATE

0169D

Related reference

[ACCELERATOR bind option \(Db2 Commands\)](#)

+20002	THE <i>specification-source</i> SPECIFICATION IS IGNORED FOR OBJECT <i>object-name</i>
---------------	---

Explanation

An SQL statement includes a specification that was ignored.

specification-source

The source of the specification, either a clause or a bind option.

GBPCACHE clause

The GBPCACHE clause conflicts with the group buffer pool specification GBPCACHE(NO). When the group buffer pool attribute is set to GBPCACHE(NO), the clause can contain only GBPCACHE NONE. The clause is part of one of the following statements:

- CREATE INDEX
- ALTER INDEX
- CREATE TABLESPACE
- ALTER TABLESPACE

PADDED or NOT PADDED clause

The statement identifies an index that does not have any varying-length character or graphic columns in the index key. The PADDED and NOT PADDED attributes do not apply in this case. The clause is part of one of the following statements:

- CREATE INDEX
- ALTER INDEX

USE CURRENTLY COMMITTED clause

The SELECT statement identifies a table that does not support multiple XML versions. The USE CURRENTLY COMMITTED clause requires that the table support multiple XML versions.

ACCESSCONCURRENTRESOLUTION (UseCurrentlyCommitted) bind option

The SELECT statements that are bound in this package identify one or more tables that do not support multiple XML versions. This bind option requires that the tables support multiple XML versions.

object-name

The name of the object.

System action

The statement is processed, but the clause is ignored.

User response

No action is required.

GBPCACHE clause

To use other GBPCACHE options (ALL, CHANGED, or SYSTEM), alter the table space or index to

use a group buffer pool that is defined with GBPCACHE(YES).

PADDED or NOT PADDED clause

To prevent future instances of this message, remove the clause from the statement.

USE CURRENTLY COMMITTED clause

To prevent future instances of this message:

- Avoid using the USE CURRENTLY COMMITTED clause to access non-versioned XML.
- Convert the table to a table that supports multiple XML versions.

ACCESSCONCURRENTRESOLUTION (UseCurrentlyCommitted)

To prevent future instances of this message:

- Avoid using this bind option for a plan or package that will access non-versioned XML.
- Convert the table to a table that supports multiple XML versions.

+20007

USE OF OPTIMIZATION HINTS IS DISALLOWED BY A DB2 SUBSYSTEM PARAMETER. THE SPECIAL REGISTER 'OPTIMIZATION HINT' IS SET TO AN EMPTY STRING.

Explanation

Db2 is not enabled to use optimization hints. The special register OPTIMIZATION HINT is set to an empty string.

System action

The user-specified optimization hints are ignored. The access path is determined without the use of hints and processing continues normally.

Programmer response

Enable the use of OPTIMIZATION HINT by changing the value of OPTIMIZATION HINTS on the Db2 Installation panel DSNTIP8.

If, after further consideration, you do not want to use an OPTIMIZATION HINT, use the SET CURRENT OPTIMIZATION HINT statement to disable the use of optimization hints.

Specify an empty string, or a string of blanks, on a SET CURRENT OPTIMIZATION HINT statement to cause Db2 to use normal optimization techniques and ignore optimization hints.

SQLSTATE

01602

+20122	DEFINE NO OPTION IS NOT APPLICABLE IN THE CONTEXT SPECIFIED
---------------	--

Explanation

The DEFINE NO option was specified, however it is not applicable in the context specified. DEFINE NO was specified in one of the following situations:

- a CREATE INDEX statement that included the VCAT clause
- a CREATE INDEX statement for a non-empty table
- a CREATE INDEX statement on a declared temporary table
- a CREATE LOB TABLESPACE statement
- a CREATE TABLESPACE statement that included the VCAT clause
- a CREATE INDEX statement for a table that has a defined clone

System action

Db2 ignored the DEFINE NO option and created the object with the DEFINE YES option instead.

SQLSTATE

01644

+20141	TRUNCATION OF VALUE WITH LENGTH <i>length</i> OCCURRED FOR <i>hv-or-parm-number</i>
---------------	--

Explanation

A value that was assigned to a host variable or parameter was truncated. However, the length of the value that was truncated is too large to be returned in

the indicator variable. This situation can occur when truncation occurs on assignment of:

- a value to a parameter of a remote stored procedure if the value being truncated is greater than 127 bytes. In this case, the indicator variable will contain a value of 127.
- a LOB value to a host variable if the value being truncated is greater than 32K bytes. In this case, the indicator variable will contain a value of 32K.

In these cases, the actual length of the truncated value cannot be returned to the application that uses the indicator variable. The actual length of the value is returned as message token *length*.

System action

The assignment was made, but the data was truncated.

Programmer response

Change the declaration of *hv-or-parm-number* to avoid truncation.

SQLSTATE

01004

+20187	ROLLBACK TO SAVEPOINT CAUSED A NOT LOGGED TABLE SPACE TO BE PLACED IN THE LPL
---------------	--

Explanation

An application issued a ROLLBACK, but uncommitted changes existed for a table space defined with the NOT LOGGED logging attribute. Db2 cannot undo changes made to not logged table spaces because no log records were written due to the logging attribute of the table space. The table space is placed in the LPL so that other concurrently running agents are not able to see the data that cannot be rolled back. The table space is also marked recover pending because the table space has been modified.

System action

The ROLLBACK TO SAVEPOINT was performed, however changes that were made to not logged table spaces have not been undone.

Programmer response

Avoid making changes to a not logged table space within the span of a savepoint to which you intend to rollback.

To remove a table space from the LPL and reset recover pending, use one of the following options:

- REFRESH TABLE to repopulate a Materialized Query Table, but only if the Materialized Query Table is alone in its table space. If the table, including Materialized Query Tables, is not alone in its table space, a utility must be used to reset the table space and remove it from recover pending.
- RECOVER utility, to recover either to currency or to a prior image copy
- LOAD REPLACE utility or LOAD REPLACE PART utility:
 - With an input data set to empty the table space and repopulate the table
 - Without an input data set to empty the table space to prepare for one or more insert operations to repopulate the table
- Drop and re-create the table space and repopulate the table.
- DELETE without a WHERE clause to empty the table. When the table space is a segmented (non-UTS) table space or universal table space, the table is alone in its table space and the table does not have a VALIDPROC, referential constraints, delete Triggers, or a SECURITY LABEL column (or has this column, but multilevel security is not in effect).
- TRUNCATE TABLE to empty the table. When the table space is segmented (non-UTS) table space or universal table space, the table is alone in its table space and the table does not have a VALIDPROC, referential constraints, or a SECURITY LABEL column (or has this column, but multilevel security with row level granularity is not in effect).

Important: If the table, materialized query table or not, is not alone in its table space, a utility must be used to reset the table space and remove it from recover pending.

+20224	ENCRYPTED DATA THAT WAS ORIGINALLY A BINARY STRING CANNOT BE DECRYPTED TO A CHARACTER STRING
--------	---

Explanation

The DECRYPT_BIT, DECRYPT_CHAR, or DECRYPT_DB function was invoked with an argument that represents an encrypted string that was originally a binary string. A binary string cannot be cast to a character string using the DECRYPT_BIT, DECRYPT_CHAR, or DECRYPT_DB function.

System action

The statement cannot be processed.

Programmer response

The encrypted value can only be decrypted using the DECRYPT_BINARY function.

SQLSTATE

01658

+20237	FETCH PRIOR ROWSET FOR CURSOR <i>cursor-name</i> RETURNED A PARTIAL ROWSET
--------	--

Explanation

A FETCH PRIOR ROWSET statement was issued, but there were not enough rows prior to the current cursor position to reposition the cursor on a full rowset. The cursor has been positioned on a partial rowset. If a target was specified, then data has only been returned for the number of rows that were actually fetched for the partial rowset.

System action

The cursor is positioned on a partial rowset.

Programmer response

Analyze the situation to determine if anything should be rolled back.

SQLSTATE

02504

+20245	NOT PADDED CLAUSE IS IGNORED FOR INDEXES CREATED ON AUXILIARY TABLES
--------	--

Explanation

The NOT PADDED clause is ignored on the CREATE INDEX statement because auxiliary indexes are always PADDED.

System action

The option is ignored; processing continues.

Programmer response

Remove the NOT PADDED clause to avoid this warning.

SQLSTATE

01663

+20270	OPTION NOT SPECIFIED FOLLOWING ALTER PARTITION CLAUSE
--------	---

Explanation

An ALTER INDEX statement, which included the ALTER PARTITION clause, did not contain an option following the ALTER PARTITION keywords.

System action

The SQL statement is processed.

Programmer response

Specify a partition option after the ALTER PARTITION keywords to avoid this warning in the future. For an ALTER INDEX statement, if *partition-element* is specified, specify either the ENDING clause of:

- *partition-element*
- *using-block*
- *free-block*
- *gbcaches-block*

SQLSTATE

01664

+20271	THE NAME AT ORDINAL POSITION <i>position-number</i> IN THE STATEMENT, WITH NAME <i>object-</i> <i>name</i> , WAS TRUNCATED.
--------	--

Explanation

At least one object name in the described statement was truncated. The object name was either too long, or became too long after code page conversion.

position-number

The ordinal position number of the name that was truncated. For the describe output of a prepared query, the ordinal position is relative to the order of columns in the select list of the query:

- For DESCRIBE CURSOR or DESCRIBE OUTPUT, the position is relative to the order of the columns in the select list of the query.
- For DESCRIBE TABLE, the position is relative to the order of the columns in the table or view definition.
- When describing the output of a CALL statement, the position is relative to the OUT or INOUT

parameters of the procedure to which the CALL resolved.

- When describing the input of a CALL statement, the position is relative to the IN or INOUT parameters of the procedure to which the CALL resolved.

object-name

The name of a column, user-defined type, schema of a user-defined type, or parameter that was truncated. Use of the SQLDA structure limits the length of names for objects of these types.

System action

Processing continues.

User response

If the exact name is significant, do one of the following:

- For the name of a result column that is specified in an AS clause, change the name in the AS clause so that the result column has a shorter name.
- For the name of a column in a table or view, drop and re-create the table or view so that the column has a shorter name, or provide a shorter name for the result column in the query with an AS clause.
- For the name of a column in a table, use the ALTER TABLE statement to rename the column so that it has a shorter name.
- For a parameter name, change the procedure so the parameter has a shorter name.
- For a user-defined type name drop and recreate the user defined-type with a shorter name.

SQLSTATE

01665

+20272	TABLE SPACE <i>table-space-name</i> HAS BEEN CONVERTED TO USE TABLE-CONTROLLED PARTITIONING INSTEAD OF INDEX-CONTROLLED PARTITIONING, ADDITIONAL INFORMATION: <i>old-limit-key-value</i>
--------	--

Explanation

When one of the following statements executed, *table-space-name* was converted to use table-controlled partitioning instead of index-controlled partitioning:

- ALTER INDEX with the CLUSTER NO clause
- ALTER TABLE...ADD PARTITION

- ALTER TABLE...ALTER PARTITION
- ALTER TABLE...ROTATE PARTITION
- CREATE INDEX...ENDING AT without the CLUSTER clause
- CREATE PARTITIONED INDEX
- DROP INDEX for a partitioning index

If the statement was ALTER INDEX, CREATE PARTITIONED INDEX, or DROP INDEX, the last partition's old value of *old-limit-key-value* was set to the highest possible value for an ascending index key column, or the lowest possible value for a descending index key column. For all other statements, *N is returned for *old-limit-key-value*.

If the statement was ALTER TABLE with the ROTATE PARTITION clause, then certain partitions might be left in REORG pending state.

System action

The statement is successfully executed. If the statement was ALTER INDEX, CREATE PARTITIONED INDEX, or DROP INDEX, the LIMITKEY column in SYSIBM.SYSTABLEPART was set to the highest possible value for an ascending index key column, or the lowest possible value for a descending index key column.

+20278 **THE VIEW *view-name* MAY NOT BE USED TO OPTIMIZE THE PROCESSING OF QUERIES**

Explanation

The fullselect of the view includes elements that prohibit the use of the statistics on the view for optimization when the view is not referenced directly in a query. These elements of the fullselect might include:

- Aggregate functions
- Distinct operations
- Set operations (UNION, EXCEPT, or INTERSECT)

System action

The view is successfully altered to enable query optimization.

Programmer response

No action is required. If the intent of the view is to optimize queries that do not directly reference the view, you can drop the view or have query optimization disabled. You can also define the fullselect of the view to remove the elements that prevent optimization.

+20341 **OWNERSHIP TRANSFER WAS IGNORED BECAUSE *auth-id* IS ALREADY THE OWNER OF THE OBJECT.**

Explanation

A TRANSFER OWNERSHIP statement was issued to transfer the ownership of the object to authorization ID *auth-id*. The specified authorization ID is already the owner of the object. There is no need for the transfer. If the ownership is transferred to a role, the role name is returned as a single token in the format of ROLE: *role-name*.

System action

The statement cannot be processed.

Programmer response

No action is required.

SQLSTATE

01676

+20348 **THE PATH VALUE HAS BEEN TRUNCATED.**

Explanation

The PATH value exceeded the limit of bytes that the PATH column of SYSIBM.SYSJAROBJECTS can contain. The PATH column of SYSIBM.SYSJAROBJECTS stores only the first 2048 bytes of the value passed to SQLJ.ALTER_JAVA_PATH.

System action

Processing continues.

User response

If you need to know the entire PATH value, query the SYSIBM.SYSJAVAPATHS table.

SQLSTATE

01011

+20360	TRUSTED CONNECTION CAN NOT BE ESTABLISHED FOR SYSTEM AUTHID <i>authorization-name</i>
---------------	--

Explanation

A trusted connection cannot be established for *authorization-name*. A matching trusted context is not currently defined. SQLWARN8 is set to indicate that a trusted connection was not established.

System action

The attempt to create a trusted connection was not successful. A normal connection is created without any attributes of a trusted context.

Programmer response

Ensure that the trusted context has been correctly defined and try to re-establish a trusted connection.

SQLSTATE

01679

+20365	A SIGNALING NAN WAS ENCOUNTERED, OR AN EXCEPTION OCCURRED IN AN ARITHMETIC OPERATION OR FUNCTION INVOLVING A DECFLOAT.
---------------	---

Explanation

A signaling NaN (sNaN) was encountered in an expression, arithmetic operation, or function involving a DECFLOAT column, or value resulted in an exception. In either case, the result is NAN, and a warning is issued.

System action

Execution of the statement continues. All non-error columns and expressions of the outer SELECT list are

returned. If the statement is cursor controlled, then the cursor will remain open.

User response

Examine the expression for which the warning occurred to see you can determine the cause of the problem. The problem might be data-dependent, in which case you must examine the data that was being processed at the time the error occurred.

SQLSTATE:

01565

+20367	OPTION <i>clause</i> IS NOT SUPPORTED IN THE CONTEXT IN WHICH IT WAS SPECIFIED
---------------	---

Explanation

The *clause* in the statement is not supported in the context in which has been specified. The *clause* is ignored.

System action

Processing continues normally.

Programmer response

No change is required for the current release; however, it is recommended that the statement be modified to conform to valid SQL syntax.

SQLSTATE

01680

+20368	TRUSTED CONTEXT <i>context-name</i> IS NO LONGER DEFINED TO BE USED BY SPECIFIC VALUES FOR ATTRIBUTE <i>attribute-name</i>.

---------------	---

Explanation

The format or content of the parameter in ordinal position *number1* in the call to the procedure *procedure-name* is invalid. The output parameter specified in ordinal position *number2* contains information on how to respond to the error.

User response

Use the information in the output parameter specified in ordinal position *number2* to correct the format or content of the parameter value and call the procedure again.

SQLSTATE

01H54

+20459	THE PROCEDURE <i>procedure-name</i> HAD ENCOUNTERED AN INTERNAL PROCESSING ERROR. THE VALUE FOR PARAMETER <i>number</i> CONTAINS FURTHER INFORMATION ABOUT THE ERROR.
---------------	--

Explanation

An error occurred when the procedure *procedure-name* was processing a request. The output parameter specified in ordinal position *number* contains information on how to respond to the error.

User response

An error occurred when the procedure *procedure-name* was processing a request. The output parameter specified in ordinal position number contains information on how to respond to the error. number to correct the error and call the procedure again.

SQLSTATE

01H55

+20460	THE PROCEDURE <i>procedure-name</i> SUPPORTS A HIGHER VERSION, <i>version1</i> . THAN THE SPECIFIED VERSION, <i>version2</i> , FOR PARAMETER <i>number</i> .
--------	--

Explanation

A higher version, *version1*, for the parameter in ordinal position number is supported by the procedure *procedure-name*. The specified version, *version2*, is supported for the parameter.

User response

Check the documentation for the procedure to understand the additional features supported by the newer version of the parameter. Upgrade to the current version to take advantage of these additional features.

SQLSTATE

01H56

+20461	THE PROCEDURE <i>procedure-name</i> RETURNED OUTPUT IN THE ALTERNATE LOCALE, <i>locale1</i> , INSTEAD OF THE LOCALE <i>locale2</i> , SPECIFIED IN PARAMETER <i>number</i> .
--------	---

Explanation

The locale, *locale2*, specified in the parameter in ordinal position *number* was not available for the output of the procedure *procedure-name*. The output is returned using locale *locale1*.

User response

Install the message file support on the server for the specified locale, *locale2*, or specify a supported locale.

SQLSTATE

01H57

+20468	THE COMBINATION OF TARGET NAMESPACE <i>target-namespace</i> AND SCHEMA LOCATION HINT <i>location-hint</i> IS NOT UNIQUE IN THE DB2 XML SCHEMA REPOSITORY.
--------	---

Explanation

XSR_COMPLETE completed registration of an XML schema. However, the Db2 XML schema repository already contains one or more XML schemas with the same combination of the target namespace and schema location hint values.

target-namespace
The target namespace of the XML schema that was registered.

location-hint
The schema location hint for the XML schema that was registered.

System action

The XML schema has been successfully registered and is stored in the Db2 XML schema repository.

Programmer response

Applications that perform XML schema validation using this XML schema can refer to the XML schema only by its schema name, and not by its target namespace and schema location hint. If there is a need to refer to the XML schema with the target namespace and schema location hint, remove the XML schema from the XML schema repository, and register it again with a unique combination of target namespace and schema location hint.

+20528	A DATA CHANGE OPERATION FOR A TABLE WITH DBID.OBID <i>dbid-value.obid-value</i>, WHICH INCLUDES A PERIOD <i>period-name</i>, CAUSED AN ADJUSTMENT TO A RECORDED TIME VALUE FOR THE PERIOD.
---------------	---

Explanation

FL 507 The target of the data change operation is a table with that includes a period. The requested data change operation was performed and resulted in an adjustment to a recorded time value for the period.

dbid-value.obid-value

The DBID and OBID of the table that is the target of the data change operation.

period-name

The name of the period.

This adjustment can occur when two concurrent transactions are accessing the same row for data

changes, if the SYSTIME_PERIOD_ADJUST global variable is set to Y. For an update operation, the adjustment affects both the start and end columns for the period. For a delete operation, the adjustment only affects the end column for the period.

System action

Processing continues. The statement was processed with an adjustment to the recorded time for the period.

User response

If you did not want the adjustment, issue a rollback and retry the transaction.

Otherwise, no action is required.

Applications can block the adjustment of affected values by setting the SYSTIME_PERIOD_ADJUST global variable to N.

-010	THE STRING CONSTANT BEGINNING <i>string</i> IS NOT TERMINATED
-------------	--

Explanation

The statement contains a string constant, beginning with 'string', that is not terminated properly.

System action

The statement cannot be processed.

Programmer response

Examine the statement for missing quotation marks or apostrophes in the indicated string constant.

SQLSTATE

42603

-011	COMMENT NOT CLOSED
-------------	---------------------------

Explanation

A comment is not closed correctly with a comment delimiter. The comment is treated as if it were closed by the end of source file.

System action

The statement cannot be processed.

User response

Ensure that the comment delimiter is specified properly. This error is likely to cause other errors. Some statements might not have been processed as a result of a missing comment delimiter.

SQLSTATE

42601

-029	INTO CLAUSE REQUIRED
-------------	-----------------------------

Explanation

SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

System action

The statement cannot be processed.

Programmer response

Add the INTO clause to the SELECT statement and precompile the application program again.

SQLSTATE

42601

-051	<i>identifier-name (sql-type)</i> WAS PREVIOUSLY DECLARED OR REFERENCED
-------------	--

Explanation

The identifier name has already been defined for the indicated type of SQL object.

identifier-name

The name that has already been used.

sql-type

The type of SQL object: TABLE, CURSOR, or STATEMENT.

The definition might have occurred implicitly. For example, *identifier-name* might have been found in the FROM clause of a SELECT, which causes it to be defined as a table.

A cursor name must be unique within the program or routine.

System action

The statement cannot be processed.

User response

Remove duplicate definitions or correct the references.

SQLSTATE

3C000

-056	AN SQLSTATE OR SQLCODE VARIABLE DECLARATION IS IN A NESTED COMPOUND STATEMENT
-------------	--

Explanation

An SQLSTATE or SQLCODE variable declaration is in a nested compound statement instead of the outermost compound statement in the SQL routine.

System action

The statement cannot be processed.

User response

Change the routine definition so that the SQLSTATE and SQLCODE variables are only declared in the outermost compound statement of the SQL routine.

SQLSTATE

42630

-057	THE RETURN STATEMENT IN AN SQL FUNCTION MUST RETURN A VALUE.
-------------	---

Explanation

A RETURN statement is specified without a value in an SQL function. The return value must be specified.

System action

The statement cannot be processed.

User response

Add a return value to the statement, and retry your request.

SQLSTATE

42631

-058	VALUE SPECIFIED ON RETURN STATEMENT MUST BE AN INTEGER
-------------	---

Explanation

A RETURN statement is specified in an SQL procedure but the value specified is not an integer. The return value for an SQL procedure must be an integer.

System action

The statement cannot be processed.

User response

Specify an integer value on the RETURN statement. Try the request again.

SQLSTATE

428F2

-060	INVALID <i>specification-type</i> SPECIFICATION : <i>specification-value</i>
-------------	---

Explanation

The specified value is invalid.

specification-type

The type of specification: LENGTH, SCALE, or CCSID.

specification-value

The value specified.

LENGTH or SCALE must be specified by an unsigned integer constant and the value must be in the range allowed by the data type.

In addition:

- For a CREATE INDEX statement, a length specified for VARCHAR must not be greater than 1000, and an integer specified with DECFLOAT must be 34.
- For CREATE TABLE, CREATE TYPE, ALTER TABLE ADD COLUMN, or ALTER TABLE ALTER COLUMN statements, the INLINE LENGTH attribute specified for a LOB type must not exceed 32680 for a CLOB or BLOB column, or 16340 for a DBCLOB column.
- For a CREATE VARIABLE statement, an array type with elements that are defined as character strings must be defined with CCSID UNICODE.

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and reissue the statement.

[Statements \(Db2 SQL\)](#)

-078

PARAMETER NAMES MUST BE SPECIFIED FOR ROUTINE *routine-name*

Explanation

The routine does not have parameter names specified for all parameters.

routine-name

The name of the routine.

When the SQL routine is defined with LANGUAGE SQL, a parameter name is required for each parameter that is defined. For native SQL procedures, LANGUAGE

SQL is optional, but for external SQL procedures, LANGUAGE SQL is required.

System action

The statement cannot be processed.

Programmer response

Ensure that each defined parameter includes a parameter name.

SQLSTATE

42629

Related reference

[CREATE TABLE statement \(Db2 SQL\)](#)

-079

QUALIFIER FOR OBJECT *name* WAS SPECIFIED AS *qualifier1* but *qualifier2* IS REQUIRED

Explanation

The schema qualifier for the Db2 object must be *qualifier2*. The statement defines a new object named *name* with an explicit schema qualifier of *qualifier1*. Specifying a schema qualifier other than *qualifier2* is not allowed.

System action

The statement cannot be processed.

Programmer response

Change the statement in one of the following ways:

- Change the schema qualifier to *qualifier2*.
- Remove the schema qualifier, and let Db2 default it to *qualifier2*.

SQLSTATE

428EK

-084

UNACCEPTABLE SQL STATEMENT

Explanation

This SQL statement is unacceptable to Db2. One of the following situations has occurred:

- An attempt has been made to PREPARE or EXECUTE IMMEDIATE an SQL statement that cannot be prepared.
- The embedded SQL statement is not an SQL statement supported by Db2.

- The statement referenced an undeclared cursor.
- An attempt was made to prepare an ALLOCATE CURSOR statement but the statement identifier is already associated with a declared cursor.
- A statement that is to be processed remotely referenced an array variable or array element. The remote execution is the result of one of the following actions:
 - Previous execution of a CONNECT statement
 - Use of a three-part name or alias in the current statement that resolves to an object at a remote server

A statement that is executed remotely cannot reference an array, except in the following cases:

- The statement is a CALL statement.
- An array element in the statement is a target of a FETCH, SELECT INTO, SET *assignment-statement*, or VALUES INTO statement.

System action

The statement cannot be processed.

Programmer response

Perform one of the following actions, depending on the situation:

- If the SQL statement cannot be prepared, the problem is in the source of the SQL statement, not the application program. Thus, no action is necessary unless the source of the SQL statement is the application program itself.
- If the SQL statement is not supported by Db2, remove it from the application program and precompile again.
- If an attempt was made to prepare an ALLOCATE CURSOR statement, change the application program to use a statement identifier that is not associated with a declared cursor.
- If the SQL statement references an array, change the application program so that the statement does not execute on a remote server.

-087

**A NULL VALUE WAS SPECIFIED
IN A CONTEXT WHERE A NULL IS
NOT ALLOWED**

Explanation

An SQL parameter or SQL variable having a null value was specified in a context in which a null value is not allowed. For example, an SQL statement can be specified with an SQL parameter or SQL variable on the PREPARE and EXECUTE statements. In these contexts the value of an SQL parameter or SQL variable must not be null.

System action

The statement cannot be processed.

User response

Correct the SQL statement.

SQLSTATE

22004

[EXECUTE statement \(Db2 SQL\)](#)

-096

**VARIABLE *variable-name* DOES
NOT EXIST OR IS NOT SUPPORTED
BY THE SERVER AND A DEFAULT
VALUE WAS NOT PROVIDED**

Explanation

For a global variable, the variable does not exist at this server.

For a built-in session global variable, the GETVARIABLE function was invoked. However, a value does not exist for a variable with the name that was specified, and a default value was not provided.

- If the qualifier is SESSION, a user-defined variable with the specified name has not been set by the connection or signon exit routine.
- If the qualifier is SYSIBM, the server does not support a built-in session variable with name that was specified.

variable-name

The name of the variable.

System action

The statement cannot be processed.

Programmer response

For a global variable, create the variable at this server using the CREATE VARIABLE statement.

For a built-in session global variable, change the invocation of the function to specify a default value for *variable-name*, or specify a variable that is supported at the server.

SQLSTATE

42704

Related reference

[CREATE VARIABLE statement \(Db2 SQL\)](#)

[GETVARIABLE scalar function \(Db2 SQL\)](#)

-097 THE USE OF LONG VARCHAR OR LONG VARGRAPHIC IS NOT ALLOWED IN THIS CONTEXT

Explanation

The statement attempted to use the LONG VARCHAR or LONG VARGRAPHIC syntax. This syntax cannot be used for the following statements:

- CAST specification syntax
- CREATE DISTINCT TYPE
- CREATE FUNCTION
- CREATE PROCEDURE
- ALTER FUNCTION
- COMMENT ON FUNCTION
- GRANT EXECUTE ON FUNCTION
- REVOKE EXECUTE ON FUNCTION
- DROP

Use the VARCHAR or VARGRAPHIC syntax specifying an explicit length as required.

System action

The statement cannot be processed.

Programmer response

Correct the statement.

SQLSTATE

42601

-101 THE STATEMENT IS TOO LONG OR TOO COMPLEX

Explanation

Db2 cannot process the statement because it exceeds the system limits for length or complexity. This SQLCODE is issued for a variety of situations, such as:

- Too many parameter markers are specified.
- Enablement of parallelism has made the statement too complex.
- [FL 503](#) A query specifies an IN list predicate that has more than 32767 elements. This type of predicate is an accelerator-only function and is supported only for a query that is accelerated to IBM Db2 Analytics Accelerator for z/OS version 7, but this IN list feature or query acceleration is not enabled for this query. This query cannot run in Db2 for z/OS if both of these features and their requirements for acceleration are not enabled or satisfied.

System action

Db2 cannot process the statement.

Programmer response

Divide the statement into shorter or less complex SQL statements.

If parallelism is enabled for the statement, disable parallelism. You can do that by using the DEGREE(1) bind option for static SQL, or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

[FL 503](#) If the query specifies an IN list predicate that has more than 32767 (32K) elements in the IN list and you want to accelerate that query, ensure that all of the following requirements and conditions are satisfied at the time the query is prepared or bound, and run, or when the view is created:

- This type of IN predicate must specify only SQL constants in the elements list. If this IN predicate specifies other types of elements, the query cannot be accelerated or run in Db2 for z/OS.
- The query contains only functions or features that are supported by IBM Db2 Analytics Accelerator for z/OS version 7, which uses IBM Db2 Warehouse to process SQL statements.
- All tables referenced in the query are added and loaded to an IBM Db2 Analytics Accelerator for z/OS version 7 accelerator, and the target accelerator was started successfully at least once for this Db2 for z/OS subsystem before the query is prepared or bound or the query's view is created.
- Query acceleration is enabled for the query by a query acceleration option other than NONE. For more information, see [Enabling acceleration of SQL queries \(Db2 Performance\)](#).

- The list of values includes option 12 for ACCELERATION OPTIONS field (QUERY_ACCEL_OPTIONS subsystem parameter) (Db2 Installation and Migration).
- The query runs at Db2 for z/OS application compatibility level V13R1M503 or higher.

For more information see, "Accelerator-only support for more than 32K elements in an IN list" in [IN predicate \(Db2 SQL\)](#).

SQLSTATE

54001

-102 **STRING CONSTANT IS TOO LONG.
STRING BEGINS *string***

Explanation

The string constant beginning with *string* has a length greater than the maximum allowed length. Most strings have these limits:

- For a hexadecimal constant (X, GX, or UX), the number of hexadecimal digits must not exceed 32704.
- Any other character string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
- Any other graphic string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
- The sum of the lengths of the UTF-8 representations of the constant values in an ENDING AT clause must not exceed 765 bytes. This clause applies to CREATE TABLE, ALTER TABLE, CREATE INDEX, or ALTER INDEX.

In some contexts, however, the limit is smaller.

For special registers, the allowable length depends on the particular special register. A string that exceeds the limit can be specified only through assignment from a host variable.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

System action

The statement cannot be processed.

Programmer response

The requested function is not available interactively. If the error occurred in the context of an SQL statement

embedded in an application program, assign the long string to a host variable, and substitute that variable for the string constant in the SQL statement.

SQLSTATE

54002

Related reference

[Limits in Db2 for z/OS \(Db2 SQL\)](#)

-103 **constant IS AN INVALID NUMERIC
CONSTANT**

Explanation

The indicated *constant* begins with a digit, but is not a valid integer, decimal, decimal floating point, or float constant.

System action

The statement cannot be processed.

Programmer response

Correct the invalid constant.

SQLSTATE

42604

-104 **ILLEGAL SYMBOL "*token*". SOME
SYMBOLS THAT MIGHT BE LEGAL
ARE: *token-list***

Explanation

A syntax error was detected where the symbol "*token*" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, Db2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions. Some of those symbols might not even be legal for statements to be executed by Db2. Those symbols are possibly correct for statements sent to other database management systems.

This SQLCODE will also be issued if the ROLLBACK TO SAVEPOINT statement is specified without a savepoint name.

System action

The statement cannot be processed.

Programmer response

Correct the statement and execute it again.

SQLSTATE

42601

-105 **INVALID STRING**

Explanation

The statement contains an invalid string. It is neither a character string nor a graphic string.

System action

The statement cannot be processed.

Programmer response

Specify the correct format of the string. Check for a graphic string, paired delimiters, the character G or N, and an even number of bytes within the string.

SQLSTATE

42604

-107 **THE NAME *name-value* IS TOO LONG. MAXIMUM ALLOWABLE SIZE IS *maximum-size***

Explanation

The name *name-value* is too long. The maximum permissible length for names of that type is indicated by *maximum-size*.

For an SQL version ID, the name must not exceed 64 EBCDIC bytes, or 122 UTF-8 bytes.

System action

The statement cannot be processed.

Programmer response

Choose a shorter name for the object.

SQLSTATE

46002, 42622

Related reference
[Limits in Db2 for z/OS \(Db2 SQL\)](#)

-108 **THE NAME *name* IS QUALIFIED INCORRECTLY**

Explanation

The name *name* is improperly qualified.
A target name on the RENAME statement may not have a schema qualifier.

System action

The statement cannot be processed.

Programmer response

Remove the schema qualifier and reissue the statement.

SQLSTATE

42601

-109 ***clause-type* CLAUSE IS NOT PERMITTED**

Explanation

A clause was used where it is not permitted.

clause-type
The type of clause.

The error can be issued for reasons that include the following:

- An ALTER TABLESPACE statement with a LOGGED or NOT LOGGED clause was specified for an XML table space.
- An ALTER TABLE statement specified an ALTER PARTITION clause, an ADD PARTITION clause to insert a partition, a ROTATE PARTITION clause, or an ALTER PARTITIONING clause to convert the partitioning scheme, for a table that contains an XML column.
- A UNION or UNION ALL set operator is specified in a SELECT INTO statement.
- A CREATE TRIGGER statement with an OR REPLACE clause was specified without a VERSION clause and the existing trigger is defined with more than a single version.
- A CREATE TRIGGER statement with an OR REPLACE clause was specified without a VERSION clause and the existing trigger is defined with a single version but the version id is not V1.
- A CREATE PROCEDURE statement with an OR REPLACE clause was specified without a VERSION

clause and the existing procedure is defined with more than a single version.

- A CREATE PROCEDURE statement with an OR REPLACE clause was specified without a VERSION clause and the existing procedure is defined with a single version but the version id is not V1.
- A CREATE LOB TABLESPACE statement specifies a COMPRESS YES FIXEDLENGTH or COMPRESS YES HUFFMAN clause.

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and reissue the SQL statement.

You can use a nested table expression to rewrite a UNION or UNION ALL set operator that is used in a SELECT INTO statement.

SQLSTATE

42601

Related reference

[ALTER TABLESPACE statement \(Db2 SQL\)](#)
[ALTER TABLE statement \(Db2 SQL\)](#)

-110 INVALID HEXADECIMAL CONSTANT BEGINNING *constant*

Explanation

The string constant that begins with the specified *string* is invalid because it has at least one of the following errors:

- the string constant contains one or more characters that are not valid hexadecimal digits
- the string constant does not have an even number of digits
- for a UX or GX string constant, the number of digits is not a multiple of 4

System action

The statement cannot be processed.

Programmer response

Correct the invalid string constant.

SQLSTATE

42606

-111 AN AGGREGATE FUNCTION DOES NOT INCLUDE A COLUMN NAME

Explanation

The specification of an aggregate function was invalid because a column name was not specified in the argument. In a trigger definition, a transition variable specification does not qualify as a column name for this purpose.

System action

The statement cannot be executed.

Programmer response

Refer to [Aggregate functions \(Db2 SQL\)](#) for information about the proper usage of aggregate functions.

SQLSTATE

42901

-112 THE OPERAND OF AN AGGREGATE FUNCTION INCLUDES AN AGGREGATE FUNCTION, AN OLAP SPECIFICATION, OR A SCALAR FULLSELECT

Explanation

The operand of an aggregate function can be either an expression or DISTINCT followed by an expression. The operand cannot be another aggregate function, an OLAP specification, or a scalar fullselect.

System action

The statement cannot be processed.

Programmer response

Correct the use of the aggregate function to eliminate the invalid expression and reissue the statement.

SQLSTATE

42607

Related concepts

[Aggregate functions \(Db2 SQL\)](#)

-113 INVALID CHARACTER FOUND IN: *string*, REASON CODE *nnn*

Explanation

The *string* contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

Certain SQL identifiers (for example names of buffer pools, databases, and plans) must contain only uppercase alphabetic or national characters and numerics; the first character must be alphabetic or national.

The following reason codes apply to SBCS identifiers:

000

An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed.)

The following reason codes apply to DBCS identifiers or comments:

101

An odd number of bytes exists between the shift-out and the shift-in character.

102

Either a shift-in or shift-out character is missing.

103

DBCS blanks X'4040' are not allowed.

104

There are no characters between the shift-out and the shift-in characters.

105

Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

System action

Processing is terminated.

User response

Correct the name.

SQLSTATE

42602

-114

THE LOCATION NAME *location* DOES NOT MATCH THE CURRENT SERVER

Explanation

A 3-part SQL procedure name was provided for one of the following SQL statements:

ASSOCIATE LOCATORS
CALL
DESCRIBE PROCEDURE

The first part of the SQL procedure name, which specifies the location where the stored procedure resides, did not match the value of the SQL CURRENT SERVER special register.

System action

The statement cannot be processed.

Programmer response

Take one of these actions to resolve the mismatch:

- Change the location qualifier to match the CURRENT SERVER special register.
- Issue an SQL CONNECT to the location where the stored procedure resides before issuing the SQL statement. Ensure that the SQL CALL statement is issued before the ASSOCIATE LOCATORS or DESCRIBE PROCEDURE.
- Bind the package containing the 3-part SQL procedure name with the BIND option DBPROTOCOL(DRDA). With this option, Db2 implicitly uses the DRDA protocol for remote access to the stored procedure.
- Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location.

SQLSTATE

42961

-115

A PREDICATE IS INVALID BECAUSE THE COMPARISON OPERATOR *operator* IS FOLLOWED BY A PARENTHEZIZED LIST OR BY ANY OR ALL WITHOUT A SUBQUERY

Explanation

A simple comparison like '>' must not be followed by a list of items. ANY and ALL comparisons must be followed by a subselect, rather than an expression or a list of items.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement.

SQLSTATE

42601

-117	THE NUMBER OF VALUES ASSIGNED IS NOT THE SAME AS THE NUMBER OF SPECIFIED OR IMPLIED COLUMNS
-------------	--

Explanation

The number of insert values in the value list of the insert operation is not the same as the number of object columns specified. Alternatively, the number of values on the right side of an assignment in a SET assignment statement or the SET clause of an update operation does not match the number of columns on the left side.

System action

The statement cannot be processed. No data was inserted into the object table.

Programmer response

Correct the statement to specify one and only one value for each of the specified object columns.

SQLSTATE

42802

-118	THE OBJECT TABLE OR VIEW OF THE DELETE OR UPDATE STATEMENT IS ALSO IDENTIFIED IN A FROM CLAUSE
-------------	---

Explanation

The table or view specified as the object of a DELETE or UPDATE statement also appears in the FROM clause of a subselect within the statement.

The table or view that is the object of a UPDATE or DELETE cannot also be used to supply the values to be inserted or to qualify the rows to be updated or deleted.

System action

The statement cannot be processed. No data was updated or deleted.

Programmer response

Create a temporary copy of the object table or view, and perform the subselect on that copy.

SQLSTATE

42902

-119	A COLUMN OR EXPRESSION IN A HAVING CLAUSE IS NOT VALID
-------------	---

Explanation

A column or expression identified in a HAVING clause, possibly within a scalar function, does not appear in the GROUP BY clause. Columns or expressions specified in a HAVING clause must appear within aggregate functions or also be specified in the GROUP BY clause.

Grouping expressions can be used in a SELECT list or in a search condition in a HAVING clause. A grouping expression specifies only one value for each group. A grouping expression specified in this context must exactly match a grouping expression specified in the GROUP BY clause, with the exception of blanks, which are not significant.

This message is also issued when an expression starting with GROUPING is specified in a SELECT clause, and a GROUP BY clause is not specified.

System action

The statement cannot be processed.

Programmer response

The implied function is not supported by Db2.

SQLSTATE

42803

Related concepts

[Queries \(Db2 SQL\)](#)

Related reference

[group-by-clause \(Db2 SQL\)](#)

[having-clause \(Db2 SQL\)](#)

-120

AN AGGREGATE FUNCTION OR OLAP SPECIFICATION IS NOT VALID IN THE CONTEXT IN WHICH IT WAS INVOKED

Explanation

An aggregate function, a user-defined function that is sourced on an aggregate function, or an OLAP specification is not permitted in the following contexts:

- In a SET clause.
- In a VALUES clause.
- In a SET transition-variable statement.
- In an assignment statement.
- In the key-expression of an index definition.
- In the expression of a RETURN statement.

An aggregate function or an OLAP specification can only be specified in a WHERE clause if the WHERE clause appears within a subquery of a HAVING clause.

The *search-condition* of the ON clause of a MERGE statement cannot contain an expression that uses an aggregate function.

System action

The statement cannot be processed.

Programmer response

Change the statement so that the aggregate function or OLAP specification is not specified in a context where it is not allowed.

SQLSTATE

42903

-121

THE TARGET *name* IS IDENTIFIED MORE THAN ONCE FOR ASSIGNMENT IN THE SAME SQL STATEMENT

Explanation

The same name is specified more than once as a target for an assignment.

name

The name of the target of the assignment.

This situation can occur when a target name is specified more than once in any of the following contexts:

- In the list of object columns of a data change operation
- In the SET clause of an update operation
- In the SET statement for assignment to a transition variable

This error can also occur during an update or insert operation on a view, when one column of the view is based on the same column of a base table.

System action

The statement cannot be processed. No data was assigned.

Programmer response

Correct the syntax of the statement so that each target name is specified only once.

SQLSTATE

42701

-122

COLUMN OR EXPRESSION IN THE SELECT LIST IS NOT VALID

Explanation

The SELECT statement contains one of these errors:

- The statement contains a column name and an aggregate function in the SELECT clause, but no GROUP BY clause.
- A column name is contained in the SELECT clause (possibly within a scalar function) but not in the

GROUP BY clause. Grouping expressions can be used in a SELECT list. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

Attention: A HAVING clause specified without a GROUP BY clause implies a GROUP BY with no columns. Thus, no column names are allowed in the SELECT clause.

- An expression is specified in the SELECT clause but not in the GROUP BY clause.
- A *sort-key-expression* was specified in the ORDER BY clause, the result table contains grouped data, but the *select-clause* and ORDER BY clause contain a mixture of grouped data and non-grouped data. Grouping expressions can be used in a *sort-key-expression* of an ORDER BY clause. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

System action

The statement cannot be processed.

Programmer response

You can correct the statement by:

- Including the columns or expressions in the GROUP BY clause that are in the SELECT clause, or
- Removing the columns or expressions from the SELECT clause.

THE PARAMETER IN POSITION *n* IN THE FUNCTION *name* MUST BE A CONSTANT OR KEYWORD

Explanation

The parameter in position *n* in the function *name* is not a constant when it is required to be a constant or a keyword when it is required to be a keyword.

System action

The statement cannot be processed.

Programmer response

Action: Ensure that each argument of the function conforms to the definition of the corresponding parameter.

SQLSTATE

42601

-125

AN INTEGER IN THE ORDER BY CLAUSE DOES NOT IDENTIFY A COLUMN OF THE RESULT

Explanation

The ORDER BY clause in the statement contains a column number that is either less than one, or greater than the number of columns of the result table (the number of items in the SELECT clause).

System action

The statement cannot be processed.

Programmer response

Correct the syntax of the ORDER BY clause such that each column identifier properly denotes a column of the result table.

SQLSTATE

42805

-126

THE SELECT STATEMENT CONTAINS BOTH AN UPDATE CLAUSE AND AN ORDER BY CLAUSE

Explanation

The SELECT statement in the declaration for a cursor contains both an UPDATE clause and an ORDER BY clause. Unless you use a static sensitive scrollable cursor, an ORDER BY clause cannot be specified in the declaration for a cursor that is to be used for UPDATE.

System action

The statement cannot be processed. The cursor remains undefined in the application program.

Programmer response

The implied function is not supported by Db2. A cursor that is to be used for update cannot be defined to fetch the rows of the object table in a specific order.

**-130 THE ESCAPE CLAUSE CONSISTS
 OF MORE THAN ONE
 CHARACTER, OR THE STRING
 PATTERN CONTAINS AN INVALID
 OCCURRENCE OF THE ESCAPE
 CHARACTER**

Explanation

The ESCAPE character must be a single character, either SBCS or DBCS as appropriate. For 'column-name LIKE pattern', the ESCAPE character can only appear in the character string if it is followed by itself,

%, or _ (underscore). The Escape Clause cannot be specified if the column name at the left of the LIKE or NOT LIKE has the MIXED subtype.

System action

The statement cannot be processed.

Programmer response

Correct the string pattern, or choose a different ESCAPE character and change the pattern accordingly, or eliminate the use of the Escape Clause on the LIKE or NOT LIKE predicate where the column name to the left has the MIXED subtype.

SQLSTATE

22019 if other than invalid ESCAPE pattern. 22025 if invalid ESCAPE pattern.

-131	STATEMENT WITH LIKE PREDICATE HAS INCOMPATIBLE DATA TYPES
------	---

Explanation

If the column name at the left of LIKE or NOT LIKE is of type character, the expression at the right and the ESCAPE character must be of type character. If the column name is of type graphic, the expression at the right and the ESCAPE character must be of type graphic. If the column data type is binary string, the expression on the right and the ESCAPE character must be binary strings.

System action

The statement cannot be processed.

Programmer response

Check the data type of every operand.

SQLSTATE

42818

-132	AN OPERAND OF <i>value</i> IS NOT VALID
------	--

Explanation

The operation value can be the LIKE predicate, the ESCAPE clause, the LOCATE scalar function, the LOCATE_IN_STRING scalar function, the POSITION scalar function, or the POSSTR scalar function. The operand or argument of *value* was not valid for one of the following reasons:

- The match-expression operand of a LIKE or NOT LIKE predicate must be a string expression.
- The pattern-expression operand of the LIKE or NOT LIKE predicate, or search-string argument of the LOCATE, LOCATE_IN_STRING, POSITION, or POSSTR function must be a string expression that can be specified by any one of the following:
 - A constant
 - A special register
 - A variable
 - An array element specification
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
 - A CAST specification whose arguments are any of the above
 - An expression that concatenates (using CONCAT or ||) any of the above
- The source-string argument of the LOCATE, LOCATE_IN_STRING, POSITION, or POSSTR function must be a string expression that can be specified by any of the following:
 - A constant
 - A special register
 - A host variable (including a LOB locator variable)
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
 - A CAST specification whose arguments are any of the above
 - A column name
 - An expression that concatenates (using CONCAT or ||) any of the above
- The escape-expression operand of the LIKE or NOT LIKE predicate must be a string expression that can be specified by any of the following:
 - A constant
 - A host variable (including a LOB locator variable)
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
 - A CAST specification whose arguments are any of the above

A LIKE predicate, ESCAPE clause, LOCATE scalar function, LOCATE_IN_STRING scalar function, POSITION scalar function, or POSSTR scalar function cannot be used with DATE, TIME, or TIMESTAMP.

System action

The statement cannot be processed.

Programmer response

Check and correct the syntax of the LIKE predicate, or LOCATE, LOCATE_IN_STRING, POSITION, or POSSTR scalar function.

AN AGGREGATE FUNCTION IN A SUBQUERY OF A HAVING CLAUSE IS INVALID BECAUSE ALL COLUMN REFERENCES IN ITS ARGUMENT ARE NOT CORRELATED TO THE GROUP BY RESULT THAT THE HAVING CLAUSE IS APPLIED TO

Explanation

If an aggregate function has a correlated column reference, it must be correlated from within a HAVING clause to the GROUP BY result that the HAVING clause is applied to. All column references in the argument must satisfy this condition.

System action

The statement cannot be processed.

Programmer response

Correct the syntax of the HAVING clause.

-134

IMPROPER USE OF A STRING, LOB, XML, OR ARRAY VALUE

Explanation

The SQL statement references a string, LOB, XML value, or an array with elements that are defined as LOBs, that is not valid in the context that was specified.

This error can be issued when the length attribute of a string value is too long for the context in which it is used. The string value that you specified is invalid for one of the following reasons:

- A string value with a length attribute greater than 255 bytes is not allowed in a SELECT list that also specifies DISTINCT.
- A string value with a length attribute greater than 255 bytes is not allowed for a string representation of a number.
- A string value with a length attribute greater than 16000 bytes is not allowed for a sort operation such as an ORDER BY clause.
- A string value with a length attribute greater than 32704 bytes is not allowed as an argument to the REPLACE function.

This error can also be issued when:

- LOB or XML values are specified in a context in which they are not allowed. The LOB or XML value that you specified is invalid for one of the following reasons:
 - A LOB or an XML value is not allowed in an ORDER BY clause.
 - A LOB or an XML value is not allowed in a check constraint.
- An array type with LOB elements is specified in a context in which it is not allowed. The array type that you specified is invalid for one of the following reasons:
 - The array type that was specified is invalid because an array type with LOB elements is not allowed as a parameter data type for a procedure defined with the AUTONOMOUS option.
 - The ARRAY_AGG function returned an array of LOBs, and the query in which ARRAY_AGG was invoked also contained a GROUP BY clause.

A token might be returned with the name of the column or special register that resulted in the error. The nature of the error and the syntax in which it occurred determines whether a token is returned.

System action

The statement cannot be processed.

Programmer response

Db2 does not support the requested operation on the string, LOB, or XML value.

-136

**SORT CANNOT BE EXECUTED
BECAUSE THE SORT KEY LENGTH
TOO LONG**

Explanation

A sort key is derived from the list of columns specified following a DISTINCT keyword, or in an ORDER BY or GROUP BY clause in a query. If both a DISTINCT keyword and an ORDER BY or GROUP BY clause are present, the sort key is derived from the combination of both lists of columns.

The internal length of the sort key cannot exceed 16000 bytes. In attempting to process the SQL statement, the internal length of the sort key derived from the DISTINCT and ORDER BY (or GROUP BY), or, the DISTINCT or ORDER BY (or GROUP BY) specifications was found to exceed that maximum limit.

The error can also occur for an ORDER BY specification for the XMLAGG function. The internal length of the sort key for XMLAGG cannot exceed 4000 bytes. In attempting to process the XMLAGG function invocation, the internal length of the sort key derived from the ORDER BY specification was found to exceed that maximum limit.

System action

The statement cannot be processed.

User response

The statement must be modified such that the internal length of the sort key does not exceed the maximum limit. In general, this means that one or more column names must be deleted from the ORDER BY or GROUP BY clause, or deleted from the list following the DISTINCT keyword.

SQLSTATE

54005

-137

**THE LENGTH RESULTING FROM
operation IS GREATER THAN
maximum-length**

Explanation

The length of the result of concatenation or a function exceeds the defined maximum. The operation that resulted in the error is *operation*.

- For concatenation, the length cannot exceed 32,764 (if character operands) or 16,382 (if graphic operands).
- For other functions, check the maximum result length.

System action

The statement cannot be processed.

Programmer response

Ensure that the length of the result does not exceed the defined maximum.

SQLSTATE

54006

Related reference

[Limits in Db2 for z/OS \(Db2 SQL\)](#)

-138

**THE SECOND OR THIRD
ARGUMENT OF THE SUBSTR OR
SUBSTRING FUNCTION IS OUT OF
RANGE**

Explanation

One of the following conditions exists:

- The value of the second argument of the SUBSTR or SUBSTRING function is less than 1 or greater than M.
- The value of the third argument of the SUBSTR or SUBSTRING function is an integer constant 0 or greater than M-N+1.

M is the length of the first argument if it is of fixed-length, or, M is the maximum length of the first argument if it is of varying-length. N is the value of the second argument.

System action

The statement cannot be processed.

Programmer response

Ensure that the second and third arguments of the SUBSTR or SUBSTRING function have legal values according to the rules listed in the Explanation.

SQLSTATE

22011

-142 THE SQL STATEMENT IS NOT SUPPORTED

Explanation

An SQL statement was detected that is not supported by the database. The statement might be valid for other IBM relational database products or it might be valid in another context. For example, statements such as VALUES and SIGNAL or RESIGNAL SQLSTATE can be used only in certain contexts, such as in a trigger body or in an SQL Procedure.

System action

The statement cannot be processed.

Programmer response

Change the syntax of the SQL statement or remove the statement from the program.

SQLSTATE

42612

**-144 INVALID SECTION NUMBER
number**

Explanation

One of the following:

- The user attempted to execute an invalid section.
- This release of Db2 does not support the SQL statement.
- The section number in the call parameter list is one of these:
 - Negative
 - An invalid duplicate
 - Greater than the maximum section number of the DBRM or package

System action

The statement cannot be processed.

Programmer response

For case 1: If you are executing a package that was bound with SQLERROR(CONTINUE), determine whether the statement in question was bound as a valid section. You can use the following statements to query the Db2 catalog:

```
SELECT SQLERROR
FROM SYSIBM.SYSPACKAGE
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name;
```

If that query returns 'C', the package was bound with SQLERROR(CONTINUE).

```
SELECT STMTNO, TEXT
FROM SYSIBM.SYSPACKSTMT
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name AND
SECTNO = number AND
BINDERROR = 'Y';
```

If that query returns any rows, the section is invalid. Refer to the error messages issued during the bind to determine the cause. Correct any errors and bind the package again, using the REPLACE option.

For case 2: If the Db2 system has fallen back to a previous release, determine whether there are any SQL statements with a section number of zero that are not supported by that release. You can use the following statements to query the Db2 catalog.

When executing from a DBRM, use:

```
SELECT *
FROM SYSIBM.SYSSTMT
WHERE SECTNO = 0
ORDER BY NAME, PLNAME, STMTNO, SEQNO;
```

When executing from a package, use:

```
SELECT *
FROM SYSIBM.SYSPACKSTMT
WHERE SECTNO = 0
ORDER BY COLLID, NAME, VERSION, STMTNO, SEQNO;
```

For case 3: Examine the application to determine whether the call parameter list was changed in some way. In general, you should not attempt to change the output of the precompiler.

SQLSTATE

58003

**-147 ALTER FUNCTION *function-name*
FAILED BECAUSE SOURCE
FUNCTIONS OR SPATIAL
FUNCTIONS CANNOT BE ALTERED**

Explanation

The function cannot be altered because it is a source function or a spatial function. Only fenced external scalar functions, or fenced external table functions can be altered.

To change an existing source function or spatial function, you must DROP the function and re-create it.

System action

The statement cannot be processed.

Programmer response

Change the statement to refer to a function that can be altered, or re-create the function by dropping it and then creating a new version of it.

SQLSTATE

42917

-148	THE SOURCE TABLE OR TABLESPACE <i>source-name</i> CANNOT BE ALTERED, REASON <i>reason-code</i>
------	---

Explanation

The ALTER statement issued could not be processed.

source-name

The name of the source table or table space.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

01

The ALTER statement specified an ALTER COLUMN clause that attempted to drop the default value, alter the default value, or change the length of the column. The column cannot be altered because the column has a field procedure or is involved in a referential or check constraint. The default value cannot be changed because the column has a field procedure.

02

The ALTER statement specified an ALTER COLUMN clause that attempted to drop the default value, alter the default value, or change the length of the column. The column cannot be altered because the table that is identified by *source-name* might be one of the following:

- A table that has an edit procedure or validation procedure.

03

The ALTER statement specified an ALTER COLUMN clause that attempted to drop the default value, alter the default value, or alter the data type of the column. The column cannot be altered because the table is defined with DATA CAPTURE CHANGES and the subsystem parameter RESTRICT_ALT_COL_FOR_DCC is set to YES.

04

The ALTER statement cannot be used to define a clone table because a clone table is already defined for *source-name*.

05

The ALTER statement cannot be used to define a clone table because table *source-name* is not in a universal table space or it is in a table space that is defined with PAGENUM RELATIVE.

06

The ALTER statement cannot be used to define a clone table because table *source-name* is involved in a referential or check constraint.

07

The ALTER statement cannot be used to define a clone table because table *source-name* has an after trigger defined on it.

08

The ALTER statement cannot be used to define a clone table because table *source-name* is a materialized query table.

09

The ALTER statement cannot be used to define a clone table because table *source-name* has more than one table space version or index version in use.

10

Either of the following reasons:

The ALTER statement cannot be used to define a clone table because table space of table *source-name* or an index on table *source-name* was created with DEFINE NO, and the data set is not yet defined.

An auxiliary object for a source table with a LOB or XML column was created with DEFINE NO, and the data set is not yet defined

11

The ALTER statement attempted to change a table that has a defined clone, or a table that is a clone.

12

The ALTER statement cannot be used to define a clone table because table *source-name* is

defined with an edit procedure, validation procedure, or field procedure.

- 13** The ALTER statement cannot be processed because an index exceeds versioning limit of 16.
- 14** An ALTER statement with an ALTER COLUMN clause attempted to change the data type from character FOR BIT DATA to BINARY, but the cast default value length exceeds 1536 UTF-8 bytes.
- 15** The ALTER statement cannot be processed because no pending changes are associated with the table space.
- 16** An ALTER TABLESPACE statement cannot include the MEMBER CLUSTER YES option for hash-organized table space.
- 17** The ALTER statement cannot be used to define a clone table because table *source-name* is hash-organized.
- 18** The ALTER statement cannot be processed because Db2 11 Unicode columns in EBCDIC tables can only be altered by specifying the same data type, length, and CCSID as were specified when the column was originally defined with a CREATE or ALTER TABLE statement. The alteration migrates the column definitions for Db2 11 Unicode columns to Db2 12 or later Unicode columns. For more information, see [Unicode columns in EBCDIC tables \(Db2 SQL\)](#).
- 19** The ALTER statement attempted to define or change a key label for a clone table.

System action

The statement cannot be processed.

Programmer response

Change *source-name* to the name of an object that can be altered as specified and reissue the statement, or take an appropriate action for the *reason-code* value:

- 01** Do not attempt to change *source-name* to the name of an object that can be altered as specified and reissue the statement.

- 02** Do not attempt to change a column that is defined with an edit procedure or valid procedure.
- 03** Do not attempt to change or drop the default value, or change the data type of a column when the table is defined with DATA CAPTURE CHANGES and the subsystem parameter RESTRICT_ALT_COL_FOR_DCC is set to YES.
- 04** Before defining a clone table, verify that there is no clone table already defined for *source-name*.
- 05** Before defining a clone table, verify that table *source-name* is in a universal table space.
- 06** Before defining a clone table, verify that table *source-name* is not involved in a referential or check constraint.
- 07** Before defining a clone table, verify that table *source-name* does not have any AFTER triggers defined on it.
- 08** Before defining a clone table, verify that table *source-name* is not a materialized query table.
- 09** Before defining a clone table, verify that table *source-name* does not have more than one table space version or index version in use.
- 10** Before defining a clone table, verify that the data sets for *source-name* and its indexes are defined.
- 11** Drop the clone table, then alter the column. Use an ALTER TABLE statement with the DROP CLONE clause.
- 12** Before defining a clone table, verify that table *source-name* does not have an edit procedure, valid procedure, or field procedure.
- 13** Reduce the number of versions for the index, then issue the ALTER statement again.
- 14** Either reduce or drop the default value. To alter the default value, use an ALTER TABLE statement with ALTER COLUMN SET DEFAULT. To drop the default value, use an ALTER TABLE statement with ALTER COLUMN DROP DEFAULT.
- 15** Avoid altering a table space to drop the pending changes that do not exist.

16

Do not attempt to add the MEMBER CLUSTER YES option for a hash-organized table space.

17

Do not attempt to define a clone table for a hash-organized table.

18

Do not attempt to alter a Db2 11 Unicode column in an EBCDIC table.

19

Do not attempt to define or change a key label for a clone table. The key label is inherited from the base table.

SQLSTATE

42809

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

Updates to a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a built-in function.

Also, a given column in a view cannot be updated (that is, the values in that column cannot be updated) if the column is derived from an arithmetic expression, a constant, a column that is part of the key of a partitioned index, or a column of a catalog table that cannot be updated.

Deletes against a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a built-in function.

Truncates against a view are always prohibited.

- An auxiliary table or an XML table was named in a TRUNCATE statement.

System action

The statement cannot be processed. No data was inserted, updated, deleted, merged, or truncated.

User response

The requested function cannot be performed on the view.

If the error occurred on a CREATE TRIGGER statement, remove the INSERT, UPDATE, MERGE, or DELETE reference to the transition table.

SQLSTATE

42807

Related concepts

-150

THE OBJECT OF THE INSERT, DELETE, UPDATE, MERGE, OR TRUNCATE STATEMENT IS A VIEW, SYSTEM-MAINTAINED MATERIALIZED QUERY TABLE, OR TRANSITION TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation

One of the following occurred:

- A transition table was named in an INSERT, UPDATE, DELETE, MERGE, or TRUNCATE statement in a triggered action. Transition tables are read-only.
- The view named in the INSERT, UPDATE, DELETE, MERGE, or TRUNCATE statement is defined in such a way that the requested insert, update, delete, or truncate operation cannot be performed upon it.

Inserts into a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier, an arithmetic expression, a string expression, a built-in function, or a constant.
- Two or more columns of the view are derived from the same column.
- A base table of the view contains a column that does not have a default value and is not included in the view.

Explanation

The requested function is not supported by Db2.

column-name

The name of the column that could not be updated.

This error occurs if either:

- The object column in an update operation is defined with the GENERATED ALWAYS and AS IDENTITY or AS ROW CHANGE TIMESTAMP attributes, its value is not being set with the DEFAULT keyword, and one of the following conditions is true:
 - Extended indicator variable values are not enabled.
 - Extended indicator variable values are enabled, but the value specified for the indicator variable is not the extended indicator variable-based values of DEFAULT or UNASSIGNED.
- The object column is not updatable.

A column is not updatable for one or more of the following reasons:

- The values for columns occurring in the partitioning key of a partitioned table cannot be updated.
- The object table is a view and the specified column is defined (in the definition of the view) in such a way that it cannot be updated.
- The object table is a catalog table with no columns that can be updated.
- The object column is a ROWID column.
- The specified column of catalog tables cannot be updated because the column itself is not updatable.
- The values for columns occurring in the hash key of a table that is organized by hash cannot be updated.
- The BUSINESS_TIME period in the table includes a column that was specified to be updated. A column of a BUSINESS_TIME period must not be modified within a trigger body.
- The BUSINESS_TIME period in the table includes a column that was specified to be updated. A column of a BUSINESS_TIME period must not be modified if the data change statement includes a period clause.

Individual columns in a view cannot be updated for one of the following reasons:

- The column is derived from an SQL function, an arithmetic expression, or a constant.
- The column is defined for a column of an underlying view that cannot be updated.
- The column is defined for a read-only view.
- The column is defined for a column that is in the partitioning key of a partitioned table.

System action

The statement cannot be processed. No data was updated in the object table or view.

Programmer response

Correct the syntax and reissue the statement that included the update operation.

-152

THE DROP *clause* CLAUSE IN THE ALTER STATEMENT IS INVALID BECAUSE *constraint-name* IS A *constraint-type*

Explanation

The DROP *clause* of an ALTER TABLE statement tried to drop a constraint that does not match the *constraint-type* in the DROP clause. *clause* must identify an appropriate *constraint-type* as follows:

REFERENTIAL CONSTRAINT

The identified constraint must be a referential constraint.

CHECK CONSTRAINT

The identified constraint must be a check constraint.

PRIMARY KEY CONSTRAINT

The identified constraint must be a primary key constraint.

UNIQUE KEY CONSTRAINT

The identified constraint must be a unique key constraint.

System action

The ALTER TABLE DROP statement cannot be executed. No object was dropped.

Programmer response

Drop the existing object with the correct DROP clause of the ALTER TABLE statement.

SQLSTATE

42809

-153

**THE STATEMENT IS INVALID
BECAUSE THE VIEW OR TABLE
DEFINITION DOES NOT INCLUDE
A UNIQUE NAME FOR EACH
COLUMN**

Explanation

You must specify a list of column names if the result table of the fullselect that is specified in the CREATE VIEW, CREATE TABLE, or DECLARE GLOBAL TEMPORARY TABLE statement has duplicate column names or an unnamed column (a column from a constant, function, or expression).

System action

The statement cannot be processed. The specified view or table was not created, or the declared temporary table was not declared.

Programmer response

Correct the statement by providing a list of names for the columns of the view or table.

-157 **ONLY A TABLE NAME CAN BE SPECIFIED IN A FOREIGN KEY CLAUSE. *object-name* IS NOT THE NAME OF A TABLE.**

Explanation

The indicated object was identified in a FOREIGN KEY clause of a CREATE or ALTER TABLE statement. A FOREIGN KEY clause must identify a table.

System action

The statement cannot be processed.

Programmer response

Correct the statement to specify a table name in the foreign key clause.

SQLSTATE

42810

-158 **THE NUMBER OF COLUMNS OR ARGUMENTS SPECIFIED FOR *name* IS NOT THE SAME AS THE NUMBER OF COLUMNS IN THE RESULT TABLE.**

Explanation

One of the following situations has occurred:

- The number of column names that are specified for a view in a CREATE VIEW statement is not the same as the number of elements that are specified in the SELECT clauses of the fullselect that follows. These elements might be column names, SQL functions, and expressions, for example.
- The number of column names that are specified for a table in a CREATE TABLE statement is not the same as the number of columns in the result table of the fullselect that follows.
- The number of column names that are specified in a correlation clause is not the same as the number of columns in the corresponding table, view, table expression, table function, data change table reference, or UNNEST.
- The number of columns that are specified in the RETURNS TABLE clause of a user defined table function is not the same as the number of elements that are specified in the fullselect in the RETURN statement. The fullselect can return zero or more rows with one or more columns. The number of columns in the fullselect must match the number of columns in the function result.

- The number of column names that are specified in a column list of a common table expression is not the same as the number of elements specified in the fullselect.

System action

The statement cannot be processed.

Programmer response

Specify a column name for each column in the result, and try the request again.

SQLSTATE

42811

Related reference

[Statements \(Db2 SQL\)](#)

-159 **THE STATEMENT REFERENCES *object-name* WHICH IDENTIFIES AN *actual-type* RATHER THAN AN *expected-type***

Explanation

An object was specified as part of a statement, but the actual type of the object is not the expected type. For example, if the statement is DROP ALIAS TED.T1, then TED.T1 must be an alias name.

object-name

The name of the object.

actual-type

The current type of the object.

expected-type

The expected type of the object.

If *actual-type* or *expected-type* is TABLE, and *actual-type* or *expected-type* is a particular type of table, then the type of table was not valid for the statement that was specified.

System action

The statement cannot be processed.

Programmer response

Change the statement to match the type of object that is identified by the *expected-type* value. For example:

- An ALTER VIEW statement must reference an existing view.
- A COMMENT ON ALIAS statement must specify the name of an alias, and not the name of a table or view.

- A COMMENT ON TABLE statement must reference an existing table or view.
- A CREATE INDEX statement with the UNIQUE keyword must specify a table that is not a materialized query table.
- A CREATE INDEX statement must specify the name of a table that is not a clone table.
- A CREATE TRIGGER statement must specify a table in the ON clause that is not a materialized query table. That is, a trigger cannot be defined for a materialized query table.
- A CREATE TRIGGER statement must specify the name of a table that is not a clone table.
- A DROP ALIAS statement must specify the name of an alias, and not the name of a table or view.
- A DROP TABLE statement must reference an existing table. If an alias is specified, then the table that the alias refers to is dropped. Use the DROP ALIAS statement to drop the alias.
- A DROP VIEW statement must reference an existing view.
- A REFRESH TABLE statement must refer to a materialized query table.
- A CREATE MASK or CREATE PERMISSION statement must name a base table that exists on the server. The table must not be an accelerator-only table, a materialized query table, or a table with dependent materialized query tables.
- The *table-locator-reference* must reference a table name in the LIKE clause.
- An ALTER TABLESPACE statement with a MOVE TABLE clause must identify a table that is to be moved. A view must not be specified.
- A CREATE AUXILIARY TABLE statement with a STORES clause must identify a base table. An auxiliary table, clone table, or view must not be specified.

SQLSTATE

42809

**-160 THE WITH CHECK OPTION
CLAUSE IS NOT VALID FOR THE
SPECIFIED VIEW**

Explanation

The WITH CHECK OPTION clause does not apply to a view definition under the following circumstances:

- The view is read-only (for example, the view definition includes DISTINCT GROUP BY, or JOIN).
- The view definition includes a subquery.

- The view definition includes a global variable.
- A view on which the specified view definition is dependent has an INSTEAD OF trigger defined.
- The view definition references a table for which row or column access control is activated.

System action

The statement cannot be processed. The specified view was not created.

Programmer response

Correct the syntax of the WITH CHECK OPTION keyword in the CREATE VIEW statement.

SQLSTATE

42813

Related reference

[CREATE VIEW statement \(Db2 SQL\)
Statements \(Db2 SQL\)](#)

-161	THE INSERT OR UPDATE IS NOT ALLOWED BECAUSE A RESULTING ROW DOES NOT SATISFY THE VIEW DEFINITION
-------------	---

Explanation

The WITH CHECK OPTION applies to the view that is the object of the insert or update operation. Consequently, all attempts to insert or update rows in that view are checked to ensure that the results will conform to the view definition.

System action

The statement cannot be processed. No inserts or updates were performed, and the contents of the object view (and underlying base table) remain unchanged.

Programmer response

Examine the view definition to determine why the requested insert or update operation was rejected. Note that this may be a data-dependent condition.

SQLSTATE

44000

-164	<i>authorization-id</i> DOES NOT HAVE THE PRIVILEGE TO CREATE A VIEW WITH QUALIFICATION <i>qualifier-name</i>
-------------	--

Explanation

An attempt was made to create a view, but the authorization ID that was used lacks the authority to create views with other qualifiers. Only an authorization ID that holds SYSADM or system DBADM authority can create views for other authorization IDs.

authorization-id

The authorization ID that was used for the CREATE VIEW statement.

qualifier-name

The qualifier that was specified in the CREATE VIEW statement.

System action

The statement cannot be processed. The specified view is not created.

Programmer response

Do not attempt to create views with other than your own ID as a qualifier. The system DBADM privilege should be granted on any of the databases that contain at least one of the tables on which this CREATE VIEW is based. For the view to be created successfully, system DBADM should have DATAACCESS authority or select privilege on the tables on which this CREATE VIEW is based.

**THE DATA TYPE, LENGTH, OR
VALUE OF ARGUMENT *argument-
position* OF *function-name* IS
INVALID**

Explanation

The data type, the length, or the value of an argument of a scalar function is incorrect.

argument-position

An integer that identifies the position of the incorrect argument in the function invocation.

function-name

The name of the scalar function.

This error can be issued for an attempt to use a feature that requires a higher APPLCOMPAT setting than the current setting. The current APPLCOMPAT setting does not support a feature that was requested.

System action

The statement that contains the function cannot be processed.

Programmer response

Correct the invocation of the function, and reissue the statement.

Problem determination

If the encoding scheme is EBCDIC or ASCII, a possible reason for this error is that a character argument was specified for a built-in function that expects a graphic argument, or a graphic argument was specified for a built-in function that expects a character argument. The UNICODE encoding scheme supports the mixing of character and graphic arguments, but EBCDIC and ASCII do not.

If the function is a string function, this code might be issued if a string unit was required but not specified. The string unit keywords are CODEUNITS16, CODEUNITS32, and OCTETS.

This error is issued when the RID function is invoked with an unexposed name. An exposed name must be used as the argument to the RID function.

If a parameter of the function is optional, the value of the *argument-position* token for SQLCODE -171 might take into consideration the implicit argument.

For example, suppose that you invoke this function, in which parameter value '12' is invalid:

```
TRIM('12' FROM '123')
```

The first argument to the TRIM function, BOTH, is implicitly specified. Therefore, the value of *argument-position* for parameter value '12' is 2.

SQLSTATE

22546 if the error is encountered for an invalid format for a BSON object; 42815 otherwise.

-173 **UR IS SPECIFIED ON THE WITH CLAUSE BUT THE CURSOR IS NOT READ-ONLY**

Explanation

The cursor is not a read-only cursor. WITH UR can be specified only if Db2 can determine that the cursor is read-only.

System action

Statement execution fails.

Programmer response

If the cursor is intended to be read-only but is ambiguous, add the FOR FETCH ONLY clause. If the cursor is updatable, change the isolation level specified on the WITH clause.

SQLSTATE

42801

-180 **THE DATE, TIME, OR TIMESTAMP VALUE value IS INVALID**

Explanation

The length or string representation of a DATE, TIME, or TIMESTAMP value does not conform to any valid format.

The value can contain one of the following:

- For a host variable, the position number of the input host variable. If the position number cannot be determined, a blank is displayed.
- For a character string constant, the character string constant. The maximum length that is displayed is the length of SQLERRM.
- For a character column, the column name. If the column is a VIEW column and it has a corresponding base column, the VIEW column name is displayed. If the column is a VIEW column but it does not have a corresponding base column, a string of '*N' is displayed.

Otherwise, value is a string of '*N'.

System action

The statement cannot be processed.

Programmer response

Correct the program to ensure the specified value conforms to the syntax of DATE, TIME, and TIMESTAMP.

SQLSTATE

22007

Related concepts

-181 **THE STRING REPRESENTATION OF A DATETIME VALUE IS NOT A VALID DATETIME VALUE**

Explanation

The string representation of a datetime is not in the acceptable range or is not in the correct format. The proper ranges for datetime values are as follows:

Table 2. Range of datetime values

Datetime	Specific Cases	Numeric Range
Years		0001–9999

Table 2. Range of datetime values (continued)

Datetime	Specific Cases	Numeric Range
Months		1–12
Days	For months: • April (month 4) • June (6) • September (9) • November (11)	1–30
	For February (month 2)	1–28 (Years other than leap years.)
		1–29 (Leap years only.)
	For months: • January (month 1) • March (3) • May (5) • July (7) • August (8) • October (10) • December (12)	1 –31
Hours	If the format for hours is USA	0–12
	For all other predefined formats	0–24
Minutes ¹		0–59
Seconds ¹		0–59
Fractional seconds ¹		0–999999
Time zone hours		-12–14
Time zone minutes		0–59

Note:

1. When the hour format is not USA and the value of the hour is 24, other parts of time values are zeros.

System action

The statement cannot be processed.

Programmer response

Check whether the value is within the valid range and is in the proper format. Correct the syntax, and reissue the statement.

-182

AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation

The specified arithmetic expression contains an improperly used datetime value or labeled duration.

System action

The statement cannot be processed.

Programmer response

Correct the indicated arithmetic expression.

SQLSTATE

42816

-183

AN ARITHMETIC OPERATION ON A DATE OR TIMESTAMP HAS A RESULT THAT IS NOT WITHIN THE VALID RANGE OF DATES

Explanation

The result of an arithmetic operation is a date or timestamp that is not within the valid range of dates which are between 0001-01-01 and 9999-12-31.

System action

The statement cannot be processed.

Programmer response

Examine the SQL statement to see if the cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was processed at the time the error occurred.

SQLSTATE

22008

-184	AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER
------	---

Explanation

The specified arithmetic expression contains a parameter marker improperly used with a datetime value.

System action

The statement cannot be processed.

Programmer response

Correct the indicated arithmetic expression.

SQLSTATE

42610

-185	THE LOCAL FORMAT OPTION HAS BEEN USED WITH A DATE OR TIME AND NO LOCAL EXIT HAS BEEN INSTALLED
------	---

Explanation

The local format option has been used with a datetime value and no datetime exit has been installed. This may occur if the LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel indicated that an exit for datetime was supplied, but in fact the exit supplied by Db2 was not replaced. This may also occur if the datetime exit was replaced and the corresponding LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel was not set to a nonzero value.

System action

The statement cannot be processed.

Programmer response

Contact the system programmer about installation of the date or time exit.

SQLSTATE

57008

-186

THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED AND EXECUTING PROGRAM RELIES ON THE OLD LENGTH
--

Explanation

The local format option has been used with a datetime value and Db2 has discovered that the datetime exit routine has been changed to produce a longer local format.

System action

The statement cannot be processed.

Programmer response

If the statement receiving this error is embedded in the application program, then a REBIND command must be issued for the application plan. If the statement was dynamic SQL, then the statement can be reentered.

SQLSTATE

22505

-187	A REFERENCE TO A CURRENT DATETIME SPECIAL REGISTER IS INVALID BECAUSE THE MVS TOD CLOCK IS BAD OR THE MVS PARMTZ IS OUT OF RANGE
------	--

Explanation

Db2 has encountered an invalid time-of-day (TOD) clock. The user referenced one of the special registers: CURRENT DATE, CURRENT TIME, CURRENT TIMESTAMP, or CURRENT TIMEZONE. If the user referenced CURRENT TIMEZONE, the MVS parameter PARMTZ was out of range.

System action

The statement cannot be processed.

Programmer response

For CURRENT TIMEZONE, check that the MVS parameter PARMTZ is between -24 and +24 hours. For the other CURRENT special registers, check that the MVS TOD clock has been set correctly.

SQLSTATE

22506

Explanation

The host variable referenced in the DESCRIBE statement does not contain a valid string representation of a name. One of the following error conditions has occurred.

- The first byte of the variable is a period or a blank.
- The number of identifiers is greater than 3.
- An identifier is too long.
- A period not contained in a delimited identifier is followed by a period or a blank.
- A delimited identifier is followed by a character other than a period or a blank.
- A delimited identifier is not terminated by a quotation mark.

System action

The statement cannot be processed.

Programmer response

Correct the value of the host variable so that it is a valid string representation of a name.

SQLSTATE

22503

Explanation

To determine the subtype of an input host variable or result column, the SYSSTRINGS catalog table was accessed with the specified CCSID and, one of the following error conditions occurred:

- The CCSID is not a value of either INCCSID or OUTCCSID.
- The TRANSTYPE column classifies the CCSID as GRAPHIC rather than CHARACTER.
- A graphic CCSID has not been specified on your system.
- The CCSID is outside the acceptable range of values. The CCSID must be in the range 1–65533, inclusive, or the value 65535.
- A DBCS CCSID was specified when casting to CHAR, VARCHAR or CLOB.
- An SBCS or mixed CCSID, or 65535 was specified when casting to a graphic data type.

- CCSID 65535, which is valid only for data with the FOR BIT DATA attribute, was specified when casting to a CLOB.

This error can occur when SYSSTRINGS is accessed with a pair of CCSIDs to determine if a translation is defined for the pair. In this case, the error is the inconsistency between the data type of a string and the TRANSTYPE classification of its CCSID (one is GRAPHIC and the other is CHARACTER).

This error can also occur when a CCSID specified in DECP does not exist as a value in the INCCSID or OUTCCSID columns of SYSSTRINGS.

Another reason this error can occur is that you may be using one of the graphic built-in functions but a graphic CCSID was not specified during system installation.

System action

The statement cannot be bound or executed.

Programmer response

Ensure that the CCSID is valid and consistent with the data type of the string. If a valid CCSID is not listed in a built-in row of SYSSTRINGS, it can be defined by inserting a user-provided row. If a valid CCSID is misclassified in a user-provided row, that row can be updated to correct the mistake.

If a graphic CCSID had not been specified at system installation, update your DECP to include a graphic CCSID and recycle your Db2.

SQLSTATE

[Setting up Db2 to ensure that it interprets characters correctly \(Db2 Internationalization Guide\)](#)

[Checking defined character conversions \(Db2 Internationalization Guide\)](#)

Related reference

[SYSSTRINGS catalog table \(Db2 SQL\)](#)

Explanation

The attributes for the column in an ALTER TABLE statement are not compatible with the attributes of the existing column.

table-name

The name of the table.

column-name

The name of the column.

Possible reasons for this error include:

Incompatible data type

The ALTER TABLE ALTER COLUMN SET DATA TYPE statement allows changing columns of the following data types only:

- Character
- Numeric
- Binary

If the SET DATA TYPE clause was specified, the existing column is not compatible with the new data type that was specified, or is of a data type that cannot be changed.

Identity column is required

The following clauses can be specified only for a column that is defined as an identity column:

- RESTART
- SET GENERATED
- SET INCREMENT BY
- SET MINVALUE and SET NO MINVALUE
- SET MAXVALUE and SET NO MAXVALUE
- SET CYCLE and SET NO CYCLE
- SET CACHE and SET NO CACHE
- SET ORDER and SET NO ORDER

If one of these clause was specified, the existing column is not defined as an identity column.

Default values

If a SET DEFAULT or DROP DEFAULT clause was specified, the existing column either:

- Does not have a defined default value, or the column has NOT NULL as the null attribute.
- Is defined as an identity column, ROWID, or row change timestamp column.

Changing ROW BEGIN, ROW END, or TRANSACTION START ID columns

If ALTER COLUMN was specified to change the column to a ROW BEGIN, ROW END, or TRANSACTION START ID column:

- The column is already defined as a generated column.

- The column is already defined with a user-specified default value. Issue an ALTER TABLE statement to drop the default value. Then the column definition can be changed.

System action

The statement cannot be processed.

Programmer response

Review the SQL statement and take the appropriate action, then resubmit the statement.

- Modify the statement so that the attributes that are specified for the altered column are compatible with the existing column definition.
- Remove the incompatible attribute specification.
- Specify a different column.

SQLSTATE

42837

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

-191

**A STRING CANNOT BE USED
BECAUSE IT IS INVALID MIXED
DATA**

Explanation

The operation required the conversion of a mixed data character string to a different coded character set. The string could not be converted because it does not conform to the rules for well-formed mixed data.

System action

The statement cannot be processed.

Programmer response

If the string contains the intended information, the description of the column or host variable should be changed from MIXED DATA to BIT or SBCS DATA. If the description of the column or host variable is correct, the string is the problem and it must be changed to conform to the rules for well-formed mixed data.

SQLSTATE

22504

Related concepts

[Conversion rules for comparisons \(Db2 SQL\)](#)

[Mixed data in character strings \(Db2 SQL\)](#)

**-195 LAST COLUMN OF *table-name*
CANNOT BE DROPPED**

Explanation

table-name

The name of the table.

An attempt was made to drop a column using an ALTER TABLE statement. The column cannot be dropped from the table *table-name* because at least one of the existing columns must be preserved when altering a table.

System action

The statement cannot be processed.

Programmer response

Ensure that the table, *table-name*, will have at least one column after the ALTER statement is complete. If all of the columns should be removed, consider dropping the table (and if necessary, create it again).

SQLSTATE

42814

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

**-196 COLUMN *table-name.column-name*
CANNOT BE DROPPED. REASON =
reason-code.**

Explanation

An attempt was made to drop the specified column, but the column cannot be dropped for the indicated reason.

table-name

The name of the table.

column-name

The name of the column.

reason-code

A numeric value that indicates the reason that the statement cannot be executed.

1

The column cannot be dropped because it is part of the hash key or partitioning key.

3

The column cannot be dropped because it is a security label column.

4

The column cannot be dropped because it is part of a period.

5

The column cannot be dropped because the table is a system-period temporal table or archive-enabled table.

6

The column cannot be dropped because it is a column in a history table or archive table.

8

The table, *table-name*, is defined with an edit procedure or validation procedure.

9

The table, *table-name*, is referenced (directly or indirectly) in the definition of a materialized query table.

10

A check constraint is defined on the table, *table-name*.

11

An extended index is defined on the table, *table-name*.

12

A trigger is defined on the table, *table-name*, or an INSTEAD OF trigger is defined on a view that is dependent on the table.

13

A row permission is dependent on the table, *table-name*.

14

A column mask is dependent on the table, *table-name*.

15

An SQL table function is dependent on the table, *table-name*.

System action

The statement cannot be processed.

Programmer response

Take the action that corresponds to the *reason-code* value:

1

- If the column is part of a partitioning key, drop the table and create it again without the column that needs to be dropped and redefine the partitioning key.
- If the column is part of a hash key:

1. Alter the table to remove the hash organization.
2. Drop the column.
3. Run the REORG utility on the containing table space so the drop column operation takes effect.
4. Alter the table to add the hash organization.

As an alternative, consider dropping the table and creating it again without the column that needs to be dropped.

- 3 Drop the table and create it again, without creating the security label column.
- 4 Drop the table and create it again, without creating the column that needs to be dropped.
- 5 Alter the table to remove system-period data versioning or disable archiving. (Issue ALTER TABLE with the DROP VERSIONING or DISABLE ARCHIVE clause.) Then drop the column from the table.

If system-period versioning or archiving is still needed, drop the column from the previously associated history table or archive table. Then add system-period data versioning or archiving back to the table.
- 6 Drop versioning or archiving so that the table is no longer a history table or an archive table. (Use the ALTER TABLE statement with the DROP VERSIONING or DISABLE ARCHIVE clause on the associated system-period temporal table or archive-enabled table.) Then drop the column from the table.

If versioning or archiving is still needed, drop the column from the system-period temporal table or archive-enabled table. Then add versioning or archiving back to this table.
- 8 If the table is defined with a validation procedure, alter the table to remove the valid procedure and then drop the column. If the table is defined with an edit procedure, drop the table and create it again without the column that needs to be dropped.
- 9 Drop any materialized query tables that reference the table, then drop the column.
- 10 Drop and check constraints that reference the table, then drop the column.

- 11 Drop any extended indexes that reference the table, then drop the column.
- 12 Drop any triggers that reference the table or dependent views, then drop the column.
- 13 Drop any row permissions that reference the table, then drop the column.
- 14 Drop any column masks that reference the table, then drop the column.
- 15 Drop any SQL table functions that reference the table, then drop the column.

(Introduction to Db2 for z/OS)

-197

A QUALIFIED COLUMN NAME IS NOT ALLOWED IN THE ORDER BY CLAUSE WHEN A SET OPERATOR IS ALSO SPECIFIED

Explanation

The ORDER BY clause of a fullselect that includes a set operator, such as UNION, EXCEPT, or INTERSECT, cannot have qualified column names.

System action

The statement cannot be processed.

Programmer response

Change the statement to ensure that all column names in the ORDER BY clause are unqualified.

SQLSTATE

42877

-198

THE OPERAND OF THE PREPARE OR EXECUTE IMMEDIATE STATEMENT IS BLANK OR EMPTY

Explanation

The operand (host variable or string constant) that was the object of the PREPARE or EXECUTE IMMEDIATE statement either contained all blanks or was an empty

string. A DBRM built in Version 2 Release 3 cannot be used on a Version 2 Release 2 system if the distributive functions were used. If this error appears on Version 2 Release 2 and the DBRM was built on Version 2 Release 3, then the program needs to be precompiled again to correct the problem.

System action

The statement cannot be processed.

Programmer response

Correct the logic of the application program to ensure that a valid SQL statement is provided in the operand of the PREPARE or EXECUTE IMMEDIATE statement before that statement is executed.

SQLSTATE

42617

-199 **ILLEGAL USE OF KEYWORD**
***keyword*. TOKEN *token-list* WAS**
EXPECTED

Explanation

A syntax error was detected in the statement at the point where the keyword *keyword* appears.

As an aid to the programmer, a partial list of valid tokens is provided in SQLERRM as *token-list*. Only those tokens that will fit are listed. Some tokens in the list might not be valid in statements to be executed by Db2; those tokens are valid for sending to other database management systems.

System action

The statement cannot be processed.

Programmer response

Examine the statement in the area of keyword *keyword*. A colon or SQL delimiter might be missing.

Verify that the clauses are in the correct order. If the reserved word that is identified in the messages is listed as a reserved word, make the word a delimited identifier.

SQLSTATE

42601

Related reference
[Reserved words in Db2 for z/OS \(Db2 SQL\)](#)

-203 **A REFERENCE TO COLUMN**
***column-name* IS AMBIGUOUS**

Explanation

An unqualified column name is ambiguous if more than one table or view identified in the FROM clause has a column with that name, or if more than one column of a nested table expression has that name.

A qualified column name is ambiguous only if the qualifier is the correlation name for a nested table expression and the column name is not unique.

A reference to a column of the triggering table in a CREATE TRIGGER statement is ambiguous if it does not use the correlation name to indicate if it refers to the old or new transition variable.

System action

The statement cannot be processed.

Programmer response

If the problem is caused by a nonunique column name in a nested table expression, change the nested table expression so that the column name is unique. If the problem is caused by the use of an unqualified name, qualify it with a table, view, or correlation name.

SQLSTATE

42702

-204 ***name* IS AN UNDEFINED NAME**

Explanation

The object that is identified by *name* is not defined in the Db2 subsystem. This SQLCODE can be generated for any type of Db2 object.

If the error was encountered for a particular version of an object, the *name* token might return the version identifier. For example:

```
name-of-procedure VERSION version-id
```

For COMMENT or DROP, if the specified object is a package, the implicitly or explicitly specified version of the package is not defined in the Db2 subsystem. If the version-ID was not explicitly specified, the statement attempted to process the null version for the identified package, but the null version does not exist. The VERSION clause can be used to specify a specific version to be processed.

For CREATE FUNCTION, the *name* token can refer to a built-in function that cannot be the source of a user-

defined function, or cannot be used as the source of a user-defined function in certain conditions. For details, see [CREATE FUNCTION statement \(sourced function\) \(Db2 SQL\)](#).

If the statement executes on an accelerator, the *name* token can refer the name of a table on the accelerator server instead of the name of the associated table on Db2.

System action

The statement cannot be processed.

Programmer response

Verify that the object name was correctly specified in the SQL statement, including any required qualifiers. If it is correct, ensure that the object exists in the system before resubmitting the statement.

Check the application compatibility value that is used by your application to ensure that it is set properly. The behavior of the statement might change based on the application compatibility level.

If the specified object is a routine, issue the CREATE PROCEDURE or CREATE FUNCTION statement to define the routine to Db2. Issue the -START PROCEDURE command to activate the new definition.

If the specified object is a package, issue the COMMENT or DROP statement with the VERSION clause to identify the specific version to be processed.

SQLSTATE

42704, 46002

-205

***column-name* IS NOT A COLUMN
OF TABLE *table-name***

Explanation

No column with the specified *column-name* occurs in the table *table-name*.

System action

The statement cannot be processed.

Programmer response

Verify that the column and table names are specified correctly (including any required qualifiers) in the SQL statement.

SQLSTATE

42703

-206

***object-name* IS NOT VALID IN THE
CONTEXT WHERE IT IS USED**

Explanation

An object is specified in a context where it is not valid.

object-name

The name of the object that could not be resolved.

Possible reasons for this error include:

- The specified name is not a column of any of the source or target tables or views of the statement.
 - In a SELECT or DELETE statement, the specified name is not a column of any of the tables or views that are identified in a FROM clause in the statement.
 - In an INSERT, UPDATE, or MERGE statement, the specified name is not a column of the table, or view that was specified as the target of the data change statement.
 - A column list of an SQL data change statement specified a name that is not a column of the target table or view of the statement.
- A qualified column name was specified, but the table designator that is specified as the qualifier is not defined in this context.
- A correlated reference to a column was specified in an OLAP specification. Each column name that is referenced in an OLAP specification must unambiguously reference a column of the result table of the subselect that contains the OLAP specification.
- The specified period is not a period of any of the source or target tables or views of the statement.
- The target of an assignment clause of an SQL data change statement specified a name that is not a column of the target table or view of the statement, or an INCLUDE column defined for the statement. For a DELETE statement, the target of an assignment clause can only be an INCLUDE column.
- The source of an assignment clause of an SQL data change statement referenced an INCLUDE column in an expression. A column defined in an INCLUDE clause can only be specified as the target of an assignment in an SQL data change statement.
- A correlated reference to a column was specified for a grouping expression, which is not allowed.
- A column defined in the INCLUDE clause of an UPDATE or DELETE statement was referenced in the WHERE clause of that statement.
- The specified name is a correlated column reference in a subselect, which is not allowed.

- A VALUES clause of an SQL data change statement specified the name of a column of the target table, which is not allowed.
- For a CREATE or ALTER FUNCTION statement, or a CREATE or ALTER PROCEDURE statement:
 - The specified *name* does not resolve to the name of a column or variable.
 - The specified *name* resolves to the name of a variable that is not available in the current scope.
 - The specified condition name *name* specified in the SIGNAL statement has not been declared.
- For a CREATE TRIGGER statement:
 - A reference is made to a name using an OLD or NEW correlation name for a transition variable. The name is not defined as a column in the triggering table.
 - The target of an assignment in the triggered action specified an old transition variable that is not valid for the type of trigger.
 - The referenced name does not resolve to the name of a column or variable.
 - The specified *name* resolves to the name of a variable that is not available in the current scope.
 - The specified condition name *name* specified in the SIGNAL statement has not been declared.
 - The target variable is not a transition variable. The target of a SET assignment statement in a basic trigger must be a transition variable.
- The specified column reference to the index of an array element is not allowed in the INTO clause for a SELECT INTO statement.
- For a subselect in an ORDER BY clause, ensure that there are no correlated column references.
- For a DELETE statement, ensure that columns that are defined in the INCLUDE clause are specified only as targets of assignments.
- For a CREATE FUNCTION, ALTER FUNCTION, CREATE PROCEDURE or ALTER PROCEDURE statement, ensure that:
 - The specified *name* resolves to the name of a column or variable.
 - The specified *name* resolves to the name of a variable that is available in the current scope.
 - The specified condition name *name* specified in the SIGNAL statement has been declared.
- For a CREATE TRIGGER statement, ensure that:
 - The target of an assignment in a SET *transition-variable* statement specifies only new transition variables. Any reference to columns of the triggering table, including those that are contained in the top-level query block in the WHEN clause search condition, are qualified with a transition variable correlation name.
 - The top-level query block in the WHEN clause search condition contains only transition variables or transition table correlation names.
 - The specified *name* resolves to the name of a variable that is available in the current scope.
 - The specified condition name *name* specified in the SIGNAL statement has been declared.
- For a SELECT INTO statement, make sure that the index of an array element is not specified as a column in the INTO clause.

This error can be issued when there is an attempt to use a feature that requires a higher APPLCOMPAT setting than the current setting. The current APPLCOMPAT setting does not support a feature that was requested.

System action

The statement cannot be processed.

Programmer response

Verify the following items:

- For a SELECT statement:
 - Ensure that all the required tables are specified in the FROM clause.
 - Verify that all of the required tables or views were named in the FROM clause. If the name was intended to be a correlated reference to a column, qualify the name with the correct table designator.

SQLSTATE

42703

-208

**THE ORDER BY CLAUSE IS
INVALID BECAUSE COLUMN
column-name IS NOT PART OF THE
RESULT TABLE**

Explanation

The statement is invalid because a column (*column-name*) specified in the ORDER BY list does not appear in the result table (that is, it is not specified in the SELECT-list). Only columns in the result table can be used to order that result when the fullselect of the SELECT statement is not a subselect.

System action

The statement cannot be processed.

Programmer response

Correct the syntax of the statement, either by adding the specified column to the result table, or deleting it from the ORDER BY clause.

SQLSTATE

42707

-214 ***AN EXPRESSION IN THE FOLLOWING POSITION, OR STARTING WITH *position-or-expression-start* IN THE *clause-type* CLAUSE IS NOT VALID. REASON CODE = *reason-code****

Explanation

The expression identified by the first part of the expression *expression-start* in the *clause-type* clause

is not valid for the reason specified by the *reason-code* as follows:

- 1** The fullselect of the select-statement is not a subselect. Expressions are not allowed in the ORDER BY clause for this type of select-statement. This reason code occurs only when *clause-type* is ORDER BY.
- 2** DISTINCT is specified in the SELECT clause, and a column name or *sort-key-expression* in the ORDER BY clause cannot be matched exactly with a column name or *expression* in the select list. This reason code occurs only when *clause-type* is ORDER BY.
- 3** The select list includes an aggregate function or the subselect includes a GROUP BY clause and the expression is not an aggregate function or does not match exactly with an expression in the select list.
- 4** Grouping is caused by the presence of an aggregate function in the ORDER BY clause. This reason code occurs only when *clause-type* is ORDER BY.
- 5** Expression in a GROUP BY clause cannot contain a scalar-fullselect. This reason code occurs only when *clause-type* is GROUP BY.
- 6** Invalid use of scalar-fullselect. This reason code can be issued when the scalar-fullselect appears in an ORDER BY clause, the RETURN statement of an SQL function contains a scalar-fullselect, or a scalar-fullselect is passed as an argument on a CALL statement for a parameter that is defined as an input parameter (IN).
- 8** DISTINCT is specified in the LISTAGG function and the first argument expression cannot be matched exactly with the first sort key expression of the ORDER BY specified in the WITHIN GROUP clause. This reason code occurs only when *clause-type* is ORDER BY. [FL 506](#) The mismatch can occur when a column mask is defined on a column referenced in first argument expression.

System action

The statement cannot be processed.

Programmer response

Modify the select-statement based on the reason specified by the *reason-code*. Use the following suggestions to modify the select-statement:

- 1 Remove the expression from the ORDER BY clause. If attempting to reference a column of the result, change the sort key to the *simple-integer* or *simple-column-name* form. For more information, see the ORDER BY syntax diagram in [order-by-clause \(Db2 SQL\)](#).
- 2 Remove DISTINCT from the SELECT clause.
- 3 Change the expression in the ORDER BY or GROUP BY clause to an aggregate function or change the clause to use a numeric column identifier or a column name.
- 4 Add a GROUP BY clause or remove the aggregate function from the ORDER BY clause.
- 5 Remove the scalar fullselect from the GROUP BY clause.
- 6 Remove the scalar fullselect from the statement.
- 8 When DISTINCT is specified in the LISTAGG function, ensure that ORDER BY is specified and that the first sort key expression matches the argument of LISTAGG. [FL 506](#) Also, verify that no column mask is defined on the first argument expression.

SQLSTATE

42822

-216	THE NUMBER OF ELEMENTS ON EACH SIDE OF A PREDICATE OPERATOR DOES NOT MATCH. PREDICATE OPERATOR IS <i>operator</i>.
-------------	---

Explanation

The number of expressions specified on the left-hand side of OPERATOR *operator* is unequal to either the number of values returned by the fullselect or to the number of expressions specified on the right-hand side of the operator. The number of expressions and the number of values/expressions on either side of the operator must be equal.

System action

The statement cannot be processed.

Programmer response

Change the number of expressions to match the number of values returned by the fullselect or vice versa.

SQLSTATE

428C4

-219	THE REQUIRED EXPLANATION TABLE <i>table-name</i> DOES NOT EXIST
-------------	--

Explanation

The EXPLAIN statement assumes the existence of an EXPLAIN table, but it is not defined in the Db2 subsystem as a base table.

System action

The statement cannot be processed.

Programmer response

Determine whether the required EXPLAIN tables exist. If they do not, create the required tables.

SQLSTATE

42704

Related tasks

[Creating EXPLAIN tables \(Db2 Performance\)](#)

Related reference

[EXPLAIN statement \(Db2 SQL\)](#)

[EXPLAIN tables \(Db2 Performance\)](#)

[PLAN_TABLE \(Db2 Performance\)](#)

-220	THE COLUMN <i>column-name</i> IN EXPLANATION TABLE <i>table-name</i> IS NOT DEFINED PROPERLY
-------------	---

Explanation

An error occurred during the insertion of a row into the EXPLAIN table.

column-name

The name of the column that caused the error. If the column definition is incorrect, *column-name* is the name of the column in error. Otherwise, *N is returned for *column-name* because the column name is not applicable.

table-name

The name of the EXPLAIN table.

Possible reasons for this error include:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.
- The SQL statement contains contains mixed data, and the EXPLAIN table was defined as CCSID EBCDIC.

System action

The statement cannot be processed. The EXPLAIN information is not generated.

Programmer response

Correct the definition of the required EXPLAIN table. If the SQL statement being explained contains mixed data and the EXPLAIN table is defined as CCSID EBCDIC, take the following actions:

1. Copy the data from the EXPLAIN table.
2. Drop the EXPLAIN table.
3. Re-create the EXPLAIN table with CCSID UNICODE.
4. Copy the data into the EXPLAIN table.

SQLSTATE

-222

AN UPDATE OR DELETE OPERATION WAS ATTEMPTED AGAINST A HOLE USING CURSOR *cursor-name*

Explanation

Db2 could not process a positioned update or delete with cursor *cursor-name* that is defined as SENSITIVE STATIC. The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was positioned on a row of the object table that is a *hole*. Each row that the cursor is positioned on, that is to be updated or deleted must not be a *hole*:

- An *update hole* occurs when the corresponding row of the underlying table has been updated, and the updated row no longer satisfies the search condition that is specified in the SELECT statement of the cursor.
- A *delete hole* occurs when the corresponding row of the underlying table has been deleted.

This error might be issued if the following situations occur:

- If the cursor is not a rowset cursor, then the row corresponding to the current cursor position is either an update hole, or a delete hole. Db2 detects these holes when Db2 tries to update or delete the current

row of the result table for the cursor *cursor-name*, and cannot locate the corresponding row of the underlying table.

- If the cursor is a rowset cursor, then a row corresponding to a row of the current rowset cursor position is either an update hole or a delete hole. Db2 detects these holes when Db2 tries to update or delete the current row of the result table for cursor *cursor-name*, and cannot locate the corresponding row or rows of the underlying table.

System action

The statement cannot be processed. No data was updated or deleted, and the cursor position is unchanged.

Programmer response

Correct the logic of the application program to ensure that the cursor is correctly positioned on the intended row or rows of the object table, and that the intended rows are not *holes*, before the DELETE or UPDATE statement is executed.

- If the cursor is not a rowset cursor, then issue a FETCH statement to position the cursor on a row that is not a hole. Then, reissue the UPDATE or DELETE statement.
- If the cursor is a rowset cursor, and is also the positioned UPDATE or DELETE statement intended to affect a single row corresponding to the rows of the current rowset cursor position (this means for a FOR ROW n of ROWSET clause was specified), then change the UPDATE or DELETE statement to process the rows that are not holes, one at a time.
- If the cursor is a rowset cursor, and is also the positioned UPDATE or DELETE statement intended to affect all rows corresponding to the rows of the current rowset cursor position (this means for a FOR ROW n of ROWSET clause was not specified), then change the UPDATE or DELETE statement to process the rows that are not holes, one at a time. Add a FOR ROW n of ROWSET clause to the UPDATE or DELETE statement to indicate which row of the cursor is to be updated or deleted.

SQLSTATE

24510

-224	THE RESULT TABLE DOES NOT AGREE WITH THE BASE TABLE USING <i>cursor-name</i>
-------------	---

Explanation

A positioned UPDATE or DELETE was attempted on a row that no longer matches its previous condition. The column values in the result table row no longer match the current values in the base table row. The row was updated after it was inserted into the result table but before the positioned update or delete was completed.

cursor-name

The name of the cursor that was used for the positioned update or delete.

System action

The statement cannot be processed. The cursor is positioned on the same row.

Programmer response

Correct the application program to handle this error condition, or change the isolation levels so that the base row cannot be updated during the cursor operation.

SQLSTATE

24512

[DELETE statement \(Db2 SQL\)](#)

[UPDATE statement \(Db2 SQL\)](#)

-225	FETCH STATEMENT FOR <i>cursor-name</i> IS NOT VALID FOR THE DECLARATION OF THE CURSOR
-------------	--

Explanation

Db2 could not process a FETCH statement for cursor *cursor-name* because it contained a disallowed keyword. One of the following errors have occurred:

- A FETCH statement for a non-scrollable cursor specified one of the keywords PRIOR, FIRST, LAST, ABSOLUTE, RELATIVE, CURRENT, BEFORE, or AFTER. These keywords are disallowed for a cursor that was not declared with the SCROLL attribute, however, the CURRENT clause is allowed with a non-scrollable cursor only when combined with the CONTINUE clause.
- CONTINUE was specified on the FETCH statement, but the specified cursor was opened for a multiple-row fetch operation. This combination is not supported.

System action

The statement cannot be processed. No data was written to the output host variables.

Programmer response

If a scrolling option was specified on the FETCH statement for a non-scrollable cursor, correct the FETCH statement to exclude the disallowed keyword, or, correct the DECLARE CURSOR statement to include the appropriate SCROLL option. If the CONTINUE clause was specified for a multiple-row cursor, change the application to use single row fetch for this cursor. If multiple-row fetch is required, use another technique, such as a LOB locator for retrieving large LOB or XML values.

SQLSTATE

42872

-227	FETCH <i>fetch-orientation</i> IS NOT ALLOWED, BECAUSE CURSOR <i>cursor-name</i> HAS AN UNKNOWN POSITION (<i>sqlcode</i>,<i>sqlstate</i>)
-------------	--

Explanation

The cursor position for *cursor-name* is unknown. The previous multiple-row FETCH for cursor *cursor-name* resulted in an error (SQLCODE *sqlcode*, SQLSTATE *sqlstate*) in the middle of processing multiple rows that were retrieved from Db2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown.

If an indicator structure had been provided on the previous multiple-row FETCH, a positive SQLCODE would have been returned and all of the rows that were retrieved from Db2 could have been returned to the application program.

System action

The statement cannot be processed. The cursor position is not changed.

Programmer response

Close and reopen the cursor to reset the position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations (such as FIRST, LAST, BEFORE, AFTER, or ABSOLUTE) to establish a valid cursor position and fetch a row of data.

SQLSTATE

24513

-228	FOR UPDATE CLAUSE SPECIFIED FOR READ-ONLY CURSOR <i>cursor-name</i>
-------------	--

Explanation

A cursor was declared read-only with the INSENSITIVE SCROLL option, but the SELECT statement contained a FOR UPDATE clause.

cursor-name

Name of the cursor used for the FETCH.

System action

The statement cannot be processed.

Programmer response

To define a scrollable cursor that is read-only, specify INSENSITIVE SCROLL, but do not specify FOR UPDATE clause. To define a scrollable cursor that can be updated, specify SENSITIVE SCROLL. Correct the application program to DECLARE CURSOR appropriately.

SQLSTATE

42620

-229	THE LOCALE <i>locale</i> SPECIFIED IN A SET LC_CTYPE OR OTHER STATEMENT THAT IS LOCALE SENSITIVE WAS NOT FOUND
-------------	---

Explanation

The statement attempted to reference a locale that is not known or not available to Db2. The value of the variable *locale* indicates what locale Db2 is using when it processed the statement. Db2 used the locale that was either specified on the SET CURRENT LOCALE LC_CTYPE statement or the locale that was in effect at the time the locale access was attempted.

System action

The statement cannot be executed.

Programmer response

Depending on whether the locale was explicitly specified in a SET CURRENT LOCALE LC_CTYPE statement or the current locale was used implicitly, complete one of the following actions:

- If the statement was a SET CURRENT LOCALE LC_CTYPE statement, re-specify a locale that is correct (known and available to Db2).
- If the statement was something other than SET CURRENT LOCALE LC_CTYPE, then the statement contained a locale sensitive interface (the UPPER function is an example of a locale sensitive interface).

Issue the following statement to determine the value of the locale in use by your program:

```
SELECT CURRENT LOCALE LC_CTYPE FROM
SYSIBM.SYSDUMMY1.
```

Another possible reason for this message is that Db2 used an incorrect locale default value specified at installation time. Because locales are dynamic, they can be added, created, or deleted at anytime. Db2 does not validate the value of the locale until it is used. Therefore, it is possible to specify a locale that is not valid at installation time.

For information about locales and their naming conventions, see [z/OS XL C/C++ Programming Guide](#).

SQLSTATE

42708

-240 **THE PARTITION CLAUSE OF
A LOCK TABLE STATEMENT IS
INVALID**

Explanation

The LOCK TABLE statement is invalid for one of the following reasons:

- If it is partitioned, specify a PARTITION clause that identifies the partition you want to lock.

System action

The LOCK TABLE statement cannot be executed.

Programmer response

Determine whether the specified table resides in a partitioned table space defined with LOCKPART YES.

- If it is partitioned and defined with LOCKPART YES, specify a PART clause that identifies the partition you want to lock.
- If it is partitioned but does not have the LOCKPART YES attribute and you want to lock a single partition, use ALTER TABLESPACE to change the LOCKPART attribute to YES.
- If it is not partitioned, do not specify the PART clause.

SQLSTATE

428B4

-242 **THE OBJECT NAMED *object-*
name OF TYPE *object-type* WAS
SPECIFIED MORE THAN ONCE
IN THE LIST OF OBJECTS, OR
THE NAME IS THE SAME AS AN
EXISTING OBJECT**

Explanation

In a list of object names of type *object-type*, the object named *object-name* was specified more than once, or is the same as an existing name of that type.

System action

The statement cannot be processed.

User response

Correct the error by removing all of the duplicate occurrences of the object from the list.

SQLSTATE

42713

-243 **SENSITIVE CURSOR *cursor-name*
CANNOT BE DEFINED FOR THE
SPECIFIED SELECT STATEMENT**

Explanation

A clause was not valid for one of the following reasons:

- The cursor, *cursor-name*, is defined as SENSITIVE, but the content of the SELECT statement makes the cursor read-only. In most cases the SELECT statement requires Db2 to build a temporary table or work file with the result table of the cursor, and Db2 cannot guarantee that changes made outside the cursor will be visible. In this case, the cursor must be defined INSENSITIVE or ASENSITIVE.
- The cursor, *cursor-name*, is defined as SENSITIVE DYNAMIC and an OFFSET or FETCH clause was specified for outermost subselect or fullselect.

System action

The statement cannot be processed.

Programmer response

If the cursor is defined as SENSITIVE, but the content of the SELECT statement makes the cursor read-only, either change the content of the query to result in a

result table that is not read-only, or change the type of cursor to be INSENSITIVE or ASENSITIVE.

If the cursor is defined as SENSITIVE DYNAMIC and an OFFSET clause or FETCH clause was specified for outermost subselect or fullselect, either change the cursor sensitivity or change the outermost subselect or fullselect to remove the OFFSET clause or FETCH clause.

-244	SENSITIVITY <i>sensitivity</i> SPECIFIED ON THE FETCH IS NOT VALID FOR CURSOR <i>cursor-name</i>
------	---

Explanation

The sensitivity option specified on FETCH conflicts with the sensitivity option in effect for cursor *cursor-name*. If a cursor is declared INSENSITIVE, the FETCH statement can only specify INSENSITIVE or nothing. If a cursor is declared SENSITIVE, the FETCH statement can specify INSENSITIVE, SENSITIVE, or nothing.

The keyword INSENSITIVE is not allowed with the FETCH statements if the associated cursor is either:

- Declared as SENSITIVE DYNAMIC SCROLL, or
- The cursor is declared ASENSITIVE, and Db2 selected the maximum allowable sensitivity of SENSITIVE DYNAMIC SCROLL for the associated SELECT statement.

In the case of a non-scrollable cursor, the sensitivity option cannot be specified.

sensitivity

Specified sensitivity for the FETCH statement.

cursor-name

Name of the cursor used for the FETCH statement.

System action

The statement cannot be processed.

Programmer response

Change or remove the sensitivity option that is specified on the FETCH.

SQLSTATE

428F4

-245	THE INVOCATION OF FUNCTION <i>routine-name</i> IS AMBIGUOUS
------	--

Explanation

Db2 was not able to resolve the indicated function.

routine-name

The name of the function.

This situation can occur in the following circumstances:

- An untyped parameter marker is passed to a function and there are two or more possible candidate functions to resolve to during function resolution.
- Db2 cannot determine how to implicitly cast the arguments between string and numeric data types.
- Db2 is unable to resolve a function invocation using the promotable process or castable process of function resolution.

System action

The statement cannot be processed.

Programmer response

Correct the problem and reissue the statement. You might need to change the SQL statement, the definition of a function, or the user's SQL path.

SQLSTATE

428F5

Related concepts

[How Db2 resolves functions \(Db2 Application programming and SQL\)](#)

-246	STATEMENT USING CURSOR <i>cursor-name</i> SPECIFIED NUMBER OF ROWS <i>num-rows</i> WHICH IS NOT VALID WITH <i>dimension</i>
------	--

Explanation

A multiple-row FETCH, MERGE, or INSERT statement is not valid in this context. The statement is invalid for one of the following reasons:

- The specified number of rows is not greater than 0 and not less than or equal to 32767.
- The specified number of rows is greater than the dimension of the host-variable array.

- If the statement is a multiple-row FETCH statement that is executed in a distributed environment or is executed on an accelerator, the computed maximum size of the reply data exceeds the Db2 limit. The computed maximum size of the reply data is the product of the number of rows and the maximum size of the data that is returned in a single row of the query.
- If the statement is a multiple-row INSERT statement that is executed on an accelerator, the FOR *n* ROWS clause is not supported unless when the VALUES clause uses a host variable array.

cursor-name

If the SQL statement is a FETCH statement, this value is the name of the cursor that was used for the FETCH statement. If the SQL statement is not a FETCH statement, this value is the string *N. *N indicates that the cursor name is not applicable.

num-rows

The number of rows that were specified.

dimension

If the statement is not a multiple-row FETCH statement that is executed in a distributed environment, and is not a multiple-row FETCH statement that is executed on an accelerator, this value is the dimension of the array.

If the statement is a multiple-row FETCH statement that is executed in a distributed environment, or a multiple-row FETCH statement that is executed on an accelerator, this value is the string *N. *N indicates that the dimension is not applicable.

System action

The statement cannot be processed. The cursor position is unchanged.

Programmer response

Take one of the following actions:

- Change the application to declare or allocate a host-variable array that is large enough to contain the specified number of rows.
- Change the specified number of rows to be in the range 1–32767, inclusive.
- If the statement is a multiple-row FETCH statement that is executed in a distributed environment, or is executed on an accelerator, decrease the specified number of rows.
- If the statement is a multiple-row INSERT statement that is executed on an accelerator, use host variable arrays in the VALUES clause.

SQLSTATE

42873

-247

A HOLE WAS DETECTED ON A MULTIPLE ROW FETCH STATEMENT USING CURSOR *cursor-name*, BUT INDICATOR VARIABLES WERE NOT PROVIDED TO DETECT THE CONDITION

Explanation

A hole was detected on a FETCH statement for multiple rows of data, but no indicator variables were provided to reflect the situation to the application.

System action

The statement cannot be processed.

Programmer response

Change the FETCH statement to provide at least one indicator variable, and resubmit the statement.

SQLSTATE

24519

-248

A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR *cursor-name* SPECIFIED ROW *n* OF A ROWSET, BUT THE ROW IS NOT CONTAINED WITHIN THE CURRENT ROWSET

Explanation

The FOR ROW *n* OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but row *n* is not contained within the bound of the rowset. This situation can also occur when row *n* is within the bounds of the rowset that was requested, but the current rowset contains less than the requested number of rows. In this case, a partial rowset is returned. A partial rowset can occur for various reasons, including an end of data condition or an error that did not result in the closure of the cursor.

System action

The statement cannot be processed.

Programmer response

Reissue the positioned UPDATE or DELETE with a value that corresponds to a row of the current rowset. If the

row that is specified is outside of the current rowset, then do the following:

- Use the FOR *n* ROWS clause on a FETCH CURRENT ROWSET statement to specify that the rowset contains a larger number of rows
- Reissue the positioned UPDATE or DELETE statement.

If this message is issued because a partial rowset was returned,

- Update the application logic to detect that the actual rowset size was less than the rowset size that was requested
- Ensure that a positioned UPDATE or DELETE statement only refers to rows of the current rowset.

SQLSTATE

24521

-249	DEFINITION OF ROWSET ACCESS FOR CURSOR <i>cursor-name</i> IS INCONSISTENT WITH THE FETCH ORIENTATION CLAUSE <i>clause</i> SPECIFIED
-------------	--

Explanation

A *clause* specified for the FETCH statement is inconsistent with the definition of the cursor *cursor-name*. This error can be issued for the following situations:

- A cursor defined WITHOUT ROWSET POSITIONING can only use BEFORE, AFTER, row positioned fetch orientation keywords: NEXT, PRIOR, FIRST, LAST, CURRENT, ABSOLUTE, or RELATIVE.
- A cursor defined WITH ROWSET POSITIONING can use BEFORE, AFTER, rowset positioned fetch orientation clauses: NEXT ROWSET, PRIOR ROWSET, FIRST ROWSET, LAST ROWSET, CURRENT ROWSET, or ROWSET STARTING AT, or, row positioned fetch orientation keywords: NEXT, PRIOR, FIRST, LAST, CURRENT, ABSOLUTE, or RELATIVE.

A FOR *n* ROWS clause was specified on a FETCH statement, but the cursor is not defined for rowset access.

System action

The statement cannot be processed.

Programmer response

Correct the fetch orientation, remove the FOR *n* ROWS clause, or redefine the cursor.

SQLSTATE

24523

-250	THE LOCAL LOCATION NAME IS NOT DEFINED WHEN PROCESSING A THREE-PART OBJECT NAME
-------------	--

Explanation

A three-part object name (table, view, or alias) cannot be used until the local location name is defined.

System action

Install or reinstall the Db2 distributed data facility (DDF) with a registered location name for local Db2.

Programmer response

Define the local location name and then retry the function.

SQLSTATE

42718

-251	TOKEN <i>name</i> IS NOT VALID
-------------	---------------------------------------

Explanation

A location name cannot contain alphabetic extenders. (The standard alphabetic extenders in the United States are #, @, \$.)

System action

The statement cannot be processed.

Programmer response

Correct the name and reissue the statement.

SQLSTATE

42602

-253	A NON-ATOMIC <i>statement</i> STATEMENT SUCCESSFULLY COMPLETED FOR SOME OF THE REQUESTED ROWS, POSSIBLY WITH WARNINGS, AND ONE OR MORE ERRORS
-------------	--

Explanation

A non-atomic *statement* statement successfully processed some of the rows of data that were requested. However, one or more error

conditions occurred, and some warnings might have also occurred. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System action

One or more rows were successfully processed, but one or more errors or warnings also occurred.

Programmer response

Analyze the error and warning conditions to determine if the statement should be rolled back.

SQLSTATE

22529

-254	A NON-ATOMIC <i>statement</i> STATEMENT ATTEMPTED TO PROCESS MULTIPLE ROWS OF DATA, BUT ERRORS OCCURRED
-------------	--

Explanation

A non-atomic *statement* specified that multiple rows of data were to be processed, but errors occurred during the processing of those rows of data. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System action

The statement cannot be processed.

Programmer response

Analyze the error and warning conditions to determine the appropriate corrective actions.

SQLSTATE

22530

-270	FUNCTION NOT SUPPORTED
-------------	-------------------------------

Explanation

The statement cannot be processed because it violates one or more of the following restrictions:

ALTER FUNCTION statement

- An obfuscated function cannot be altered.

ALTER INDEX or CREATE INDEX statements

- A CREATE INDEX or ALTER INDEX statement must not specify PADDED for an XML index or an index on a VARBINARY column.

- A CREATE INDEX or ALTER INDEX statement must not specify a column that is defined as NOT NULL when the index is defined with EXCLUDE NULL KEYS.
- A CREATE INDEX statement must not specify UNIQUE, BUSINESS_TIME WITHOUT OVERLAPS, an XML-index-specification, or a key-expression when the index is defined with EXCLUDE NULL KEYS.
- A CREATE INDEX statement must not specify EXCLUDE NULL KEYS when the index is a partitioning index.
- A CREATE INDEX statement must not specify ASC, DESC, or RANDOM for an XML index.
- A CREATE INDEX statement must not specify DESC or RANDOM if the index is an expression-based index.
- A CREATE INDEX statement must not specify DESC, PADDED, or RANDOM for a Db2 11 Unicode column in an EBCDIC table.
- A CREATE INDEX statement must not specify INCLUDE or CLUSTER for an expression-based index.
- A CREATE INDEX statement must not specify a BINARY or VARBINARY column in a partitioning key.
- A CREATE or ALTER INDEX statement must not specify RANDOM for an index that contains a column that is defined as TIMESTAMP WITH TIME ZONE or DECFLOAT.
- A CREATE INDEX statement must specify DEFER YES for a spatial index.
- A CREATE INDEX statement must not specify the name of a declared global temporary table.
- A column can have one spatial index only.
- When a spatial index is created on a column of BLOB or distinct type on BLOB, the LOB table space that stores the BLOB column must exist.
- A spatial index cannot be altered.
- The internal limit of 30,000 bytes for the versioned object descriptor (OBD) was exceeded. This condition can happen when an ALTER INDEX statement resulted in a new index version.
- A CREATE INDEX DSSIZE and CREATE INDEX PART DSSIZE cannot both be specified in the same statement.

For more information, see the following topics:

- [CREATE INDEX statement \(Db2 SQL\)](#)
- [ALTER INDEX statement \(Db2 SQL\)](#)
- [Unicode columns in EBCDIC tables \(Db2 SQL\)](#)

ALTER PROCEDURE statement

- An obfuscated procedure cannot be altered.

ALTER TABLE or CREATE TABLE statements

- An ALTER TABLE statement must not attempt to alter a VARBINARY column to BINARY if that column is part of a unique index.
 - An ALTER TABLE statement must not specify a materialized query table in an ADD CLONE clause. Alter the materialized query table into a base table before altering the table.
 - An ALTER TABLE or CREATE TABLE statement can only specify the KEY LABEL clause for tables in a universal or partitioned table space.
 - An ALTER TABLE statement with the ALTER COLUMN SET DATA TYPE clause must not specify VARBINARY or BINARY for the new data type when both of the following conditions are true:
 - The column is a partitioning key column.
 - The existing data type is CHAR or VARCHAR FOR BIT DATA.
 - A materialized query table cannot be cloned for ALTER TABLE.
 - The result table of the fullselect in the *as-result-table* clause of a CREATE TABLE statement includes data that is encoded with different CCSID sets. The result table must not use multiple CCSID sets.
 - The internal limit of 30000 bytes for the versioned object descriptor (OBD) was exceeded. This condition can happen when an ALTER table statement results in a new table version or index version, or is executed on a versioned table.
 - INLINE LENGTH is not allowed for the LOB column because the table space is not a universal table space.
 - An ALTER TABLE statement was specified with an ADD PERIOD clause and a column mask or row permission is defined for the table. A period cannot be added to a table for which a column mask or row permission is defined.
 - The table or view that is specified in a LIKE clause must not contain a Db2 11 Unicode column in an EBCDIC table.
 - An ALTER TABLE statement must not specify an ADD PARTITION BY RANGE clause if the table is EBCDIC and it contains a Db2 11 Unicode column.
 - An ALTER TABLE statement must not specify an IMPLICITLY HIDDEN clause in an ADD COLUMN clause for a column that is defined as a ROWID, or a distinct type that is based on a ROWID. [FL 506](#) This restriction is removed in application compatibility level V13R1M506 or higher.
- [FL 506](#) If a table contains a ROWID that was implicitly generated by Db2, an ALTER TABLE statement must not specify IMPLICITLY HIDDEN in the ADD COLUMN clause for a column that is a ROWID or a distinct type based on a ROWID.
 - An ALTER TABLE or CREATE TABLE statement that defines a generated expression column must specify the same data type as the result type of the expression. For a column that is defined as DATA CHANGE OPERATION, CHAR(1) must be specified as the data type.
 - A CREATE TABLE statement must not contain a LIKE clause and an IN ACCELERATOR clause.
 - A CREATE TABLE statement must not contain a LIKE clause that references an accelerator-only table.
 - A CREATE TABLE statement must not contain an AS fullselect clause and an IN ACCELERATOR clause.
 - A CREATE TABLE statement must not contain an AS fullselect clause where the fullselect references an accelerator-only table.
 - A CREATE TABLE statement must not contain a materialized query definition and an IN ACCELERATOR clause.
 - A CREATE or ALTER TABLE statement must not define a Unicode column in an EBCDIC table if the table is an accelerator-only table.
 - CREATE TABLE with PAGENUM RELATIVE or in a table space with PAGENUM RELATIVE must have rows with a minimum data size of 3 bytes.
 - An ALTER TABLE or CREATE TABLE statement must not specify KEY LABEL clause for a table in a multi-table table space. If the table resides in a multiple-table table space, consider using the key label specification at the storage group level.

For more information, see the following topics:

- [CREATE TABLE statement \(Db2 SQL\)](#)
- [ALTER TABLE statement \(Db2 SQL\)](#)
- [Unicode columns in EBCDIC tables \(Db2 SQL\)](#)

ALTER TABLE ALTER COLUMN SET DATATYPE statement

- Altering the data type of a column in a table with PAGENUM RELATIVE is not allowed if it causes the minimum data size of a row to be less than 3 bytes.

ALTER TABLE DROP COLUMN statement

- Dropping a column in a table with PAGENUM RELATIVE is not allowed if it causes the

minimum data size of a row to be less than 3 bytes.

ALTER TABLESPACE statements

- An ALTER TABLESPACE DSSIZE and ALTER TABLESPACE PART DSSIZE cannot both be specified in the same statement.
- An ALTER TABLESPACE PAGENUM RELATIVE is not allowed when the table space has a table in which the minimum data size of the row is less than 3 bytes.

CREATE GLOBAL TEMPORARY TABLE statements

- *table* or *view* that is specified in a LIKE clause must not contain a Db2 11 Unicode column in an EBCDIC table.

For more information, see the following topics:

- [CREATE GLOBAL TEMPORARY TABLE statement \(Db2 SQL\)](#)
- [Unicode columns in EBCDIC tables \(Db2 SQL\)](#)

DECLARE GLOBAL TEMPORARY TABLE statements

- The result table of the fullselect in the *as-result-table* clause of a DECLARE GLOBAL TEMPORARY TABLE statement includes data that is encoded with different CCSID sets. The result table must not use multiple CCSID sets, other than EBCDIC and Unicode.
- A BINARY or VARBINARY column cannot be specified in a partitioning key.
- *table* or *view* that is specified in a LIKE clause must not contain a Db2 11 Unicode column in an EBCDIC table.
- The LIKE clause of a DECLARE GLOBAL TEMPORARY TABLE must not reference an accelerator-only table.

For more information, see [DECLARE GLOBAL TEMPORARY TABLE statement \(Db2 SQL\)](#).

CREATE FUNCTION statements

A CREATE FUNCTION statement must not attempt to define an SQL table function with either of the following items:

- A function body that references a column that is defined with a field procedure
- A RETURNS clause that references a column that is defined with a field procedure.

For more information, see [CREATE FUNCTION statement \(overview\) \(Db2 SQL\)](#).

CREATE MASK statements

A CREATE MASK statement must not define a mask for an accelerator-only table.

For more information, see:

[CREATE MASK statement \(Db2 SQL\)](#)

CREATE PERMISSION statements

A CREATE PERMISSION statement must not define a column permission for an accelerator-only table.

For more information, see [CREATE PERMISSION statement \(Db2 SQL\)](#).

CREATE PROCEDURE statement

A CREATE PROCEDURE statement must not be used to add or replace a version of an obfuscated procedure.

For more information, see [CREATE PROCEDURE statement \(overview\) \(Db2 SQL\)](#).

CREATE VARIABLE statements

A CREATE VARIABLE statement cannot specify a default value of the CURRENT TEMPORAL SYSTEM_TIME or CURRENT TEMPORAL BUSINESS_TIME special registers.

For more information, see [CREATE VARIABLE statement \(Db2 SQL\)](#).

CREATE VIEW or ALTER VIEW REGENERATE statements

All of the views and SQL functions that are referenced in a view definition must have the same rounding mode as the view that is being defined. SQL functions that have undefined rounding mode information are ignored during rounding mode checking.

For more information, see the following topics:

- [CREATE VIEW statement \(Db2 SQL\)](#)
- [ALTER VIEW statement \(Db2 SQL\)](#)

FETCH statements

A FETCH statement cannot include WITH CONTINUE or CURRENT CONTINUE within an SQL routine.

For more information, see [FETCH statement \(Db2 SQL\)](#).

GET DIAGNOSTICS statements

The STACKED keyword cannot be specified for a GET DIAGNOSTICS statement in an external SQL routine. The STACKED keyword is supported only within a native SQL routine.

For more information, see [GET DIAGNOSTICS statement \(Db2 SQL\)](#).

MERGE statements

- A column of the source table is referenced multiple times in a modification operation of the MERGE statement. When extended indicators are in effect, a column of the source table must not be referenced more than one time in a modification operation. A modification

operation is an update operation or an insert operation. Extended indicators are in effect when EXTENDEDINDICATOR(YES) is used, or when the WITH EXTENDED INDICATORS prepare attribute is specified for the MERGE statement.

- The *search-condition* of the ON clause of a MERGE statement must not include an IN predicate that includes a fullselect, or a quantified predicate that includes a fullselect.
- The *matching-condition* of the WHEN MATCHED or WHEN NOT MATCHED clause of a MERGE statement must not include an IN predicate that includes a fullselect, or a quantified predicate that includes a fullselect.
- A MERGE statement that contains a delete operation cannot be used as a *data-change-table-reference* in the FROM clause of the outer SELECT clause of a fullselect.

For more information, see [MERGE statement \(Db2 SQL\)](#).

TRIGGER statements

- A CREATE TRIGGER statement must not specify a view that has any of the following types of columns:
 - ROWID columns
 - LOB columns
 - XML columns
 - Defined (directly or indirectly) as identity columns
 - Security label columns
 - Row change timestamp columns
 - Row-begin columns
 - Row-end columns
 - Transaction-start-ID columns
 - Expressions
 - Columns of result tables that involve set operators
- A CREATE TRIGGER or ALTER TRIGGER statement must not reference an accelerator-only table in the body of the trigger.
- A CREATE TRIGGER statement with INSTEAD OF clause specified must not reference a view that references an accelerator-only table in the body of the trigger.
- The transition variable that is specified does not support XML.
- A CREATE TABLE statement in the body of a trigger must not define a column as a LOB or XML.

- The statement string for a PREPARE statement must not be an ALLOCATE CURSOR statement if the PREPARE statement is issued in the body of a trigger.
- An ALTER TRIGGER (basic) statement must not specify an option other than SECURED or NOT SECURED.
- An ALTER TRIGGER (advanced) statement can only be dynamically prepared.
- A CREATE TRIGGER (advanced) or ALTER TRIGGER (advanced) statement cannot be processed as a static statement.
- An obfuscated trigger cannot be altered.

For more information, see [CREATE TRIGGER statement \(basic trigger\) \(Db2 SQL\)](#).

UPDATE statements:

Some UPDATE statements that modify data in a column for which a BEFORE UPDATE trigger is defined might result in this code in certain circumstances.

- If a BEFORE UPDATE TRIGGER statement contains a SET clause for one or more columns that participate in the access path index, execution of the BEFORE UPDATE TRIGGER statement might cause the row to qualify again. This situation occurs when all of the following conditions are met:
 - Db2 is using an index access path to locate rows that qualify for update.
 - A BEFORE TRIGGER exists on the table to which the rows belong.
 - The BEFORE TRIGGER updates the values of one or more columns that participate in the access path index.

This situation can happen with both searched updates and positioned updates (updates that use the statement UPDATE WHERE CURRENT OF CURSOR). This code is issued for statements that are susceptible to this problem, even if the data involved in the update would not cause requalification. See "Programmer response" for information about handling requalification errors.

Other restrictions for SQL statements:

- Views and SQL functions that are referenced in an SQL statement must have the same rounding mode as the SQL statement. Views and SQL functions that have undefined rounding mode information are ignored during rounding mode checking.
- In a subselect, the select list cannot contain an XML column if OLD TABLE is specified.

- The RID built-in function and ROW CHANGE TOKEN expression must not be specified in a subselect when that subselect directly includes one of the following operators:
 - LEFT OUTER JOIN
 - RIGHT OUTER JOIN
 - FULL OUTER JOIN
- The ROW CHANGE TIMESTAMP expression can be specified only in a subselect when the following conditions are true:
 - That subselect directly includes a LEFT OUTER JOIN, RIGHT OUTER JOIN, or FULL OUTER JOIN operator.
 - The table designator identifies a base table that contains a row change timestamp column.
- An SQL table function must not be invoked with an expression that is derived from a column that is defined with a field procedure.
- An input argument for an SQL table function must not contain a scalar fullselect, a function, or a column reference, either directly or as part of an expression.
- No combination of ARRAY_AGG, LISTAGG or XMLAGG can be specified together in the same statement.
- The SQL statement includes a use of UNNEST, and an argument to the UNNEST operator is an array function invocation that includes a reference to a column. An argument of an array function invocation must not include a reference to a column of a common table expression.
- A query or a SELECT INTO, INSERT, UPDATE, DELETE, or MERGE statement must not reference tables or views that include both inclusive-exclusive BUSINESS_TIME periods and inclusive-inclusive BUSINESS_TIME periods.
- In a DELETE or UPDATE statement, a FROM *expression1* TO *expression2* clause must not be specified for an inclusive-inclusive period.
- In a DELETE or UPDATE statement, a BETWEEN *expression1* AND *expression2* clause must not be specified for an inclusive-exclusive period.

BIND PACKAGE command

A BIND PACKAGE command with the DEPLOY option must not be specified for the following situations:

- A package for a routine that is obfuscated.
- A package for a version of a procedure for which the CREATE PROCEDURE statement contains an OR REPLACE or SPECIFIC clause.

For more information, see [BIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#).

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and resubmit the statement. For the following errors, take the specified actions.

Errors that are caused by an XML data type

If this error is caused by an XML data type, input the XML data to one of the functions that accept XML input. Store the output of the function in the database, or return it to the application.

Errors that are caused by the rounding mode

If this error is caused by different rounding modes, take one of the following actions:

If a view or SQL function has a different rounding mode than the referencing SQL statement:

Change the SQL statement or change the rounding mode in effect to make sure all the views or SQL functions that are referenced have the same rounding mode as the SQL statement. A new view, SQL function, or both might be needed to match the rounding mode of the SQL statement.

If a view or SQL function has a different rounding mode than the referencing view during execution of CREATE VIEW:

Change the view definition or change the rounding mode in effect to make sure all the views or SQL functions that are referenced have the same rounding mode as the referencing view. A new view, SQL function, or both might be needed to match the rounding mode of the referencing view.

If a view or SQL function has a different rounding mode than the referencing view during execution of ALTER VIEW REGENERATE:

Change the rounding mode in effect to make sure all the views or SQL functions that are referenced have the same rounding mode as the referencing view. The view for ALTER VIEW REGENERATE might always fail. In this case, drop and re-create the view with a different view definition that references a new view or SQL function.

Errors that are caused by the requalification of data

If the problem is caused by requalification of data that was set by a BEFORE UPDATE TRIGGER statement, take one of the following actions:

- Ensure that the columns that are modified by the trigger are also modified by the UPDATE statement itself. Modify the UPDATE statement to include a dummy clause of the type *column-name=column-name* for each column that the BEFORE UPDATE TRIGGER modifies.
- Rebind with hints to cause the RIDLIST access path to use the same index.

Errors that are caused by size of the OBDREC

If the size of the OBDREC exceeds 30,000 bytes, you might be able to reclaim some space in the OBD by reducing the size of the default value for varying-length columns, if any exist.

SQLSTATE

42997

-300	THE STRING CONTAINED IN HOST VARIABLE OR PARAMETER <i>position-number</i> IS NOT NUL-TERMINATED
-------------	--

Explanation

A host variable or parameter is invalid. Its entry in the SQLDA is indicated by *position-number*. The host variable or parameter is a C string variable that is one of the following:

- Used as an input parameter to a stored procedure or function.
- Returned as an output parameter from a stored procedure or function.
- Referenced as an input variable in an embedded SQL statement.
- Used to provide a value for a parameter marker of a dynamic SQL statement.

If the data type of the variable is character string, it is invalid because it does not include X'00'. If the data type of the variable is graphic string, it is invalid because it does not include X'0000'.

System action

The statement cannot be processed.

Programmer response

Append a NUL-terminator to the end of the string.

SQLSTATE

22024

-301	THE VALUE OF INPUT VARIABLE OR ARGUMENT NUMBER <i>position-</i>
-------------	--

***number* CANNOT BE USED AS SPECIFIED BECAUSE OF ITS DATA TYPE**

Explanation

Db2 received data that could not be used as specified in the statement because its data type is incompatible with the requested operation.

The *position-number* identifies either the variable number (if the message is issued as a result of an INSERT, UPDATE, MERGE, DELETE, SELECT, VALUES INTO, or SET assignment statement), or the argument number (if the message is issued as the result of a CALL statement, or the invocation of a function).

For a statement other than CALL, an ordinary array cannot be specified for a target that is defined as an associative array in the specified context. See [CALL statement \(Db2 SQL\)](#) for the exceptions for a CALL statement.

System action

The statement cannot be processed.

Programmer response

Correct the application program, function or stored procedure. Ensure that the data type of the indicated input variable or argument in the statement is compatible with the way it is used.

SQLSTATE

42895

-302	THE VALUE OF INPUT VARIABLE OR PARAMETER NUMBER <i>position-number</i> IS INVALID OR TOO LARGE FOR THE TARGET COLUMN OR THE TARGET VALUE
-------------	---

Explanation

Db2 received data that was invalid or too large to fit in the corresponding column of the table or the corresponding target value. The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, MERGE, DELETE, SELECT, VALUES INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of a CALL statement or the invocation of a function).

One of the following occurred:

- The column is defined as a string and the host variable or parameter contains a string that is too long for the column.
- The column is defined as numeric and the host variable or parameter contains a numeric value too large for the definition of the column.
- The host variable is defined as decimal, but contains invalid decimal data.
- The target value is a string constant and the host variable or parameter contains a string that is too long for the target value.
- The target value is a numeric constant and the host variable or parameter contains a numeric value that is too large for the target value.

System action

The statement cannot be processed.

Programmer response

Correct the application program, function or stored procedure. Check the column type and length of the value or the data type and contents of the input host variable or parameter *position-number*. Ensure that the value of the host variable or parameter will fit in the column or contains valid decimal data. Valid decimal data is a System/370 packed decimal number.

SQLSTATE

22003 if *number too large for target*; 22001 otherwise.

-303	A VALUE CANNOT BE ASSIGNED TO VARIABLE NUMBER <i>position-number</i> BECAUSE THE DATA TYPES ARE NOT COMPATIBLE
------	--

Explanation

A CALL, FETCH, SELECT, VALUES INTO, or SET *assignment-statement* statement with an output variable could not be performed because the data type of a variable was not compatible with the data type of the source value in the statement. For more information, see [Assignment and comparison \(Db2 SQL\)](#).

position-number

Location of the variable in the statement.

The values of the target variable and the corresponding source value must be in one of the following categories:

- One value is numeric and one of the following conditions is true:
 - The other value is also numeric.

- The other value is a character string.
- The other value is a graphic string and uses Unicode.
- The statement has a subtype of FOR BIT DATA.
- Both must be character strings, unless you are using Unicode.
- Both must be graphic strings, unless you are using Unicode.
- Both must be row IDs.
- Both must be binary strings, or one can be BINARY or VARBINARY, and the other can be FOR BIT DATA.
- A variable is XML or binary XML and the corresponding statement list element is XML.

In addition:

- For datetime or timestamp values, the target host variable must be a character string variable with the correct length.
- For array values, see [Assignment and comparison \(Db2 SQL\)](#).

System action

The statement was not executed. No data is retrieved.

Programmer response

Verify that table definitions are current, and that the target variable has the correct data type.

SQLSTATE

42806

-304	A VALUE WITH DATA TYPE <i>data-type1</i> CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION <i>position-number</i> WITH DATA TYPE <i>data-type2</i>
------	---

Explanation

A CALL, FETCH, SELECT, VALUES INTO, or SET *assignment statement* with a host variable list or structure in position number *position-number* failed because the host variable with data type *data-type2* was not large enough to hold the retrieved value with data type *data-type1*.

System action

The statement cannot be processed. No data was retrieved. If the statement was a FETCH, the cursor remains open.

Programmer response

Verify that table definitions are current, and that the host variable has the correct data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

SQLSTATE

22003

-305	THE NULL VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER <i>position-number</i> BECAUSE NO INDICATOR VARIABLE IS SPECIFIED
-------------	---

Explanation

A FETCH, SELECT, VALUES INTO, or SET assignment statement resulted in the retrieval of a null value to be inserted into the output host variable, designated by entry number 'position-number' of the output SQLDA, for which no indicator variable was provided. An indicator variable must be supplied if a column returns a null value.

System action

The statement cannot be processed. No data was retrieved.

Programmer response

Examine the definition of the table that is the object of the statement and correct the application program to provide indicator variables for all host variables into which null values can be retrieved. This includes host variables for columns which can contain null values and host variables which receive the results of aggregate functions whose result table could be empty.

SQLSTATE

22002

-309	A PREDICATE IS INVALID BECAUSE A REFERENCED HOST VARIABLE HAS THE NULL VALUE
-------------	---

Explanation

The statement could not be processed because a host variable appearing in a predicate such as

```
column-name = host-variable
```

had the NULL value. Such a predicate is not permitted when the host variable contains the NULL value even though the object column might contain nulls.

System action

The statement cannot be processed.

Programmer response

Rebind the plan or package containing the statement. The condition described is not an error in Version 2 Release 3 and later Db2 releases.

SQLSTATE

22512

-310	DECIMAL HOST VARIABLE OR PARAMETER <i>number</i> CONTAINS NON-DECIMAL DATA
-------------	---

Explanation

Db2 received nondecimal data from either an application (in the form of a host variable), function or a stored procedure (in the form of a parameter that was passed to or from function or a stored procedure).

number

Identifies either the host variable number (if the message is issued as a result of a FETCH, INSERT, UPDATE, MERGE, DELETE, SELECT, VALUES INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of the invocation of a function, or a CALL statement).

System action

The statement cannot be processed.

Programmer response

Correct the application program or stored procedure. Ensure that all decimal variables or parameters contain valid System/370 packed decimal numbers.

SQLSTATE

22023

-311	THE LENGTH OF INPUT HOST VARIABLE NUMBER <i>position-number</i> IS NEGATIVE OR GREATER THAN THE MAXIMUM
-------------	--

Explanation

When evaluated, the length specification for input host string variable, whose entry in the SQLDA is indicated by position-number, was negative or greater than the maximum.

System action

The statement cannot be processed.

Programmer response

Correct the program to ensure that the lengths of all host string variables are not negative or that they are not greater than the maximum allowed length.

SQLSTATE

22501

-312 **VARIABLE *variable-name* IS NOT DEFINED OR NOT USABLE**

Explanation

A variable is referenced in the SQL statement, but it either is not defined or cannot be used.

variable-name
The name of the variable that is referenced in the statement.

The following list identifies examples of conditions that result in this SQLCODE:

- The variable is not declared.
- The attributes of the variable are inconsistent with its usage in the SQL statement.
- The host variable was specified in a dynamic SQL statement. Host variables are not valid in dynamic SQL statements.
- The variable is a host-variable array that was referenced in an unsupported context. For more information, see [Host-variable arrays \(Db2 SQL\)](#).
- The variable appeared in one of the triggered SQL statements in a CREATE TRIGGER statement. An OLD transition variable cannot be modified in a trigger body.
- The variable name is used in the body of an SQL procedure, SQL function, or trigger, but the variable is not declared as an SQL variable or parameter. The scope of an SQL variable is the compound statement that contains the declaration, including any compound statements that are nested within that compound statement.
- The variable appeared in one of the key-expressions of an index definition.

- An array variable is used in a context in which it is unsupported. An array variable, other than a global variable, is not allowed in a CREATE VIEW statement.
- A host variable is declared in PL/I with the attributes BINARY, FIXED and UNSIGNED.

System action

The statement cannot be processed.

Programmer response

Do one of the following solutions and try the request again:

- Verify that the program or SQL routine contains a declaration for the variable. Verify that the variable name in the SQL statement is spelled correctly.
- Verify that the attributes of the variable are compatible with its use in the statement.
- Use parameter markers in a dynamic SQL statement instead of host variables.
- Specify a NEW transition variable when the variable is modified in a trigger.
- Declare the variable as an SQL variable or parameter in the SQL routine.
- Check the definition of the index and remove any host variables that are specified.
- Remove array variables, other than global variables, from the statement.
- BINARY FIXED UNSIGNED variables cannot be used as host variables in PL/I. Instead, use a BINARY FIXED SIGNED variable with enough precision to represent the range of values needed.

SQLSTATE

42618

Related concepts
[Host-variable arrays \(Db2 SQL\)](#)

-313 **THE NUMBER OF HOST VARIABLES SPECIFIED IS NOT EQUAL TO THE NUMBER OF PARAMETER MARKERS**

Explanation

The number of host variables specified in the EXECUTE or OPEN statement is not the same as the number of parameter markers (question marks) appearing in the prepared SQL statement.

System action

The statement cannot be processed.

Programmer response

Correct the application program so that the number of host variables specified in the EXECUTE or OPEN statement is the same as the number of parameter markers appearing in the prepared SQL statement. The DESCRIBE INPUT SQL statement can be used to determine the expected number of input parameter markers.

SQLSTATE

07001

-314	THE STATEMENT CONTAINS AN AMBIGUOUS HOST VARIABLE REFERENCE
-------------	--

Explanation

A host variable used in the statement has been defined more than once in this application program causing confusion as to which host variable defined should be used.

System action

The statement cannot be processed.

Programmer response

Make the host variable unique or use qualifications to indicate which host variable definition is to be used.

SQLSTATE

42714

-327	THE ROW CANNOT BE INSERTED BECAUSE IT IS OUTSIDE THE BOUND OF THE PARTITION RANGE FOR THE LAST PARTITION
-------------	---

Explanation

When a row is inserted, the calculated partition key value for the new row must be within the bounds of a partition.

System action

The statement cannot be processed.

Programmer response

Correct the statement to specify a value for the partition key that is within the bounds of the last partition of the partitioned table space.

SQLSTATE

22525

-330	A STRING CANNOT BE USED BECAUSE IT CANNOT BE PROCESSED. REASON <i>reason-code</i>, CHARACTER <i>code-point</i>, HOST VARIABLE <i>position-number</i>
-------------	---

Explanation

AN error occurred during the processing of a string, or in the conversion of a string. The type of error is indicated by the *reason-code*:

8

Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).

12

Invalid code point (for example, use of the ERRORBYTE option of SYSSTRINGS).

16

Form exception (for example, invalid MIXED data).

20

Conversion procedure error (for example, an exit set the length control field of the string to an invalid value).

24

SBCS character found in string contained in a wchar_t or sqlbchar host variable.

If the *reason-code* is 12, *code-point* is the invalid code point. Otherwise, *code-point* is either blank or an additional *reason-code* returned by an exit.

If the string is the value of an input host variable, the *position-number* is the ordinality of the variable in the SQLDA. If the string is not the value of a host variable, the *position-number* is blank.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions based on the *reason-code*:

- 8** Extend the maximum length of the host variable to allow for the expansion that occurs when the string is converted.
- 12** Change the convert table to accept the *code-point* or the data to eliminate the *code-point*.
- 16** If the string is described as MIXED data, change its description or change the string to conform to the rules for well-formed mixed data.
- 20** Correct the conversion procedure.
- 24** Delete the SBCS character from the graphic string.

SQLSTATE

22021

-331 CHARACTER CONVERSION CANNOT BE PERFORMED BECAUSE A STRING, POSITION *position-number*, CANNOT BE CONVERTED FROM *source-ccsid* TO *target-ccsid*, REASON *reason-code*

Explanation

The operation required the conversion from *source-ccsid* to *target-ccsid* and a conversion error occurred. The type of error is indicated by the *reason-code*:

- 8 for length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 for invalid *code-point* (for example, use of the ERRORBYTE option of SYSSTRINGS).
- 16 for form exception (for example, invalid MIXED data).
- 20 for conversion procedure error (for example, an exit set the length control field of the string to an invalid value). You can find the procedure name in SYSIBM.SYSSTRINGS row with INCCSID=*source-ccsid* and OUTCCSID=*target-ccsid* in the TRANSPROC column.

The *position-number*, if provided (non-zero), is the ordinality of the output variable in the SQLDA.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions based on the *reason-code*:

- 8** Extend the maximum length of the result column to allow for the expansion that occurs when the string is converted.
- 12** Change the conversion table to accept the *code-point*, or change the data to eliminate the *code-point*.
- 16** If the string is described as MIXED data, change its description or change the string to conform to the rules for well-formed MIXED data.
- 20** Correct the conversion procedure.

An alternative to these corrective actions is to provide an indicator variable so that a null value and a warning can be returned rather than an error.

SQLSTATE

22021

Related concepts

[Coded character sets and CCSIDS \(Introduction to Db2 for z/OS\)](#)

-332 CHARACTER CONVERSION BETWEEN CCSID *from-ccsid* TO *to-ccsid* REQUESTED BY *reason-code* IS NOT SUPPORTED

Explanation

The operation required a conversion between two different CCSIDs. No conversion support was found.

from-ccsid

Identifies the coded character set of the string to be converted.

to-ccsid

Identifies the coded character set to which it must be converted.

reason-code

Describes the reason codes returned from Db2. Reason codes returned from Db2 begin with 'DSN' and identify the context in which the conversion was requested. Values other than those that start with 'DSN' are returned from other Db2 platforms and are described in the documentation for the platform.

System action

The statement cannot be processed.

Programmer response

If the conversion request is correct, see the information about how to add conversion support.

SQLSTATE

57017

-336

**THE SCALE OF THE DECIMAL
NUMBER MUST BE ZERO**

Explanation

The decimal number is used in a context where the scale must be zero. This can occur when a decimal number is specified in a CREATE or ALTER SEQUENCE statement for START WITH, INCREMENT BY, MINVALUE, MAXVALUE, or RESTART WITH.

Programmer response

Change the decimal number so that there are no non-zero digits to the right of the decimal point.

SQLSTATE

428FA

-338

AN ON CLAUSE IS INVALID

Explanation

A statement contains an invalid ON clause. Conditions that can cause this error include, but are not limited to, violations of the following requirements:

- For a full join, each expression of the predicate must reference only columns in its own operand tables.
- For a full join, a Db2 11 Unicode column in an EBCDIC table must not be referenced in the join condition.
- Only VALUE and COALESCE functions are allowed in the ON clause for full outer joins and full joins.
- Full outer joins and full joins permit only the = operator.
- The ON clause cannot contain a subquery.
- The ON clause cannot contain an XMLEXISTS predicate.
- The *search-condition* of the ON clause of a MERGE statement cannot contain non-deterministic scalar functions.
- A subquery is not allowed in the *search-condition* of the ON clause of a MERGE statement.

Explanation

The CCSID in the run time SQLDA is inconsistent with the bind time subtype of the host variable or parameter marker. Either the run time description is BIT and the bind time description was not BIT, or the run time description is not BIT and the bind time description was BIT.

System action

The statement cannot be processed.

Programmer response

Change the CCSID in the SQLDA so that the subtype of the host variable is consistent with the bind time subtype of the host variable or parameter marker. If the input data in error is a parameter marker, you can use the DESCRIBE INPUT SQL statement to determine the expected SQLTYPE, SQLLEN and CCSID expected.

SQLSTATE

56010

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and reissue the statement.

SQLSTATE

42972

-340	THE COMMON TABLE EXPRESSION <i>name</i> HAS THE SAME IDENTIFIER AS ANOTHER OCCURRENCE OF A COMMON TABLE EXPRESSION DEFINITION WITHIN THE SAME STATEMENT
-------------	--

Explanation

The common table expression name *name* is used in the definition of more than one common table expressions in the statement. The name used to describe a common table expression must be unique within the same statement.

System action

The statement cannot be processed.

Programmer response

Correct the error by changing the name of one of the common table expressions.

SQLSTATE

42726

-341	A CYCLIC REFERENCE EXISTS BETWEEN THE COMMON TABLE EXPRESSIONS <i>name1</i> AND <i>name2</i>
-------------	---

Explanation

The common table expression *name1* refers to *name2* in a FROM clause within its fullselect and *name2* refers to *name1* in a FROM clause within its fullselects. Such forms of cyclic references are not allowed.

System action

The statement cannot be processed.

Programmer response

Remove the cyclic reference from one of the common table expressions.

SQLSTATE

42835

-342	THE COMMON TABLE EXPRESSION <i>name</i> MUST NOT USE SELECT DISTINCT AND MUST USE UNION ALL BECAUSE IT IS RECURSIVE
-------------	--

Explanation

There are two possible explanations:

- A fullselect within the common table expression *name* cannot start with SELECT DISTINCT because the common table expression is recursive.
- A fullselect within the common table expression *name* specified UNION instead of UNION ALL as required for recursive common table expressions.

System action

The statement cannot be processed.

Programmer response

Remove the keyword DISTINCT from the common table expression, add the keyword ALL following UNION, or remove the recursive reference within the common table expression.

SQLSTATE

42925

-343	THE COLUMN NAMES ARE REQUIRED FOR THE RECURSIVE COMMON TABLE EXPRESSION <i>name</i>
-------------	--

Explanation

The recursive common table expression name *name* must include the specification of the column names following the identifier of the common table expression.

System action

The statement cannot be processed.

Programmer response

Add column names following the identifier of the common table expressions.

SQLSTATE

42908

-344	THE RECURSIVE COMMON TABLE EXPRESSION <i>name</i> HAS MISMATCHED DATA TYPES OR LENGTHS OR CODE PAGE FOR COLUMN <i>column-name</i>
-------------	--

Explanation

The recursive common table expression name *name* has a column *column-name* that is referred to in the iterative fullselect of the common table expression. The data type and length are set based on the initialization fullselect for this column. The result of the expression for the column *column-name* in the iterative fullselect has a different data type or length that may result in failure to assign the value for the column.

System action

The statement cannot be processed.

Programmer response

Correct the column used in the fullselects of the recursive common table expression so that the initialization column matches the iterative columns.

SQLSTATE

42825

-345	THE FULLSELECT OF THE RECURSIVE COMMON TABLE EXPRESSION <i>name</i> MUST BE A UNION ALL AND MUST NOT INCLUDE AGGREGATE FUNCTIONS, GROUP BY, HAVING, ORDER BY, OFFSET, FETCH FIRST, OR AN EXPLICIT JOIN INCLUDING AN ON CLAUSE
-------------	--

Explanation

The common table expression *name* includes a reference to itself and therefore:

- must be the union of two or more fullselects.
- cannot have aggregate functions.
- cannot include a GROUP BY clause.

- cannot include a HAVING clause.
- cannot include an ORDER BY clause.
- cannot include an OFFSET clause.
- cannot include a FETCH FIRST clause.
- cannot include an explicit join with an ON clause.

System action

The statement cannot be processed.

Programmer response

Change the common table expression by:

- making it a union of two or more fullselects.
- removing any aggregate functions, GROUP BY clause, HAVING clause, ORDER BY clause, OFFSET clause, FETCH FIRST clause, or explicit JOIN including an ON clause.
- removing the recursive reference.

SQLSTATE

42836

[Queries \(Db2 SQL\)](#)

-346	AN INVALID REFERENCE TO COMMON TABLE EXPRESSION <i>name</i> OCCURS IN THE FIRST FULLSELECT, AS A SECOND OCCURRENCE IN THE SAME FROM CLAUSE, OR IN THE FROM CLAUSE OF A SUBQUERY
-------------	--

Explanation

The common table expression *name* includes an invalid reference to itself as described by one of the following:

- A recursive reference in the first fullselect before the UNION ALL set operator. The first fullselect must be an initialization and cannot include a recursive reference.
- More than one reference to the same common table expression in the same FROM clause. Such references are not permitted in recursive common table expression.
- A recursive reference in the FROM clause of a subquery. A recursion cycle cannot be defined using a subquery.

System action

The statement cannot be processed.

Programmer response

Change one of the following:

- the fullselect prior to the union operator so that it does not include a recursive reference.
- the FROM clause containing more than one reference to the same common table expression to just one reference .
- the FROM clause of the subquery so that it does not reference the common table expression.

SQLSTATE

42836

-348 ***sequence-expression CANNOT BE SPECIFIED IN THIS CONTEXT***

Explanation

The statement contains a NEXT VALUE expression or PREVIOUS VALUE expression in an invalid context.

The NEXT VALUE expression or PREVIOUS VALUE expression cannot be specified in the following contexts:

- Join condition of a full outer join
- DEFAULT value for a column in a CREATE TABLE or ALTER TABLE statement
- Column definition that is generated in a CREATE TABLE or ALTER TABLE statement
- Materialized query table definition in a CREATE TABLE or ALTER TABLE statement
- An *as-result-table* clause of a CREATE TABLE or DECLARED GLOBAL TEMPORARY TABLE statement.
- Condition of a CHECK constraint
- Input value-specification for LOAD
- CREATE VIEW statement
- Key-expression of an index definition.
- The SELECT list of a subselect that contains a NOT ATOMIC data change statement.
- An expression that generates the value of an index for an array.

The NEXT VALUE expressions cannot be specified in the following contexts:

- CASE expression
- Parameter list of an aggregate function
- Subquery in a context in which it is not otherwise allowed
- SELECT statement for which the outer SELECT contains a DISTINCT operator or a GROUP BY clause

- SELECT statement for which the outer SELECT is combined with another SELECT statement using a set operator such as UNION, EXCEPT, or INTERSECT
- Join condition of a join
- Nested table expression
- Parameter list of a table function
- SELECT clause of the fullselect of an expression in the SET clause of an UPDATE statement
- ORDER BY clause in the SELECT statement
- ORDER BY clause in an OLAP specification
- IF, WHILE, DO ... UNTIL, or CASE statement in an SQL routine
- Key-expression of an index definition.
- The select list of a subselect that contains a NOT ATOMIC data change statement.
- The select list of a fullselect that contains an OFFSET clause.

System action

The statement cannot be processed.

Programmer response

Remove the reference to the sequence expression and resubmit the statement.

SQLSTATE

428F9

Related reference

[Sequence reference \(Db2 SQL\)](#)

-350 ***column-name WAS IMPLICITLY OR EXPLICITLY REFERENCED IN A CONTEXT IN WHICH IT CANNOT BE USED***

Explanation

The SQL statement cannot be processed because it references a column in an invalid context.

column-name

The name of the column.

Possible reasons for this error include:

DECFLOAT columns

A DECFLOAT column cannot be:

- Specified as a column of a foreign key in a *referential-constraint* clause.
- Specified as a column of a parent key in a REFERENCES clause.

- Specified as a column of a partitioning key for range partitioning.
- Defined in a table that has an EDITPROC.
- The result data type of a key expression in an expression-based index must not be DECFLOAT or a distinct type based on the DECFLOAT data type. An intermediate result, of a key expression for an index can be the DECFLOAT data type or a distinct type based on the DECFLOAT data type.
- Specified as a column in a CREATE TABLE ORGANIZE BY HASH or ALTER TABLE ADD ORGANIZE BY HASH statement.

LOB columns

A LOB column cannot be:

- Defined in a temporary table (created global temporary table or declared global temporary table).
- Defined in an accelerator-only table.
- Defined in a table that has an edit procedure that is defined with row attribute sensitivity.
- Specified as a column of the primary key in a PRIMARY KEY clause.
- Specified as a column of a UNIQUE KEY.
- Specified as a column of a parent key in a REFERENCES clause.
- Specified as a column of an index key. Additionally, the result data type, including the intermediate result, of a *key-expression* for an index cannot be a LOB data type or a distinct type based on a LOB data type. However, an inline LOB column is allowed in *index-expression* as the source of a SUBSTR function expression or as the first argument of the JSON_VAL function, and the LOB data type is allowed as the intermediate result of the expression.
- Referenced in the first argument of the JSON_VAL function invocation in the *index-expression* of a CREATE INDEX statement, unless the column is defined as an inline LOB.
- Specified as a column of a partitioning key for range partitioning.
- Referenced by the definition of a column mask or a row permission.
- Defined as a column mask.
- Referenced in a period specification or period clause.
- Specified as a column in a CREATE TABLE ORGANIZE BY HASH or ALTER TABLE ADD ORGANIZE BY HASH statement.
- FL 506 Specified in the select list or predicates for a SELECT statement with FROM FINAL TABLE

that uses an INSERT statement that specifies multiple rows, if it is an inline LOB column.

Hidden columns

A hidden column cannot be specified in a key expression for an index.

Result table columns

- A ROWID, LOB, or XML data type cannot be the data type of a column in the result table of an *as-result-table* clause of a CREATE TABLE or DECLARE GLOBAL TEMPORARY TABLE statement.
- A security label column *column-name* exists in the result table of the *as-result-table* clause; however, it is not the only security label column in that result table. A table can be defined only with a single security label column.

Security label columns

A security label column cannot be:

- Specified as a column of a foreign key in a *referential-constraint* clause.
- Specified in a REFERENCES clause.
- Specified in a key expression for an index.

Timestamp with time zone columns

A timestamp with time zone column cannot be specified as a column of a partitioning key for range partitioning.

A Db2 11 Unicode column in an EBCDIC table

A Db2 11 Unicode column in an EBCDIC table cannot be specified in the following:

- An ALTER TABLE statement in an ADD COLUMN clause if the table is already defined with an EDITPROC.
- In a UNIQUE, PRIMARY KEY, REFERENCES, FOREIGN KEY, or ORGANIZE BY HASH clause.

This error can also be issued for the following:

- An EDITPROC clause cannot be specified if the table contains a Db2 11 Unicode column in an EBCDIC table.
- A value must not be specified after the DEFAULT keyword for a Db2 11 Unicode column in an EBCDIC table.
- NOT PADDED must not be specified for an index for an EBCDIC table if the table contains a Db2 11 Unicode column.
- A UNIQUE or PRIMARY KEY clause must not be specified for a Db2 11 Unicode column in an EBCDIC table.

VARBINARY columns

A VARBINARY column can not be specified as a column of an index key when DESC is also specified.

XML columns

An XML column cannot be:

- Specified as a column of the primary key in a PRIMARY KEY clause.
- Specified as a column of a UNIQUE KEY.
- Specified as a column of a foreign key in a *referential-constraint* clause.
- Specified as a column of a parent key in a REFERENCES clause.
- Specified as a column of a partitioning key for range partitioning.
- Defined in a temporary table (created global temporary table or declared global temporary table).
- Defined in a table that has an edit procedure that is defined with row attribute sensitivity.
- Specified as a column of an index key. Additionally, the result data type, including the intermediate result, of a key expression for an index cannot be an XML data type. For an XML index, only XML columns can be specified, and the result type of the index key can be DECFLOAT.
- Specified with the SET DEFAULT or DROP DEFAULT clause.
- Referenced by the definition of a column mask or a row permission.
- Defined as a column mask.
- Specified as a column in a CREATE TABLE ORGANIZE BY HASH or ALTER TABLE ADD ORGANIZE BY HASH statement.
- Specified in an ALTER TABLE statement in a DROP COLUMN clause.

DOCID columns

A DOCID column cannot be specified in the following:

- An ALTER TABLE statement in an ALTER COLUMN clause.
- An ALTER TABLE statement in a DROP COLUMN clause.

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and resubmit the statement.

SQLSTATE

42962

-351

**AN UNSUPPORTED SQLTYPE WAS
ENCOUNTERED IN POSITION
position-number OF THE SELECT-
LIST**

Explanation

position-number

The position of the first element in the SQLDA with an unsupported data type.

This error can occur when an application requester or application server does not have support for this type.

System action

The statement cannot be processed.

Programmer response

Change the statement to exclude the unsupported data type. For a select statement, remove the names of any columns in the select-list with the unsupported data types.

SQLSTATE

56084

-352

**AN UNSUPPORTED SQLTYPE WAS
ENCOUNTERED IN POSITION
position-number OF THE INPUT-
LIST**

Explanation

The input SQLDA for an OPEN, EXECUTE, FETCH, or CALL statement contains an unsupported SQLTYPE for a parameter.

position-number

The position of the first element in the SQLDA with an unsupported data type.

For an array type, this value is the position number of the first element in the SQLDA with an unsupported data type for the elements of the array.

Either the application requester or the application server does not have support for this data type. This error can occur only in a client/server environment.

System action

The statement cannot be processed.

Programmer response

Change the SQLDA to exclude the unsupported data type.

SQLSTATE

56084

-353	FETCH IS NOT ALLOWED, BECAUSE CURSOR <i>cursor-name</i> HAS AN UNKNOWN POSITION
------	--

Explanation

The cursor position for *cursor-name* is unknown. The previous multiple-row-fetch for cursor *cursor-name* resulted in an error in the middle of processing multiple rows that were retrieved from Db2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown.

The error might have been detected at the requester. For example, a row with a null value was returned to an application, but no indicator variable was provided. A subsequent FETCH statement would result in SQLCODE -353. If an indicator had been provided, a positive SQLCODE would have been returned and all of the rows retrieved from Db2 could have been returned to the application program.

System action

The statement cannot be processed. The cursor position is not changed.

Programmer response

Close and reopen the cursor to reset the cursor position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations. For example, you can modify the FETCH statement by specifying one of the following fetch orientations:

- BEFORE or AFTER
- row-positioned fetch orientations: FIRST, LAST, or ABSOLUTE to establish a valid row cursor and fetch a row of data
- rowset-positioned fetch orientations: FIRST ROWSET, LAST ROWSET, or ROWSET STARTING AT ABSOLUTE to establish a valid rowset cursor position and fetch multiple rows of data

Alternately, change the application to correct the error that originally occurred. For example, if the error was issued because an indicator was not provided, change the application to provide an indicator.

SQLSTATE

24513

-354	A ROWSET FETCH STATEMENT MAY HAVE RETURNED ONE OR MORE ROWS OF DATA. HOWEVER, ONE OR MORE NON-TERMINATING ERROR CONDITIONS WERE ENCOUNTERED. USE THE GET DIAGNOSTICS STATEMENT FOR MORE INFORMATION REGARDING THE CONDITIONS THAT WERE ENCOUNTERED
------	---

Explanation

A rowset FETCH statement encountered one or more non-terminating error conditions. One or more warnings might also have been encountered. Use the GET DIAGNOSTICS statement to obtain information about the conditions that occurred, and to determine if data was returned. It is possible that one or more rows of data were returned. In cases where the row information returned for the row that encountered the condition is incomplete, use of the data for the row that encountered the condition, such as displaying or printing the data, is not recommended.

System action

Db2 processed the statement successfully, but with at least one non-terminating error. Additionally, the fetching of some rows might have encountered warnings.

Programmer response

Analyze the conditions to determine whether follow-up actions are needed. The GET DIAGNOSTICS statement can be used to determine which additional actions might be necessary.

Attention: It is possible that an end of data condition was detected. SQLERRD3 and GET DIAGNOSTICS can be used to determine if all the requested rows were fetched or if a partial rowset was returned.

SQLSTATE

22537

**-355 A LOB COLUMN IS TOO LARGE TO
 BE LOGGED**

Explanation

One of the following has occurred:

- a CREATE TABLE statement for an auxiliary table stores a BLOB, CLOB or DBCLOB column whose length exceeds 1 gigabyte but whose associated LOB table space was defined with the LOG YES attribute
- an ALTER TABLESPACE statement of a LOB table space specifies the LOG YES clause but the auxiliary table in the LOB table space stores a BLOB or CLOB column whose length exceeds 1 gigabyte or a DBCLOB column whose length exceeds 500 megabyte characters

System action

The statement cannot be processed.

Programmer response

Either change the attribute of the LOB table space to LOG NO or drop the base table, and re-create it with columns of an acceptable length for logging.

SQLSTATE

42993

**-356 COLUMN OR KEY EXPRESSION
 expression-number IS NOT VALID,
 REASON CODE = *reason-code***

Explanation

The CREATE INDEX statement cannot be processed because a column or key expression is not valid.

expression-number

The number of the invalid column or key expression.

reason-code

A numeric value that indicates the reason for the failure.

- 1** Contains a subquery.
- 2** Does not contain at least one reference to a column.
- 3** References a special register.
- 4** Includes a CASE expression.

- 5** Includes a user-defined function.
- 6** Appears more than once in the index.
- 7** References a qualified column name.
- 8** References a column that is defined with a FIELDPROC.
- 9** References the LOWER or UPPER function without a locale name or the input string-expression is FOR BIT DATA.
- 10** References the TRANSLATE function without an output translation table.
- 11** The encoding scheme of the result of a column or key expression is different than the CCSID encoding scheme of the table.
- 12** The SUBSTR built-in function is allowed to reference the inline portion of a LOB column in the specified context. In addition, the START and LENGTH arguments of the SUBSTR function must be constants.
- 13** References one of the following built-in functions:
 - VERIFY_GROUP_FOR_USER
 - VERIFY_TRUSTED_CONTEXT_ROLE_FOR_USER
 - VERIFY_ROLE_FOR_USER.
- 14** Contains an expression that requires the use of an implicit time zone value. For example, the key expression might include an explicit cast of a TIMESTAMP WITHOUT TIME ZONE value to a TIMESTAMP WITH TIME ZONE value.
- 15** References a global variable.
- 25** A specification for an index on an EBCDIC table includes one or more Db2 11 Unicode columns and one or more Db2 12 or later Unicode columns. For more information, see [Unicode columns in EBCDIC tables \(Db2 SQL\)](#).
- 116** In an invocation of the JSON_VAL built-in function in a *key-expression* for an index, the third argument of the function must end in ':na'.

to indicate that the first argument does not contain a JSON array.

117

In an invocation of the JSON_VAL built-in function in a *key-expression* for an index, if the first argument of the function is a column, that column must be contained in a table in a partition-by-growth table space.

118

If there is an invocation of the JSON_VAL built-in function in a *key-expression* for an index, the CREATE INDEX statement must not reference a LOB column other than the LOB column that is the argument to the JSON_VAL function. Such a CREATE INDEX statement can refer only to a single LOB column.

119

If a *key-expression* for an index contains an invocation of the JSON_VAL function, the invocation must be the outermost expression for *key-expression*.

120

The *key-expression* must not reference one of the following built-in functions:

- AI_ANALOGY
- AI_COMMONALITY
- AI_SEMANTIC_CLUSTER
- AI_SIMILARITY

System action

The statement cannot be processed.

Programmer response

Correct the error in the key expression, and reissue the statement.

SQLSTATE

429BX

-359	THE RANGE OF VALUES FOR THE IDENTITY COLUMN OR SEQUENCE IS EXHAUSTED
------	--

Explanation

Db2 attempted to generate a value for an identity column or a sequence object. However, all allowable values have already been assigned.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions:

- For an identity column, redefine the table with a larger range of values for the identity column. If a MAXVALUE or MINVALUE specification has been made that limits the range of values to be less than the range for the data type of the column, then the column can be altered to expand the range of valid values. Otherwise, the identity column must be re-created, which requires that the table be re-created. First, drop the existing table; then, re-create the table with a different data type for the identity column, specifying a data type that has a larger range of values than the current data type for the identity column.
- For a sequence object, redefine the sequence with a larger range of values. If a MAXVALUE or MINVALUE specification has been made that limits the range of values to be less than the range for the data type, then the sequence can be altered to expand the range of valid values. Otherwise, the sequence must be re-created using DROP SEQUENCE and CREATE SEQUENCE to cover a larger range of values.

SQLSTATE

23522

-363	THE EXTENDED INDICATOR VARIABLE VALUE FOR PARAMETER <i>position-number</i> IS OUT OF RANGE.
------	---

Explanation

The extended indicator variable value is invalid.

position-number

The ordinal position of parameter marker.

When extended indicator variables are enabled, all negative input indicator variable values must be in the -1 to -7 (inclusive) range.

System action

The statement cannot be processed.

System programmer response

Correct the value, and reissue the statement.

SQLSTATE

22010

-365	USE OF THE VALUE OF EXTENDED INDICATOR VARIABLE
------	---

IN POSITION *value-position* IS NOT VALID.

Explanation

The value of DEFAULT (-5) or UNASSIGNED (-7) was used for the extended indicator variable in a context where it is not allowed. These values are allowed as indicator variables only in INSERT, UPDATE, and MERGE statements when the host variable provides the source value for a column value.

value-position

Identifies the location of the extended indicator variable value.

When extended indicator variables are enabled:

- An expression must not be more complex than a reference to a single host variable if the indicator is set to the extended indicator values of DEFAULT (-5) or UNASSIGNED (-7), except that a CAST specification is allowed when the following conditions are met:
 - The source of the CAST specification is a single host variable.
 - The data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.
- The extended indicator variable values of DEFAULT (-5) or UNASSIGNED (-7) must not be used in:
 - An expression that involves more than a host variable, or a host variable that is explicitly cast.
 - Any expression other than:
 - The set assignment list of an UPDATE operation.
 - The values list of an INSERT operation.
 - The expression's corresponding places in a MERGE statement.
 - The *source-value* parameter of a MERGE statement.
 - The select list of an INSERT statement in the FROM clause of the SELECT statement.

System action

The statement cannot be processed.

System programmer response

Change the value of the extended indicator variable to an allowable value for the context in which it is used

SQLSTATE

ONLY ONE ROWID, IDENTITY, ROW CHANGE TIMESTAMP, ROW BEGIN, ROW END, TRANSACTION START ID, SECURITY LABEL, OR DATA CHANGE OPERATION COLUMN IS ALLOWED IN A TABLE

Explanation

An attempt was made to modify or create a table to have two columns of the same type when only one column of that type is permitted in a table.

A table cannot have two or more columns of the following types:

- Explicitly created ROWID
- Implicitly hidden ROWID
- Identity
- ROW CHANGE TIMESTAMP
- ROW BEGIN
- ROW END
- TRANSACTION START ID
- Security label
- DATA CHANGE OPERATION

System action

The statement cannot be processed.

Programmer response

For a CREATE TABLE statement, select only one column to have the specified attribute.

For an ALTER TABLE statement, a column with one of the specified types already exists for the table. Do not attempt to add another column with the same data type.

[ALTER TABLE statement \(Db2 SQL\)](#)

-373

DEFAULT CANNOT BE SPECIFIED FOR COLUMN OR SQL VARIABLE *name*

Explanation

The definition or change that was specified for the column or the SQL variable included the DEFAULT clause. However, DEFAULT is not supported for the column data type or SQL variable.

name

The name of the column or SQL variable.

Possible reasons for this error include the following situations:

- A CREATE TABLE or ALTER TABLE statement attempted to define one of the following columns with the DEFAULT clause:
 - Identity column
 - ROWID column
 - XML column
 - Row change timestamp column
 - Security label column
 - Row begin column
 - Row end column
 - Transaction start ID column
 - Generated expression column
- The declaration of an SQL variable specified the DEFAULT clause, and the data type of the SQL variable is ROWID or XML.
- A SET statement specified DEFAULT for the value of a ROWID column.

System action

The statement cannot be processed.

Programmer response

Remove the DEFAULT clause and resubmit the statement.

SQLSTATE

42623

THE CLAUSE *clause* HAS NOT BEEN SPECIFIED IN THE CREATE OR ALTER FUNCTION STATEMENT FOR LANGUAGE SQL FUNCTION *function-name* BUT AN

EXAMINATION OF THE FUNCTION BODY REVEALS THAT IT SHOULD BE SPECIFIED

Explanation

This message might be issued if the following conditions apply:

- You must specify NOT DETERMINISTIC if either of the following conditions apply within the body of the function:
 - Db2 invokes a function that has the NOT DETERMINISTIC attribute specified.
 - Db2 accesses a special register.
- You must specify MODIFIES SQL DATA if the body of the function defined with LANGUAGE SQL can modify SQL data or if it calls a function or a procedure that can modify SQL data.
- You must specify READS SQL DATA if the body of the function defined with LANGUAGE SQL contains a subselect, or if it invokes a function that can read SQL data.
- You must specify EXTERNAL ACTION if the body of the function defined with LANGUAGE SQL invokes a function that has the EXTERNAL ACTION attribute specified.

System action

The statement cannot be processed.

Programmer response

Specify the correct clause or change the function of the body.

SQLSTATE

428C2

-390

OBJECT *object-name*, SPECIFIC NAME *specific-name*, IS NOT VALID IN THE CONTEXT WHERE IT IS USED

Explanation

One of the following situations occurred:

- A function resolved to a specific function that is not valid in the context where it is used.
- UNNEST was used in a context in which it is not allowed.

object-name

The name of the object.

specific-name

The specific name. If *specific-name* is an empty string, then the function resolved to the built-in function identified by *function-name*.

If the error is for an invalid use of UNNEST, *specific-name* is *N.

Possible causes for this error include:

- A scalar or aggregate function is referenced where only a table function is allowed (such as in the FROM clause of a query).
- A table function is referenced where only a scalar or aggregate function is allowed (such as in an expression).
- A function is referenced in a SOURCE clause of a CREATE FUNCTION statement, but a source function cannot be defined on that function (or on that specific function signature).
- Function XMLMODIFY is referenced where it is not the topmost expression on the right side of the SET assignment clause in an update.
- A generic table function is referenced, but a *typed-correlation-clause* is not specified.
- A *typed-correlation-clause* is specified, but the referenced function is not a generic table function.
- UNNEST was specified in an unsupported context.
- A CORRELATION, COVARIANCE, COVARIANCE_SAMP or ARRAY_AGG set function is referenced where a CUBE, ROLLUP or GROUPING SETS clause exists in the same SQL statement.
- ARRAY_AGG is referenced in a fullselect that includes an ORDER BY clause or a DISTINCT clause.
- The operand for the ARRAY_AGG function references a scalar fullselect.
- LISTAGG is referenced in a fullselect that includes a DISTINCT clause.
- AI_ANALOGY, AI_SEMATIC_CLUSTER, or AI_SIMILARITY is referenced in one of the following statements where they are not allowed:
 - CREATE FUNCTION (sourced)
 - CREATE FUNCTION (inlined SQL scalar)
 - CREATE FUNCTION (SQL table)

System action

The statement cannot be processed.

Programmer response

For a function, ensure that the correct function name and arguments are specified and that the SQL path includes the schema where the correct function is

defined. You might need to change the function name, arguments, or SQL path (using SET CURRENT PATH or the PATH bind option), or change the context in which the function is used.

-392

**SQLDA PROVIDED FOR CURSOR
cursor-name HAS BEEN CHANGED
FROM THE PREVIOUS FETCH
(*reason-code*)**

Explanation

The application has requested incompatible returns from successive FETCH statements.

cursor-name

The name of the cursor.

reason-code

A numeric value that indicates the reason for the failure. Possible values are:

1

The application is running with DB2 rules, and has requested that LOB data be returned as a LOB in one FETCH statement, and as a locator in another FETCH statement. This request is not permitted.

2

The application has requested textual XML in one FETCH statement, and binary XML in another FETCH statement. This request is not permitted.

If the cursor is a result set returned by a stored procedure called by the application, then the application error might result from a mismatch with the last FETCH performed by the stored procedure.

System action

The statement is not processed, and the connection is terminated.

Programmer response

Take the action that corresponds to the *reason-code* value:

1

For a mismatch involving LOB and locator: Either do not use DB2 rules, or modify the application so that it does not change the data type code from LOB to locator (or the reverse) in the SQLDA between successive fetches.

2

For a mismatch involving textual XML and binary XML: Change the application to request textual XML data in successive fetches, or to request binary XML data in successive fetches.

-398	A LOCATOR WAS REQUESTED FOR HOST VARIABLE NUMBER <i>position-number</i> BUT THE VARIABLE IS NOT A LOB
-------------	--

Explanation

The application requested that a locator be returned from host variable number *position-number*. A locator can only be used with LOB data, and the requested data is not a LOB.

System action

The statement cannot be processed.

Programmer response

Change the statement to either return LOB data, or change the target host variable to not be a locator.

SQLSTATE

428D2

-399	INVALID VALUE ROWID WAS SPECIFIED
------	-----------------------------------

Explanation

When inserting into a table, a value specified for a ROWID column was invalid. Only row ID values previously generated by Db2 are valid.

System action

The statement cannot be processed.

System programmer response

Do not attempt to generate any value into a ROWID column. Insertion into ROWID columns is supported for purposes of Data Propagation, where Db2 has previously generated the row ID values. Only row ID values previously generated by Db2 can be used as values for insertion into a row ID column. Alternatively, insert the row specifying DEFAULT for the ROWID column or remove the ROWID column from the insert column-list.

You could also use the OVERRIDING clause as a possible solution for this situation. For more information about the OVERRIDING USER VALUE clause, see [INSERT statement \(Db2 SQL\)](#).

SQLSTATE

22511

-400	THE CATALOG HAS THE MAXIMUM NUMBER OF USER DEFINED INDEXES
------	--

Explanation

No more than 500 user-defined indexes can be created in the catalog database.

System action

The statement cannot be processed.

Programmer response

If this index must be created, another user-defined index on the catalog must be dropped. After that index is dropped, this statement can be executed.

SQLSTATE

54027

-401	THE DATA TYPES OF THE OPERANDS OF AN OPERATION ARE NOT COMPATIBLE
------	---

Explanation

An operation cannot be processed for one of the following reasons:

- The data types of the operands must be compatible but at least one pair of data types is not compatible.
- An operation contains a mixture of numeric and non-numeric operands.
- One of the operands is a column defined with a field procedure, and another column operand is not defined with the same field procedure. If one column of arithmetic or comparison operation is defined with a field procedure, other columns in the operation must be defined with the same field procedure.

System action

The statement cannot be processed.

Programmer response

Check the data types of all operands to ensure that their data types are comparable and compatible with their usage in the statement.

If all the operands of the SQL statement are correct, then, if a view is being accessed, check the data types of all the operands in the view definition.

SQLSTATE

42818

-402	AN ARITHMETIC FUNCTION OR OPERATOR <i>function-operator</i> IS
------	--

108 Db2 13 for z/OS: Codes (Last updated: 2026-03-12)

Programmer response

See the explanation of SQLCODE -405 for allowed ranges for numeric data types.

If the error occurred while accessing a table column that was altered from DECIMAL(19,0) to BIGINT, alter the column data type back to DECIMAL(19,0) and refer description of the ALTER TABLE statement for information about how to change DECIMAL(19,0) columns to BIGINT.

THE NUMERIC CONSTANT *constant* CANNOT BE USED AS SPECIFIED BECAUSE IT IS OUT OF RANGE

-407

**AN UPDATE, INSERT, OR SET
VALUE IS NULL, BUT THE OBJECT
COLUMN *column-name* CANNOT
CONTAIN NULL VALUES**

Explanation

One of the following conditions occurred:

- A null insert or update value was specified for a column defined as NOT NULL.
- A SET transition variable statement specified a NULL value for column defined as NOT NULL without the WITH DEFAULT clause in the table definition.
- The update or insert value was DEFAULT, but the object column was declared as NOT NULL without WITH DEFAULT in the table definition. Consequently:
 - A default value of NULL cannot be inserted into that column.
 - An update cannot set default values of NULL in that column.
 - A SET transition variable statement in a trigger cannot set default values of NULL in that column.
- The column name list for the INSERT statement omits a column declared NOT NULL and without WITH DEFAULT in the table definition.
- The view for the INSERT statement omits a column declared NOT NULL and without WITH DEFAULT in the base table definition.

- A null insert value was specified for a ROWID column.

System action

The statement cannot be processed. The 'column-name' might be returned in the SQLCA, depending on the syntax of the SQL statement in which the error was detected.

Programmer response

Examine the definition of the object table to determine which columns of the table have the NOT NULL attribute or have a type of ROWID, and correct the SQL statement accordingly.

SQLSTATE

23502

-408

**THE VALUE IS NOT COMPATIBLE
WITH THE DATA TYPE OF ITS
TARGET. TARGET NAME IS *name***

Explanation

A statement failed required assignment rule checking.

name

The name of the target of the assignment.

The data type that is to be assigned is incompatible with the declared data type of the assignment target. Both data types must be:

- Numeric or character
- Character (see restriction)
- Graphic (see restriction)
- Dates or character (see restriction)
- Times or character (see restriction)
- Timestamps or character (see restriction)
- Row IDs
- The same distinct types
- XML
- Result set locator
- Table locator

Restrictions:

- Dates, times, and timestamps cannot be assigned to a character column that has a field procedure.
- Character and graphic data types are compatible when using Unicode.
- An array value with a user-defined array type can be assigned only to an array variable that is defined as the same user-defined array type.

The rules for assigning an array value without a user-defined array type to an array variable depend on the statement that specifies the assignment. See [User-defined type assignments \(Db2 SQL\)](#) for more information.

System action

The statement cannot be processed.

Programmer response

Examine the SQL statement and the current definition for the object table, procedure, user-defined function, host variable, or SQL variable, and ensure that the variable, constant, or result of an expression that is assigned to the object has the proper data type.

If the target is a result set locator, the application might have tried to explicitly assign an invalid locator value to a result set locator. Use the ASSOCIATE LOCATORS statement to get a valid locator value for a result set into a locator variable. Then, reference the result set locator in an ALLOCATE CURSOR statement.

SQLSTATE

42821

-409	INVALID OPERAND OF A COUNT FUNCTION
-------------	--

Explanation

The operand of the COUNT or COUNT_BIG function in the statement violates SQL syntax. A common error is a column name or other expression without DISTINCT.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

SQLSTATE

[subselect \(Db2 SQL\)](#)

-413	OVERFLOW OR UNDERFLOW OCCURRED DURING NUMERIC DATA TYPE CONVERSION
-------------	---

Explanation

During processing of the SQL statement, an overflow or underflow condition arose when converting from one numeric type to another. Numeric conversion is performed according to the standard rules of SQL.

System action

The statement cannot be processed. No data was retrieved, updated, or deleted.

Programmer response

Examine the syntax of the SQL statement to determine the cause of the error. If the problem is data-dependent, it might be necessary to examine the data processed at the time of the error.

SQLSTATE

22003

-414	A LIKE PREDICATE IS INVALID BECAUSE THE FIRST OPERAND IS NOT A STRING
-------------	--

Explanation

The data type of the first operand of the LIKE predicate must be a character string, graphic string, or binary string.

System action

The statement cannot be processed.

Programmer response

Specify the predicate so that the data type of each operand is a character string or a graphic string.

SQLSTATE

42824

-415	THE CORRESPONDING COLUMNS, <i>column-number</i>, OF THE OPERANDS OF A SET OPERATOR ARE NOT COMPATIBLE
-------------	--

Explanation

The data types of the corresponding columns of a UNION, EXCEPT, or INTERSECT set operator are not compatible, or the corresponding columns do not have the same field procedure. The relative position of the value in the select list is *column-number*.

This error is issued if one of the columns is a distinct type, and the other column is not a distinct type, or the other column is a different distinct type. This error code is also issued if one column is defined with a field procedure, and the other column is not defined with the same field procedure. If corresponding columns

have field procedures, they must both be defined with the same field procedure.

System action

The statement cannot be processed.

Programmer response

Check the data types of the specified columns and correct the statement containing the set operator to ensure that all corresponding columns have comparable column descriptions. A CAST specification can be used to make the data type of the columns compatible.

SQLSTATE

42825

**A STATEMENT STRING TO
BE PREPARED INCLUDES
PARAMETER MARKERS AS THE
OPERANDS OF THE SAME
OPERATOR**

Explanation

The statement string specified as the object of a PREPARE contains a predicate or expression where parameter markers have been used as operands of the same operator—for example: ? > ?

This syntax is not permitted.

System action

The statement cannot be processed.

Programmer response

Correct the logic of the application program so that this syntax error does not occur.

SQLSTATE

42609

Related concepts

[Variables \(Db2 SQL\)](#)

[References to SQL parameters and variables in SQL PL \(Db2 SQL\)](#)

Related reference

[PREPARE statement \(Db2 SQL\)](#)

- In a *key-expression* of an index definition.
- As an argument to an XMLEXISTS predicate.

System action

The statement cannot be processed.

Programmer response

Correct the logic of the application program so that this error does not occur. See the discussion of the PREPARE statement for information about the proper usage of parameter markers within SQL statements and for EXECUTE IMMEDIATE SQL statement restrictions. The PREPARE statement description includes tables that describe contexts where untyped parameter markers are supported in expressions, predicates, and statements. A CAST specification can be used in some cases to explicitly assign attributes to a parameter marker.

SQLSTATE

42610

Related reference

[PREPARE statement \(Db2 SQL\)](#)

-419

**THE DECIMAL DIVIDE OPERATION
IS INVALID BECAUSE THE RESULT
WOULD HAVE A NEGATIVE SCALE**

Explanation

The decimal division is invalid because it will result in a negative scale.

System action

The statement cannot be processed. No data was retrieved, updated, or deleted.

Programmer response

Examine the precision and scale of all columns that might have participated in a decimal division. Note that an integer or small integer value might have been converted to decimal for this calculation.

A YES value for the DECDIV3 subsystem parameter specifies that the scale of the result of a decimal division is never less than 3.

SQLSTATE

42911

Related concepts

[Arithmetic operators in expressions \(Db2 SQL\)](#)

-418

**A STATEMENT STRING TO
BE PREPARED CONTAINS AN
INVALID USE OF PARAMETER
MARKERS**

Explanation

The statement cannot be executed because a parameter marker has been used in an invalid way.

Examples of places where parameter markers cannot be used:

- As an argument to some built-in functions.
- In the SELECT list of a scalar fullselect that is the sole argument of a scalar function.
- In a concatenation operation.
- In the string expression of an EXECUTE IMMEDIATE SQL statement.
- In a *result-expression* in any CASE expression when all the other *result-expressions* are either NULL or untyped parameter markers.

Related reference

MINIMUM DIVIDE SCALE field (DEC DIV3 subsystem parameter) (Db2 Installation and Migration)

-420	THE VALUE OF A STRING ARGUMENT WAS NOT ACCEPTABLE TO THE <i>function-name</i> FUNCTION
-------------	---

Explanation

A string argument did not conform to the requirements of the function. For example, a character string passed to the DECIMAL function did not conform to the rules for forming an SQL integer or decimal constant.

If the error is issued for an implicit or explicit cast, the *function-name* token contains the name of the cast's target data type. For implicit cast where a character-string or graphic-string value is compared with a numeric value, Db2 implicitly converts the string value to DECFLOAT(34) so the *function-name* function will have a DECFLOAT value.

System action

The statement cannot be processed.

Programmer response

Change the argument value so that it conforms to the requirements of the function.

SQLSTATE

22018

Related reference

Built-in functions and functions that are supplied with Db2 (Db2 SQL)
DECIMAL or DEC scalar function (Db2 SQL)

-421	THE OPERANDS OF A SET OPERATOR DO NOT HAVE THE SAME NUMBER OF COLUMNS
-------------	--

Explanation

The operands of a set operator, such as UNION, EXCEPT, or INTERSECT, must have the same number of columns.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement so that there are exactly the same number of columns.

SQLSTATE

42826

-423	INVALID VALUE FOR LOCATOR IN POSITION <i>position-#</i>
-------------	--

Explanation

The value specified in a result set locator host variable, a LOB locator host variable, or a table locator that is specified at position *position-#* in the locator variable list of the SQL statement does not identify a valid result set locator, LOB locator variable, or table locator, respectively.

System action

The statement cannot be processed.

Programmer response

For a result set locator there are two common causes for the error:

- The host variable used as a result set locator was never assigned a valid result set locator value. Result set locator values are returned by the DESCRIBE PROCEDURE and ASSOCIATE LOCATORS statements. Make sure the value in your host variable is obtained from one of these statements.
- Result set locator values are only valid as long as the underlying SQL cursor is open. If a commit or rollback operation closes an SQL cursor, the result set locator associated with the cursor is no longer valid.

For a LOB locator, some common causes for the error are:

- The host variable used as a LOB locator was never assigned a valid LOB value.
- A commit or rollback operation or an SQL FREE LOCATOR statement freed the locator.

For a table locator, the error commonly occurs when the host variable that was used as a table locator was never assigned a valid table locator value.

SQLSTATE

0F001

**-426 DYNAMIC COMMIT NOT VALID AT
AN APPLICATION SERVER WHERE
UPDATES ARE NOT ALLOWED****Explanation**

An application executing using DRDA protocols has attempted to issue a dynamic COMMIT statement, or a stored procedure has attempted to issue a COMMIT_ON_RETURN, while connected to a location at which updates are not allowed. A dynamic COMMIT or COMMIT_ON_RETURN can be issued only while connected to a location at which updates are allowed.

System action

The statement cannot be processed. No COMMIT is performed.

Programmer response

The IMS or CICS protocols should be used to commit work in these environments.

SQLSTATE

2D528

**-427 DYNAMIC ROLLBACK NOT VALID
AT AN APPLICATION SERVER
WHERE UPDATES ARE NOT
ALLOWED****Explanation**

An application executing using DRDA protocols has attempted to issue a dynamic ROLLBACK statement while connected to a location at which updates are not allowed. A dynamic ROLLBACK may be issued only while connected to a location at which updates are allowed.

System action

The statement cannot be processed. No ROLLBACK is performed.

Programmer response

The IMS or CICS protocols should be used to rollback work in these environments.

SQLSTATE

2D529

**-430 *routine-type routine-name*
(SPECIFIC NAME *specific-name*)
HAS ABNORMALLY TERMINATED****Explanation**

An abnormal termination has occurred while the routine *routine-name* (stored procedure or function) was in control.

System action

The statement cannot be processed.

Programmer response

The stored procedure or function needs to be fixed. Contact the author of the routine or your database administrator. Until it is fixed, the routine should not be used.

SQLSTATE

38503

**-431 ROUTINE *routine-name* (SPECIFIC
NAME *specific-name*) OF
TYPE *routine-type* HAS BEEN
INTERRUPTED BY THE USER****Explanation**

A user has issued TERMINATE during a debugging session of SQL routine *routine-name*. The TERMINATE might have been issued because an infinite wait or loop was encountered.

System action

The statement cannot be processed.

User response

No recovery is necessary.

SQLSTATE

38504

-433 VALUE *value* IS TOO LONG**Explanation**

The value *value* required truncation by a system (built-in) cast or adjustment function, which was called to transform the value in some way. The truncation is not allowed where this value is used. The value being transformed is one of the following:

- an argument to a user defined function (UDF)
- an input to the SET clause of an UPDATE statement
- a value being INSERTed into a table

- an input to a cast or adjustment function in some other context.

If *value* has the 'for bit data' subtype, or has a data type of BINARY or VARBINARY, then the *value* is printed as a hexadecimal string in quotes followed by an X.

System action

The statement cannot be processed.

Programmer response

If *value* is a literal string in the SQL statement, it is too long for its intended use. If *value* is not a literal string, examine the SQL statement to determine where the transformation is taking place. Either the input to the transformation is too long, or the target is too short. Correct the problem and rerun the statement.

SQLSTATE

22001

-435 **AN INVALID SQLSTATE
sqlstate IS SPECIFIED IN
A RAISE_ERROR FUNCTION,
RESIGNAL STATEMENT, OR
SIGNAL STATEMENT**

Explanation

The SQLSTATE specified in the RAISE_ERROR function, RESIGNAL statement, or SIGNAL statement of a trigger or a routine does not conform to the rules for a valid SQLSTATE.

System action

The statement cannot be processed.

Programmer response

Change the SQLSTATE specified in the RAISE_ERROR function, RESIGNAL statement, or SIGNAL statement so that it conforms to the rules of the statement.

For the RAISE_ERROR function, the SQLSTATE must be a character string containing exactly five (5) characters. It must be of type CHAR defined with a length of five (5), or, a type VARCHAR defined with a length of five (5) or greater. The SQLSTATE value must conform to the following rules:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letters ('A' through 'Z').

- The SQLSTATE class (the first two characters) cannot be '00', '01' or '02' because these characters do not indicate error classes.
- If the SQLSTATE class (the first two characters) start with the character '0' through '6' or 'A' through 'H', then the subclass (the last three characters) must start with a letter in the range 'I' through 'Z'.
- If the SQLSTATE class (the first two characters) start with the character '7', '8', '9' or 'I' through 'Z', then the subclass (the last three characters) must be from the set of characters '0' through '9' or 'A' through 'Z'.

For the RESIGNAL and SIGNAL statements, the SQLSTATE value must be exactly five (5) characters that follow the following rules:

- Each character must be from the set of digits '0' through '9' or non-accented upper case letter 'A' through 'Z'.
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

SQLSTATE

-438 **APPLICATION RAISED ERROR
WITH DIAGNOSTIC TEXT: *text***

Explanation

This error occurred as a result of the RAISE_ERROR function, a RESIGNAL statement, a SIGNAL SQLSTATE statement, or it was an unhandled condition when processing of the trigger or routine completed.

text

Diagnostic text provided by the invocation of the RAISE_ERROR function or the SIGNAL SQLSTATE statement.

System action

The statement cannot be processed.

Programmer response

Use application-provided diagnostic text, if provided, to determine the cause of the error.

SQLSTATE

Defined by the application

-440	NO AUTHORIZED <i>routine-type</i> BY THE NAME <i>routine-name</i> HAVING COMPATIBLE ARGUMENTS WAS FOUND
-------------	--

Explanation

An attempt was made to invoke a routine, but Db2 could not resolve the invocation of a routine, including the argument list, to a specific routine definition.

routine-type

The type of routine, such as FUNCTION or PROCEDURE.

routine-name or *schema-name.routine-name*

The name of the routine. If the originating statement references a qualified name, the routine name in the message text is qualified by the name of the schema.

Possible causes for this error include:

- The routine name was either incorrectly specified or does not exist in the database.
- A qualified reference was used, and the schema qualifier was incorrectly specified.
- The user's SQL path does not contain the schema to which the function belongs, and an unqualified reference was used.
- The wrong number of arguments was included.
- The right number of arguments was included in the routine reference, but the data type of one or more of the arguments is incorrect.
- The invoker of the routine is not authorized to execute the routine.
- CURRENT QUERY ACCELERATION was set to NONE while a passthrough-only expression was running.
- An application or SQL object attempted to use a capability that is not supported by the current application compatibility level.
 - Before the activation of function level 500 or higher, Db2 environments must use application compatibility levels from previous releases. After the activation of function level 500 or higher, the application compatibility level can be equivalent to the current function level, a lower function level in the current release, or a function level from a previous release.

System action

The statement cannot be processed.

Programmer response

Use the routine name identified in the message to find the invocation, and verify that the invocation can be resolved to the intended routine, based on the function and procedure resolution processes.

- For functions: [Function resolution \(Db2 SQL\)](#)
- For procedures: [CALL statement \(Db2 SQL\)](#)

To ensure that the intended routine is invoked, specify a qualified routine name whenever possible.

If you are executing a passthrough-only expression, set CURRENT QUERY ACCELERATION to ELIGIBLE, ENABLE, or ALL.

If the error might be due to an unsupported capability, check the application compatibility level of your application or SQL object and take one of the following actions:

- Rebind the application or modify the SQL object to use an application compatibility level that supports the capability.
- Remove usage of the unsupported capability from the application or SQL object.

SQLSTATE

42884

Related concepts

[Privileges required for executing routines \(Managing Security\)](#)

-441	INVALID USE OF 'DISTINCT' OR 'ALL' WITH FUNCTION <i>function-name</i>
-------------	--

Explanation

This error can occur for the following situations:

- The keyword DISTINCT or ALL was detected within parentheses in a reference to function *function-name* and the function has been resolved as a scalar function. Use of the keywords DISTINCT or ALL with the specified scalar function is invalid.
- The keyword DISTINCT was detected within parentheses in a reference to function *function-name* and the function has been resolved as an aggregate function. Use of the keywords DISTINCT with the specified aggregate function is not valid.
- The function was expected to be an aggregate function supporting the keyword ALL or DISTINCT,

but the function that was resolved to is not an aggregate function.

System action

The statement cannot be processed.

Programmer response

Take the appropriate action:

- If a scalar function is being used, then remove the keyword DISTINCT or ALL.
- If the function is an aggregate function that does not support the DISTINCT or ALL keywords, then remove the keyword.
- Otherwise, if an aggregate function is being used, then there is a problem with function resolution. Check your SQL path to see if the function is in one of the schemas, and also check the SYSIBM.SYSROUTINES catalog for the spelling of the function name and the number and types of parameters

SQLSTATE

42601

-443 **ROUTINE *routine-name* (SPECIFIC NAME *specific-name*) HAS RETURNED AN ERROR SQLSTATE WITH DIAGNOSTIC TEXT *msg-text***

Explanation

An SQLSTATE was returned by routine *routine-name*, along with message text *msg-text*.

System action

Execution of the SQL statement is terminated.

Programmer response

Contact the author of the routine or your database administrator. Until the problem is resolved, the routine should not be used.

SQLSTATE

xxxxx (the SQLSTATE that was returned by the routine).

-444 **USER PROGRAM *name* COULD NOT BE FOUND**

Explanation

Db2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function, and found the row in the SYSIBM.SYSROUTINES catalog table associated with the requested procedure name. However, the MVS load module identified in the EXTERNAL_NAME column of the SYSIBM.SYSROUTINES row could not be found.

name

The name of the MVS load module that could not be found

System action

The statement cannot be processed.

Programmer response

If the EXTERNAL_NAME column value in the SYSIBM.SYSROUTINES table is incorrect, use the ALTER FUNCTION or ALTER PROCEDURE statement to correct the value.

If the EXTERNAL_NAME column value is correct, use the MVS linkage editor to create the required MVS load module in one of the MVS load libraries used by your installation for stored procedures.

This error can also occur if you are invoking a WLM-managed stored procedure that is not APF authorized, and the Db2 load libraries are not in the STEPLIB concatenation because they are being loaded from LINKLIST. In this case, if you want the stored procedure program to run APF-authorized, link-edit it with AC=1 into an MVS APF authorized library. If you do not want the stored procedure program to run APF authorized, add the Db2 load library to the STEPLIB concatenation of the JCL used to start the WLM-managed address space.

SQLSTATE

42724

-449 **CREATE OR ALTER STATEMENT FOR FUNCTION OR PROCEDURE *routine-name* CONTAINS AN INVALID FORMAT OF THE EXTERNAL NAME CLAUSE OR IS MISSING THE EXTERNAL NAME CLAUSE**

Explanation

An error was found in the EXTERNAL NAME clause of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement

for *routine-name*, or the clause is needed but was not specified.

- For external routines with LANGUAGE JAVA, the name must be specified and it must contain a valid *external-java-routine-name* of the following form: *jar-name:package-id...class-id.method-id(method-signature)*
 - No blanks are permitted within the single quotes.
 - The *method-name* consists of the list of *package-ids*, *class-id*, and *method-id*, and must not be longer than 254 bytes.
 - Zero or more *package-ids* can be specified, preceding the *class-id*.
 - The *method-signature* is optional, and is a list of Java™ data types that are separated by commas. If specified, the *method-signature* must not be longer than 1024 bytes.
 - If multiple strings are specified, the total length of all the strings concatenated together for the *external-java-routine-name* must not be greater than 1305.
- For external routines with a language other than JAVA, the external name must be a short identifier with letters or digits. The first character must be a letter (this is the MVS naming convention for load modules). A possible cause for this error is the inclusion of a blank in the name.

If the clause is omitted, the external name defaults to *function-name*. However, for CREATE FUNCTION or CREATE PROCEDURE, if the function or procedure name is longer than eight characters then the EXTERNAL NAME clause must be explicitly specified to specify a valid *short identifier* as the external name.

System action

The statement cannot be processed.

User response

When LANGUAGE is JAVA, possible causes include:

- Omitting the EXTERNAL NAME clause.
- Including a blank.
- Having the '!' at the beginning or end of the name.
- Specifying an invalid *external-java-routine-name*.

Programmer response

Correct the syntax of the SQL statement.

THE *data-item* DEFINITION IN THE CREATE OR ALTER STATEMENT FOR *routine-name* CONTAINS DATA TYPE *type* WHICH IS NOT SUPPORTED FOR THE TYPE AND LANGUAGE OF THE ROUTINE

Explanation

An error was made in the *data-item* part of the CREATE or ALTER statement for *routine-name*. The statement contained an invalid data type, or it contained a distinct type which is based on the invalid data type.

System action

The statement cannot be processed.

Programmer response

Correct the specification of the routine and reissue the CREATE statement.

SQLSTATE

42815

-452 **UNABLE TO ACCESS THE FILE
REFERENCED BY HOST VARIABLE
variable-position. REASON CODE:
*reason-code***

Explanation

An error was encountered while Db2 was accessing, or attempting to access, the file referenced by the specified host variable.

variable-position

Indicates the position of the host variable that referenced the file, as the *n*th host variable, where *n* is the value.

reason-code

A numeric value that indicates the reason for the error:

- 1** If the file name length is invalid, the path has an invalid format, or a relative path was specified.
- 2** If the file option is invalid (the file option must be 2, 8, 16, or 32), or the specified file option is not consistent with the operation that Db2 attempted to perform. For example, the file option FILE_READ is specified on a FETCH SQL statement.
- 3** If the file cannot be found.
- 4** If the SQL_FILE_CREATE option was specified for a file with the same name as an existing file.
- 7** If a full disk was encountered while writing to the file.
- 9** If a media error was encountered while accessing the file.

12

If the HFS file Db2 attempted to open for a read, append, or rewrite operation is not a regular file:

- The BSAM data set that Db2 attempted to open for a read, append, or rewrite operation is not a physical sequential (PS) or partition organization (PO) data set.
- The BSAM data set that Db2 attempted to open for a read, append, or rewrite operation does not have a record format of VB, V, or U.
- The APPEND option was specified for a data set with partition organization (PO).

13

If errors were encountered when Db2 attempted to OPEN, READ, WRITE, or CLOSE an HFS file or BSAM data set, there might be a system completion code on the console to indicate the reason that Db2 was unable to perform the requested operation.

variable-position is set to 0 if the host variable position cannot be determined.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions based on the *reason-code* value:

- 1** Correct the file name length, file name, and file path. If a relative path is being used for the HFS file, replace it with an absolute path.
- 2** Correct the file option in the application.
- 3** Ensure that the file specified exists before attempting to access the file.
- 4** Delete the file if it is no longer required or specify a file name that does not currently exist.
- 7** Delete unnecessary files to free up disk space or specify a file that resides on another drive or file system with sufficient disk space. Also, ensure that no operating system or user file size limits were reached. If your application code page uses a multibyte encoding scheme, it is possible that only part of the last character was written. Ensure that the file contains only fully formed characters.

- 8 The maximum length of the result column must be extended to allow for the expansion that occurs when the string is converted.
- 9 Correct all errors on the media where the file has been read.
- 12 Take the appropriate action:
- Correct the file name to refer to a regular file if it is an HFS file.
 - Correct the file name to refer to a PS or a PO data set if it is a BSAM data set.
 - Correct the file operation to contain the correct action.
- 13 Correct the error based on the system completion code.

SQLSTATE

428A1

-453	THERE IS A PROBLEM WITH THE RETURNS CLAUSE IN THE CREATE FUNCTION STATEMENT FOR <i>function-name</i>
------	---

Explanation

A problem casting the result of user-defined function *function-name* has been identified. The CAST FROM data type is not castable to the RETURNS data type, and it must be. For more information, see [Casting between data types \(Db2 SQL\)](#)

System action

The statement cannot be processed.

Programmer response

Change the RETURNS or CAST FROM clause so that the CAST FROM data type is castable to the RETURNS data type.

SQLSTATE

42880

-454	THE SIGNATURE PROVIDED IN THE CREATE FUNCTION STATEMENT FOR <i>function-name</i> MATCHES THE SIGNATURE OF SOME OTHER FUNCTION ALREADY EXISTING IN THE SCHEMA
------	---

Explanation

The signature consists of the function name (*function-name*), the number of parameters defined for the function, and an ordered list of the types of the parameters (without regard to any parameters of the types). In this case there is a function already in the schema and the existing function has the same signature as the function being created. See the SQL Reference for the details on the uniqueness of a function.

System action

The statement cannot be processed.

Programmer response

Determine if the existing function already provides the appropriate functionality. If not, change the signature of the new function. One way to do that is to change the function name.

SQLSTATE

42723

-455	IN CREATE FOR <i>routine-name</i>, THE SCHEMA NAME <i>schema-name1</i> PROVIDED FOR THE SPECIFIC NAME DOES NOT MATCH THE SCHEMA NAME <i>schema-name2</i> OF THE ROUTINE
------	--

Explanation

If the SPECIFIC name is specified as a two part name, the *schema-name1* portion must be the same as the *schema-name2* portion of the *routine-name*. Note that the *schema-name2* portion of *routine-name* might have been specified directly or it might have defaulted to the authorization ID of the statement.

System action

The statement cannot be processed.

Programmer response

Correct the statement.

SQLSTATE

42882

-456	IN CREATE FUNCTION FOR <i>function-name</i>, THE SPECIFIC NAME <i>specific-name</i> ALREADY EXISTS IN THE SCHEMA
------	---

Explanation

A SPECIFIC name has been explicitly specified as *specific-name* in the CREATE FUNCTION statement for *function-name*, but this name already exists as the SPECIFIC name for another function within the schema.

System action

The statement cannot be processed.

Programmer response

Choose a new SPECIFIC name.

SQLSTATE

42710

-457 **A USER-DEFINED FUNCTION OR USER-DEFINED TYPE CANNOT BE CALLED *name* SINCE IT IS RESERVED FOR SYSTEM USE**

Explanation

A user-defined function or user-defined type cannot be created or referenced because the name is reserved for use by the system.

name

The name of the user-defined function or user-defined type.

A number of names that are used as keywords are reserved for system use. These names cannot be used as user-defined functions or user-defined type names, **even if they are delimited identifiers**.

Those names are:

=	<	>	>=	<=
< >	¬=	¬>	¬>	
ALL	AND	ANY	BETWEEN	
DISTINCT				
EXCEPT	EXISTS	FALSE	FOR	
FROM				
IN	IS	LIKE	MATCH	
NOT				
NULL	ONLY	OR	OVERLAPS	
SIMILAR				
SOME	TABLE	TRUE	TYPE	
UNIQUE				
UNKNOWN				

The names of built-in data types cannot be used as the name of a user-defined type (for example, CHAR).

You cannot use an asterisk (*) as a specific name for a user-defined type or procedure name.

System action

The statement cannot be processed.

Programmer response

Select a name for the function or user-defined type that is not reserved for system use.

SQLSTATE

42939

-458 **IN A REFERENCE TO FUNCTION *function-name* BY SIGNATURE, A MATCHING FUNCTION COULD NOT BE FOUND**

Explanation

In a reference to function *function-name* by signature, no matching function could be found. The problem could be with the data type or some other attributes of a parameter. For some data types there are attributes in addition to data type:

- Length, precision, or scale

While it is not necessary to specify a length, precision, or scale attribute for a data type, if one is specified then there must be an exact match on the corresponding specification of the parameter for the existing function as defined in SYSPARMS.

A type of FLOAT(*n*) does not need to match the defined value for *n* since $1 \leq n \leq 21$ means REAL and $22 \leq n \leq 53$ means DOUBLE. Matching occurs based on whether the type is REAL or DOUBLE.

However, a match on data type is sufficient.

To indicate this, an empty set of parentheses must be specified for the data types that allow a specification of length, precision, or scale. For example, assuming a function exists for which a parameter was defined as CHAR(12) on the CREATE FUNCTION statement, a reference to that function by a signature could specify this parameter as either CHAR(12), or CHAR(). The CHAR() syntax provides a way to say, "do not care about length, precision and scale attributes in finding a matching function".

FLOAT() cannot be used since the parameter value indicates different data types (REAL or DOUBLE).

If, however, neither length, precision, scale, or empty parenthesis were specified, then normal default rules apply. For example, a specification of CHAR would result in CHAR(1) as on the CREATE TABLE statement. Furthermore, this implicit specification of length, precision, or scale must exactly match the

corresponding specification of the parameter for the existing function as defined in SYSPARMS.

- Subtype, or encoding scheme

You do not need to specify the subtype or encoding scheme (CCSID clause) to identify an existing function in the database. However, if a subtype or encoding scheme is specified then there must be an exact match on the corresponding specification of the parameter for the existing function as defined in SYSPARMS.

Unqualified function names:

- For ALTER FUNCTION, DROP FUNCTION, COMMENT ON FUNCTION, GRANT and REVOKE statements for EXECUTE on functions, an unqualified function name is implicitly qualified with the default schema, and this is the schema where the function with the problem can be found.
- In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the SQL path. In this case, Db2 could not resolve the invocation of a function using the schemas in the user's SQL path. For details, see [CREATE FUNCTION statement \(sourced function\) \(Db2 SQL\)](#).

System action

The statement cannot be processed.

Programmer response

Possible responses include:

- Changing the SQL path to include the correct schema.
- Changing the attributes of the parameters.
- Using a SPECIFIC name to refer to the function instead of a signature.

-461

A VALUE WITH DATA TYPE *source-data-type* CANNOT BE CAST TO TYPE *target-data-type*

Explanation

The statement contains an implicit or explicit CAST, but the combination of the source and target data types is not supported. Db2 attempted to cast a value of *source-data-type* to the data type *target-data-type*. This combination is not supported.

This error is also issued for a statement that references multiple encoding schemes, when there is an attempt to cast a string value with a field procedure. This combination is not supported.

This error can be issued for an attempt to use a feature that requires a higher APPLCOMPAT setting than the current setting. The current APPLCOMPAT setting does not support a feature that was requested.

System action

The statement cannot be processed.

Programmer response

Change the data type of either the source or target so that the cast is supported.

For built-in data type values, a cast involving a user-defined distinct type value, or a cast involving an array value, see [Casting between data types \(Db2 SQL\)](#).

If an explicit CAST was specified, correct the CAST specification to specify a supported combination of source and target types.

SQLSTATE

-469

SQL CALL STATEMENT MUST SPECIFY AN OUTPUT VARIABLE FOR PARAMETER *number*

Explanation

Db2 received an SQL CALL statement for a stored procedure. Db2 found the row in the SYSIBM.SYSROUTINES catalog table associated with the requested procedure name. However, parameter *number* was identified in the SYSIBM.SYSPARMS table

as an OUT or INOUT parameter. An updatable variable must be supplied on the SQL CALL statement for a parameter that is defined as OUT or INOUT.

A constant or an expression is an example of an invalid input argument to a function or an OUT or INOUT parameter to a procedure. For example, suppose that a procedure named MY_PROC is defined with one OUT parameter. The following invocation of the procedure is not valid because the argument that is passed to the OUT parameter is a constant expression, which cannot have values assigned to it.

```
CALL MY_PROC(1+2);
```

number
The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System action

The statement cannot be processed.

Programmer response

If the SQL CALL statement is coded incorrectly, modify the SQL application to provide an output variable on the SQL CALL statement.

If the SYSIBM.SYSPARMS table contains incorrect information, the DROP PROCEDURE and CREATE PROCEDURE statements must be used to replace the catalog definition for the stored procedure.

SQLSTATE

42886

-470	SQL CALL STATEMENT SPECIFIED A NULL VALUE FOR INPUT PARAMETER <i>number</i> , BUT THE STORED PROCEDURE DOES NOT SUPPORT NULL VALUES.
------	--

Explanation

Db2 received an SQL CALL statement for a stored procedure and found a null value in the incoming parameter list. The stored procedure was defined in the SYSIBM.SYSROUTINES catalog table with PARAMETER_STYLE of GENERAL, which specifies that the routine does not accept null values.

A call to a stored procedure with a LANGUAGE value of JAVA receives this SQLCODE if an input parameter in the Java stored procedure has a Java base type that cannot be set to a null value.

number
The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System action

The statement cannot be processed.

Programmer response

If the stored procedure should not accept null values, change the calling application to provide a non-null value.

If the stored procedure should accept null values, use the ALTER PROCEDURE statement to change the PARAMETER STYLE of the stored procedure to be DB2SQL or GENERAL WITH NULLS.

SQLSTATE

39004

-471	INVOCATION OF FUNCTION OR PROCEDURE <i>name</i> FAILED DUE TO REASON <i>rc</i>
------	--

Explanation

A routine was invoked. The routine invocation was not accepted because of Db2 reason code *rc*.

name
The name of the routine that was invoked.

rc
The Db2 reason code describing the cause of the failure.

System action

The statement cannot be processed. A DSNX9xx message describing the error might be displayed on the MVS system console.

Programmer response

Correct the condition described by the Db2 reason code.

SQLSTATE

55023

-472	CURSOR <i>cursor-name</i> WAS LEFT OPEN BY EXTERNAL FUNCTION <i>function-name</i> (SPECIFIC NAME <i>specific-name</i>)
------	---

Explanation

The function program did not close the specified cursor. Modify the function program so that it closes the cursor.

System action

The statement cannot be processed.

Programmer response

Reissue the statement.

SQLSTATE

24517

-473 A USER DEFINED DATA TYPE CANNOT BE CALLED THE SAME NAME AS A SYSTEM PREDEFINED TYPE (BUILT-IN TYPE)

Explanation

The name of a data type to be created has an unqualified name that is the same as a system-predefined data type. The name that you specified is not allowed. Adding delimiters does not make the name valid. The following names are restricted:

Restricted names

BIGINT	DECIMAL	REF
BINARY	DECFLOAT	ROWID
BLOB	DOUBLE	SMALLINT
BOOLEAN	DOUBLE PRECISION	TIME
CHAR	FLOAT	TIMESTAMP
CHAR VARYING	GRAPHIC	VARBINARY
CHARACTER	INT	VARCHAR
CHARACTER VARYING	INTEGER	VARGRAPHIC
CLOB	LONG VARCHAR	XML
DATALINK	LONG VARGRAPHIC	
DATE	NUMERIC	
DBCLOB	REAL	
DEC	ROWID	

System action

The statement cannot be processed.

Programmer response

Correct the statement to use another identifier for the name of the new user-defined type.

SQLSTATE

42918

-475 THE RESULT TYPE *type-1* OF THE SOURCE FUNCTION CANNOT BE CAST TO THE RETURNS TYPE *type-2* OF THE USER-DEFINED FUNCTION *function-name*

Explanation

In order for the CREATE FUNCTION for a sourced user-defined function to be valid, the result type (*type-1*) of the source function must be castable to the RETURNS type (*type-2*) of the function being created. There is no supported cast between these data types.

System action

The statement cannot be processed.

Programmer response

Change the RETURNS data type or the SOURCE function identified so that the result type of the SOURCE function is castable to the RETURNS data type.

SQLSTATE

42866

Related concepts

[Casting between data types \(Db2 SQL\)](#)

Related reference

[CREATE FUNCTION statement \(sourced function\) \(Db2 SQL\)](#)

-476 REFERENCE TO ROUTINE *routine-name* WAS IDENTIFIED WITHOUT A SIGNATURE, OR BY BOTH SIGNATURE AND SPECIFIC NAME, BUT THE ROUTINE IS NOT UNIQUE WITHIN ITS SCHEMA

Explanation

References to a routines without a signature are permitted, but the identified routine *routine-name* must be unique in its schema and it is not.

Note also that in the ALTER FUNCTION, DROP FUNCTION, COMMENT, GRANT and REVOKE (for

EXECUTE on functions) statements, an unqualified reference is qualified with the default schema, and this is the schema where the problem can be found. In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the SQL path. In this case, the first schema in the path containing a function with this name had other functions by the same name.

System action

The statement cannot be processed.

Programmer response

If the statement references a function, take one of the following actions:

- Complete the signature.
- Use the SPECIFIC name of the function.
- Change the SQL path.

If the statement references a procedure, a procedure with the same name exists, but there are differences in the parameter list. To change the parameter list of the existing procedure, add the SPECIFIC clause with the name of the procedure to the CREATE statement.

**ALTER, DROP, OR REVOKE
AFFECTING OBJECT TYPE *object-type*
CANNOT BE PROCESSED
BECAUSE OBJECT *dependent-object*
OF TYPE *dependent-type* IS
DEPENDENT ON IT**

Explanation

An ALTER, DROP, or REVOKE statement was issued on an object type that is a dependency for one or more

objects. An object type cannot be dropped or revoked if another object type has a dependency on that object type.

object-type

The type of object that is required and cannot be dropped.

dependent-object

The name of the object that prevents the *object-type* from being dropped or revoked.

dependent-type

The type of the object that prevents the *object-type* from being dropped or revoked.

Examples of where the dependency might occur include the following situations:

ALTER or DROP statement

For an ALTER or DROP statement, the following dependencies might exist based on the *object-type* value.

- If *object-type* is ALIAS:
 - A row permission or a column mask references this alias.
This will only occur when the alias is an alias for a table or view.
 - An inline SQL function exists that uses the sequence in a NEXT VALUE or PREVIOUS VALUE expression. This will only occur when the alias is an alias for a sequence.
- If *object-type* is COLUMN:
 - An index references this column.
 - A unique constraint references this column.
 - A view that directly or indirectly references this column.
 - A referential constraint that references this column as a foreign key.
- If *object-type* is ARRAY:
 - A function or stored procedure uses the user-defined array type.
- If *object-type* is DISTINCT TYPE:
 - A column of a table is defined as this distinct type.
 - A parameter or an SQL variable of a function is defined as this distinct type.
 - A parameter or an SQL variable of a procedure is defined as this distinct type.
 - A sequence is defined with this distinct type as the data type.

The dependency might be on one of the generated cast functions for a distinct type.

- If *object-type* is FUNCTION:
 - A row permission or a column mask references this function.
 - Another function is sourced on this function.
 - A view uses this function.
 - A trigger package uses this function.
 - A table uses this function in a check constraint or user-defined default.
 - A materialized query table definition uses this function.
- If *object-type* is JAR:
 - A function or stored procedure uses this JAR in its EXTERNAL NAME.
 - Another JAR uses this JAR in its Java path.
- If *object-type* is ROLE:
 - A trusted context uses this role.
 - The role is associated with the current thread.
 - The role is the owner of the object that is being dropped.
 - The role is the grantor of ACCESSCTRL, DATAACCESS, or system DBADM authority.
 - The role is the grantor of any privilege or authority that used ACCESSCTRL or SECADM authority to make the grant.

In the case where *object-type* is ROLE, this error can also occur when revoking the privileges held by this role. When the role privileges are revoked, the cascading of the REVOKE statement might encounter dependencies that prevent the REVOKE statement from being successfully processed.

- If *object-type* is SEQUENCE:
 - An SQL function is defined that references this sequence.
 - An SQL procedure is defined that references this sequence.
 - A view definition is defined that references this sequence.
 - A trigger is defined that references this sequence.
- If *object-type* is SYNONYM:
 - A row permission or a column mask references this synonym.
- If *object-type* is TABLE:
 - A row permission or a column mask references this table.
 - This table is the history table for a system-period temporal table. An attempt to drop

the table space or database that contains the history table also causes this error.

- This table is the archive table for an archive-enabled table. An attempt to drop the table space or database that contains the archive table also causes this error.
- If *object-type* is VIEW:
 - A row permission or a column mask references this view.
- If *object-type* is a global variable:
 - An SQL function references this global variable.
 - A view references this global variable.
 - A trigger references this global variable.

REVOKE statement

For a REVOKE statement, the following dependencies might exist based on the *object-type* value.

- SYSADM is being revoked. When SYSADM is revoked, the cascading of the REVOKE statement might encounter dependencies that prevent the REVOKE statement from being successfully processed.
- If *object-type* is ARRAY:
 - A function or stored procedure uses the user-defined array type.
- If *object-type* is DISTINCT TYPE:
 - A column of a table that is owned by the revokee is defined as this distinct type.
 - A parameter or an SQL variable of a function that is owned by the revokee is defined as this distinct type.
 - A parameter or an SQL variable of a procedure that is owned by the revokee is defined as this distinct type.
 - A sequence that is owned by the revokee is defined with this distinct type as the data type.
- If *object-type* is FUNCTION:
 - A function that is owned by the revokee is sourced on this function.
 - A view that is owned by the revokee uses this function.
 - A trigger package that is owned by the revokee uses this function.
 - A table that is owned by the revokee uses this function in a check constraint or user-defined default.
 - A materialized query table that is owned by the revokee uses this function in the definition.

- An index that is owned by the revokee uses this function.
- If *object-type* is JAR:
 - A function or stored procedure that is owned by the revokee uses this JAR in its EXTERNAL NAME.
 - Another JAR that is owned by the revokee uses this JAR in its Java path.
- If *object-type* is PROCEDURE:
 - A trigger definition that is owned by the revokee, contains a CALL statement with the name of this stored procedure.
- If *object-type* is SEQUENCE:
 - An SQL function is defined that references this sequence.
 - An SQL procedure is defined that references this sequence.
 - A view definition is defined that references this sequence.
 - A trigger is defined that references this sequence.
- If *object-type* is a global variable:
 - A function that is owned by the revokee references this global variable.
 - A view that is owned by the revokee references this global variable.
 - A trigger that is owned by the revokee references this global variable.

System action

The statement cannot be processed.

Programmer response

Remove the dependencies on this object. For example, drop the object that is identified by *dependent-object*. Then, reissue the request.

SQLSTATE

The SQLSTATE depends on the values of *object-type* and *dependent-type*:

Values	SQLSTATE
<i>object-type</i> : JAR	46003
<i>dependent-type</i> : FUNCTION or PROCEDURE	
<i>object-type</i> : JAR	4600C

Values	SQLSTATE
<i>dependent-type</i> : JAR	
All other cases	42893

Related concepts

-480 THE PROCEDURE *procedure-name* HAS NOT YET BEEN CALLED

Explanation

The procedure identified in a DESCRIBE PROCEDURE or an ASSOCIATE LOCATORS statement has not yet been called within the application process or the procedure has been called, but an explicit or implicit commit occurred before the statement.

System action

The statement cannot be processed.

Programmer response

Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location. Rerun the statements.

SQLSTATE

51030

-481 THE GROUP BY CLAUSE CONTAINS *element-1* NESTED WITHIN *element-2*

Explanation

The following types of nesting are not allowed within a GROUP BY clause:

- CUBE within CUBE, ROLLUP, or *grouping-expression-list*
- ROLLUP within CUBE, ROLLUP, or *grouping-expression-list*
- () - sometimes referred to a *grand-total* - within CUBE, ROLLUP, or *grouping-expression-list*

- GROUPING SETS within GROUPING SETS, CUBE, ROLLUP, or *grouping-expression-list*
- CUBE, ROLLUP, () - sometimes referred to a *grand-total*, GROUPING SETS within any function, CASE expression, or CAST specification

In some instances, the value "*"N" will be provided for *element-2*. In this case "*"N" represents one of CUBE, ROLLUP, GROUPING SETS, or *grouping-expression-list*.

System action

The statement cannot be processed.

Programmer response

Modify the GROUP BY clause to remove the nesting identified by *element-1*.

[group-by-clause \(Db2 SQL\)](#)

-482	THE PROCEDURE <i>procedure-name</i> RETURNED NO LOCATORS
-------------	---

Explanation

The procedure identified in an ASSOCIATE LOCATORS statement returned no result set locators.

System action

The statement cannot be processed.

Programmer response

Determine if result set locators are returned from the identified procedure by using the DESCRIBE PROCEDURE statement.

SQLSTATE

51030

-483	IN CREATE FUNCTION FOR <i>function-name</i> STATEMENT, THE NUMBER OF PARAMETERS DOES NOT MATCH THE NUMBER OF PARAMETERS OF THE SOURCE FUNCTION
-------------	---

Explanation

An attempt is being made to CREATE a user-defined function *function-name* which is sourced on another

function. One of the following situations has been identified:

- The SOURCE clause uses a function-name (input parameter list) to identify the source function, and the number of types in the list is different from the number of parameters of the function being created.
- The SOURCE clause uses different syntax to identify the source function, and the number of types of that function is different from the number of parameters of the function being created.

System action

The statement cannot be processed.

Programmer response

The number of parameters for the SOURCE function and for the function being created must be the same. The identification of the SOURCE function needs to be changed to:

- fix the input parameter list
- correct the function name or function specific name to identify the proper function.

It is also possible that the SQL path needs to be corrected in order for correct function resolution to occur.

SQLSTATE

42885

-487	<i>object-type object-name</i> ATTEMPTED TO EXECUTE AN SQL STATEMENT WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION
-------------	--

Explanation

A user-defined function or stored procedure *object-name* was invoked and attempted to execute SQL statements, but the function or procedure was created with the NO SQL option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions an procedures. The SQL data access option in effect does not allow for modifying data.

System action

The SQL statement cannot be executed.

Programmer response

Either use an ALTER statement to change the definition of the function or procedure to allow SQL statements, or remove the failing SQL statement from the external function or procedure.

SQLSTATE

38001

-490	NUMBER <i>number</i> DIRECTLY SPECIFIED IN AN SQL STATEMENT IS OUTSIDE THE RANGE OF ALLOWABLE VALUES IN THIS CONTEXT (<i>minval</i>, <i>maxval</i>)
-------------	--

Explanation

A number (*number*) was specified that is not valid in the context in which it was specified. The minimum allowed value in this context is *minval*. The maximum allowed value in this context is *maxval*. *n* must be within the range specified by *minval* and *maxval* (*minval* ≤ *n* ≤ *maxval*).

System action

The statement cannot be processed.

Programmer response

Change the value *n* to a valid value in the statement.

SQLSTATE

428B7

-491	CREATE STATEMENT FOR USER-DEFINED FUNCTION <i>function-name</i> MUST HAVE A RETURNS CLAUSE AND: THE EXTERNAL CLAUSE WITH OTHER REQUIRED KEYWORDS; THE PARAMETER NAMES; OR THE SOURCE CLAUSE
-------------	--

Explanation

A required clause is missing in the CREATE for the specified function.

function-name

The name of the function.

System action

The statement cannot be processed.

Programmer response

Add the missing clauses, and reissue the failing statement.

For an EXTERNAL function, specify EXTERNAL and one of the following options:

- LANGUAGE
- PARAMETER STYLE

For a user-defined SOURCE FUNCTION, specify the SOURCE clause.

SQLSTATE

42601

-492	THE CREATE FUNCTION FOR <i>function-name</i> HAS A PROBLEM WITH PARAMETER NUMBER <i>number</i>. IT MAY INVOLVE A MISMATCH WITH A SOURCE FUNCTION
-------------	---

Explanation

The parameter in position *number* of function *function-name* is in error.

function-name

The name of the function that cannot be created.

number

The position number of the function parameter that has the problem.

This error is issued in the following circumstances:

- The parameter of the source function is not castable to the corresponding parameter of the function being created.

If the parameter of the function being created is a table parameter, the corresponding parameter of the source function must also be a table parameter. Furthermore, the column numbers for both of the table parameters must be the same.

If the parameter of the function being created is not a table parameter, the corresponding parameter of the source function must also not be a table parameter.

- The parameter of the function that is being created is an array. A sourced function cannot be defined with an array parameter.

System action

The statement cannot be processed.

Programmer response

Possible corrections include:

- Identify a different source function.
- Change the data type of the parameter of the function being created so that the data type of the source function can be cast to this data type.
- Do not create a sourced function from a source function with array parameters.

SQLSTATE

42879

-495 **ESTIMATED PROCESSOR COST OF *estimate-amount1* PROCESSOR SECONDS (*estimate-amount2* SERVICE UNITS) IN COST CATEGORY *cost-category* EXCEEDS A RESOURCE LIMIT ERROR THRESHOLD OF *limit-amount* SERVICE UNITS**

Explanation

The prepare of a dynamic INSERT, UPDATE, MERGE, DELETE, or SELECT SQL statement resulted in a cost estimate that exceeded the error threshold value specified in the resource limit specification table (RLST). This error is also issued if the Db2 cost category value was "B", and the default action specified in the RLF_CATEGORY_B column in the RLST is to issue an error.

estimate-amount1

The cost estimate (in processor seconds) if the prepared INSERT, UPDATE, MERGE, DELETE or SELECT statement were to be executed.

estimate-amount2

The cost estimate (in service units) if the prepared INSERT, UPDATE, MERGE, DELETE or SELECT statement were to be executed.

cost-category

The Db2 cost-category for this SQL statement. The possible values are A or B.

limit-amount

The error threshold (in service units) specified in the RLFASUERR column of the RLST. If you entered any negative number for the RLFASUERR column, the value for *limit-amount* defaults to zero.

System action

The prepare of the dynamic INSERT, UPDATE, MERGE, DELETE, or SELECT statement was unsuccessful.

User response

If the warning is caused by an SQL statement that is consuming too much processor resource, attempt to rewrite the statement to perform more efficiently. Another option is to ask the administrator to increase the error threshold value in the RLST.

Programmer response

If this SQLCODE was returned because the cost category value is "B", it might be that the statement is using parameter markers or that some statistics are not available for the referenced tables and columns. Make sure the administrator has run the utility RUNSTATS on the referenced tables. It might also be that UDFs will be invoked when the statement is executed, or for INSERT, UPDATE, MERGE, or DELETE statements that triggers are defined on the changed table. Check the DSN_STATEMNT_TABLE or the IFCID 22 record for this statement to find the reasons this SQL statement has been put in cost category "B". If the program cannot be changed, or if statistics cannot be obtained, ask the administrator to change the value in the RLF_CATEGORY_B column in the RLST to "Y" which allows the statement to execute or "W" which returns a warning instead of an error.

SQLSTATE

57051

-496 **THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT REFERENCES A RESULT SET THAT WAS NOT CREATED BY THE CURRENT SERVER**

Explanation

The SQL statement cannot be executed because the current server is different from the server that called a stored procedure. The SQL statement can be any of the following:

- ALLOCATE CURSOR
- DESCRIBE CURSOR
- FETCH (using an allocated cursor)
- CLOSE (using an allocated cursor)

System action

The statement cannot be processed.

Programmer response

Connect to the server that called the stored procedure which created the result set before running the SQL statement that failed.

SQLSTATE

51033

-497 **THE MAXIMUM LIMIT OF
INTERNAL IDENTIFIERS HAS
BEEN EXCEEDED FOR DATABASE
*database-name***

Explanation

The SQL statement cannot be executed because an internal identifier limit has been exceeded for the database. The cause of this error is due to one of the following:

1. On a CREATE DATABASE statement, the limit of 65217 DBIDs has been exceeded.
2. For all other statements, the limit of 32767 OBIDs has been exceeded for that database.
3. If the database is a WORKFILE database, then one of the following reasons might apply:
 - The number of tablespaces in the WORKFILE database has exceeded the limit of 500.
 - The number of indexes defined on declared global temporary tables belonging to all agents on the local Db2 member has exceeded the limit of 10,000.
 - The number of tables and triggers belonging to a local agent exceeded the limit of 11,767. The tables in the WORKFILE database include work files, created global temporary tables, and declared global temporary tables.

System action

The statement cannot be processed.

Programmer response

Take the appropriate action as described in the following cases:

1. In the case of a DBID limit being exceeded, DROP all unused databases and issue a COMMIT.
2. In the case of an OBID limit being exceeded, take one of the following actions:
 - Specify a different database.
 - Drop all unused table spaces or indexes in the database and issue a COMMIT.

- If the database contains multi-table table spaces that contain a mix of used and unused tables, drop all unused tables and issue a COMMIT. Run the REORG utility on each affected table space, and then run the MODIFY RECOVERY utility to reclaim the dropped table OBIDs. For more information, see [Reclaiming space in the DBD \(Db2 Utilities\)](#).

SQLSTATE

54041

-499 **CURSOR *cursor-name* HAS
ALREADY BEEN ASSIGNED TO
THIS OR ANOTHER RESULT
SET FROM PROCEDURE *procedure-
name*.**

Explanation

An attempt was made to assign a cursor to a result set using the SQL statement ALLOCATE CURSOR and one of the following applies:

- The result set locator variable specified in the ALLOCATE CURSOR statement has been previously assigned to cursor *cursor-name*.
- Cursor *cursor-name* specified in the ALLOCATE CURSOR statement has been previously assigned to a result set from stored procedure *procedure-name*.

System action

The statement cannot be processed.

Programmer response

Determine if the target result set named in the ALLOCATE CURSOR statement has been previously assigned to a cursor.

If the result set has been previously assigned to cursor *cursor-name*, then either choose another target result set or call stored procedure *procedure-name* again and reissue the ASSOCIATE LOCATOR and ALLOCATE CURSOR statements.

If the result set has not been previously assigned to a cursor, the cursor *cursor-name* specified in the

ALLOCATE CURSOR statement has been previously assigned to some result set from stored procedure *procedure-name*. You can not assign cursor *cursor-name* to another result set, so you must specify a different cursor name in the ALLOCATE CURSOR statement.

Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location.

SQLSTATE

24516

-500	THE IDENTIFIED CURSOR WAS CLOSED WHEN THE CONNECTION WAS DESTROYED
-------------	---

Explanation

The FETCH, UPDATE, DELETE, or CLOSE statement identifies a closed cursor that was defined with the WITH HOLD option. The cursor was closed when the connection on which it was dependent was destroyed during a commit operation. The connection was destroyed because the application process placed it in the released state, or the application plan was bound with the DISCONNECT(AUTOMATIC) option.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions:

- If you want the cursor closed, change the application program so that the cursor is not referenced in the closed state.
- If you want the cursor open and the connection was placed in the released state by the application program, change the program so that the connection is not placed in the released state until the cursor is explicitly closed.
- If you want the cursor open and the connection was placed in the released state as a result of the DISCONNECT(AUTOMATIC) option, rebind the plan using DISCONNECT(CONDITIONAL).

Correct the error in the application, rebind the plan, and resubmit the job.

SQLSTATE

24501

-501	THE CURSOR IDENTIFIED IN A FETCH OR CLOSE STATEMENT IS NOT OPEN
-------------	--

Explanation

The application program attempted either to fetch using a cursor or to close a cursor at a time when the specified cursor was not open.

System action

The statement cannot be processed.

Programmer response

Check whether the cursor was closed by one of the following situations. After a cursor is closed, any subsequent FETCH or CLOSE statement for the cursor receives SQLCODE -501.

- A previous CLOSE statement
- A commit or rollback operation
- An error when accessing an unavailable object, such as -679, -901, -904, -909, -910, -911, -913, or -952
- An error when attempting to update an object, such as -404 or -652
- An arithmetic error when processing an aggregate function, such as -802
- An error during predicate processing

Correct the logic of the application program to ensure that the cursor is open at the time the FETCH or CLOSE statement is processed.

-502 THE CURSOR IDENTIFIED IN AN OPEN STATEMENT IS ALREADY OPEN

Explanation

The application program attempted to execute an OPEN statement for a cursor that was already open.

System action

The statement cannot be processed. The cursor was unchanged (that is, it was not 'reopened').

Programmer response

Correct the logic of the application program to ensure that it does not attempt to execute an OPEN statement for a cursor that is already open.

SQLSTATE

24502

-503 A COLUMN CANNOT BE UPDATED BECAUSE IT IS NOT IDENTIFIED IN THE UPDATE CLAUSE OF THE SELECT STATEMENT OF THE CURSOR

Explanation

The application program attempted to update (using a cursor) a value in a column of the object table that was not identified in the FOR UPDATE clause in the cursor declaration.

Any column that is to be updated must be identified in the FOR UPDATE clause of the cursor declaration.

System action

The statement cannot be processed. No data was updated in the object table.

Programmer response

Correct the application program. If the column is to be updated, its name must be added to the FOR UPDATE clause of the cursor declaration.

SQLSTATE

42912

-504 CURSOR NAME *cursor-name* IS NOT DECLARED

Explanation

Cursor *cursor-name* was referenced in an SQL statement, and one of the following is true:

- Cursor *cursor-name* was not declared (using the DECLARE CURSOR statement) or allocated (using the ALLOCATE CURSOR statement) in the application program or SQL routine before it was referenced.
- Cursor *cursor-name* was referenced in a positioned UPDATE or DELETE statement which is not a supported operation for an allocated cursor.
- Cursor *cursor-name* was allocated, but a CLOSE cursor statement naming *cursor-name* was issued and deallocated the cursor before this cursor reference.
- Cursor *cursor-name* was allocated, but a ROLLBACK operation occurred and deallocated the cursor before this cursor reference.
- Cursor *cursor-name* was allocated, but its associated cursor declared in a stored procedure was not declared WITH HOLD, and a COMMIT operation occurred and deallocated the cursor before this cursor reference. The COMMIT operation can be either explicit (the COMMIT statement) or implicit (that is, a stored procedure defined as COMMIT_ON_RETURN = 'Y' was called before this cursor reference).
- Cursor *cursor-name* was allocated, but its associated stored procedure was called again since the cursor was allocated, new result sets were returned, and cursor *cursor-name* was deallocated.
- The declaration of a cursor *cursor-name* was not in scope for the reference to a cursor named *cursor-name*.

System action

The statement cannot be processed.

Programmer response

Check the application program or SQL routine for completeness and for a possible spelling error in the cursor declaration or allocation. The declaration for or allocation of a cursor must appear in an application program or SQL routine before SQL statements that reference the cursor.

If the *cursor-name* was <UNKNOWN>, the cursor was not successfully declared or allocated. This error can occur if SQL(Db2) was used, and a warning message was issued during precompilation. Check the precompile output for warning messages on the DECLARE CURSOR or ALLOCATE CURSOR statement, and correct the statement.

For an allocated cursor, if an implicit or explicit COMMIT, ROLLBACK, or CLOSE occurred since the cursor was successfully allocated, modify the application program logic to do one of the following actions:

- After the COMMIT, ROLLBACK, or CLOSE operation, call the associated stored procedure again, and reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.
- For COMMIT, declare the associated cursor in the stored procedure WITH HOLD so the COMMIT operation does not deallocate the cursor.

For an allocated cursor, if the associated stored procedure was called again and new result sets were returned since the cursor was allocated, reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.

SQLSTATE

34000

-507	THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT OPEN
-------------	--

Explanation

The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not open.

System action

The statement cannot be processed. No update or delete was performed.

Programmer response

Check whether the cursor was closed by one of the following situations. After a cursor is closed, any subsequent UPDATE or DELETE statement for that cursor receives SQLCODE -507.

- A previous CLOSE statement
- A commit or rollback operation
- An error when accessing an unavailable object, such as -679, -901, -904, -909, -910, -911, -913, or -952
- An error when attempting to update an object, such as -404 or -652
- An arithmetic error when processing an aggregate function, such as -802
- An error during predicate processing

Correct the logic of the application program to ensure that the specified cursor is open at the time the UPDATE or DELETE statement is executed.

SQLSTATE

24501

-508	THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT POSITIONED ON A ROW OR ROWSET THAT CAN BE UPDATED OR DELETED
-------------	--

Explanation

The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not positioned on a row or rowset of the object table. The cursor must be positioned on the row that is to be updated or deleted.

This can occur in the following situations:

- The cursor is no longer positioned on the row because another cursor in the same application program deletes the row or updates an index column. This includes deletes and index column updates that are performed as a result of rolling back to a savepoint.
- A sensitive dynamic cursor with the FOR ROW *n* OF ROWSET clause is specified, and the specified row of the current rowset has been updated or deleted.

System action

The statement cannot be processed. No data was updated or deleted, and the cursor position is unchanged.

Programmer response

Correct the logic of the application program to ensure that the cursor is correctly positioned on the intended row of the object table before the UPDATE or DELETE statement is executed. Note that for single row or non-rowset cursors, the cursors are not positioned on a row if FETCH returned SQLCODE +100.

SQLSTATE

24504

Related reference

[DELETE statement \(Db2 SQL\)](#)

[FETCH statement \(Db2 SQL\)](#)

Related information

+100

ROW NOT FOUND FOR FETCH, UPDATE OR DELETE, OR THE RESULT OF A QUERY IS AN EMPTY TABLE

-509

THE TABLE IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT THE SAME TABLE DESIGNATED BY THE CURSOR

Explanation

The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement where the table named in that statement did not match the name of the table specified in the declaration for that cursor.

System action

The statement cannot be processed. The update or delete was not performed.

Programmer response

Correct the application program to ensure that the table identified in the UPDATE or DELETE statement is the same table identified in the declaration for the cursor.

SQLSTATE

42827

-510

THE TABLE DESIGNATED BY THE CURSOR OF THE UPDATE OR DELETE STATEMENT CANNOT BE MODIFIED

Explanation

The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement against a table or view that cannot be updated or deleted. This error can be returned for the following reasons:

- A delete was performed from a read-only view or for an update in which the cursor was not defined with the FOR UPDATE clause.
- A target table exists at a remote location and Db2 has employed block fetching because you explicitly declared the cursor FOR FETCH ONLY, or because the application is bound CURRENTDATA(NO) and the cursor is ambiguous.
- Db2 has employed parallelism to execute the SELECT statement associated with the cursor named

in a DELETE WHERE CURRENT OF cursor statement, or a DELETE WHERE CURRENT OF is issued against a row which Db2 cannot guarantee to have not been modified by another application since the time the cursor was positioned upon it (in accordance with ISO(CS)) semantics for an ambiguous cursor in an application bound CURRENTDATA(NO)).

- The cursor references a view on which an INSTEAD OF UPDATE trigger is defined, even if the view is an updatable view.

System action

The statement cannot be processed. No data was updated or deleted in the object table or view.

Programmer response

The requested UPDATE or DELETE cannot be performed.

For a remote table, modify the DECLARE CURSOR and then rebind the PLAN.

For a cursor that uses parallelism, disable parallelism for the query by using the DEGREE(1) BIND option for static SQL or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

For an ambiguous cursor in an application bound CURRENTDATA(NO), either make the cursor unambiguous (declare it FOR UPDATE OF), or rebind the application CURRENTDATA(YES).

For a view with INSTEAD OF triggers, drop those triggers.

-511

THE FOR UPDATE CLAUSE CANNOT BE SPECIFIED BECAUSE THE RESULT TABLE DESIGNATED BY THE SELECT STATEMENT CANNOT BE MODIFIED

Explanation

The result table of the SELECT statement cannot be updated. This error can occur if the SELECT specifies more than one table or view in the FROM clause, if the SELECT list contains a built-in function or DISTINCT,

or if the statement contains an ORDER BY or GROUP BY or HAVING clause. This error can also occur if a view is specified in the FROM clause and the view cannot be updated, or if a data change statement is specified within the SELECT statement, for example: SELECT from INSERT.

System action

The statement cannot be processed.

Programmer response

Updates cannot be performed on the result table as it is specified.

SQLSTATE

42829

Related reference

- [read-only-clause \(Db2 SQL\)](#)
- [update-clause \(Db2 SQL\)](#)

-512	STATEMENT REFERENCE TO REMOTE OBJECT IS INVALID
-------------	--

Explanation

One of the following conditions exists:

- The statement refers to multiple locations.
- A statement with a remote reference is being EXPLAINED either by a dynamic EXPLAIN statement or the EXPLAIN(YES) option.
- An alias is used incorrectly.
- A three-part name is implicitly or explicitly used in a statement that is not supported by the Db2 private protocols.
- A three-part name is implicitly or explicitly used in a triggered statement.
- A PREPARE statement contains an ATTRIBUTES clause. This is not supported by the Db2 private protocols.
- A three-part name with a remote reference is not allowed in a body of an SQL function.
- A three-part name with a remote reference is specified in a TRANSFER OWNERSHIP statement.

System action

The statement cannot be processed.

Programmer response

If the object cannot be meaningfully eliminated from the statement, see your database administrator for other ways to obtain the data required.

If the remote object reference is in a triggered SQL statement, you can instead invoke a user-defined function or a stored procedure from the trigger and access the remote object from the function or stored procedure.

SQLSTATE

56023

-513	INVALID USE OF <i>alias-name</i>
-------------	---

Explanation

The object indicated by *alias-name* can be the name of an alias that was being created, or the name of an alias that was used in an invalid context. An alias cannot be defined on another alias at the same server.

System action

The statement cannot be processed.

Programmer response

Modify the SQL statement to refer to the name of an object of a supported type.

SQLSTATE

42924

Related concepts

[Aliases \(Introduction to Db2 for z/OS\)](#)

[CREATE ALIAS statement \(Db2 SQL\)](#)

-514	THE CURSOR <i>cursor-name</i> IS NOT IN A PREPARED STATE
-------------	---

Explanation

The application program has tried to use a cursor, 'cursor-name,' that is not in a prepared state. The cursor is associated with a statement that:

1. Was never prepared.
2. Was invalidated by a commit or rollback operations

System action

The statement cannot be processed.

Programmer response

For case 1, ensure that you prepare the statement that is named in the DECLARE CURSOR statement for 'cursor-name' before you try to open the cursor.

For case 2, take one of the following actions:

- Use the WITH HOLD option of DECLARE CURSOR.
- Do not execute a commit or rollback operation until you are finished using the cursor.
- Prepare the statement again after the commit or rollback.

SQLSTATE

26501

Related reference

[DECLARE CURSOR statement \(Db2 SQL\)](#)

[EXPLAIN statement \(Db2 SQL\)](#)

[Explicit system privileges \(Managing Security\)](#)

-516	THE DESCRIBE STATEMENT DOES NOT SPECIFY A PREPARED STATEMENT
-------------	---

Explanation

An attempt was made to execute a DESCRIBE statement that did not refer to a statement that had been successfully prepared at the current server.

System action

The statement cannot be processed.

Programmer response

Verify that the statement name specified in the DESCRIBE statement is a statement that has been prepared at the current server.

SQLSTATE

26501

-517	CURSOR <i>cursor-name</i> CANNOT BE USED BECAUSE ITS STATEMENT NAME DOES NOT IDENTIFY A PREPARED SELECT STATEMENT
-------------	--

Explanation

The cursor 'cursor-name' could not be used as specified because the prepared statement named in the declaration for the cursor was not a SELECT statement.

System action

The statement cannot be processed.

Programmer response

Verify that the statement-name is specified correctly in the PREPARE statement and the DECLARE CURSOR statement for cursor 'cursor-name'. Alternatively, correct the application program logic to ensure that only prepared SELECT statements are used in association with cursor declarations.

SQLSTATE

07005

-518	THE EXECUTE STATEMENT DOES NOT IDENTIFY A VALID PREPARED STATEMENT
-------------	---

Explanation

One of the following conditions exists:

- The statement identified in the EXECUTE statement has not been prepared.
- The statement identified in the EXECUTE statement identifies a SELECT, or ASSOCIATE LOCATORS statement
- The statement identified in the EXECUTE IMMEDIATE statement identifies a SELECT or ASSOCIATE LOCATORS statement.
- The statement identified in the EXECUTE statement is a data definition statement written in native SQL language, and that statement has already been executed.
- A COMMIT or ROLLBACK statement was issued. The COMMIT or ROLLBACK operation destroyed the prepared version of the statement.

System action

The statement cannot be processed.

Programmer response

Ensure that you prepare the statement prior to EXECUTE. Also, ensure that the statement prepared statement is not:

- A SELECT statement.
- An ASSOCIATE LOCATORS statement.

If the statement is a data definition statement written in native SQL language and that statement has already been executed, you must prepare the statement again before it can be executed again.

If the prepared statement is issued after a COMMIT or ROLLBACK statement, take one of the following actions:

- Prepare the statement again.
- Bind the application package with the KEEP_DYNAMIC(YES) option to keep the prepared statement after a COMMIT or ROLLBACK statement.
- Bind the application package with RELEASE(DEALLOCATE) to keep a prepared statement that references declared temporary tables after a COMMIT statement.

SQLSTATE

07003

-519	THE PREPARE STATEMENT IDENTIFIES THE SELECT STATEMENT OF THE OPENED CURSOR <i>cursor-name</i>
------	--

Explanation

The application program has attempted to PREPARE (actually, re-PREPARE) the SELECT statement for the specified cursor at a time when that cursor was already open.

System action

The statement cannot be processed. The cursor was not affected.

Programmer response

Correct the logic of the application program so that it does not attempt to re-PREPARE the SELECT statement for a cursor when that cursor is open.

SQLSTATE

24506

-525	THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS
------	--

IN ERROR AT BIND TIME FOR SECTION = sectno PACKAGE = pkgname CONSISTENCY TOKEN = contoken

Explanation

One of the following:

- The statement was in error when the package was bound, but the error was ignored then because the option SQLERROR (CONTINUE) was used. Since the statement contains an error, it cannot be executed.
- The statement might not be an executable statement at this location, or might only be executable by a Db2 application requester (for example, DECLARE TABLE in an application running on OS/2 causes this message).

The variables are:

sectno
Section number
pkgname
locid.collid.pkgid
contoken
Consistency token in hexadecimal

System action

The statement cannot be processed.

Programmer response

If the SQL statement is not supposed to execute at the indicated location, then correct the program so that the statement in error does not execute at that location. Precompile, compile, and bind replace the package. If the SQL statement is supposed to execute at the indicated location, correct the problem found when it was bound and bind the package over using BIND with ACTION(REPLACE). If multiple versions of the package have been bound, issue the following SELECT statement to determine which version has the error: SELECT VERSION FROM locid.SYSIBM.SYSPACKAGE WHERE LOCATION = ' ' AND COLLID = 'collid' AND NAME = 'pkgid' AND HEX(CONTOKEN) = 'contoken'

Where:

locid
Location name
collid
Collection id
pkgid
Program name

SQLSTATE

51015

-526 **THE REQUESTED OPERATION OR USAGE DOES NOT APPLY TO *table-type* TEMPORARY TABLE *table-name***

Explanation

Db2 assumes that the SQL statement being executed refers to a *created* or *declared* temporary table, named *table-name*, and the requested operation or usage in the statement is not allowed on the temporary table.

table-type

CREATED or DECLARED

CREATED is for a temporary table defined by the CREATE GLOBAL TEMPORARY TABLE statement.

DECLARED is for a temporary table defined by the DECLARE GLOBAL TEMPORARY TABLE statement.

table-name

Qualified name of the temporary table.

This error might be issued for the following reasons when *table-type* is CREATED:

- If the SQL statement is a DELETE statement that specifies the fetch-clause, remove the fetch-clause from the DELETE statement.
- A KEY LABEL clause is specified

System action

The statement cannot be processed.

Programmer response

Modify the SQL statement to ensure that the object references are not to the indicated type of temporary table

If *table-type* is DECLARED and you intended *table-name* to refer to an existing persistent base table, you must perform one of the following actions:

- Recreate the persistent base table *table-name* with a different schema qualifier
- In the same application process, issue a DROP TABLE for *table name* followed by a COMMIT to drop the declared temporary table and afterwards be able to reference the persistent base table with the same *table-name* in the same application process
- Remove the DECLARE GLOBAL TEMPORARY TABLE statement from the application process to use the persistent base table with the same *table-name*

If *table-type* is CREATED, perform the following action and issue the statement again:

- If the SQL statement is a DELETE statement that specifies the fetch-clause, remove the fetch-clause from the DELETE statement.
- If the SQL statement contains a KEY LABEL clause, remove the key label specification.

SQLSTATE

42995

-530 **THE INSERT OR UPDATE VALUE OF FOREIGN KEY *constraint-name* IS INVALID**

Explanation

An insert or update operation attempted to place a value in a foreign key of the object table; however, this value was not equal to some value of the parent key of the parent table.

When a row is inserted into a dependent table, the insert value of a foreign key must be equal to the value of the parent key of some row of the parent table in the associated relationship.

When the value of the foreign key is updated, the update value of a foreign key must be equal to the value of the parent key of some row of the parent table of the associated relationship.

The following additional rules apply for a temporal referential constraint:

- When a row is inserted into a dependent table, the BUSINESS_TIME value in the child table must be contained in a BUSINESS_TIME period in the parent table that is represented by the union of BUSINESS_TIME periods of one or more contiguous matching rows in the parent table.
- When the value of the foreign key is updated, the update value of the foreign key must be contained in a BUSINESS_TIME period in the parent table that is represented by the union of BUSINESS_TIME periods of one or more contiguous matching rows in the parent table.

System action

The UPDATE, MERGE, or INSERT statement cannot be executed. The object table is unchanged.

Programmer response

Examine the insert or update value of the foreign key first, and then compare it with each of the parent key

values of the parent table to determine the cause of the problem.

SQLSTATE

23503

-531 **PARENT KEY IN A PARENT ROW CANNOT BE UPDATED BECAUSE IT HAS ONE OR MORE DEPENDENT ROWS IN RELATIONSHIP *constraint-name***

Explanation

For plans and packages bound beginning with Version 5 or dynamic SQL, a multi-row update of a parent key attempted to remove a parent key value on which a foreign key was dependent.

For plans and packages bound prior to Version 5, an UPDATE operation attempted to update a primary key in the specified row of the object table; however, the primary key in the specified row had dependent rows associated with it. The value of a primary key in a parent row cannot be updated if the parent row has any dependent rows.

System action

The UPDATE statement cannot be executed. The object table is unchanged.

Programmer response

Examine the parent key of the object table and the foreign key of the dependent table to determine if the value of the specified row of the parent key should be changed. If this does not expose the problem, examine the contents of the object table and the dependent table to determine the cause of the problem.

-532

THE RELATIONSHIP *constraint-name* RESTRICTS THE DELETION OF ROW WITH RID X *rid-number*

Explanation

A DELETE operation attempted to delete a specified parent row in the object table and all related descendent rows in the descendent tables. However, a delete rule of RESTRICT or NO ACTION was specified for one or more descendent tables.

A row of the table cannot be deleted because it has a dependent in a relationship with a delete rule of RESTRICT or NO ACTION or the deletion cascades to a row which is a dependent in a relationship with a delete rule of RESTRICT or NO ACTION.

If the statement that failed is an ALTER TABLE with ALTER PART ROTATE FIRST TO LAST, then there is a referential constraint that is defined with DELETE RESTRICT on the table, and the data in the partition that is to be reused cannot be deleted because of the referential constraint.

System action

The DELETE statement cannot be executed. The contents of the object table are unchanged.

Programmer response

Examine the delete rule for all descendent tables to determine the cause of the problem. The specific tables involved can be determined from the relationship *constraint-name*. The specific descendent row is known by RID X *rid-number*.

SQLSTATE

23504

-533

INVALID MULTIPLE-ROW INSERT

Explanation

An INSERT operation with a subselect attempted to insert multiple rows into a self-referencing table.

The subselect of the INSERT operation should return no more than one row of data.

System action

The INSERT statement cannot be executed. The contents of the object table are unchanged.

Programmer response

Examine the search condition of the subselect to make sure that no more than one row of data is selected.

SQLSTATE

21501

-534	THE PRIMARY KEY CANNOT BE UPDATED BECAUSE OF MULTIPLE-ROW UPDATE
-------------	---

Explanation

An UPDATE operation attempted to update a primary key on multiple rows of the object table.

An UPDATE statement updating the primary key cannot be used to update more than one row of the object table.

Note: This SQLCODE will only be issued for plans and packages bound prior to Version 5. SQLCODE -534 will not be issued for dynamic SQL or plans and packages bound with Version 5 or later releases.

System action

The UPDATE statement cannot be executed. The contents of the object table are unchanged.

Programmer response

Examine the search condition of the UPDATE statement to make sure that no more than one row of the object table is selected to be updated.

-536	THE DELETE STATEMENT IS INVALID BECAUSE TABLE <i>table-name</i> CAN BE AFFECTED BY THE OPERATION
-------------	---

Explanation

A DELETE operation with the indicated table referenced in a subquery was attempted.

If 'T' is the object table of the DELETE, the indicated table is one of the following:

- A dependent of 'T' in a relationship with a delete rule of CASCADE or SET NULL
- A dependent of another table in a relationship with a delete rule of CASCADE or SET NULL in which deletions from 'T' can cascade to that table.

System action

The DELETE statement cannot be processed. The contents of the object table are unchanged.

Programmer response

Do not attempt to reference a table in a subquery of a DELETE statement when the table can be affected by the DELETE statement.

SQLSTATE

42914

-537	THE PRIMARY KEY, FOREIGN KEY, UNIQUE, OR PARTITIONING KEY CLAUSE IDENTIFIES COLUMN <i>column-name</i> MORE THAN ONCE
-------------	---

Explanation

PRIMARY KEY, FOREIGN KEY, UNIQUE, or PARTITIONING KEY can each be followed by a list of column names. The statement violates the rule that no column name can appear more than once in any such list.

System action

The statement cannot be processed.

Programmer response

Correct the statement to specify unique names for each column.

SQLSTATE

42709

-538	FOREIGN KEY <i>name</i> DOES NOT CONFORM TO THE DESCRIPTION OF A PARENT KEY OF TABLE <i>table-name</i>
-------------	---

Explanation

The definition of the indicated foreign key does not conform to the description of parent key of the indicated table due to one of the following reasons:

- The referenced parent key has not been defined as a primary key or a unique key.
- The keys do not have the same number of columns.
- The description of the keys are not identical. The requirement for identical descriptions includes data type, length attribute, and field procedure.
- PERIOD BUSINESS_TIME was specified for the child key in the FOREIGN KEY clause, but PERIOD BUSINESS_TIME was not specified in the parent key in the REFERENCES clause.
- PERIOD BUSINESS_TIME was specified for the parent key in the REFERENCES clause, but PERIOD BUSINESS_TIME was not specified in the child key in the FOREIGN KEY clause.
- PERIOD BUSINESS_TIME was specified for both the parent and child keys, but the semantic of the BUSINESS_TIME period in the two tables is not the same.

name is the constraint-name specified in the foreign key clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System action

The statement cannot be processed.

Programmer response

Correct the statement so that the description of the foreign key references a primary key or unique key, or so that the description of the foreign key conforms to that of a parent key of the indicated table.

SQLSTATE

42830

-539 **TABLE *table-name* DOES NOT HAVE A PRIMARY KEY**

Explanation

Db2 cannot perform the CREATE or ALTER TABLE statement because the indicated table does not have a primary key. Thus, the primary key cannot be dropped, or the table cannot be defined as a parent in a referential constraint.

System action

The statement cannot be processed.

Programmer response

Correct the statement to reference a table with a primary key, or define a primary key with ALTER TABLE ADD PRIMARY KEY before referencing the table in a FOREIGN KEY clause.

SQLSTATE

42888

-540 **THE DEFINITION OF TABLE *table-name* IS INCOMPLETE BECAUSE IT LACKS A PRIMARY INDEX OR A REQUIRED UNIQUE INDEX**

Explanation

An attempt was made to use table *table-name* in a CREATE or ALTER statement to define a foreign key or a clone table, or it was referenced in an SQL manipulative statement. However, the current status of the table is incomplete, so it cannot be used as specified. The definition of the table may be incomplete because the table was defined with a PRIMARY KEY clause, a UNIQUE clause, a referential constraint, or a ROWID column with the GENERATED BY DEFAULT attribute. The definition of the table is incomplete, and it cannot be used until a required index is defined for:

- the primary key (the primary index)
- a ROWID column
- for each set of columns in any UNIQUE clause (the required unique indexes).
- a foreign key of a temporal referential constraint

An attempt was made to use the table in a FOREIGN KEY clause or in an SQL manipulative statement.

System action

The statement cannot be processed.

Programmer response

Define a primary index or a required unique index on the table before referencing it.

SQLSTATE

57001

-541 **DUPLICATE TEMPORAL FOREIGN KEY CONSTRAINT EXISTS FOR TABLE *table-name* (*constraint name*).**

Explanation

An attempt was made to add a FOREIGN KEY constraint. The table already has a constraint that is a duplicate of the constraint being added. A temporal FOREIGN KEY constraint is a duplicate if the columns in the constraint are the same as in another temporal foreign key constraint. An attempt was made to use the table in a FOREIGN KEY clause or in an SQL manipulative statement.

System action

The statement cannot be processed.

Programmer response

The constraint is already in effect.

SQLSTATE

42891

-542

column-name CANNOT BE A COLUMN OF A HASH KEY, PRIMARY KEY, A UNIQUE CONSTRAINT, OR A PARENT KEY BECAUSE IT CAN CONTAIN NULL VALUES

Explanation

A column that is identified in a HASH KEY, a PRIMARY KEY, a UNIQUE constraint clause, or a parent key (through a REFERENCES clause) is defined to allow null values. Null values are not permitted for these keys and clauses.

System action

The statement cannot be processed.

Programmer response

In the case of a column identified in a HASH KEY, a PRIMARY KEY or a UNIQUE constraint clause, correct the statement and resubmit it.

In the case of a column identified in a REFERENCES clause:

1. Drop the parent table.
2. Recreate it with referenced columns defined as NOT NULL.
3. Resubmit the statement.

SQLSTATE

42831

-543

A ROW IN A PARENT TABLE CANNOT BE DELETED BECAUSE THE CHECK CONSTRAINT *check-constraint* RESTRICTS THE DELETION

Explanation

The delete operation cannot be executed because the target table is a parent table and is connected with a referential constraint to a dependent table with a delete rule of SET NULL. However, a check constraint defined on the dependent table restricts the column from containing a null value.

System action

The DELETE statement was not executed. The contents of the tables are unchanged.

Programmer response

Examine the foreign key and its delete rule in the dependent table and the conflicting check constraint. Change either the delete rule or the check constraint so that they do not conflict.

SQLSTATE

23511

-544

THE CHECK CONSTRAINT SPECIFIED IN THE ALTER TABLE STATEMENT CANNOT BE ADDED BECAUSE AN EXISTING ROW VIOLATES THE CHECK CONSTRAINT

Explanation

An existing row violates the check constraint specified in the ALTER TABLE statement.

System action

The statement cannot be processed. The check constraint definition is not added to the table. The table definition is unchanged.

Programmer response

Examine the check constraint definition that was specified in the ALTER TABLE statement and the data in the table to determine why the ALTER TABLE statement was rejected.

You can determine which rows violated the check constraint by using the SELECT statement, negating

the check constraint in the WHERE clause. For example:

```
SELECT * FROM table WHERE (NOT (check-  
condition));
```

SQLSTATE

23512

-545	THE REQUESTED OPERATION IS NOT ALLOWED BECAUSE A ROW DOES NOT SATISFY THE CHECK CONSTRAINT <i>check-constraint</i>
------	--

Explanation

Check constraint violations occurred on an INSERT, UPDATE, or MERGE statement. The resulting row violated the check constraint definition on the table.

System action

The INSERT, UPDATE, or MERGE statement cannot be executed. The contents of the table are unchanged.

Programmer response

Examine the data and the check constraint definition in the SYSIBM.SYSCHECKS catalog table to determine why the INSERT, MERGE, DELETE, or UPDATE statement was rejected. The data must be changed to satisfy the check constraint.

SQLSTATE

23513

-546	THE CHECK CONSTRAINT <i>constraint-name</i> IS INVALID
------	--

Explanation

A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:

```
small integer < large integer < decimal  
< single precision float  
< double precision float
```

- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a DECFLOAT column.
- The constraint definition refers to a Db2 11 Unicode column in an EBCDIC table.
- The constraint definition refers to a built-in or user-defined function.
- The constraint definition uses a cast function that requires conversion of the data. The only functions that are allowed in a check constraint are cast functions that do not require conversion of the data.
- The constraint definition contains a global variable.
- The constraint contains an XML column
- The constraint definition contains an XMLQuery expression.

constraint-name

The name of the check constraint.

System action

The statement cannot be processed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer response

Correct the check constraint definition and execute the statement again.

SQLSTATE

42621

Related reference

- [CREATE TABLE statement \(Db2 SQL\)](#)
- [ALTER TABLE statement \(Db2 SQL\)](#)

-548	A CHECK CONSTRAINT THAT IS DEFINED WITH <i>column-name</i> IS INVALID
------	---

Explanation

A check constraint in the CREATE TABLE or ALTER TABLE statement is not valid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:

```
small integer < large integer
< big integer < decimal
< single precision float
< double precision float
```

- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a ROWID column.
- The constraint definition refers to a LOB column.
- The constraint definition refers to a DECFLOAT column.
- The constraint definition refers to a Db2 11 Unicode column in an EBCDIC table.
- The constraint contains an XML column.
- The constraint definition contains an XMLQuery expression.
- An XMLQUERY or XMLEXISTS argument list contained two arguments with the same name.
- The generated column expression references a column for a column mask is defined.
- The constraint definition contains a built-in function that depends on the value of a special register.
- The constraint definition contains a global variable.

System action

The statement cannot be processed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer response

Correct the check constraint definition, and execute the statement again.

SQLSTATE

42621

[CREATE TABLE statement \(Db2 SQL\)](#)

-549

THE statement STATEMENT IS NOT ALLOWED FOR *object_type1* *object_name* BECAUSE THE BIND OPTION DYNAMICRULES(RUN) IS NOT IN EFFECT FOR *object_type2*

Explanation

A program attempted to issue the indicated SQL statement that is one of several SQL statements that cannot be issued from a plan or package for which the option DYNAMICRULES(RUN) is not in effect. Those SQL statements are:

- Dynamic GRANT statement
- Dynamic REVOKE statement
- Dynamic ALTER statement
- Dynamic CREATE statement
- Dynamic DROP statement

The indicated SQL statement is bound to one of the following:

- The named plan or package that was not bound with the option DYNAMICRULES(RUN)
- The named package that was not bound with the DYNAMICRULES option, but is appended to a plan that was not bound with DYNAMICRULES(RUN)

statement

The SQL statement in error

object_type1

PACKAGE or DBRM

object_name

If *object_type1* is PACKAGE, *object_name* is the name of the package in the format 'location-id.collection-id.package-id'.

If *object_type1* is DBRM, *object_name* is the name of the DBRM in the format 'plan-name DBRM-name'.

object_type2

PLAN or PACKAGE

If *object_type1* is PACKAGE, *object_type2* can be either PACKAGE or PLAN (whichever is bound with a DYNAMICRULES value other than RUN).

If *object_type1* is DBRM, *object_type2* is PLAN.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions to correct the error:

- If the SQL statement is embedded, remove it, precompile and compile the application program again, and reissue the BIND command with the appropriate DYNAMICRULES option.
- Use the SQL statement with a package or plan that is bound with DYNAMICRULES(RUN).
- Issue the REBIND command with the DYNAMICRULES(RUN) option for the plan or package to which the SQL statement is bound.

Determine if either the SQL statement should be removed from the program or the plan or package should be rebound with the DYNAMICRULES(RUN) option.

-551 ***auth-id* DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION *operation* ON OBJECT *object-name***

Explanation

Authorization IDs or roles were checked for authorization to perform an operation on a Db2 object. None of the authorization IDs or roles were authorized to perform the operation.

auth-id

One of the following values:

- A list of one to three authorization IDs that were checked for authorization to perform the operation
- A role name

operation

The operation for which authorization was checked.

object-name

The name of the object on which the operation was to be performed.

Some of the situations in which this error occurs are:

- For an INSERT, DELETE, or UPDATE statement, the target object is a read-only view.
- For a CREATE TABLE or CREATE VIEW statement, the authorization ID of the user who issues the CREATE statement does not match the schema name of the object that is to be created.

You can create a table with a schema name that is different from your authorization ID only if your authorization ID has SYSADM, DBADM, or DBCTRL authority. You can create a view from an with a schema name that is different from your authorization ID only if your authorization ID has SYSADM authority.

If you are using a trusted context, the *auth-id* value contains a role name if a role was in effect when the condition was encountered, and the authorization checking was performed against the role. In that case, the *auth-id* value is in the following format:

ROLE: *role-name*

If you use the RACF access control module for authorization checking, *auth-id* might be different from the value that is reported in message ICH408I. The ID that is reported in message ICH408I is the user ID that RACF used to check the privilege.

In addition to the situations mentioned previously, this error can occur for the following situations:

- When *operation* is GRANT ***, the keyword ALL was used in the GRANT statement, but the grantor *auth-id* does not have any privilege to grant.
- When *operation* is GRANT (table or view privileges) and the specified privilege cannot be granted on a view or auxiliary table.
- If *operation* is DROP PACKAGE, the *object-name* consists of the collection ID, the package name, and the consistency token. The consistency token uniquely identifies the version of the package that the user does not have authorization to drop.
- If *operation* is USAGE OF DISTINCT TYPE, USAGE OF USER-DEFINED TYPE, or USAGE OF JAR, the *object-name* identifies, respectively, the DISTINCT TYPE, USER-DEFINED TYPE, or JAR for which the *auth-id* lacks USAGE privilege.
- If *operation* is ALTER JAR, the *auth-id* lacks ALTERIN privilege on the schema of the JAR *object-name*.

- If this error occurs while Db2 is creating or altering a table that involves referential constraints, this error message reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, DROP PRIMARY KEY, or DROP UNIQUE operation. The *object-name* identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.
- If this error occurs for a distributed SQL request, one of the following conditions can occur:
 - If authorization ID translation is in effect for either the requesting Db2 site or the serving (responding) Db2 site, then *auth-id* is the translated authorization ID. Refer to Part 3 (Volume 1) of the Db2 Administration Guide for information on authorization ID translation.
 - If an alias name was used in the SQL statement, the *object-name* is the resolved remote table name or view name.
- If this error occurs during invocation of a routine, the authorization ID *auth-id* does not have the EXECUTE privilege on any candidate routine in the SQL path. The variable for *object-name* is the name of a candidate routine in the SQL path.
- An object does not exist, and the CURRENT RULES special register is set to STD.
- This error might occur for packages that are bound with the DYNAMICRULES(BIND) option when authorization caching, statement caching, or both are enabled and if the following conditions exist:
 - The access control authorization exit routine is active
 - The AUTHEXIT_CHECK subsystem parameter is set to PRIMARY
 - The authorization ID of the process does not have the necessary privileges.
- If the access control authorization exit is active and the AUTHEXIT_CHECK subsystem parameter is set to DB2, this error might occur if ACEE cannot be created for the authorization ID *auth-id*.
- If *operation* is CREATE VARIABLE or DROP VARIABLE, the *auth-id* lacks the necessary privileges to perform this action.
- When *operation* is CREATE, the OR REPLACE clause was specified, and the object already exists, the user who issues the statement must be the owner of the object that is to be replaced. The security administrator, who holds SECADM authority, can use the TRANSFER OWNERSHIP statement to transfer the ownership of the object, if necessary.
- If *operation* is UPDATE or DELETE and *object-name* is SYSIBM.SYSAUDITPOLICIES, this error might occur

if the *auth-id* lacks access to the audit policy profile in the RACF DSNR class.

System action

The statement cannot be processed.

Programmer response

To correct the error, verify the following situations:

- The *auth-id* has the authority to perform the operation.
- The *object-name* exists.
- The *auth-id* is not trying to create a table with a schema qualifier that is not the same as *auth-id*.
- If you are using the access control authorization exit with RACF, ensure that the authorization ID *auth-id* is defined in RACF and was granted the required privilege to perform the operation. Check the USER value in RACF message ICH408I to determine the authorization ID that attempted to perform the operation.

SQLSTATE

42501

-552

***authorization-id* DOES NOT HAVE
THE PRIVILEGE TO PERFORM
OPERATION *operation***

Explanation

An operation was attempted by an authorization ID that lacks the required authority.

authorization-id

The authorization ID that attempted to perform the operation.

If you are using a trusted context, the *authorization-id* value might be a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role, rather than the authorization ID of the session, when the condition was encountered. Otherwise an authorization ID is returned. A role is returned in the following format as a single token:

ROLE: *role-name* DOES NOT HAVE
THE PRIVILEGE TO PERFORM OPERATION
operation

operation

The operation that was attempted.

If you use the RACF access control module for authorization checking, *auth-id* might be different from the value that is reported in message ICH408I. The ID

that is reported in message ICH408I is the user ID that RACF used to check the privilege.

System action

The statement cannot be processed.

Administrator response

Check for an attempted authorization violation.

Programmer response

Ensure that the authorization ID has been granted the authority necessary to perform the operation.

SECADM authority is required to revoke any of the following:

- System DBADM authority
- DATAACCESS authority
- ACCESSCTRL authority
- CREATE_SECURE_OBJECT privilege

SQLSTATE

42502

-553	AUTHORIZATION ID OR SCHEMA NAME <i>name</i> SPECIFIED IS NOT VALID FOR REQUESTED OPERATION
------	---

Explanation

The statement failed for one of the following reasons:

- The authorization ID specified as the value of *name* or host variable in the SQL SET CURRENT SQLID statement is neither the user's primary authorization ID nor one of the associated secondary authorization IDs.
- The authorization ID specified as the value of the PACKAGE OWNER option for a CREATE or ALTER PROCEDURE statement is neither the user's primary authorization ID nor one of the associated secondary authorization IDs.
- SYSPUBLIC cannot be specified as the schema for a private alias for a sequence.

Schema names should not start with 'SYS' because additional schemas that start with these letters might be reserved for exclusive use of Db2 products in the future.

System action

The statement cannot be processed.

User response

Change the *name* to a value that the user can use.

SQLSTATE

42503

-554	AN AUTHORIZATION ID OR ROLE CANNOT GRANT A PRIVILEGE TO ITSELF
------	---

Explanation

An authorization ID or a role attempted to execute a GRANT statement in which that ID itself appears as one of the entries in the list of 'grantee' authorization IDs or role names.

An authorization ID or a role cannot GRANT a privilege to itself. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, GRANT to self is allowed.

System action

The statement cannot be processed. No privileges were granted.

Programmer response

Remove the reference to the authorization ID that issued the GRANT statement from the list of grantee authorization IDs.

SQLSTATE

42502

Related reference

[Statements \(Db2 SQL\)](#)

[GRANT statement \(Db2 SQL\)](#)

[SQLRULES bind option \(Db2 Commands\)](#)

[CURRENT RULES special register \(Db2 SQL\)](#)

-555	AN AUTHORIZATION ID OR ROLE CANNOT REVOKE A PRIVILEGE FROM ITSELF
------	--

Explanation

An authorization ID or a role attempted to execute a REVOKE statement in which that ID itself appears as one of the entries in the list of authorization IDs or role names to be revoked.

An authorization ID or a role cannot REVOKE its own privilege. However, if SQLRULES(STD) is in effect or

CURRENT RULES contains STD, REVOKE from self is allowed.

System action

The statement cannot be processed. No privileges were revoked.

Programmer response

Take one of the following actions and reissue the REVOKE statement:

- Remove the authorization ID that issues the REVOKE statement from the list of authorization IDs to be revoked.
- Issue the REVOKE statement from a different authorization ID.

SQLSTATE

42502

[REVOKE statement \(Db2 SQL\)](#)

[CURRENT RULES special register \(Db2 SQL\)](#)

-556	revoke-target CANNOT HAVE THE privilege PRIVILEGE object-name REVOKED BY revoker-id BECAUSE THE REVOKEE DOES NOT POSSESS THE PRIVILEGE OR THE REVOKER DID NOT MAKE THE GRANT
------	---

Explanation

The REVOKE statement was not successful.

revoke-target

The authorization ID that the revoke attempt was made against.

privilege

The name of the privilege that was to be revoked.

object-name

The name of the object that the privilege applies to.

revoker-id

The authorization ID that attempted to revoke the privilege.

If you are using a trusted context, the tokens *revoke-target* and *revoker-id* might return a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role, rather than the authorization ID of the session, when the condition was encountered.

Otherwise an authorization ID is returned. A role is returned in the following format as a single token:

ROLE: *role-name*

A failed revocation attempt is commonly caused by one or more of the following conditions:

- The authorization ID that was the target of the REVOKE statement, *revoke-target*, does not possess the privilege that was to be revoked.
- The revoking authorization ID, *revoker-id*, did not explicitly grant the privilege to *revoke-target*. An authorization ID can revoke only the privileges that it has explicitly granted to other authorization IDs, unless the authorization ID has SECADM or ACCESSCTRL authority and specifies the BY clause.
- The authorization ID *revoke-target* is the owner of the specified object. No authorization ID, not even SECADM, can revoke privileges on an object from the object owner.
- If *privilege* is "****": The keyword ALL was used in the REVOKE statement, but *revoke-target* did not possess any privilege to revoke.
- If *revoker-id* is "ALL": The BY ALL clause was used in the REVOKE statement, but *revoke-target* did not possess any privilege to revoke.
- If *revoker-id* holds SECADM or ACCESSCTRL authority: The BY clause might have been omitted from the REVOKE statement.

System action

The statement was not executed. No privileges were revoked from any authorization ID.

Programmer response

Check the appropriate authorization catalog tables to verify that *revoke-target* possesses the privilege to be revoked. Issue a query with GRANTEE set to the value in *revoke-target* and the privilege column not equal to blanks. Correct and reissue the REVOKE statement.

SQLSTATE

42504

-557	INCONSISTENT GRANT/REVOKE KEYWORD keyword. PERMITTED KEYWORDS ARE keyword-list
------	---

Explanation

The GRANT or REVOKE statement contains a syntax or spelling error at or before the specified 'keyword'. As an aid to the programmer, 'keyword-list' provides

a list of the keywords that would be permitted in this context.

Alternatively:

- The mixture of privileges specified on the GRANT or REVOKE statement is not permitted. The privileges must all be of one type, and consistent with the form of the GRANT or REVOKE statement.
- REVOKE UPDATE (column-list) is not permitted; only REVOKE UPDATE is valid.
- The keywords DELETE, INSERT, TRIGGER, UPDATE, REFERENCES and ALTER cannot be specified for an auxiliary table.

System action

The statement cannot be processed.

Programmer response

Correct the syntax of the GRANT or REVOKE statement.

SQLSTATE

42852

-559	ALL AUTHORIZATION FUNCTIONS HAVE BEEN DISABLED
------	--

Explanation

The authorization mechanism has been disabled in the Db2 subsystem. Consequently, GRANT and REVOKE statements are ignored.

System action

The statement cannot be processed. No privileges were granted or revoked.

Programmer response

Do not attempt to execute GRANT or REVOKE statements unless and until the authorization mechanism is enabled in the Db2 subsystem.

SQLSTATE

57002

-562	THE SPECIFIED PRIVILEGES CANNOT BE GRANTED TO PUBLIC.
------	---

Explanation

The GRANT statement attempted to grant one of the following privileges to the reserved authorization ID PUBLIC (public):

- System DBADM
- DATAACCESS
- ACCESSCTRL
- CREATE_SECURE_OBJECT

These privileges cannot be granted to PUBLIC (public).

System action

The statement cannot be processed.

Programmer response

Change the statement to specify a privilege that can be granted to PUBLIC, or specify a grantee other than PUBLIC.

-567	<i>bind-type</i> AUTHORIZATION ERROR USING <i>auth-id</i> AUTHORITY PACKAGE = <i>package-name</i> PRIVILEGE = <i>privilege</i>
------	---

Explanation

The authorization ID given does not have the privilege indicated, and cannot invoke the indicated subcommand against the indicated package.

bind-type

Type of bind subcommand (BIND | REBIND | FREE).

auth-id

Authorization ID of the package owner.

package-name

Name of the package
(location.collection.package.version)

privilege

Name of the privilege not held:

- BINDADD—The authority to create a new package using BIND with the ADD option.
- BIND—The authority to BIND (REPLACE) or REBIND a package.
- COPY—The authority to COPY from the indicated package

- CREATE IN—The authority to create a package in the indicated collection.

If you are using a trusted context, the token *auth-id* might return a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role, rather than the authorization ID of the session, when the condition was encountered. Otherwise an authorization ID is returned. A role is returned in the following format as a single token:

- ROLE: *role-name*

System action

The indicated package is not bound, rebound, or freed.

System programmer response

The indicated privilege must be granted to the authorization ID that will become the package owner.

SQLSTATE

42501

**-571 THE STATEMENT WOULD RESULT
IN A MULTIPLE SITE UPDATE**

Explanation

This SQLCODE is issued in the following situations:

- When an application program operating in an IMS or CICS environment attempts to modify data at a remote location where multi-site update capabilities are not supported.
- When an application program has explicit SQL statements within a commit scope that would result in updates at multiple sites where one of the sites at which data is being updated does not support multi-site update.

This SQLCODE can be issued when an application program explicitly modifies data at a single location within a commit scope. This can occur in the following situations:

- A package that is associated with the application program was invalidated.
- A package or plan was bound at one release of Db2 and fallback occurs to a prior release.

In the situations described above, an implicit autobind is done on behalf of the user. An autobind results in the Db2 catalog being updated. The conditions that must exist for this SQLCODE to be issued when an autobind occurs are:

- One site where data has been modified does not support multi-site update.
- The autobind occurs at a separate and distinct site from where an application program explicitly modifies data.
- At the time of the autobind, locks are being held to process an SQL statement within the application program.

System action

The statement cannot be processed.

Programmer response

- Ensure that all requests for modifications to the data are confined to a single location within any given commit scope for any application that references a location that does not support multi-site update.
- For programs operating in an IMS or CICS environment where the remote database systems do not support multi-site update, all SQL statements must be read-only access.
- If an autobind is causing this SQLCODE to be issued, REBIND the plan or package.

SQLSTATE

25000

**-573 TABLE *table-name* DOES NOT
HAVE A UNIQUE KEY WITH THE
SPECIFIED COLUMN NAMES**

Explanation

A referential constraint cannot be defined with the specified table as the parent because a unique index with the specified column names does not exist for the identified parent table.

System action

The statement cannot be processed.

Programmer response

Create a unique index with the specified columns for the parent table.

SQLSTATE

42890

**-574 THE SPECIFIED DEFAULT VALUE
OR IDENTITY ATTRIBUTE
VALUE CONFLICTS WITH THE**

DEFINITION OF COLUMN *column-name*

Explanation

A value specified for a column is not valid.

column-name

The name of the column.

Possible reasons for this error include:

- The value is not assignable to the column because the constant does not conform to the format for a constant of that data type, or the value has the incorrect length or precision.
- A floating-point constant is specified and the column is not a floating point data type.
- A decimal constant is specified and non-zero digits would be truncated when assigned to the column.
- The value is more than 255 bytes, including quotation marks for strings, introducer characters such as the X for a hex constant, fully qualified function names, and parentheses.
- Either the USER, or SESSION_USER, or CURRENT SQLID special register is specified and the length attribute of the character string column is not sufficient to store a value that is 8 characters when the value is expressed in CCSID 37.
- A system-generated cast function was specified and the column is not defined with a user-defined distinct type.
- A function was specified that is not supported. A function can be specified only when the data type is a distinct type, and in this case the specified function must be one of the system-generated cast functions associated with this distinct type.
- A value with non-zero scale was specified for the START WITH or INCREMENT BY option of an identity column with the DECIMAL data type.
- A decimal floating point (DECFLOAT) constant is specified. A decimal floating point cannot be restricted to zero scale numbers and, as such, may not be used in IDENTITY columns.
- WITH DEFAULT is specified using a value other than NULL for a LOB column without INLINE LENGTH attribute.
- The length of the default value is greater than the INLINE LENGTH attribute of the LOB column.
- A default value was specified for a timestamp with time zone column but the default value does not contain a time zone.

System action

The statement cannot be processed.

Programmer response

Specify a default value that is valid for the definition of the column, and reissue the statement.

SQLSTATE

42894

-575

OBJECT *object-name* (OBJECT TYPE *object-type*) CANNOT BE REFERENCED EXPLICITLY OR IMPLICITLY

Explanation

The statement referenced an object, but the object cannot be used as requested.

object-name

The name of the referenced object.

object-type

The type of object that was referenced. Possible values include:

VIEW

An alteration was made to a table that underlies the *object-name* view, which caused the view definition to become invalid. The view must be successfully regenerated with an ALTER VIEW statement before it can be referenced in a statement other than ALTER VIEW, GRANT, REVOKE, DROP, COMMENT, or LABEL. Issue an ALTER VIEW statement to regenerate the view.

ROW PERMISSION

The *object-name* row permission is invalid because a previous attempt to regenerate it was unsuccessful. The row permission must be disabled before the row access control enforced table can be referenced. To correct the invalid state, the row permission must be dropped and re-created with a modified definition.

COLUMN MASK

The *object-name* column mask is invalid because a previous attempt to regenerate it was unsuccessful. The column mask must be disabled before the column access control enforced table can be referenced. To correct the invalid state, the column mask must be dropped and re-created with a modified definition.

System action

The statement cannot be processed.

Programmer response

Take the suggested corrective action.

SQLSTATE

51024

-577 *object-type object-name*
**ATTEMPTED TO MODIFY DATA
WHEN THE DEFINITION OF THE
FUNCTION OR PROCEDURE DID
NOT SPECIFY THIS ACTION**

Explanation

The current environment does not allow SQL statements that modify data. One of the following situations has occurred:

- A user-defined function or stored procedure *object-name* was invoked and attempted to modify data, but the function or procedure was defined without the MODIFIES SQL option.
- A user-defined function or stored procedure *object-name* was invoked and attempted to execute a data definition statement, but the function or procedure was defined without the MODIFIES SQL option.
- A function or procedure defined with READS SQL DATA, CONTAINS SQL, or NO SQL has attempted to invoke another function or procedure defined with MODIFIES SQL DATA.
- A user-defined function or stored procedure *object-name* was invoked and attempted to use a NEXT VALUE expression. However, the function or procedure was defined without the MODIFIES SQL DATA option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for modifying the data.

System action

The statement cannot be processed.

Programmer response

Either use an ALTER statement to change the definition of the function or procedure to allow statements that modify data, or remove the failing SQL statement from the external function or procedure.

SQLSTATE

38002

-578 **THE RETURN STATEMENT WAS
NOT EXECUTED FOR SQL
FUNCTION *function-name*.**

Explanation

The SQL function reached the end of the routine body without executing a RETURN statement.

function-name
The name of the function.

System action

The statement cannot be processed.

User response

Add a RETURN statement to the function routine body, and try the request again.

SQLSTATE

2F005

-579 *object-type object-name*
**ATTEMPTED TO READ DATA
WHEN THE DEFINITION OF THE
FUNCTION OR PROCEDURE DID
NOT SPECIFY THIS ACTION**

Explanation

The current environment does not allow SQL statements that read data. One of the following situations had occurred:

- A user-defined function or stored procedure *object-name* was invoked and attempted to read data, but the function or procedure was defined without the READS SQL DATA or MODIFIES SQL DATA option.
- A function or procedure defined with CONTAINS SQL or NO SQL has attempted to invoke another function or procedure defined with READS SQL DATA.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for reading data.

System action

The SQL statement failed.

Programmer response

Either use an ALTER statement to change the definition of the function or procedure to allow statements that read data, or remove the failing SQL statement from the external function or procedure.

SQLSTATE

38004

-580	THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL
------	--

Explanation

There is a CASE expression in the statement that has all the *result-expressions* (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

System action

The statement cannot be processed.

Programmer response

Change the CASE expression to include at least one *result-expression* with a keyword other than NULL.

SQLSTATE

42625

-581	THE DATA TYPES OF THE RESULT-EXPRESSIONS OF A CASE EXPRESSION ARE NOT COMPATIBLE
------	--

Explanation

There is a CASE expression in the statement that has *result-expressions* (expressions following THEN and ELSE keywords) that are not compatible. The data type of the *result-expressions* might be incompatible because the CASE condition result data types are not all:

- character
- graphic
- numeric
- date
- time
- timestamp
- binary string
- user-defined type

If encoded in Unicode, character and graphic data types are compatible, however.

An array value with a user-defined array type can be assigned only to an array variable that is defined as the same user-defined array type. The rules for assigning an array value without a user-defined array type to an array variable depend on the statement that specifies the assignment. See [User-defined type assignments \(Db2 SQL\)](#) for more information.

System action

The statement cannot be processed.

Programmer response

Correct the *result-expressions* so that they are compatible.

SQLSTATE

42804

-582	THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE OF A CASE IS NOT VALID IN THE CONTEXT IN WHICH IT WAS SPECIFIED. THE SEARCH CONDITION CONTAINS A QUANTIFIED PREDICATE OR AN IN PREDICATE THAT INCLUDES A FULLSELECT, AND THESE ARE NOT ALLOWED IN THE SPECIFIED CONTEXT.
------	---

Explanation

The *search-condition* in a *searched-when-clause* specifies a quantified predicate, an IN predicate, or an EXISTS predicate, but is not allowed. However, an IN predicate is allowed within a select list or VALUES clause if that IN predicate explicitly includes a list of expressions.

The *search-condition* in a *searched-when-clause* specifies a quantified predicate or an IN predicate that includes a fullselect. A CASE specification that includes either of these cannot be used in the following contexts:

- A SELECT list
- A VALUES clause of an INSERT or MERGE statement
- A SET or assignment clause of an UPDATE, MERGE, or DELETE statement
- The right side of a SET or an assignment statement
- A column mask or row permission definition

The *search-condition* in a *searched-when-clause* specified an EXISTS predicate. A CASE specification that includes an EXISTS predicate cannot be used in the following contexts:

- A VALUES clause of an INSERT or MERGE statement
- The right side of a SET or an assignment statement
- The *diagnostic-string-expression* of a SIGNAL statement
- An ORDER BY clause or a GROUP BY clause

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and reissue the statement.

SQLSTATE

42625

-583	THE USE OF FUNCTION OR EXPRESSION <i>name</i> IS INVALID BECAUSE IT IS NOT DETERMINISTIC OR HAS AN EXTERNAL ACTION
------	---

Explanation

The function *name* is defined as a non-deterministic function or a function with an external action, or the expression *name* is defined as a non-deterministic expression. This type of function or expression is not supported in the context in which it is used. The contexts in which these are not valid are:

- In the expression prior to the first WHEN keyword in a simple-case-expression.
- In the WHERE clause of the fullselect in a CREATE VIEW statement if the WITH CHECK OPTION is specified.
- In an expression of an ORDER BY clause
- In a key-expression of an index definition
- In an expression of a GROUP BY clause
- In an expression that generates the value of an index for an array
- In an OFFSET or FETCH FIRST clause
- In a *row-value-expression* if the comparison operator is <, <=, >, or >=

System action

The statement cannot be processed.

Programmer response

If the use of a non-deterministic or external action function or expression was not intended, substitute a function or expression without these characteristics. If the behavior associated with the non-deterministic or external action function or expression is intentional, use the alternate form of the statements that make that intent explicit.

- Instead of a simple-when-clause, use the corresponding searched-when-clause where the function or expression would be specified in each search-condition.
- Remove the WITH CHECK OPTION from the CREATE VIEW statement.
- Remove the function or expression from the ORDER BY clause. If the column is part of the result set of the query, change the expression in the ORDER BY clause to the *simple-integer* or *simple-column-name* form of the sort key.
- Remove the function or expression from the GROUP BY clause.
- Remove the expression that generates the value of an index for an array.
- Remove the expression from the OFFSET or FETCH FIRST clause.
- Change the comparison operator in the *row-value-expression*, or remove the comparison with the *row-value-expression*.

SQLSTATE

42845

-584	INVALID USE OF NULL OR DEFAULT
------	---------------------------------------

Explanation

The NULL or DEFAULT keyword is not valid as specified. One of the following error situations occurred:

- The NULL keyword was used in the USING *source-table* clause of the MERGE statement, but the NULL keyword was not explicitly cast to a supported data type.

- In a SET *assignment-statement* statement, DEFAULT was assigned to a variable other than a global variable.
- A CREATE VARIABLE statement was used to define a global variable as an array type. The DEFAULT *constant* or DEFAULT *special-register* clause was specified in the CREATE VARIABLE statement. Only DEFAULT NULL is allowed.
- The DEFAULT keyword was specified as the source value for a transition variable in a SET *assignment-statement* statement that assigns values to multiple targets, and either all of the targets were not transition variables, or all of the source values were not specified with the DEFAULT keyword.

System action

The statement cannot be processed.

User response

Take one of the following actions:

- Specify the NULL keyword within a CAST expression when using NULL within the USING VALUES clause of the MERGE statement.
- Do not assign DEFAULT to any variable other than a global variable.
- In a CREATE VARIABLE statement that is used to define a global variable as an array type, do not assign DEFAULT *constant* or DEFAULT *special-register* to the global variable.
- Do not assign DEFAULT to a transition variable in a SET *assignment-statement* statement that assigns values to multiple targets if all the targets are not transition variables, or if all the source values are not specified as the DEFAULT keyword. Replace the single assignment statement with separate assignment statements.

SQLSTATE

42608

-585	THE COLLECTION <i>collection-id</i> APPEARS MORE THAN ONCE IN THE SET <i>special-register</i> STATEMENT
------	---

Explanation

The SET statement for special register *special-register* includes *collection-id* more than once.

System action

The statement cannot be processed.

Programmer response

Remove duplicate occurrences of *collection-id* from the SET statement for the special register.

SQLSTATE

42732

-586	THE TOTAL LENGTH OF THE CURRENT PATH SPECIAL REGISTER CANNOT EXCEED 2048 CHARACTERS
------	---

Explanation

The CURRENT PATH special register is defined as a VARCHAR(2048). The content of the string includes each schema name delimited with double quotes and separated from the next schema name by a comma. The total length of the string of all schema names in the CURRENT PATH cannot exceed 2048 characters. A SET PATH statement causing this message would exceed this limit.

System action

The statement cannot be processed.

Programmer response

Remove schema names to reduce the total length to fit the 2048 character maximum length. If all the schema names are required, it may be necessary to consolidate some user-defined functions so that fewer schema names are required for the CURRENT PATH.

SQLSTATE

42907

-589	A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR <i>cursor-name</i> SPECIFIED A ROW OF A ROWSET, BUT THE CURSOR IS NOT POSITIONED ON A ROWSET
------	---

Explanation

The FOR ROW *n* OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but the cursor is not currently positioned on a rowset.

System action

The statement cannot be processed.

Programmer response

Issue a FETCH statement to position the cursor on the correct rowset, and then reissue the positioned DELETE or UPDATE statement. If the cursor is not defined for rowset access, redefine the cursor first.

SQLSTATE

24520

-590	NAME <i>name</i> IS NOT UNIQUE IN THE CREATE OR ALTER FOR ROUTINE OR TRIGGER <i>object-name</i>
------	--

Explanation

The name that is specified for a parameter, SQL variable, cursor, label, or condition in a CREATE or ALTER statement for a routine or advanced trigger is not unique.

name

The item name that is not unique within the routine or trigger.

object-name

The name of the routine or trigger that contains the duplicate item names.

The value for *name* must adhere to the following rules:

- A parameter name must be unique within the parameter list.
- An SQL variable name must be unique within the compound statement in which it is declared, excluding any declarations within compound statements that are nested within the compound statement that declares the SQL variable.
- An SQL variable name must not be the same as a parameter name.
- A cursor name must be unique within the routine or trigger in which it is declared, excluding any declaration within compound statements that are nested within the compound statement that declares the cursor.
- A condition name must be unique within the compound statement in which it is declared, excluding any declarations within compound statements that are nested within the compound statement that declares the condition.
- A label must be unique within a compound statement, **including** any labels within compound statements that are nested within the compound statement that defines the label.

System action

The statement cannot be processed.

Programmer response

Change the name so that it is unique.

SQLSTATE

42734

-592	NOT AUTHORIZED TO CREATE OR ALTER FUNCTIONS, PROCEDURES, OR TRIGGERS IN WLM ENVIRONMENT <i>env-name</i>
------	--

Explanation

This message is issued when the check for authorization to the WLM application environment in *env-name* token failed.

System action

The statement cannot be processed.

Programmer response

To correct the error, choose a different value for the WLM ENVIRONMENT keyword or request authorization to create objects in the specified WLM ENVIRONMENT from the system administrator. Then, reissue the SQL statement.

SQLSTATE

42510

-593	NOT NULL MUST BE SPECIFIED FOR <i>column-name</i> BECAUSE IT IS DEFINED AS A ROWID (OR DISTINCT TYPE FOR ROWID), ROW CHANGE TIMESTAMP COLUMN, ROW BEGIN COLUMN, ROW END COLUMN, OR COLUMN OF A PERIOD <i>column-name</i>
------	---

Explanation

The NOT NULL clause was specified for a column whose type does not permit null values.

column-name

The name of the column that requires the NOT NULL clause.

The following columns do not permit null values:

- ROWID columns

- Distinct type columns for which the source type is ROWID
- Row change timestamp columns
- Row begin columns and row end columns
- Columns of a period

When one of these columns is defined on a CREATE TABLE, ALTER TABLE, or DECLARE TABLE statement, the NOT NULL clause must be specified for the column.

System action

The statement cannot be processed.

Programmer response

Change the statement to specify the NOT NULL clause.

SQLSTATE

42831

Related reference

[Statements \(Db2 SQL\)](#)

-594	ATTEMPT TO CREATE A NULLABLE ROWID OR DISTINCT TYPE COLUMN <i>column-name</i>
-------------	--

Explanation

A CREATE VIEW statement attempted to create a new view with a nullable ROWID column. ROWID columns (or distinct type columns for which the source type is a ROWID) do not support null values. One of the following situations has occurred:

- The subselect of a CREATE VIEW statement involves an outer join for which a column of the result table is a ROWID column that needs to allow for null values.

System action

The statement cannot be processed.

Programmer response

Change the content of the statement so that it does not try to create a ROWID column which must allow for null values.

SQLSTATE

42831

-601	THE NAME (VERSION OR VOLUME SERIAL NUMBER) OF THE OBJECT TO BE DEFINED OR THE TARGET
-------------	---

OF A RENAME STATEMENT IS IDENTICAL TO THE EXISTING NAME (VERSION OR VOLUME SERIAL NUMBER) *object-name* OF THE OBJECT TYPE *object-type*

Explanation

An attempt to name an object failed because the name is already in use for an object of the same type.

object-name

The name of the object.

object-type

The type of object.

This message can be issued for different situations, including the following examples, among others:

ALTER statements

An ALTER statement attempted to alter an object.

object-type=TABLE

An ALTER statement attempted to add a clone table, but an object of the same type with the same name already exists in the catalog table SYSIBM.SYSPENDINGOBJECTS.

object-type=VERSION

An ALTER statement attempted to define a new version of an SQL routine or advanced trigger and specified a version identifier that already exists for the specified object.

object-type=VOLUME

An ALTER statement attempted to add a volume name to a storage group, but a volume with volume serial number already exists for the storage group.

CREATE statements

A CREATE statement attempted to create an object *object-name* of type *object-type*, but an object of that type with the same name is already defined in the Db2 subsystem.

A CREATE statement failed because an object of the same type with the same name already exists in the catalog table SYSIBM.SYSPENDINGOBJECTS.

object-type=CONSTRAINT

The object name was specified in the FOREIGN KEY clause, CHECK clause, PRIMARY KEY clause, or UNIQUE clause of either a CREATE or ALTER TABLE statement. All referential integrity, check constraint, primary key, and unique key constraint names defined on a table must be unique.

object-type=DISTINCT TYPE

If a CREATE DISTINCT TYPE statement failed, a user-defined type already exists with the

same name as the distinct type name specified in the CREATE DISTINCT TYPE statement.

object-type=FUNCTION

If a CREATE FUNCTION statement failed, a routine already exists with the same name as the name specified in the CREATE FUNCTION statement. If a CREATE DISTINCT TYPE statement failed, a user-defined function already exists with the same name as the distinct type that is specified in the CREATE DISTINCT TYPE statement.

If the error was encountered for a particular version of an SQL function, the *object-name* token might return the name and version of the function, in the following format: *function-name* VERSION *version-id*.

object-type=INDEX

If a CREATE INDEX statement failed, an index already exists with the same name as the name specified in the CREATE INDEX statement.

object-type=JAR

If an invocation of procedure SQLJ.INSTALL_JAR failed, a JAR already exists with the same name as the name specified on the invocation of procedure SQLJ.INSTALL_JAR.

object-type=MASK

If a CREATE MASK statement failed, the column mask name identifies a column mask that already exists at the current server.

object-type=PERMISSION

If a CREATE PERMISSION statement failed, the row permission name identifies a row permission that already exists at the current server.

object-type=PROCEDURE

If a CREATE PROCEDURE statement failed, a routine already exists with the same name as the name specified in the CREATE PROCEDURE statement. If the CREATE PROCEDURE statement for an SQL procedure failed, then an SQL procedure might already with the same name as the external name that was implicitly or explicitly specified.

If the error was encountered for a particular version of a native SQL procedure, the *object-name* token might return the name and version of the procedure, in the following format:

procedure-name VERSION *version-id*

.

object-type=ROLE

If a CREATE ROLE statement failed, a role already exists with the same name as the name specified in the CREATE ROLE statement.

object-type=SEQUENCE

If a CREATE SEQUENCE statement failed, a sequence already exists with the same name as the sequence name that was specified in the CREATE SEQUENCE statement.

object-type=TABLE

If a CREATE ALIAS statement failed, the alias name specified in the CREATE ALIAS statement is identical to the table name or view name specified. The table might not exist in the Db2 subsystem.

object-type=TRIGGER

If a CREATE TRIGGER statement failed, a trigger already exists with the same name as the name specified in the CREATE TRIGGER statement.

If the error was encountered for a particular version of a trigger, the *object-name* token might return the name and version of the trigger, in the following format: *trigger-name* VERSION *version-id*.

object-type=TRUSTED CONTEXT

If a CREATE TRUSTED CONTEXT statement failed, a trusted context already exists with the same name as the name specified in the CREATE TRUSTED CONTEXT statement.

object-type=VARIABLE

If a CREATE VARIABLE statement failed, the name of global variable that was specified in the CREATE VARIABLE statement is identical to the name of a global variable that already exists at this server.

object-type=VIEW

If a CREATE ALIAS statement failed, the alias name specified in the CREATE ALIAS statement is identical to the table name or view name specified. The view might not exist in the Db2 subsystem.

object-type=XSR SCHEMA

If an invocation of procedure SYSPROC.XSR_REGISTER failed, an XSR XML schema already exists with the same name as the name specified on the invocation of procedure SYSPROC.XSR_REGISTER.

RENAME statements

An object with the same name as the target name already exists in the catalog table SYSIBM.SYSPENDINGOBJECTS.

System action

The statement cannot be processed.

Programmer response

Either drop or remove the existing object or choose another name.

If the *object-type* is a data set, consider one of the following actions:

- Verify that the correct integrated catalog facility catalog is specified in the storage group definition. The ICF catalog is identified in the VCATNAME column of SYSIBM.SYSTOGROUP catalog table.
- Issue an IDCAMS DELETE of the data set before retrying the CREATE statement.

-602 **TOO MANY COLUMNS, PERIODS, OR KEY-EXPRESSIONS SPECIFIED IN A CREATE INDEX OR ALTER INDEX STATEMENT**

Explanation

One of the following specifications in a CREATE INDEX or ALTER INDEX statement exceeds the permitted maximum value of 64:

- The sum of the number of columns and twice the number of identified periods:

$$columns + (2 \times periods)$$

- The number of key-expressions.

System action

The statement cannot be processed.

Programmer response

Modify the index definition to conform to the system-imposed column or key-expression limit of 64.

SQLSTATE

54008

Related reference

[Statements \(Db2 SQL\)](#)

-603

A UNIQUE INDEX CANNOT BE CREATED BECAUSE THE TABLE CONTAINS ROWS WHICH ARE DUPLICATES WITH RESPECT TO THE VALUES OF THE IDENTIFIED COLUMNS AND PERIODS

Explanation

The index that is defined in the CREATE INDEX statement could not be created as unique because the specified table already contains rows that are duplicates with respect to the values of the identified columns and periods.

System action

The statement cannot be processed.

Programmer response

Examine the data to determine whether or not the duplicate data is valid. Alternatively, consider creating a nonunique index.

SQLSTATE

23515

Related reference

[CREATE INDEX statement \(Db2 SQL\)](#)

-604

A DATA TYPE DEFINITION SPECIFIES AN INVALID ATTRIBUTE SUCH AS LENGTH, PRECISION, OR SCALE ATTRIBUTE

Explanation

A data type definition in a CREATE or ALTER statement is incorrect in one of the following ways:

- The data type definition contains an invalid length, precision, or scale attribute specification.
- The specification of the data type might be incorrect or invalid.
- The column definition in a view referenced in a CREATE TABLE LIKE *view* statement has an invalid length.

System action

The statement cannot be processed. The specified object was not created or altered.

Programmer response

Correct the statement syntax as follows, and resubmit the statement:

- Correct the data type definition in the statement to have a valid length, precision, or scale attribute.
- Ensure that the specified data types are valid for the CREATE or ALTER statement.
- Correct the invalid length in the column definition of the view that is referenced in the CREATE TABLE LIKE statement.

SQLSTATE

42611

Related concepts

[Data types in Db2 for z/OS \(Db2 SQL\)](#)

-607

OPERATION OR OPTION *operation* IS NOT DEFINED FOR THIS OBJECT

Explanation

The operation or option cannot be performed on the object specified in the SQL statement.

For example, this SQL code might be issued for the following situations:

- The ownership of most system objects cannot be transferred if their OWNER is SYSIBM or if their schema begins with SYS.
- CREATE or DROP statements cannot be issued for objects in the the Db2 catalog (DSNDB06) database.
- LOGGED and NOT LOGGED cannot be set when you create or alter a table space in the Db2 catalog (DSNDB06) database.
- Catalog and directory objects cannot be cloned.
- Data change operations such as these cannot be performed on a directory table:
 - ALTER TABLE
 - ALTER TABLESPACE
 - DELETE
 - MERGE
 - UPDATE
 - RENAME TABLE
- The following operations are not allowed for an index on a directory table:
 - ALTER INDEX
 - CREATE INDEX
 - DROP INDEX

– RENAME INDEX

- A directory table cannot be:
 - The parent table in a referential relationship
 - The triggering table in a trigger
- An ALTER TABLE statement that specifies *operation* cannot be specified on a catalog table.
- A period specification must not be used if the table reference is not a table.
- The operation is a SELECT statement, and a target of the operation is a directory object. Db2 cannot convert the SELECT statement to the UR isolation level. For example, the following SQL statement cannot be executed because the SELECT operation against directory object SYSIBM.SYSLGRNX cannot be converted to the UR isolation level:

```
UPDATE T1 SET C1 = (SELECT C1 FROM T1)
WHERE EXISTS(
  SELECT LGRDBID FROM SYSIBM.SYSLGRNX);
```

- An ALTER TABLESPACE statement that includes a MOVE TABLE clause must not specify a catalog or directory table space.
- [FL 505](#) An ALTER TABLE statement that specified an ADD VERSIONING clause on a security-related catalog table must specify the corresponding catalog history table.

System action

The statement cannot be processed.

Programmer response

If an option of the SQL statement is not allowed for this object, modify the SQL statement and resubmit the statement. If an operation is not defined for the object, the statement cannot be executed.

SQLSTATE

42832

-611

ONLY LOCKMAX 0 CAN BE SPECIFIED WHEN THE LOCK SIZE OF THE TABLESPACE IS TABLESPACE OR TABLE

Explanation

This message is issued when:

- The LOCKSIZE of the table space is TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.

- The LOCKSIZE of the table space is being altered to TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.

If LOCKSIZE is TABLESPACE or TABLE, LOCKMAX must be 0 because lock escalation is not supported from these levels.

System action

The statement cannot be processed.

Programmer response

Do one of the following:

- Reissue the statement with LOCKMAX 0.
- Alter the LOCKSIZE of the table space to a value other than TABLESPACE or TABLE.

SQLSTATE

53088

-612 *identifier* IS A DUPLICATE NAME

Explanation

A non-unique name was specified where a unique name is required. Column and period names must be unique within an index, a table, or a view, and in the UPDATE OF clause of a trigger definition.

identifier

The non-unique name.

Possible causes for this error include:

CREATE INDEX and ALTER INDEX statements

- The same column name is specified for two or more columns of the index.

CREATE TABLE and ALTER TABLE statements

- The same column name is specified for two or more columns of the table.
- A constraint specifies an XML column and the constraint definition contains an expression that invokes the XMLQUERY function or uses the XMLEXISTS predicate.
- The same period name is specified for two or more columns of the table.
- The same period is specified more than one time in the constraint.
- A period and a column are defined with the same name.
- For a CREATE TABLE statement, a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE

clause contains two or more occurrences of the same column name.

- A column is specified more than once in an ALTER TABLE statement. With only one exception, a column cannot be specified in multiple clauses of an ALTER TABLE statement. The exception is when the two clauses are ALTER COLUMN and ADD CHECK CONSTRAINT.

CREATE VIEW statements

- The same column name is specified for two or more columns of the view

CREATE TRIGGER statements

- For a CREATE TRIGGER statement, the UPDATE OF clause specifies the same column name more than once.

XMLQUERY function or XMLEXISTS predicate

- The PASSING clause of an XMLQUERY function or an XMLEXISTS predicate contains two arguments with the same name.
- An XMLQUERY or XMLEXISTS argument list contains two arguments with the same name.

SQL data change statements

- The SQL data change statement uses an include column, and the column name that is specified is the same as another column name of the target table or view, or of another include column.

System action

The statement cannot be processed.

Programmer response

Correct the statement syntax, and reissue the statement.

SQLSTATE

42711

-613

THE PRIMARY KEY OR A HASH KEY OR A UNIQUE CONSTRAINT IS TOO LONG OR HAS TOO MANY COLUMNS AND PERIODS

Explanation

The number of columns and periods that are defined for a PRIMARY KEY or UNIQUE constraint is too large. Both of the following conditions must be met:

- The total of the number of columns and two times the number of identified periods must not exceed 64.
- The sum of the column length attributes of the identified columns and the begin and end columns of any identified periods must not exceed the permitted limit for the type of constraint.

If the failing statement was an ALTER TABLE statement that included the SET DATA TYPE clause to alter the definition of an existing column, a column being changed is part of a unique or primary constraint. The new sum of the lengths of the columns of the keys exceeds $2000 - n - 2m$, where n is the number of nullable columns and m is the number of varying length columns. This sum currently exceeds the maximum number that is allowed.

If the failing statement was an ALTER TABLE statement with a PARTITIONING KEY specification, only 64 columns can be specified, and the combined lengths of all columns specified in the PARTITIONING KEY clause exceeds the maximum length of $255 - n$, where n is the number of columns that can contain null values.

The failing statement might have been either CREATE TABLE with an ORGANIZE BY HASH specification or an ALTER TABLE with an ADD ORGANIZE BY HASH specification.

System action

The statement cannot be processed.

Programmer response

Change the table definition to keep within the prescribed limits.

SQLSTATE

54008

-614	THE INDEX CANNOT BE CREATED OR ALTERED, OR THE LENGTH OF A COLUMN CANNOT BE CHANGED BECAUSE THE SUM OF THE INTERNAL LENGTHS OF THE COLUMNS FOR THE INDEX IS GREATER THAN THE ALLOWABLE MAXIMUM
-------------	---

Explanation

The index could not be created or the length of a column cannot be changed because the sum of the internal lengths of the key columns would exceed

the allowable maximum. The maximum permitted key length is as follows:

- For PADDED indexes, the sum of the length attributes of the columns must not be greater than $2000 - n$, where n is the number of columns that contain null values.
- For NOT PADDED indexes, the sum of the length attributes of the columns must not be greater than $2000 - n - 2m - 3d$, where n is the number of nullable columns, m is the number of varying length columns, and d is the number of DECFLOAT columns.

System action

The statement cannot be processed. The specified index was not created or the length of the column was not changed.

Programmer response

The definition for the index must be modified (possibly by eliminating one or more key columns) to reduce the length of the key to the permitted maximum.

-615

operation-type IS NOT ALLOWED ON A PACKAGE IN USE

Explanation

The operation cannot be performed because the package is in use by the same application process, or the package is dependent on an object that is the target of a DROP statement.

operation-type

Type of bind operation (BIND, REBIND or DROP).

System action

The BIND, REBIND, or DROP operation on the package is not performed.

Programmer response

Take one of the following actions:

- Change the application to invoke the BIND, REBIND or DROP operation when the package is not in use by the same application process.

- Drop the object when the package is not in use.

SQLSTATE

55006

-616 ***obj-type1 obj-name1* CANNOT BE DROPPED BECAUSE IT IS REFERENCED BY *obj-type2 obj-name2***

Explanation

Some types of objects cannot be dropped if there are other objects which are dependent upon them. For example, a storage group cannot be dropped if there are one or more existing table spaces that use that storage group.

Execution of the specified DROP statement would drop object *obj-name1* of type *obj-type1* on which object *obj-name2* of type *obj-type2* is dependent.

System action

The statement cannot be processed. The specified object was not dropped.

Programmer response

Verify that the object specified in the DROP statement was, indeed, the object to be dropped. If so, all the existing objects that have a dependency on that object must first be dropped.

A LOB table space cannot be dropped when an association exists between it and another table space. The associated base table must be dropped first.

A populated auxiliary table and its index can only be dropped by dropping the associated base table.

A trigger package cannot be explicitly dropped. It can only be dropped by dropping the associated trigger with a DROP TRIGGER statement or by dropping the triggering table.

SQLSTATE

42893

-618 **OPERATION *operation* IS NOT ALLOWED ON SYSTEM DATABASES**

Explanation

System databases cannot be the object of certain types of operations. The attempted *operation* cannot be performed on system databases. Possible reasons are:

- CCSID ASCII was specified when a system database was being created.
- APPEND was specified when a system database was being created.
- TRANSFER OWNERSHIP was issued to transfer the ownership of a system database.

System action

The statement cannot be processed. No changes were made to the specified system database.

User response

Do not attempt to perform the requested operation on system databases.

SQLSTATE

42832

-619 **OPERATION DISALLOWED BECAUSE THE DATABASE IS NOT STOPPED**

Explanation

The statements CREATE, ALTER or DROP for a table space, table, or index in the database cannot be processed unless the database is stopped (using the STOP command).

System action

The statement cannot be processed.

Programmer response

Issue the -DISPLAY DATABASE command to verify that the RTS database is stopped before resubmitting the statement.

SQLSTATE

55011

-620 **KEYWORD *keyword* IN *stmt-type* STATEMENT IS NOT PERMITTED FOR A *space-type* SPACE IN THE *database-type* DATABASE**

Explanation

The specified *keyword* in the SQL statement *stmt-type* indicates an attribute that is not allowed for a *space-type* space in a *database-type* database. For example, you cannot set LOGGED or NOT LOGGED when you create or alter a table space in a WORK FILE database.

keyword

Specifies the keyword that is not allowed.

stmt-type

One of the following values:

CREATE

CREATE TABLESPACE or CREATE INDEX

ALTER

ALTER TABLESPACE or ALTER INDEX

space-type

One of the following values:

TABLE

Table space

INDEX

Index space

database-type

FL 508 One of the following values: WORK FILE, NON WORK FILE, or TEMP.

System action

The statement cannot be processed.

Programmer response

Correct and resubmit the statement.

SQLSTATE

**DUPLICATE DBID *dbid* WAS
DETECTED AND PREVIOUSLY
ASSIGNED TO *database-name***

Explanation

The current database being created was assigned a DBID of '*dbid*', which is identical to the DBID assigned to database '*database-name*'. An inconsistency exists between the Db2 catalog and directory.

System action

The statement cannot be processed. No new object was created, and the existing object was not altered or modified.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Programmer response

Notify the system programmer. The inconsistency must be corrected before CREATE DATABASE will be successful.

SQLSTATE

58001

-622

**FOR MIXED DATA IS INVALID
BECAUSE THE MIXED DATA
INSTALL OPTION IS NO**

Explanation

FOR MIXED DATA is specified in a column, variable or SQL parameter declaration, but the MIXED DATA installation option is set to NO. FOR MIXED DATA is valid only when the MIXED DATA installation option is set to YES.

System action

The statement cannot be processed.

Programmer response

Either change the installation option or the FOR clause. If the installation option is correctly set to NO, the allowable FOR clause options are BIT and SBCS.

SQLSTATE

56031

-623

CLUSTER IS NOT VALID FOR *table-name*

Explanation

A table can have only one cluster index, and hash organization cannot be used when a table has a clustering index.

table-name

The name of the table.

The CLUSTER option cannot be specified for one of the following reasons:

- A CREATE INDEX statement attempted to create a cluster index on the specified table, but a clustering index already exists on the table.
- An ALTER INDEX statement specified the CLUSTER clause, but there is already a clustering index defined for the table.

System action

The statement cannot be processed.

Programmer response

Check to determine the identity and validity of the existing cluster index on or use of hash organization with the object table. Alternatively, consider creating the index without the CLUSTER attribute.

SQLSTATE

55012

-624	TABLE <i>table-name</i> ALREADY HAS A PRIMARY KEY OR UNIQUE CONSTRAINT WITH SPECIFIED COLUMNS AND PERIODS
-------------	--

Explanation

An ALTER TABLE statement cannot be processed for one of the following reasons:

- The table already has a primary key.
- The table has an existing unique constraint with the same definition as the new key. (The existing set of columns and periods is specified in the ALTER statement.)

System action

The statement cannot be processed.

Programmer response

Do not attempt to define a table with more than one primary key, or a unique constraint that duplicates the definition of an existing unique constraint.

SQLSTATE

42889

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

-625	TABLE <i>table-name</i> DOES NOT HAVE AN INDEX TO ENFORCE THE UNIQUENESS OF THE PRIMARY OR UNIQUE KEY
-------------	--

Explanation

The ALTER TABLE statement is invalid for one of the following reasons:

- The table does not have a unique index with a key that is identical to the nominated primary or unique key.
- A unique index exists, but the index is already being used to enforce referential constraints. In this case, Db2 does not choose the index to enforce the primary or unique key.

System action

The statement cannot be processed.

Programmer response

Make sure the key list specified on the ALTER TABLE statement identifies an existing unique index of the table that is not already enforcing referential constraints.

SQLSTATE

55014

-626	THE ALTER STATEMENT IS NOT EXECUTABLE BECAUSE THE PAGE SET IS NOT STOPPED
-------------	--

Explanation

An ALTER statement specifies an ADD PART, USING, PRIQTY, SECQTY, ERASE, or GBPCACHE clause, but the page set is not stopped.

System action

The statement cannot be processed.

Programmer response

Stop the page set and resubmit the statement.

SQLSTATE

55015

-627	THE ALTER STATEMENT IS INVALID BECAUSE THE TABLE SPACE OR INDEX HAS USER-MANAGED DATA SETS
-------------	---

Explanation

This error is issued for the following reasons:

- A CREATE or ALTER statement specified a PRIQTY, SECQTY, or ERASE clause, USING STOGROUP was not specified, and the table space or index has user-managed data sets. The primary and secondary space allocation of a user-managed data set cannot be altered by means of an ALTER statement.
- An ALTER statement attempted to define a clone table for a base table that is in a table space that has user-managed data sets. A clone table cannot be defined for a base table that is in a table space that has user-managed data sets.
- A CREATE TABLE or ALTER TABLE statement specified a KEY LABEL clause. One or more underlying data sets for the table space that contains the table or an index on the table are user-managed data sets. The key label specification for a user-managed data set cannot be modified. This also includes data sets for associated objects that contain the table's data, such as auxiliary table spaces, XML table spaces, index spaces, and clone table spaces.

System action

The statement cannot be processed.

Programmer response

Verify that the correct table, index, or partition is specified.

SQLSTATE

55016

-628

THE CLAUSES ARE MUTUALLY EXCLUSIVE

Explanation

Mutually exclusive clauses were specified in the SQL statement. In the cases where you alter an object, a clause was specified that conflicts with an existing property of the object.

SELECT statements

- A *select-statement* value contains both the *update-clause* and the FOR FETCH ONLY clause.

CREATE DATABASE statements

- A CREATE DATABASE statement contains both the AS WORKFILE clause and the AS TEMP clause.

ALTER FUNCTION or CREATE FUNCTION statements

- An ALTER FUNCTION statement for a function that is defined as secured specified the ADD

VERSION clause or the REPLACE clause, but not the SECURED clause. When a function is defined as secured and a new version is added or a version is replaced, the ALTER FUNCTION statement must specify the SECURED clause.

- A CREATE FUNCTION statement contains both a CAST FROM clause and a SOURCE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a RETURNS TABLE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a clause used to define an external function (such as EXTERNAL, LANGUAGE, or NO SQL).
- A CREATE FUNCTION statement was specified with a PARAMETER VARCHAR clause. You can specify CREATE FUNCTION with PARAMETER VARCHAR only if LANGUAGE C is also specified.
- A CREATE FUNCTION or ALTER FUNCTION statement can contain the CAST FROM clause for only external scalar functions.
- A CREATE FUNCTION or ALTER FUNCTION statement specified SCRATCHPAD. SCRATCHPAD must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE FUNCTION or ALTER FUNCTION statement specified FINAL CALL. FINAL CALL must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE FUNCTION or ALTER FUNCTION statement specified LANGUAGE JAVA, LANGUAGE COMPIJAVA, or PARAMETER STYLE JAVA, with DBINFO. DBINFO must not be specified in these cases.
- A CREATE FUNCTION or ALTER FUNCTION statement specified LANGUAGE JAVA or PARAMETER STYLE JAVA, with RUN OPTIONS. RUN OPTIONS must not be specified in these cases.
- A CREATE FUNCTION or ALTER FUNCTION statement specified PARAMETER STYLE JAVA, but LANGUAGE JAVA was not specified.
- A CREATE FUNCTION or ALTER FUNCTION statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE FUNCTION or ALTER FUNCTION statement specified RETURNS GENERIC TABLE, but did not specify LANGUAGE C.
- LANGUAGE JAVA is not allowed for table functions.

ALTER INDEX or CREATE INDEX statements

- UNIQUE or UNIQUE WHERE NOT NULL was specified with PARTITIONED on CREATE INDEX. You cannot specify UNIQUE or UNIQUE WHERE NOT NULL with PARTITIONED on CREATE INDEX unless the index includes all the partitioning columns.
- A CREATE INDEX statement contains both a GENERATE KEY USING and column specified as ASC, DESC, or RANDOM.
- A CREATE INDEX statement contains XMLPATTERN and PARTITIONED.
- A CREATE INDEX or ALTER INDEX statement attempted to specify either CLUSTER, PARTITION BY or both for an XML index or an extended index.

ALTER PROCEDURE or CREATE PROCEDURE statements

- A CREATE PROCEDURE statement specified either FENCED or EXTERNAL indicating that an external SQL procedure is to be defined, and the statement also included one or more options which are allowed only for native SQL procedures. For example, PACKAGE OWNER can be specified on the CREATE PROCEDURE statement for a native SQL procedure, but it is not allowed for an external SQL procedure.
- A CREATE PROCEDURE statement was specified with a PARAMETER VARCHAR clause. You can specify CREATE PROCEDURE with PARAMETER VARCHAR only if LANGUAGE C is also specified.
- A CREATE PROCEDURE or ALTER PROCEDURE statement specified LANGUAGE JAVA or PARAMETER STYLE JAVA, with DBINFO. DBINFO must not be specified in these cases.
- A CREATE PROCEDURE or ALTER PROCEDURE statement specified PARAMETER STYLE JAVA, but LANGUAGE JAVA was not specified.
- A CREATE or ALTER PROCEDURE statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE PROCEDURE or ALTER PROCEDURE statement specified LANGUAGE JAVA with NO WLM ENVIRONMENT. NO WLM ENVIRONMENT must not be specified when LANGUAGE JAVA is also specified for a procedure.
- A CREATE PROCEDURE or ALTER PROCEDURE statement attempts to use the NO WLM ENVIRONMENT and PROGRAM TYPE SUB options. When NO WLM ENVIRONMENT is used, then SECURITY must also be used.
- A CREATE PROCEDURE or ALTER PROCEDURE statement attempts to use both NO WLM

ENVIRONMENT and either USER or DEFINER for SECURITY. When NO WLM ENVIRONMENT is used, then SECURITY Db2 must also be used.

- A CREATE PROCEDURE or ALTER PROCEDURE statement contains both a LANGUAGE REXX clause and either a PARAMETER STYLE DB2SQL or PARAMETER STYLE JAVA clause.
- A CREATE PROCEDURE or ALTER PROCEDURE statement specified LANGUAGE JAVA or PARAMETER STYLE JAVA, with RUN OPTIONS. RUN OPTIONS must not be specified in these cases.
- A CREATE PROCEDURE or ALTER PROCEDURE statement contains a DEBUG MODE clause when neither LANGUAGE JAVA or LANGUAGE SQL are in effect for the procedure.
- A CREATE or ALTER ADD statement contains a DYNAMIC RESULT SETS clause and an AUTONOMOUS clause.
- EXTERNAL NAME was specified on ALTER PROCEDURE for an SQL procedure. You can attempt the same action by issuing a DROP for the procedure and attempting to rebuild it with CREATE PROCEDURE.

ALTER TABLE or CREATE TABLE statements

Only for ALTER TABLE

- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY, DROP CHECK, DROP PRIMARY KEY, or DROP UNIQUE clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check constraint clause.
- An ALTER TABLE statement contains either an ADD MATERIALIZED QUERY or DROP MATERIALIZED QUERY clause, and some other clauses.
- An ALTER TABLE statement contains the DROP COLUMN clause with another clause. The DROP COLUMN clause cannot be used with any other clause.
- An ALTER TABLE statement contains an ENABLE ARCHIVE clause and another clause. The ENABLE ARCHIVE clause cannot be used with any other clause.
- An ALTER TABLE statement contains a DISABLE ARCHIVE clause and another clause. The DISABLE ARCHIVE clause cannot be used with any other clause.

- An ALTER TABLE statement contains both an ORGANIZE BY HASH clause and the APPEND option.
- An ALTER TABLE statement contains an ORGANIZE BY HASH clause, but the table is not in a universal table space. The ORGANIZE BY HASH clause is valid only for tables in a universal table space.
- An ALTER TABLE statement contains both an ADD COLUMN clause and the LONG VARCHAR (or LONG VARGRAPHIC) syntax for the data type for a system-period temporal table or archive-enabled table.
- A RENAME clause was issued with another clause in a single ALTER statement. RENAME cannot be issued with any other clause in a single ALTER statement.
- An ALTER TABLE statement distinctly contains two or more of the following clauses: ALTER COLUMN, ADD PARTITION, ALTER PARTITION, and ROTATE PARTITION. The clauses are mutually exclusive with each other, unless the ADD PARTITION and ALTER PARTITION clauses are specified together to add a new partition between existing logical partitions.
- FL 507 An ALTER TABLE statement with the ALTER PARTITIONING TO PARTITION BY GROWTH clause cannot be specified if any partition of the containing table space uses user-managed data set.

Only for CREATE TABLE

- A CREATE TABLE statement contains both a DSSIZE clause and EVERY integer G clause.
- A CREATE TABLE statement contains a CCSID 1208 clause for a VARCHAR column, or a CCSID 1200 clause for a VARGRAPHIC column in an EBCDIC table.
- A CREATE TABLE statement contains both a CCSID 1208 or CCSID 1200 clause and a FIELDPROC clause.
- An explicit table space cannot be specified on a CREATE TABLE statement that specifies table space attributes for an implicit table space.
- None

For both ALTER TABLE and CREATE TABLE

- An ALTER TABLE or CREATE TABLE statement contains an ORGANIZE BY HASH clause, but the table is defined in a table space that is defined with the MEMBER CLUSTER option.

- An ALTER TABLE or CREATE TABLE statement contains the VERSIONING clause and the LIKE clause.
- DATA CAPTURE CHANGES for ALTER TABLE or CREATE TABLE can be specified only for tables in table spaces with the LOGGED logging attribute.
- PARTITION BY SIZE was specified along with an IN clause that identified a table space that is not defined as a partition-by-growth table space.
- A *column-definition* value contains both NOT NULL and DEFAULT NULL clauses.
- A *column-definition* value contains both FIELDPROC and DEFAULT clauses.

ALTER TABLESPACE or CREATE TABLESPACE statements

- An ALTER TABLESPACE statement with the ALTER PARTITION clause also contains the DSSIZE clause. The DSSIZE clause cannot be specified for a non-relative partition-by-range table space.
- An ALTER TABLESPACE statement contains the DROP PENDING CHANGES clause with another clause. The DROP PENDING CHANGES clause cannot be used with any other clause.
- NOT LOGGED for ALTER TABLESPACE is mutually exclusive with DATA CAPTURE CHANGES, which is an attribute of one or more of the tables in the table space.
- An ALTER TABLESPACE statement contains the MOVE TABLE clause with another clause. The MOVE TABLE clause cannot be used with any other clause.
- An ALTER TABLESPACE statement contains the PAGENUM clause with another clause. The PAGENUM clause cannot be used with any other clause.
- An ALTER TABLESPACE statement contains the SEGSIZE clause with another clause. The SEGSIZE clause cannot be used with any other clause.
- A CREATE TABLESPACE statement specified MAXPARTITIONS and Numparts.
- A CREATE TABLESPACE statement contains both MAXPARTITIONS and PARTITION clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and MEMBER CLUSTER clauses without either a MAXPARTITIONS or Numparts clause.

- A CREATE TABLESPACE or ALTER TABLESPACE statement contains both LOCKPART YES and LOCKSIZE TABLESPACE.
- A CREATE TABLESPACE or ALTER TABLESPACE statement specified MAXPARTITIONS and LOCKSIZE TABLE.
- A CREATE TABLESPACE or ALTER TABLESPACE statement contains both an ORGANIZE BY HASH clause and the APPEND option.
- A USING VCAT clause was specified on a CREATE TABLESPACE or ALTER TABLESPACE statement for a partition-by-growth table space.

ALTER TRIGGER or CREATE TRIGGER statements

- An ALTER or CREATE TRIGGER statement specifies more than one correlation name for OLD, NEW, OLD_TABLE, or NEW_TABLE. Each of these correlation specifications can appear no more than once in the ALTER or CREATE TRIGGER statement.
- The WHEN clause must not be specified for an INSTEAD OF trigger.
- Two attributes in the ALTER or CREATE TRIGGER statement conflict. CREATE TRIGGER statement (basic trigger) (Db2 SQL) indicates which combinations are valid. For example, according to the table, FOR EACH STATEMENT must not be used for a BEFORE or INSTEAD OF trigger or with the REFERENCING NEW ROW clause.

ALTER TRUSTED CONTEXT statements

- A trusted context definition specified JOBNAME in the ATTRIBUTES clause with ADDRESS, SERVAUTH, or ENCRYPTION. This restriction is removed in Db2 13 by APAR PH65634.

DECLARE CURSOR statements

- A DECLARE CURSOR statement specifies both the WITH RETURN TO CLIENT option and one the following options: WITH RETURN (TO CALLER) or WITHOUT RETURN.
- If INSENSITIVE or SENSITIVE is specified, then SCROLL must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- If SCROLL is specified, then either INSENSITIVE or SENSITIVE STATIC must also be specified, either on DECLARE

CURSOR or with the ATTRIBUTES clause of the PREPARE statement.

DECLARE GLOBAL TEMPORARY TABLE statements

- The AS (*subselect*) clause of a DECLARE GLOBAL TEMPORARY TABLE statement contains both an INCLUDING COLUMN DEFAULTS clause and a USING TYPE DEFAULTS clause.

PREPARE statements

- If INSENSITIVE or SENSITIVE is specified, then SCROLL must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- If SCROLL is specified, then either INSENSITIVE or SENSITIVE STATIC must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- The *attribute-string* value specified in the ATTRIBUTES clause of the PREPARE statement cannot specify conflicting options.

System action

The statement cannot be processed.

Programmer response

Review the permitted options for the statement that you want to issue, change the options specified in the statement, and reissue the statement.

SQLSTATE

42613

Related reference

[Statements \(Db2 SQL\)](#)

-629

**SET NULL CANNOT BE SPECIFIED
BECAUSE FOREIGN KEY *name*
CANNOT CONTAIN NULL VALUES**

Explanation

The code SET NULL option of the indicated FOREIGN KEY clause is invalid because no column of the key allows null values. The *name* is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System action

The statement cannot be processed.

Programmer response

Change a column of the key to allow null values or change the delete rule.

SQLSTATE

42834

-631	FOREIGN KEY <i>name</i> IS TOO LONG OR HAS TOO MANY COLUMNS
-------------	--

Explanation

This code is used to report that the sum of the length attributes of the columns identified in the indicated FOREIGN KEY clause is greater than 255 bytes or the number of columns identified is greater than 64. The 'name' is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System action

The statement cannot be processed.

Programmer response

The table definition must be modified to conform to the system-imposed limit of the sum of the length attributes of the columns identified in the PRIMARY KEY clause.

SQLSTATE

54008

-632	THE TABLE CANNOT BE DEFINED AS A DEPENDENT OF <i>table-</i> <i>name</i> BECAUSE OF DELETE RULE RESTRICTIONS
-------------	--

Explanation

This code is used to report that the object of an ALTER TABLE statement cannot be defined as a dependent of the indicated table because either:

- The relationship would form a cycle that would cause the table to be delete-connected to itself.
- The relationship would cause the table to be delete-connected to the indicated table through multiple paths and the delete rule of the existing relationship is SET NULL.

The error is due to the delete rules of existing relationships, not the delete rule specified in the FOREIGN KEY clause of the ALTER TABLE statement.

System action

The statement cannot be processed.

Programmer response

Eliminate the particular FOREIGN KEY clause from the ALTER or CREATE TABLE statement.

SQLSTATE

42915

-633	THE DELETE RULE MUST BE <i>delete-</i> <i>rule</i>
-------------	---

Explanation

The code is used to report that the 'delete-rule' specified in a FOREIGN KEY clause of the ALTER TABLE statement is invalid. The indicated 'delete-rule' is required because:

- A self-referencing constraint must have a 'delete-rule' of CASCADE or NO ACTION.
- The relationship would cause the table to be delete-connected to the same table through multiple paths and such relationships must have the same 'delete-rule'.
- When PERIOD BUSINESS_TIME is specified for a temporal referential constraint, the 'delete-rule' must be RESTRICT.

System action

The statement cannot be processed.

Programmer response

Change the 'delete rule' in the FOREIGN KEY clause.

SQLSTATE

42915

-634	THE DELETE RULE MUST NOT BE CASCADE
-------------	--

Explanation

The code is used to report that the CASCADE delete rule specified in the FOREIGN KEY clause of an ALTER TABLE statement is invalid because:

- The relationship would form a cycle that would cause a table to be delete-connected to itself.
- The relationship would cause another table to be delete-connected to the same table through multiple paths with different delete rules or with a delete rule equal to SET NULL.

System action

The statement cannot be processed.

Programmer response

Change the delete rule.

SQLSTATE

42915

-635	THE DELETE RULES CANNOT BE DIFFERENT OR CANNOT BE SET NULL
-------------	---

Explanation

The code is used to report that the delete rules specified in two FOREIGN KEY clauses of the CREATE TABLE statement are invalid because the table would be delete-connected to the same table through multiple paths involving relationships with different delete rules or with delete rules of SET NULL.

System action

The statement cannot be processed.

Programmer response

Change the delete rule.

SQLSTATE

42915

-636	RANGES SPECIFIED FOR PARTITION <i>part-num</i> ARE NOT VALID
-------------	---

Explanation

The ranges specified for physical partition *part-num* are not valid for one of the following reasons:

- The partitioning key values specified in the limit key value specifications were not in either ascending or descending order.
- A partitioning key value that was specified in the limit key value specifications already exists. Duplicate limit keys must not be specified.

- All of the columns in the partitioning key are ascending, and a constant or MINVALUE was specified following MAXVALUE in the limit key value specification for the partition. Once MAXVALUE is specified, all subsequent columns must be MAXVALUE.
- All of the columns in the partitioning key are descending, and a constant or MAXVALUE was specified following MINVALUE in the limit key value specification for the partition. Once MINVALUE is specified, all subsequent columns must be MINVALUE.

System action

The statement cannot be processed.

User response

Correct the range partitioning specifications in the statement for the identified partition.

SQLSTATE

56016

-637	DUPLICATE <i>keyword-name</i> KEYWORD OR CLAUSE
-------------	--

Explanation

The SQL statement contains a duplicate specification for the *keyword-name* key word. For example:

- DEFAULT, UNIQUE, and PRIMARY can only be specified once in a column definition.
- UNIQUE and PRIMARY cannot both be specified for the same column definition.
- PRIMARY can only be specified once in a CREATE TABLE statement.
- The *attribute-string* specified in the ATTRIBUTES clause of the PREPARE statement cannot specify an option more than once.
- ACTIVATE or DEACTIVATE ROW ACCESS CONTROL can only be specified once.
- ACTIVATE or DEACTIVATE COLUMN ACCESS CONTROL can only be specified once.
- IN ACCELERATOR can only be specified once.
- ATTRIBUTE ENCRYPTION can only be specified once in a TRUSTED CONTEXT definition.
- There are more than one *xquery-context-item-expression* in the PASSING clause of an XMLQUERY or XMLEXISTS.

- WHEN MATCHED and WHEN NOT MATCHED clauses cannot be specified more than once in a MERGE statement.
- SKIP LOCKED DATA clause cannot be specified more than once for:
 - all clauses in *select-stmt*
 - SELECT INTO statements
 - search UPDATE statements
 - search DELETE statements
- If multiple ADD COLUMN clauses are specified in the same statement, at most one ADD COLUMN clause can contain a *references-clause*.

System action

The statement cannot be processed.

Programmer response

Correct the statement by removing duplicate clauses.

SQLSTATE

42614

-638	TABLE <i>table-name</i> CANNOT BE CREATED BECAUSE COLUMN DEFINITION IS MISSING
-------------	---

Explanation

The CREATE TABLE statement does not contain any column definition.

System action

The SQL statement cannot be executed.

Programmer response

Add column definition to the statement.

SQLSTATE

42601

-639	A NULLABLE COLUMN OF A FOREIGN KEY WITH A DELETE RULE OF SET NULL CANNOT BE A COLUMN OF THE KEY OF A PARTITIONED INDEX
-------------	---

Explanation

A partition key of the clustering index cannot be updated. Therefore, a foreign key column with a delete rule of SET NULL cannot be a column of a partition

key if that column is nullable. If this error occurs for an ALTER TABLE operation, the foreign key cannot be created. If this error occurs for a CREATE INDEX operation, the index cannot be created.

System action

The statement cannot be processed.

Programmer response

Review the delete rule of the referential constraint and the partition keys for the index. Do one of the following:

- If the operation in error was CREATE INDEX, either change the index partition key definition or drop and redefine the referential constraint with a different delete rule.
- If the operation in error was ALTER TABLE, change the referential delete rule so that all nullable index keys are not part of the foreign keys.

SQLSTATE

56027

-640	LOCKSIZE ROW CANNOT BE SPECIFIED BECAUSE TABLE IN THIS TABLESPACE HAS TYPE 1 INDEX
-------------	---

Explanation

If LOCKSIZE ROW is specified for a table space, all indexes on tables in the table space must be type 2 indexes. The following SQL statement identifies all the type 1 indexes:

```
SELECT I.CREATOR, I.NAME
FROM SYSIBM.SYSINDEXES I,
SYSIBM.SYSTABLES T
WHERE INDEXTYPE = '1'
AND T.TSNAME = 'table_space_name'
AND T.DBNAME = 'database_name'
AND T.CREATOR = I.TBCREATOR
AND T.NAME = I.TBNAME;
```

where '*table_space_name*' is the name of the table space that is to be altered; '*database_name*' is the name of the database that contains the table space.

System action

The statement cannot be processed.

Programmer response

Since the LOCKSIZE ROW on the table space and the type 1 indexes conflict, either use the ALTER INDEX

statement to convert all type 1 indexes to type 2 indexes or use another LOCKSIZE option.

SQLSTATE

56089

-643	A CHECK CONSTRAINT OR THE VALUE OF AN EXPRESSION FOR A COLUMN OF AN INDEX EXCEEDS THE MAXIMUM ALLOWABLE LENGTH KEY EXPRESSION
------	--

Explanation

The definition of a check constraint or expression of an index column exceeds the maximum allowable length:

- A check constraint exceeded 3800 UTF-8 bytes. Redundant blank spaces are excluded from this limit.
- A value for an expression for an index exceeded 4000 UTF-8 bytes.

System action

The CREATE TABLE or ALTER TABLE statement failed. The statement cannot be executed.

Programmer response

Change the constraint or expression so that it does not exceed the maximum allowable limit. If it is a check constraint, rewrite the check constraint definition so that it is less than 3800 UTF-8 bytes. You might need to divide a the check constraint into two or more smaller check constraints.

SQLSTATE

54024

-644	INVALID VALUE SPECIFIED FOR KEYWORD OR CLAUSE <i>keyword-or-clause</i> IN STATEMENT <i>statement-type</i>
------	--

Explanation

The value that was specified for the *keyword-or-clause* parameter in the *statement-type* SQL statement is not valid.

System action

The statement cannot be processed.

Programmer response

In most cases, change the value of the specified *keyword-or-clause* to a valid value.

This error might be issued for pending definition changes by utilities or data definition statements. In that case, check the STATEMENT_TEXT column of related rows in the SYSIBM.SYSPENDINGDDL catalog table for a pending definition change that contains an invalid value. If the error is for an invalid MAXPARTITIONS change, compare the actual number of partitions for the table space to the specified MAXPARTITIONS value. It is possible that the number of partitions has grown to exceed the MAXPARTITIONS value of a pending definition change. In that case, alter the table space to drop all pending definition changes. Then, reissue the pending changes with valid specifications.

SQLSTATE

42615

Related tasks

-646	TABLE <i>table-name</i> CANNOT BE CREATED IN OR MOVED TO SPECIFIED TABLE SPACE <i>table-space-name</i> BECAUSE IT ALREADY CONTAINS A TABLE
------	---

Explanation

The table space that is specified in a CREATE TABLE or ALTER TABLESPACE statement is one of the following types of table spaces and already contains an existing table or has a pending definition change to move a table to *table-space-name*:

- A partitioned table space
- An implicitly defined table space
- A LOB table space
- An XML table space
- A table space that contains a system-period temporal table or history table
- A table space that contains an archive-enabled table or archive table
- A table space that is the target table space for a pending ALTER TABLESPACE MOVE TABLE statement

Only one table can exist in these types of table spaces.

System action

The statement cannot be processed. The table was not created or moved.

Programmer response

Verify that the correct table space was specified in the failing statement.

[CREATE TABLE statement \(Db2 SQL\)](#)

-647	BUFFERPOOL <i>bp-name</i> FOR IMPLICIT OR EXPLICIT TABLESPACE OR INDEXSPACE <i>name</i> HAS NOT BEEN ACTIVATED
-------------	---

Explanation

The buffer pool specified in a CREATE or ALTER statement for a table space or index (index space) is not activated. Alternatively, on a CREATE TABLE statement without an IN clause, the buffer pool, which is chosen by Db2 implicitly according to the actual record size, is not activated.

Table spaces and indexes (index spaces) can only be assigned or reassigned to buffer pools that are currently activated.

System action

The statement cannot be processed. The specified table space or index space was not created or altered.

Programmer response

Verify that the proper buffer pool was specified in the CREATE or ALTER statement and the buffer pool is chosen by Db2. Use the -DISPLAY BUFFERPOOL command to display the attributes of the buffer pool and determine if the buffer pool is activated. If the buffer pool is not activated, use the -ALTER BUFFERPOOL command to change the VPSIZE from 0 to the appropriate size.

SQLSTATE

57003

-650	THE ALTER STATEMENT CANNOT BE EXECUTED, REASON <i>reason-code</i>
-------------	--

Explanation

The ALTER statement cannot be executed for the indicated reason.

reason-code

A numeric value that indicates the reason that the statement cannot be executed.

5 An ALTER statement with a PIECESIZE clause is not allowed for a partitioning index.

6 An ALTER statement with a PIECESIZE 4G clause is not allowed for non-partitioned indexes on a non-large table.

7 An ALTER statement with a DSSIZE clause is allowed only for LOB and universal table spaces.

8 An ALTER statement with a SEGSIZE clause is allowed for universal table spaces and partitioned table spaces that use table-controlled partitioning.

9 An ALTER statement with a BUFFERPOOL clause where a different page size is specified is allowed only for LOB and universal table spaces (excluding XML table spaces).

10 An ALTER statement with a MAXPARTITIONS clause is allowed only for the following table spaces:

- Single-table simple table spaces
- Single-table segmented table spaces
- Universal table spaces that use partition-by-growth organization

11 An ALTER statement with an ENDING AT clause is not allowed for an index on a partitioned base table with LOB columns or the table itself.

12 ALTER INDEX is not allowed when there is a pending SQL statement.

- 13** ALTER TABLE is not allowed when there is a pending SQL statement.
- 14** An ALTER INDEX statement with an ENDING AT clause is not allowed when using table-controlled partitioning.
- 15** Using ALTER to change the attributes of a partition values is not allowed for an index on a partitioned base table with LOB columns, or the table itself.
- 16** ALTER TABLE DATA CAPTURE CHANGES is not allowed for table spaces in advisory REORG-pending (AREO) state.
- 17** ALTER TABLE DROP CLONE cannot be used to drop a clone when the table itself is a clone.
- 18** ALTER INDEX is not allowed when the table has defined a clone.
- 19** ALTER TABLESPACE is not allowed when the table space contains a table that has a clone defined.
- 20** ALTER TABLE DROP CLONE cannot be used to drop a clone when the table does not have a defined clone.
- 21** ALTER TABLE SET DEFAULT is not allowed when all of the following conditions are true:
- The table exists in a table space that currently has the DEFINE YES attribute.
 - The ALTER TABLE statement references a column that was not part of the original table definition.
 - The table has not been reorganized since the referenced column was added.
- 22** ALTER TABLE SET DEFAULT and DROP DEFAULT are not allowed for tables referenced by a materialized query table or view.
- 23** ALTER TABLE DROP DEFAULT is not allowed when the table space is in the advisory REORG-pending (AREO*) state.
- 24** An ALTER TABLE statement with pending options is allowed only for universal table spaces.

- 25** ALTER TABLE DROP DEFAULT is not allowed when all of the following conditions are true:
- The table space is in either the advisory REORG-pending (AREO*) or REORG-pending (REORP) state.
 - The ALTER TABLE statement references a column that was not part of the original table definition.
 - The table has not been reorganized since the referenced column was added.
- In this case, a mass UPDATE can be used to clear the AREO* state.
- 26** An ALTER VIEW statement with a REGENERATE clause is not allowed if the view is referenced by a materialized query table.
- 27** For an ALTER TABLE statement that names a materialized query table, the alterations are limited to the following situations:
- Changing the materialized query table attributes
 - Turning the materialized query table to a base table
 - Specifying the following clauses:
 - ADD RESTRICT ON DROP
 - ALTER MATERIALIZED QUERY
 - ALTER PARTITION
 - ALTER PARTITIONING
 - AUDIT
 - DATA CAPTURE
 - DROP MATERIALIZED QUERY
 - DROP RESTRICT ON DROP
 - ROTATE PARTITION
 - KEY LABEL
 - NO KEY LABEL
- ADD RESTRICT ON DROP and DROP RESTRICT ON DROP clauses cannot be used in the same statement.
- 28** ALTER TABLE is not allowed for an accelerator-only table unless the only alteration that is specified is either ADD RESTRICT ON DROP or DROP RESTRICT ON DROP.

29

- ALTER TABLESPACE is not allowed when the table space contains an accelerator-only table.
- ALTER TABLESPACE is not allowed for an auxiliary table space when the base table space contains an accelerator-only table.

32

An ALTER statement with an ADD PARTITION clause attempted to insert a partition. This is not allowed for one of the following reasons:

- The table is not in a partition-by-range table space.
- The partition number is not valid.
- The limit key value is not valid for an affected partition.
- The table contains a LOB column, or a distinct type column that is based on a LOB data type.

34

ALTER TABLESPACE COMPRESS is not allowed for a LOB table space when the associated base table space is not a universal table space.

35

ALTER TABLESPACE PAGENUM is not successful because the table space is not a partition by range table space.

36

ALTER TABLESPACE PAGENUM is not successful because the table space is DEFINE NO, but at least one index for the table space is DEFINE YES.

37

ALTER TABLESPACE PAGENUM is not successful because an invalid keyword was specified. PAGENUM must be followed by the keyword RELATIVE.

38

ALTER TABLESPACE PAGENUM is not successful because the table space uses a hash organization, or ALTER TABLE cannot be used to add hash organization when the table resides in a table space that uses relative page numbers.

39

ALTER TABLESPACE PAGENUM is not successful because the table contains truncated limit key values.

40

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a table that exists in the table space that is being altered.

41

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a simple or segmented (non-UTS) table space that is to be altered.

42

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a table space that exists in the same database as the table space that is being altered.

43

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a target table space that is a partition-by-growth universal table space.

44

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a target table space that does not already have data sets created.

45

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a target table space that is defined with MAXPARTITIONS 1.

46

An ALTER TABLESPACE statement with a MOVE TABLE clause must specify a target table space that is defined with the same LOGGED attribute as the source table space.

47

If a table space is the target of a pending definition change to move a table, the target table space cannot be dropped and re-created before the pending change is materialized.

48

An ALTER TABLESPACE with a MAXPARTITIONS clause to convert the table space to a partition-by-growth universal table space must specify MAXPARTITIONS 1 if a pending definition change to move a table from the table space exists.

49

ALTER TABLESPACE COMPRESS YES HUFFMAN is not allowed for a non-universal table space.

50

ALTER TABLESPACE COMPRESS YES FIXEDLENGTH or COMPRESS YES HUFFMAN is not allowed for a LOB table space.

51

ALTER TABLESPACE COMPRESS YES HUFFMAN is not allowed for a table space that uses a hash organization.

52

FL 500 ALTER TABLE with an ALTER PARTITIONING clause is not allowed if the current

partitioning scheme of the table being altered is invalid for the alteration.

53

FL 500 ALTER TABLE with an ALTER PARTITIONING clause is not allowed for a table that was defined with hash organization.

54

FL 500 ALTER TABLE with an ALTER PARTITIONING clause cannot be processed due to invalid DBET states.

55

FL 500 ALTER TABLE with ALTER PARTITIONING clause requires MAXVALUE or MINVALUE for limit key columns of the last partition.

56

FL 500 ALTER TABLE with an ALTER PARTITIONING clause is not allowed for a table that has LOB columns.

57

FL 500 ALTER TABLE with an ALTER PARTITIONING clause is not allowed if the maximum number of partitions for the new partitioning scheme is less than the existing maximum number of partitions where the table is defined with DATA CAPTURE CHANGES, and the table's table space data sets are defined.

58

FL 507 ALTER TABLE with an ALTER PARTITIONING TO PARTITION BY GROWTH clause where the table space does not have data sets created is not allowed if any partitioned index on the table has defined data sets.

System action

The statement cannot be processed.

Programmer response

Correct the error based on the information provided for the *reason-code* value, and reissue the statement.

For errors due to incorrect definition of the target table space for a pending definition change to move a table, take one of the following actions:

- Alter the target table space to specify the correct attributes.
- Complete the following steps:
 1. Drop all pending definition changes, including the MOVE TABLE operation, associated with the source table space.
 2. Drop the target table space.
 3. Re-create the target table space with the correct attributes.

4. Execute all the pending definition changes again.

**TABLE DESCRIPTION EXCEEDS
MAXIMUM SIZE OF OBJECT
DESCRIPTOR.**

Explanation

The CREATE TABLE or ALTER TABLE statement causes the table descriptor (record OBD) to exceed the object descriptor size limit of 32KB.

System action

The statement is not executed. For an ALTER TABLE statement, the definition of the table is unchanged. For a CREATE TABLE statement, the table is not created.

Programmer response

Change the statement by reducing either the number or length (or a combination of both) of the user-defined default string constants or check constraints and execute the statement again.

SQLSTATE

54025

-652

**VIOLATION OF INSTALLATION
DEFINED EDIT OR VALIDATION
PROCEDURE *proc-name***

Explanation

The result of the SQL statement has been rejected by the installation defined edit or validation procedure 'proc-name' for the object table.

System action

The statement cannot be processed. The contents of the object table were not modified.

Programmer response

Determine the requirements imposed by the edit or validation procedure for inserts and updates of the object table.

SQLSTATE

23506

-653	TABLE <i>table-name</i> IN PARTITIONED TABLE SPACE <i>tspacename</i> IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED
-------------	---

Explanation

An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System action

The statement cannot be processed.

Programmer response

Verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

SQLSTATE

57004

-655	THE CREATE OR ALTER STOGROUP IS INVALID BECAUSE THE STORAGE GROUP WOULD HAVE BOTH SPECIFIC AND NON- SPECIFIC VOLUME IDS
-------------	--

Explanation

One of the following error conditions occurred:

- Both a specific and a non-specific ('*') volume ID are specified in the VOLUMES clause of a CREATE STOGROUP statement.
- Both a specific and a non-specific ('*') volume ID are specified in an ADD VOLUMES clause of an ALTER STOGROUP statement.

- A specific volume ID is specified in an ADD VOLUMES clause of an ALTER of a storage group that has non-specific volume IDs or mixed volume IDs.
- A non-specific volume ID ('*') is specified in an ADD VOLUMES clause of an ALTER of a storage group that has specific volume IDs or mixed volume IDs.

System action

The statement cannot be processed.

Programmer response

Specify either specific or non-specific volume IDs in the VOLUMES clause of CREATE STOGROUP statement and the ADD VOLUMES clause of the ALTER STOGROUP statement. To add specific volume IDs to a storage group with non-specific volume IDs, use the REMOVE VOLUMES clause to remove the non-specific volume IDs. To add non-specific volume IDs to a storage group with specific volume IDs, use the REMOVE VOLUMES clause to remove the specific volume IDs.

SQLSTATE

56036

-658	A <i>object-type</i> CANNOT BE DROPPED USING THE <i>statement</i> STATEMENT
-------------	--

Explanation

A DROP statement was issued, but the object cannot be explicitly dropped. The object must be dropped by dropping an associated object:

TRIGGER PACKAGE

A *trigger package* cannot be dropped with the DROP PACKAGE statement. A trigger package can only be dropped implicitly when the associated trigger is dropped using the DROP TRIGGER statement.

CAST FUNCTION

A *cast function* cannot be explicitly dropped with the DROP FUNCTION statement. A cast function can only be dropped implicitly when the associated distinct type is dropped using the DROP DISTINCT TYPE statement.

ROW PERMISSION

A default row permission cannot be explicitly dropped with the DROP PERMISSION statement. A default row permission can only be dropped implicitly when the associated table is dropped using the DROP TABLE statement. Alternatively, the default row permission can be dropped

by using the ALTER TABLE statement with the DEACTIVATE ROW ACCESS clause.

NOT EQUAL TO THE NUMBER OF PARTITIONS OF THE TABLE SPACE

System action

The statement cannot be processed.

Programmer response

Issue the appropriate DROP statement to drop the intended objects.

SQLSTATE

42917

-660	INDEX <i>index-name</i> CANNOT BE CREATED OR ALTERED ON PARTITIONED TABLE SPACE <i>tspace-name</i> BECAUSE KEY LIMITS ARE NOT SPECIFIED
-------------	--

Explanation

The CREATE INDEX or ALTER INDEX statement did not specify limit key values for the partitions of the table space. To create a clustering index for a table in a partitioned table space, or to modify those values using ALTER INDEX, you must include those values.

System action

The statement cannot be processed. The specified cluster index was not created or altered.

Programmer response

Verify that the correct table was specified in the CREATE INDEX or ALTER INDEX statement. If so, the definition for the partitioned table space must be examined so that a proper definition for the cluster index for the table may be constructed.

SQLSTATE

53035

[CREATE INDEX statement \(Db2 SQL\)](#)

-661	<i>object-type</i> <i>object-name</i> CANNOT BE CREATED ON PARTITIONED TABLE SPACE <i>tspace-name</i> BECAUSE THE NUMBER OF PARTITION SPECIFICATIONS IS
-------------	--

Explanation

The *object-name* definition is incorrect for one of the following reasons:

- If *object-type* is INDEX, the CREATE INDEX statement for the cluster index on a partitioned table (that is, a table residing in a partitioned table space) does not contain the same number of partition specifications as there are partitions in the table space. The definition for the cluster index for a partitioned table must contain exactly as many partition specifications as there are partitions in the table space in which that table resides. Also, the partition numbers must be valid and unique.
- If *object-type* is TABLE, the number of partitions that is specified in the partitioning clause of the CREATE TABLE statement differs from the number of partitions in the table space in which the table is being created.

System action

The statement cannot be processed. The specified cluster index or table was not created.

Programmer response

Examine the definition of the partitioned table space to determine how many partitions have been specified. Correct the syntax of the CREATE INDEX or CREATE TABLE statement to provide the proper number of partition specifications.

-662	A PARTITIONED INDEX CANNOT BE CREATED ON A TABLE SPACE, OR A TABLE SPACE CANNOT BE INDEX-CONTROLLED. TABLE SPACE <i>tspace-name</i>, REASON <i>reason-code</i>
-------------	---

Explanation

The CREATE INDEX statement could not be processed. The value in *reason-code* identifies the problem.

01

The CREATE INDEX statement contains the PARTITION BY clause for index-controlled partitioning, but the table on which the index is created has one of the following characteristics:

- The table is not in a partitioned table space.
- The table is in a partition-by-growth or a partition-by-range table space.

02

The CREATE INDEX statement contains the PARTITIONED option, but the table on which the index is created has one of the following characteristics:

- The table is not in a partitioned table space.
- The table is in a partition-by-growth table space.

System action

The statement cannot be processed. The specified index was not created.

Programmer response

Verify that the proper object table was specified in the statement. Review the proper usage of the PARTITION BY clause or the PARTITIONED option in CREATE INDEX statements

SQLSTATE

53037

Related reference

[CREATE INDEX statement \(Db2 SQL\)](#)

-663

THE NUMBER OF KEY LIMIT VALUES IS EITHER ZERO, OR GREATER THAN THE NUMBER OF COLUMNS IN THE KEY OF INDEX *index-name*

Explanation

The number of limit key value specifications provided in at least one of the PART specifications of the CREATE INDEX or ALTER INDEX statement is either zero or greater than the number of columns in the index key.

System action

The statement cannot be processed. The specified index was not created.

Programmer response

Correct the statement so that each PART specification contains exactly the same number of limit key value specifications as there are columns in the index key.

SQLSTATE

53038

-665

THE PARTITION CLAUSE OF AN ALTER STATEMENT IS OMITTED OR INVALID

Explanation

The ALTER statement is invalid for one of the following reasons:

- The table space or index is not partitioned and the PARTITION clause is specified.
- The table space is a partition-by-growth table space and the PARTITION clause is specified.
- The table space or index is partitioned, a partition attribute (FREEPAGE or PCTFREE) is specified, and the PARTITION clause is not specified.
- The integer specified in the PARTITION clause does not identify a partition of the table space or index.
- A USING, PRIQTY, SECQTY, or ERASE clause is used to alter storage attributes, but the partition is not specified.
- A GBPCACHE clause is used to alter the group buffer pool caching attributes, but the partition is not specified.
- The PARTITION BY clause is specified without a PARTITION clause to specify the range for the partition. You must specify a PARTITION clause with a range to alter the PARTITION BY specification.
- Using ALTER to change the attributes of a partition *values* is not allowed for an index on a partitioned base table with LOB columns, or the table itself.

System action

The statement cannot be processed.

Programmer response

Determine whether the table space or index you want to alter is partitioned. If it is partitioned, specify a PARTITION clause that identifies the partition you want to alter. If it is not partitioned, do not specify the PARTITION clause.

SQLSTATE

53039

-666 *stmt-verb* **object CANNOT BE EXECUTED BECAUSE function IS IN PROGRESS**

Explanation

The SQL statement could not be executed because the named function was executing at the time.

stmt-verb
The type of data definition language (DDL) statement

object
The Db2 object type

function
The active function that prevented the action. A utility, the resource limit facility, or Db2ZAI.

If the object is part of the communications database, it cannot be dropped while the DDF is active.

System action

The statement cannot be processed.

Programmer response

If the function is a utility, wait for the function to complete or stop. Then resubmit the statement for execution.

If the function is the resource limit facility, the statement cannot be executed until the resource limit facility is stopped or switched to a different resource limit table. In a Db2 data sharing environment, the resource limit facility must be stopped on all members of the Db2 data sharing group or all members must switch to a resource limit table that is not associated with the object.

If the function is the DDF, the facility must be stopped before the object can be dropped. In a Db2 data sharing environment, the facility must be stopped on all members of the Db2 data sharing group.

SQLSTATE

[-DISPLAY UTILITY command \(Db2\) \(Db2 Commands\)](#)

-667 **THE CLUSTERING INDEX FOR A PARTITIONED TABLE SPACE CANNOT BE EXPLICITLY DROPPED**

Explanation

The DROP INDEX statement attempted to drop the cluster index for a table residing in a partitioned table space. The cluster index for such a table cannot be dropped explicitly with the DROP INDEX statement.

System action

The statement cannot be processed. The specified index was not dropped.

Programmer response

The cluster index for a table in a partitioned table space can only be dropped implicitly when the associated partitioned table space is dropped.

SQLSTATE

42917

-668 **THE COLUMN CANNOT BE ADDED TO THE TABLE BECAUSE THE TABLE HAS AN EDIT PROCEDURE DEFINED WITH ROW ATTRIBUTE SENSITIVITY**

Explanation

The ALTER TABLE statement attempted to add a column to a table that has an edit procedure that is defined with row attribute sensitivity. No columns can be added to this table.

System action

The statement cannot be processed. The specified table was not altered.

Programmer response

Verify that the correct table was specified in the ALTER statement. Do not attempt to alter the definition of a table that has an installation-written edit procedure associated with it.

SQLSTATE

56018

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

-669	THE OBJECT CANNOT BE EXPLICITLY DROPPED. REASON <i>reason-code</i>
-------------	--

Explanation

The DROP statement failed.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

0001

One of the following statements attempted to drop a table that resides in an explicitly defined (non-UTS) partitioned table space:

- The DROP TABLE statement
- A DROP statement which causes a dependent table to be dropped

Prior to FL 506, SQLCODE -669 with reason code 0001 is issued when one of the statements listed above attempts to drop a table that resides in an explicitly defined partitioned table space or a partition-by-growth table space.

0002

The DROP INDEX statement attempted to drop an index that Db2 requires to retain the following conditions:

- The primary key constraint on a table
- A unique key constraint on a table
- A referential constraint on a table
- The uniqueness of a ROWID column
- An XML column defined on a table

A system required index cannot be dropped using the DROP INDEX statement.

0003

The DROP INDEX statement attempted to drop an implicitly created index for a table that is defined with HASH organization.

0004

The DROP TABLE statement attempted to drop a table that was implicitly created for an XML column.

0005

The DROP TABLESPACE statement attempted to drop a table space that was implicitly created for a table containing an XML column.

0006

The DROP statement attempted to drop an auxiliary table, an auxiliary index, or an auxiliary table space that is involved in cloning.

0007

The DROP TABLESPACE statement or DROP DATABASE statement attempted to drop a table space or database that contains an accelerator-only table.

0008

The DROP INDEX statement attempted to drop an index that is used for the definition of a foreign key for a temporal referential constraint.

System action

The statement cannot be processed. The object is not dropped.

Programmer response

Take the appropriate corrective action based on the *reason-code* value:

0001

The table of a partitioned (non-UTS) table space can be dropped implicitly only when the table space itself is dropped.

0002

If you do not want to keep the primary key, unique key, or referential constraint, use the DROP CONSTRAINT clause of the ALTER TABLE statement to remove the primary key or unique constraint. If the index was created only for enforcing the primary or unique key, the index will be dropped. If not, the DROP INDEX statement could then be processed. An index for a ROWID column can only be dropped by dropping the table.

0003

The index can only be dropped implicitly when the associated table that contains the XML column is dropped. If the error is about a table that is organized by hash, then the associated hash overflow index cannot be dropped. Dropping hash organization will automatically drop the hash overflow index.

0004

The table can be dropped implicitly only when the associated table containing the XML column is dropped.

0005

The table space can be dropped implicitly only when the associated table containing the XML column is dropped.

0006

An auxiliary table, an auxiliary index, or an auxiliary table space that is involved in cloning can be dropped implicitly only when the associated table containing the XML column is dropped.

0007

The table space or database can be dropped explicitly only when the accelerator-only table is dropped.

0008

The index can be dropped only after the temporal referential constraint is dropped.

SQLSTATE

42917

-670

**THE RECORD LENGTH OF THE
TABLE EXCEEDS THE PAGE SIZE
LIMIT**

Explanation

The row length for a table cannot exceed the page size of the table space in which that table resides (or is to reside). The page size of the table space is determined by the buffer pool used by that table space. This error can result from one of the following conditions:

Cast specification

The target length exceeds the maximum limit. The limit is 32764 for a varying length character string result.

Table creation

The following conditions are possible for a CREATE TABLE statement:

- As defined in a CREATE TABLE statement, the row length for the table would exceed the page size of the specified (or default) table space. To correct this situation, either:
 - Reduce the row length of the table by reducing the length of one or more of the columns.
 - Assign the table to a table space that uses a larger buffer pool.
- The LOB column with INLINE LENGTH clause has contributed to exceeding the page size limit.

Table alteration

The following conditions are possible for an ALTER TABLE statement:

- Addition of the specified column would cause the row length of the table to exceed the page size of

the table space. This table cannot be altered to add columns.

- The statement was issued to alter the length of an existing variable-length column and the new length of the altered column would cause the row length of the table to exceed the page size of the table space.
- The LOB column with an INLINE LENGTH clause has contributed to exceeding the page size limit.

To correct this situation, reduce the length of the column.

Table space alteration

The following conditions are possible for an ALTER TABLESPACE statement:

- In the case of an ALTER TABLESPACE statement that is used to alter the buffer pool to a smaller page size, the row length for one of the tables in the table space exceeds the new smaller page size.
- In the case of an ALTER TABLESPACE statement with a MOVE TABLE clause, the target table space must be defined with a buffer pool that has a page size that can accommodate the record length of the table that is being moved.

Join result

The row length in the result of a join exceeds the maximum limit. The limit is 65,529 bytes. The sort record includes columns that are being sorted and columns that the user selects. The length of the columns that the user selects is the sort data length.

Sort result

The following conditions are possible for a sort result:

- The row length of a large sort record exceeds the maximum limit. The limit is 65,529 bytes. The sort record includes columns that are being sorted and columns that the user selects. The length of the columns that the user selects is the sort data length.
- The sort key length for a sort exceeds the maximum limit. The limit is 32,000 bytes. The length of the columns that are being sorted is the sort key length.

System action

The statement cannot be processed.

Programmer response

Correct the error based on the information provided, and reissue the statement.

SQLSTATE

54010

[Statements \(Db2 SQL\)](#)

-671	THE BUFFERPOOL ATTRIBUTE OF THE TABLE SPACE CANNOT BE ALTERED AS SPECIFIED BECAUSE IT WOULD CHANGE THE PAGE SIZE OF THE TABLE SPACE
-------------	--

Explanation

For example, the change to the buffer pool attribute for the table space specified in the ALTER TABLESPACE statement would change the page size of the table space—either from 4KB to 32KB, 8KB to 16KB, or vice versa.

Use of the ALTER TABLESPACE statement to change the page size of a table space is not permitted.

System action

The statement cannot be processed. The table space definition was not altered.

Programmer response

For example, if the table space uses one of the 4KB buffer pools (for example, BP0, BP1, or BP2), it can be reassigned to one of the other 4KB buffer pools (but not buffer pool BP32K). If, however, it is assigned to buffer pool BP32K, the buffer pool assignment cannot be subsequently altered.

SQLSTATE

53040

-672	OPERATION DROP NOT ALLOWED ON TABLE <i>table_name</i>
-------------	--

Explanation

The DROP operation failed for one of the following reasons:

- The table being dropped has the RESTRICT ON DROP attribute.
- The table space or database being dropped contains the specified table, which has the RESTRICT ON DROP attribute.

System action

The DROP statement cannot be executed.

Programmer response

Before dropping the table, alter the table, specifying DROP RESTRICT ON DROP.

For DROP TABLESPACE or DROP DATABASE, make sure that there are no other tables within the table space or database with the RESTRICT ON DROP attribute. The following SELECT statement can identify the tables:

```
SELECT CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE TYPE = 'T'
AND CLUSTERTYPE = 'Y'
AND DBNAME = 'database_name'
AND TSNAME = 'tablespace_name';
```

SQLSTATE

55035

-676	THE PHYSICAL CHARACTERISTICS OF THE INDEX ARE INCOMPATIBLE WITH RESPECT TO THE SPECIFIED STATEMENT. THE STATEMENT HAS FAILED. REASON <i>reason-code</i>
-------------	--

Explanation

A reason code is issued during the processing of a CREATE INDEX or ALTER INDEX statement. When the statement fails, the reason for the failure is indicated by the following *reason code* value:

0001

You specified a buffer pool with a page size other than 4KB in the CREATE or ALTER INDEX statement.

0002

An ALTER INDEX or CREATE INDEX statement results in an invalid combination of a 4KB page size and COMPRESS YES. This reason-code will be issued for the following reasons:

- If you tried to CREATE or ALTER an index, you did not specify a buffer pool having a page size that is supported for index compression. You can only choose a buffer pool with an 8KB, 16KB, or 32KB page size for a compressed index.
- If you tried to ALTER an index using ALTER INDEX with the COMPRESS YES clause, then the existing index is not defined with a buffer pool that has an 8KB, 16KB, or 32KB page size, and therefore, the index cannot be compressed.

0003

The ALTER INDEX statement has resulted in an index that's on-disk page size is incompatible with the CISIZE of the index's underlying non-Db2

managed data set. This reason-code will be issued for the following reasons:

- If the index is not compressed, a 4 KB page size must reside in a data set that has a 4 KB CISIZE. A page size greater than 4KB must have a CISIZE that is either 4KB or equal to the page size.
- If the index is compressed, then the index pages on disk are always 4 KB. The CISIZE for the data set must also be 4KB.

System action

The statement cannot be processed.

Programmer response

Depending on the *reason code* value, take the following action:

0001

Change the buffer pool specification to the name of a buffer pool with a 4KB page size.

0002

Modify the statement so that it does not result in a compressed index with a 4 KB page size.

0003

ALTER the STOGROUP to use a Db2 managed data set or change the CISIZE of the user-managed data set to be compatible with the specified index options. If the index is compressed, the CISIZE must be 4KB. Otherwise, the CISIZE should match the page size or be 4KB.

-677	INSUFFICIENT VIRTUAL STORAGE FOR BUFFERPOOL EXPANSION
-------------	--

Explanation

An attempt to either open (create) or expand a buffer pool has failed because insufficient virtual storage was available.

This error may occur under either of two circumstances:

- An attempt to create a buffer pool while opening a table space or index(space), or
- An attempt to expand a buffer pool from its current size to its maximum size.

System action

The statement cannot be processed.

Programmer response

If this error should occur during interactive execution of an SQL statement or execution of an application program, installation administration should be notified.

Installation Action: It may be necessary to reexamine the buffer pool storage strategy.

One of the following messages has also been sent to the MVS console: DSNB601I, DSNB603I, or DSNB605I.

SQLSTATE

57011

-678	THE CONSTANT <i>constant</i> SPECIFIED FOR THE INDEX LIMIT KEY MUST CONFORM TO THE DATA TYPE <i>data-type</i> OF THE CORRESPONDING COLUMN <i>column-name</i>
-------------	---

Explanation

The index limit key value *constant* has been specified incorrectly in the CREATE INDEX or ALTER INDEX statement.

Limit key value specifications must conform to the data type of the corresponding index key column. In this case, *constant* must be of data type *data-type* to conform to the data type of column *column-name*.

System action

The statement cannot be processed. The index was not created.

Programmer response

Correct the statement so that each limit key value *constant* is of precisely the same data type as that of the corresponding index key column.

SQLSTATE

53045

-679	THE OBJECT <i>name</i> CANNOT BE CREATED BECAUSE A DROP IS PENDING ON THE OBJECT
-------------	---

Explanation

The application program has executed a DROP for the specified object, and then tried to re-create an object with the same name (and of the same type) before the DROP was completed.

If the object is an index, this error is returned if the index that is to be created uses the same index space name as the index that was dropped without a commit.

System action

The statement cannot be processed. The specified object was not created.

Programmer response

The logic of the application program must be modified to issue a COMMIT (or the IMS or CICS equivalent) between the DROP and CREATE statements.

SQLSTATE

57006

-680	TOO MANY COLUMNS SPECIFIED FOR A TABLE, VIEW OR TABLE FUNCTION
-------------	---

Explanation

The maximum number of columns permitted per table, view, or table function is 750. The statement attempted to perform one of the following actions:

- CREATE or ALTER a table to contain more than 750 columns
- CREATE a view with more than 750 columns
- CREATE a table function with more than 750 columns in the RETURNS TABLE clause

System action

The statement cannot be processed.

Programmer response

Change the CREATE statement to not include more than 750 columns, or do not try to alter an existing table to contain more than 750 columns.

SQLSTATE

54011

-681	COLUMN <i>column-name</i> IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE. RT: <i>return-code</i>, RS: <i>reason-code</i>, MSG: <i>message-token</i>
-------------	--

Explanation

An installation field procedure returned an error for 'column-name'. The 'reason-code' and 'message-token' are defined by the field procedure. They may give additional information to help determine the cause of the problem.

Return code

Error

4

Invalid value on encode or decode or invalid column description on define

8

Invalid parameter value

12

Field procedure error on any function

Use 'reason-code' and 'message-token' for additional information.

System action

The statement cannot be processed.

Programmer response

If it is not a field procedure error, determine the requirements imposed by the field procedure. If it is a field procedure error, examine the field procedure.

SQLSTATE

23507

-682	FIELD PROCEDURE <i>procedure-name</i> COULD NOT BE LOADED
-------------	--

Explanation

The field procedure 'procedure-name' cannot be loaded.

System action

The statement cannot be processed.

Programmer response

The application should either commit or roll back to previous COMMIT. Then, in general, the application should terminate.

SQLSTATE

57010

-683	THE SPECIFICATION FOR COLUMN, DISTINCT TYPE, FUNCTION, OR PROCEDURE <i>data-item</i> CONTAINS INCOMPATIBLE CLAUSES
------	---

Explanation

The data item specification of a CREATE or ALTER statement contains an error.

data-item

The source of the problem, which varies by statement.

CREATE DISTINCT TYPE statements

The name of the type that is being defined.

CREATE FUNCTION or ALTER FUNCTION statements

The area of the statement that caused the error, such as "PARAMETER 3", "RETURNS" or "CAST FROM".

CREATE TABLE or ALTER TABLE statements

The name of the column that caused the error. The error could be an invalid specification of FOR BIT DATA, FOR SBCS DATA, FOR MIXED DATA, or FIELDPROC for the column definition.

The following additional restrictions apply to CREATE TABLE statements, ALTER TABLE statements, or both:

- On an ALTER TABLE statement, *generation-alteration* cannot be specified for a column that is not defined as an identity column.
- The columns for a BUSINESS_TIME period must be defined with a data type of DATE or TIMESTAMP(6) WITHOUT TIME ZONE.
- The data type for a column that is defined as ROW BEGIN, ROW END, or TRANSACTION START ID must be TIMESTAMP(12) WITHOUT TIME ZONE.

General causes

FIELDPROC can only be specified for columns that are a built-in character string or graphic string data type that is not a LOB.

FIELDPROC cannot be specified for a Unicode column in an EBCDIC table.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement by removing the incompatible specification.

SQLSTATE

-688 **INCORRECT DATA RETURNED
FROM FIELD PROCEDURE, *column-
name*, *msgno***

Explanation

Unexpected data returned from field procedure for column '*column-name*'. For more information see '*msgno*'.

System action

The statement cannot be processed.

Programmer response

Correct the field procedure so that it returns values that are consistent with their descriptions.

SQLSTATE

58002

-689 **TOO MANY COLUMNS DEFINED
FOR A DEPENDENT TABLE**

Explanation

The maximum number of columns allowed for a dependent table is 749. The code is used to report that the statement is invalid because of one of the following:

- A CREATE TABLE statement is creating a dependent table with 750 columns.
- An ALTER TABLE statement is altering a dependent table with 749 columns to add a column, or altering a table with 750 columns to become a dependent table.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement to conform to the column limit for a dependent table.

SQLSTATE

54011

-690 **THE STATEMENT IS REJECTED
BY DATA DEFINITION CONTROL
SUPPORT. REASON *reason-code***

Explanation

The code is issued by the data definition control support to report that the statement is rejected for the reason indicated by '*reason-code*' after consulting the application registration table and object registration table.

The explanation of the given reason code:

- 0001

Data definition control support is running under the controlling by application name mode.

The statement is rejected because the current application is not registered in application registration table with DEFAULTAPPL on.

- 0002

Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is not registered in object registration table and the current application is not registered in application registration table with DEFAULTAPPL on.

- 0003

Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0004

Data definition control support is running under the controlling by object name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0005

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0006

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is not registered in object registration table.

System action

The statement cannot be processed.

Programmer response

Check whether data definition control support is running in the correct mode. Check one or both registration tables to determine if the entries of the registration tables are correct. If they are not, update the registration tables.

SQLSTATE

23508

-691	THE REQUIRED REGISTRATION TABLE <i>table-name</i> DOES NOT EXIST
-------------	---

Explanation

The data definition control support assumes the existence of the application registration table and object registration table. But either one or both tables is not defined.

System action

The statement cannot be processed.

Programmer response

Determine whether the required registration tables do exist. If not, create the required tables.

SQLSTATE

57018

-692	THE REQUIRED UNIQUE INDEX <i>index-name</i> FOR DDL REGISTRATION TABLE <i>table-name</i> DOES NOT EXIST
-------------	--

Explanation

A unique index must be defined for each registration table. The code is issued when either the required index does not exist or the index defined is not a unique index.

System action

The statement cannot be processed.

Programmer response

Determine whether the required unique index does exist. If not, create the required index. If the index does exist, but is not unique, drop it and re-create it as a unique index.

SQLSTATE

57018

-693	THE COLUMN <i>column-name</i> IN DDL REGISTRATION TABLE OR INDEX <i>name</i> IS NOT DEFINED PROPERLY
-------------	---

Explanation

An error occurred during verification of the application or object registration table.

The table is improperly defined for the following reasons:

- A required column is missing.

- A column description is invalid because its name, column number, data type, length, or null attribute is incorrect.

or

The index is improperly defined for the following reasons:

- A required key column is missing.
- A key column description is invalid because of its key sequence or because its ordering is incorrect.
- A defined key column should not be part of the unique key.

System action

The statement cannot be processed.

Programmer response

Correct or alter the definition of the required registration table or index.

SQLSTATE

55003

-694 **THE SCHEMA STATEMENT CANNOT BE EXECUTED BECAUSE A DROP IS PENDING ON THE DDL REGISTRATION TABLE *table-name***

Explanation

An error occurred while accessing the application registration table or object registration table. The application registration table or object registration table was dropped, but the DROP statement was not committed.

System action

The statement cannot be processed.

Programmer response

Resubmit the job. If the same error happens, check for the application that issued the DROP statement for the application registration table or the object registration table. Either commit the DROP statement which dropped the table and create a new application registration table or object registration table, or issue a ROLLBACK for the DROP statement to put the tables back.

SQLSTATE

57023

-695

INVALID VALUE *seclabel* SPECIFIED FOR SECURITY LABEL COLUMN OF TABLE *table-name*

Explanation

For an insert or an update operation to table *table-name*, the value that was specified for the security label was invalid.

System action

The statement cannot be processed.

Programmer response

Ensure that the value that is specified for the security label column is a valid security label. Alternatively, insert the row that specifies DEFAULT for the security label column, or remove the security label column from the insert column list.

SQLSTATE

23523

-696

THE DEFINITION OF TRIGGER *trigger-name* INCLUDES AN INVALID USE OF CORRELATION NAME OR TRANSITION TABLE NAME *name*. REASON CODE=*reason-code*

Explanation

The trigger definition included an invalid use of *name*

trigger-name

The trigger that encountered the error

name

The transition variable correlation name or transition table name

reason-code

A reason-code indicating the specific problem as follows:

1. NEW correlation name and NEW_TABLE name are not allowed in a DELETE trigger.
2. OLD correlation name and OLD_TABLE name are not allowed in an INSERT trigger.
3. OLD_TABLE name and NEW_TABLE name are not allowed in a BEFORE trigger.

System action

The statement cannot be processed. The trigger was not created.

Programmer response

Remove the invalid correlation name or transition table name along with the preceding keyword.

SQLSTATE

42898

-697	OLD OR NEW CORRELATION NAMES ARE NOT ALLOWED IN A TRIGGER DEFINED WITH THE FOR EACH STATEMENT CLAUSE. OLD_TABLE OR NEW_TABLE NAMES ARE NOT ALLOWED IN A TRIGGER WITH THE BEFORE CLAUSE.
-------------	--

Explanation

The trigger, as defined, includes a REFERENCING clause with one of the following invalid combinations:

- OLD or NEW correlation names specified (or both) and the FOR EACH STATEMENT clause.
- NEW_TABLE or OLD_TABLE correlation names specified (or both) and the BEFORE clause.

System action

The statement cannot be processed. The trigger was not defined.

Programmer response

Remove invalid correlation names or change the trigger granularity to FOR EACH ROW.

SQLSTATE

42899

-713	THE REPLACEMENT VALUE FOR <i>special-register</i> IS INVALID
-------------	---

Explanation

The value specified in the SET *special-register* statement is not a valid value of the indicated special register. For a description of the valid values, see the SET *special-register* statement topic for that special register.

System action

The statement cannot be processed.

Programmer response

See the description of the special register statement and correct the replacement value.

SQLSTATE

42815 or 3F000

-715	PROGRAM <i>program-name</i> WITH MARK <i>release-dependency-mark</i> FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED
-------------	--

Explanation

Program *program-name* depends on a function of Db2 that is not supported by the current active release.

program-name

Name of the application program.

release-dependency-mark

A 1-character mark showing the oldest Db2 release supporting this program.

System action

The BIND operation for this plan or package is not performed.

Operator response

Notify the system programmer.

System programmer response

Warn users not to use plans or packages containing this program until the Db2 subsystem has been remigrated to the newer release.

User response

The program cannot be used until the Db2 subsystem is remigrated to the newer release.

SQLSTATE

56064

-716	PROGRAM <i>program-name</i> PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE
-------------	--

Explanation

Program *program-name* was precompiled under a release not supported by the current level of Db2, or the contents of the DBRM have been modified after the precompilation phase.

User response

Precompile the named program again using the current precompiler. Reissue the BIND subcommand.

Problem determination

If the program was precompiled at an appropriate release, and the problem persists, collect the following:

- A hexadecimal print of the first record of the failing DBRM
- The listing from the precompile job that generated the DBRM
- Output from the BIND attempt.

SQLSTATE

56065

-717 *bind-type* FOR *object-type*
object-name WITH MARK
release-dependency-mark FAILED
BECAUSE *object-type* DEPENDS
ON FUNCTIONS OF THE RELEASE
FROM WHICH FALLBACK HAS
OCCURRED

Explanation

The plan or package indicated depends on a function of Db2 which is not supported by the currently active release.

bind-type

REBIND

object-type

PLAN | PACKAGE

object-name

Name of the application plan, or the package

release-dependency-mark

A one-character mark showing the oldest release of Db2 can support this plan or package. The release dependency mark for the plan is kept in the IBMREQD columns in the Db2 catalog in SYSIBM.SYSPLAN (plans), SYSIBM.SYSPACKAGE (packages).

System action

The REBIND operation for this plan or package is not performed.

Operator response

Notify the system programmer.

System programmer response

Warn users not to use the plan or package until the Db2 subsystem has been remigrated to the newer release.

User response

The plan or package cannot be used until the Db2 subsystem is remigrated to the newer release.

SQLSTATE

56066

-718 **REBIND OF PACKAGE *package-name* FAILED BECAUSE IBMREQD OF *ibmreqd* IS INVALID**

Explanation

The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character.

package-name

Name of the package
(location.collection.package.version)

System action

The REBIND failed.

User response

You must do a BIND ACTION(REPLACE) for this package.

SQLSTATE

56067

-719 **BIND ADD ERROR USING *auth-id* AUTHORITY PACKAGE *package-name* ALREADY EXISTS**

Explanation

An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must

be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

auth-id
Authorization ID of the invoker of the BIND subcommand.

package-name
Name of the package
(location.collection.package.version).

System action

No package is created.

System programmer response

Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Call the BIND subcommand again, with a 'location.collection.package.version' that is not in use.

SQLSTATE

42710

-720	BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = <i>package_name</i> WITH version=<i>version2</i> BUT THIS VERSION ALREADY EXISTS
------	---

Explanation

An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

package_name
Fully qualified package name

version2
Version-id of package that is to be created

System action

The bind will fail.

System programmer response

There are two approaches to solve this problem. The first is to precompile the program again with a new version name and reissue the original BIND subcommand. The other approach is not to do the precompile but reissue the BIND subcommand with REPLVER(SAME).

SQLSTATE

42710

-721	BIND ERROR FOR PACKAGE = <i>pkg-id</i> CONTOKEN = <i>contoken</i>'X IS NOT UNIQUE SO IT CANNOT BE CREATED
------	--

Explanation

An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of *location.collection.package.consistency-token* already exists.

pkg-id
Fully qualified name of the package.
contoken
Consistency token in hexadecimal.

System action

The BIND will fail.

System programmer response

Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Reissue the BIND subcommand such that the *location.collection.package.consistency-token* is unique within the catalog. The following SQL statement can be used to query the catalog:

```
SELECT COLLID,NAME
FROM loc-id.SYSIBM.SYSPACKAGE
WHERE HEX(CONTOKEN) = contoken
```

SQLSTATE

42710

-722	<i>bind-type</i> ERROR USING <i>auth-id</i> AUTHORITY PACKAGE <i>package-name</i> DOES NOT EXIST
------	---

Explanation

The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type

Type of bind subcommand (BIND | REBIND | FREE).

auth-id

Authorization ID of the invoker of the BIND subcommand.

package-name

Name of the package
(location.collection.package.version)

System action

Package not rebound or freed.

System programmer response

Check the SYSPACKAGE catalog table for the correct 'location.collection.package.version' to use.

SQLSTATE

42704

-723

AN ERROR OCCURRED IN A TRIGGERED SQL STATEMENT IN *trigger-name*. INFORMATION RETURNED: SQLCODE: *sql-code*, SQLSTATE: *sql-state*, MESSAGE TOKENS *token-list*, SECTION NUMBER *section-number*

Explanation

During execution of an UPDATE, MERGE, INSERT, or DELETE statement, a trigger was activated. One of the triggered SQL statements received an SQL error condition.

trigger-name

The trigger that was activated when the error occurred.

section-number

The section number that is associated with the failing triggered SQL statement. For triggers that contain a WHEN clause, the WHEN clause is section number one. The triggered SQL statements are numbered sequentially, beginning with section number two. This is true for triggers with or without a WHEN clause.

sql-code

A numeric value that indicates why the SQL statement execution was unsuccessful. This code is received by the activated trigger.

sql-state

The corresponding SQLSTATE for the SQLCODE.

token-list

The list of tokens from the original SQL error. This list might be truncated.

System action

The trigger and the original statement cannot be processed. The triggering table is unchanged.

System programmer response

Identify the failing SQL statement by using one of the following methods:

- Use the trigger name and section number.
- If the trigger definition is available, use the section number.
- Use the following SELECT statement to retrieve the statement from the SYSIBM.SYSPACKSTMT catalog table:

```
SELECT STMT, SEQNO FROM SYSIBM.SYSPACKSTMT
WHERE COLLID = 'schema-name' AND
NAME = 'trigger-name' AND
SECTNOI = section-number
ORDER BY SEQNO
```

The STMT result is in Unicode, unless the trigger was created in DB2® version 7 or earlier. To view a Unicode result as EBCDIC, issue the DISPLAY UTF8 command in the ISPF browse program within SPUFI.

Refer to the explanation of the SQLCODE that is indicated by *sql-code* in this code and take the appropriate action or actions.

Programmer response

Contact your database administrator to determine why the trigger named in the message received the error.

SQLSTATE

09000

-724

THE ACTIVATION OF THE *object-type* OBJECT *object-name* WOULD EXCEED THE MAXIMUM LEVEL OF INDIRECT SQL CASCADING

Explanation

Cascading of indirect SQL occurs when a trigger, user-defined function or stored procedure invokes another trigger, user-defined function or stored procedure which in turn invokes another. The activation of some of the triggers in this chain might be due to the enforcement of referential constraint delete rules. The depth of this cascading is limited to 16.

Note that recursive situations where a trigger includes a triggered SQL statement that directly or indirectly causes the same trigger to be activated are very likely to cause this error. The trigger should contain logic to check for a terminating condition to prevent this error.

object-type

Names the type of object being called. Object type is TRIGGER, FUNCTION, or PROCEDURE.

object-name

Specifies the name of the trigger, user-defined function or stored procedure that would have been activated at the seventeenth level of cascading.

System action

The original statement could not be executed. All SQL statements executed by all triggers, user-defined functions, and stored procedures in the cascade chain are rolled back. External actions performed by the indirect SQL, such as sending a network message might have already occurred.

Programmer response

Start with the indirect SQL that is activated by the original SQL operation. Check for recursive patterns in any invoked user-defined functions or in any triggers defined on the subject of an update operation. If the chain is not recursive, the cascade chain must be simplified by altering the triggers, user-defined functions, or stored procedures involved.

SQLSTATE

54038

-725 **THE SPECIAL REGISTER *register* AT LOCATION *location* WAS SUPPLIED AN INVALID VALUE**

Explanation

Db2 received a SET statement with an invalid value. Valid SETs might be allowed or retained. Further processing stops at the named site until the SET statement is corrected.

System action

All SQL statements at the named remote site are rejected until the SET statement that was in error is corrected.

Programmer response

The SET statement should be reissued with a valid value. This situation can be corrected with a local SET statement or with a DRDA SET statement executed at the remote site. Once the special register has been supplied a valid value, the application can resume execution.

SQLSTATE

42721

-726 **BIND ERROR ATTEMPTING TO REPLACE PACKAGE = *package-name*. THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE**

Explanation

The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package.

System action

Package not bound.

System programmer response

FREE the package first and then BIND the package.

SQLSTATE

55030

-729 **A STORED PROCEDURE SPECIFYING COMMIT ON RETURN CANNOT BE THE TARGET OF A NESTED CALL STATEMENT**

Explanation

A stored procedure defined with the COMMIT ON RETURN attribute was called from a stored procedure, user-defined function, or trigger. Stored procedures defined with COMMIT ON RETURN cannot be nested in this way.

System action

The SQL statement is not executed. If the CALL statement references a remote server, the unit of work is placed in a must rollback state.

Programmer response

Remove the CALL to the stored procedure that was defined with the COMMIT ON RETURN attribute.

SQLSTATE

429B1

-730	THE PARENT OF A TABLE IN A READ-ONLY SHARED DATABASE MUST ALSO BE A TABLE IN A READ-ONLY SHARED DATABASE
-------------	---

Explanation

An attempt was made to define a relationship between a table in a read-only shared database and a table that is not.

System action

The statement cannot be processed.

Programmer response

Ensure that the correct tables are being used for the relationship being defined.

SQLSTATE

56053

-731	USER-DEFINED DATASET <i>dsname</i> MUST BE DEFINED WITH SHAREOPTIONS(1,3)
-------------	--

Explanation

The VSAM SHAREOPTIONS must be (1,3) for all of the indexes and table spaces in the database. The user-defined data set identified did not meet this requirement.

System action

The statement cannot be processed.

Programmer response

Ensure that the data sets used in the shared database are defined with the proper SHAREOPTIONS.

SQLSTATE

56054

-732	THE DATABASE IS DEFINED ON THIS SUBSYSTEM WITH THE ROSHARE READ ATTRIBUTE BUT THE TABLE SPACE OR INDEX SPACE HAS NOT BEEN DEFINED ON THE OWNING SUBSYSTEM
-------------	--

Explanation

Prior to creating a table space or index in a database with the ROSHARE READ attribute, that object must first be defined on the owning subsystem.

System action

The statement cannot be processed.

Programmer response

Verify that the table space or index has been defined on the owning system in a ROSHARE OWNER database.

SQLSTATE

56055

-733	THE DESCRIPTION OF A TABLE SPACE, INDEX SPACE, OR TABLE IN A ROSHARE READ DATABASE MUST BE CONSISTENT WITH ITS DESCRIPTION IN THE OWNER SYSTEM
-------------	---

Explanation

This code is issued while creating a table space, index, or table in the ROSHARE READ database. These objects must be consistent with their descriptions in the ROSHARE OWNER database as follows:

- For a table space, the following attributes must be the same:
 - Page size
 - Segment size
 - Number of partitions
- For an index, the following attributes must be the same:
 - Number of partitions
 - Number of subpages
 - Table OBID
 - Total key length

- Index type (Type 1 or Type 2 Index)
- Number of key columns
- For a table, the following attributes must be the same:
 - Table OBID
 - Maximum record length
 - Number of columns
 - Whether an edit procedure exists

System action

The statement cannot be processed.

Programmer response

Ensure that the definition of the table space, index, or table is consistent with that in the ROSHARE OWNER database.

SQLSTATE

56056

-734	THE ROSHARE ATTRIBUTE OF A DATABASE CANNOT BE ALTERED FROM ROSHARE READ
-------------	--

Explanation

An attempt was made to ALTER a database from ROSHARE READ to either ROSHARE OWNER or ROSHARE NONE.

System action

The statement cannot be processed.

Programmer response

Verify that the correct database was specified on the ALTER DATABASE statement. The ROSHARE attribute of a read-only shared database cannot be altered. To change this, DROP and re-create the database.

SQLSTATE

56057

-735	DATABASE <i>dbid</i> CANNOT BE ACCESSED BECAUSE IT IS NO LONGER A SHARED DATABASE
-------------	--

Explanation

An attempt was made to access an object in the database identified by *dbid*, that is known to the system as having the ROSHARE READ attribute. The

database, however, is no longer defined as ROSHARE OWNER on the owning subsystem.

System action

The statement cannot be processed.

Programmer response

Verify that the correct object is specified on the statement.

SQLSTATE

55004

-736	INVALID OBID <i>obid</i> SPECIFIED
-------------	---

Explanation

An invalid OBID value was given or encountered. The OBID is invalid for one of the following reasons:

- The specified OBID for the CREATE TABLE statement does not fall within the acceptable range for OBIDs, which is 2 to 32767.
- The specified OBID for the CREATE TABLE statement is already in use for the given database.
- The ALTER statement encountered an existing object with an OBID that does not fall within the acceptable range for OBIDs, which is 2 to 32767.

System action

The statement cannot be processed.

Programmer response

For the CREATE TABLE statement, verify that the given OBID is a valid value for an OBID. If so, ensure that the OBID is correct for the object to be created, then query the catalog to find the object that is already defined as having the same OBID in the database. If an invalid OBID was given for the object to be created, correct the statement and execute it again. If the existing object is in error, then DROP and CREATE that object using the correct OBID value.

For the ALTER statement, query the catalog to find the object that is already defined as having the same OBID in the database. DROP and CREATE that object using a valid OBID value.

It is possible that the OBID “in use” is the OBID for an object that had been previously dropped. If that is the case, and the CREATE was issued for a table in a non-ROSHARE READ database, then select a different OBID for use in the OBID clause. If the object had been previously dropped and the CREATE was issued

for a table in a ROSHARE READ database, COMMIT and re-submit the CREATE TABLE request.

-737

IMPLICIT TABLE SPACE NOT ALLOWED

Explanation

A CREATE TABLE statement was issued using an implicit table space. An implicit table space may not be used in a database that has been defined as a read-only shared database.

System action

The statement cannot be processed.

Programmer response

CREATE a table space for the table, using the same name as is given on the owning system. Then resubmit the CREATE TABLE statement.

SQLSTATE

56056

-739

CREATE OR ALTER FUNCTION *function-name* FAILED BECAUSE FUNCTIONS CANNOT MODIFY DATA WHEN THEY ARE PROCESSED IN PARALLEL.

Explanation

The function cannot be created or altered because ALLOW PARALLEL and MODIFIES SQL DATA were both specified explicitly or implicitly. A function cannot be parallelized if it modifies data.

System action

The statement cannot be processed.

Programmer response

Specify DISALLOW PARALLEL or change the MODIFIES SQL DATA to NO SQL, CONTAINS SQL or READS SQL DATA.

SQLSTATE

56088

-740

FUNCTION *name* IS DEFINED WITH THE OPTION MODIFIES SQL DATA WHICH IS NOT VALID IN THE CONTEXT IN WHICH IT WAS INVOKED

Explanation

A user-defined function that is defined with the MODIFIES SQL DATA clause was invoked in an invalid context.

name

The name of the user-defined function.

A user-defined function that is defined with MODIFIES SQL DATA is only allowed in a:

- VALUES clause of an insert operation
- SET clause of an update operation
- VALUES statement in a trigger
- SET assignment statement
- CALL procedure statement
- subselect

System action

The SQL statement failed.

Programmer response

Remove the user-defined function from the failing statement, or remove the MODIFIES SQL DATA option from the definition of the function.

SQLSTATE

51034

-741

A *database-type* DATABASE IS ALREADY DEFINED FOR MEMBER *member-name*

Explanation

A CREATE DATABASE statement was issued for a WORK FILE or TEMP database, but the database can not be created because one is already defined for the named Db2 subsystem or data sharing group member.

database-type

WORK FILE or TEMP

member-name
Name of the Db2 subsystem or data sharing group member that already has a *database-type* database.

System action
The statement cannot be processed.

Programmer response
Verify the identity and validity of the existing *database-type* database for the named Db2 subsystem or data sharing member. The existing database can be altered or dropped if necessary. If the existing database is dropped, resubmit the CREATE DATABASE statement.

SQLSTATE
55020

-742 **DSNDB07 IS THE IMPLICIT WORK FILE DATABASE**

Explanation
The WORKFILE clause cannot be used on a CREATE DATABASE statement to create a work file database for a Db2 subsystem that is not a member of a Db2 data sharing group. The system database, DSNDB07, is the implicit work file database.

System action
The statement cannot be processed.

Programmer response
To create the work file database for a Db2 subsystem that is not a member of a Db2 data sharing group, create database DSNDB07 without the WORKFILE clause.

SQLSTATE
53004

-746 **THE SQL STATEMENT IN FUNCTION, TRIGGER, OR IN STORED PROCEDURE *name* VIOLATES THE NESTING SQL RESTRICTION**

Explanation
If a table is being modified by an INSERT, DELETE, UPDATE, or MERGE statement, the table cannot be accessed by the lower level nested SQL statement.

System action
The SQL statement fails.

Programmer response
Remove the failing SQL statement from the named function, stored procedure, or trigger.

SQLSTATE
57053

Related concepts
[Nested SQL statements \(Db2 Application programming and SQL\)](#)

-747 **TABLE *table-name* IS NOT AVAILABLE UNTIL THE AUXILIARY TABLES AND INDEXES FOR ITS EXTERNALLY STORED COLUMNS HAVE BEEN CREATED**

Explanation
An attempt was made to access or reference a table with one or more LOB columns, however either

- an auxiliary table for storing one of the LOB columns has not been created, or
- an index has not been created for an auxiliary table, or
- there is not an auxiliary table for each partition of the table space.

System action
The statement cannot be processed.

Programmer response

- Use CREATE TABLESPACE to create a LOB table space.
- Use CREATE TABLE to create the auxiliary table for storing the column.
- Use CREATE INDEX to create an index on the auxiliary table.
- Resubmit the statement that failed.

SQLSTATE
57054

-748 **AN INDEX *index-name* ALREADY EXISTS ON AUXILIARY TABLE *table-name***

Explanation

The CREATE INDEX statement would create a second index on the specified auxiliary table. An auxiliary table can have only one index.

System action

The statement cannot be processed.

Programmer response

An index already exists. Another index cannot be created.

SQLSTATE

54042

-750	THE SOURCE TABLE <i>source-name</i> CANNOT BE RENAMED OR ALTERED AS SPECIFIED
------	---

Explanation

An attempt was made to rename a table, index, or column, but the source object could not be renamed.

source-name

The name of the source table, index, or column.

Possible reasons for this error include, but are not limited to:

RENAME TABLE statements

- The table is referenced as the triggering table in one or more existing triggers.
- The table is a system-period temporal table or history table.
- The table is defined as an active resource limit table.
- The table is a clone table.
- The table has a clone table defined for it.
- The table is referenced in one or more view definitions.
- The table has a synonym defined for it.
- The table is an archive-enabled table.
- The table is an archive table.
- The table is an accelerator-only table.
- The table is defined as a Db2ZAI table.

RENAME INDEX statements

- The table is defined as an active resource limit table.
- The table is defined as a Db2ZAI table.

ALTER TABLE statements with RENAME COLUMN clause

- The table is a materialized query table.
- The definition of one or more materialized query tables references the table.
- The table is a system period temporal table or history table.
- The table is referenced as the triggering table in one or more existing triggers.
- The column is referenced in one or more view definitions.
- The column is referenced in a check constraint.
- The column has a field procedure defined.
- The table has a valid procedure or an edit procedure that is defined with row attribute sensitivity.
- An index is defined on the table with an expression that references the column.
- The table is an archive-enabled table.
- The table is an archive table.
- The table is defined as a Db2ZAI table.

System action

The statement cannot be processed.

Programmer response

Change the source name to the name of an object that can be renamed or altered, and reissue the statement.

Drop any triggers defined on the table before issuing the RENAME statement. To find these triggers, query the system catalog.

Drop any view that reference the table before issuing the RENAME statement. To find these views, query the system catalog.

If there is a clone defined on the table, drop the clone table before issuing the RENAME statement.

SQLSTATE

42986

[RENAME statement \(Db2 SQL\)](#)

-751	<i>object-type object-name (SPECIFIC NAME specific name) ATTEMPTED TO EXECUTE AN SQL STATEMENT sql-statement THAT IS NOT ALLOWED</i>
------	--

Explanation

A stored procedure or user-defined function attempted to execute an SQL statement that is not allowed.

object-type

The type of object:

Stored procedure

A stored procedure issued an SQL statement that forced the Db2 thread to roll back the unit of work. The SQL statement that caused the thread to be placed in the MUST_ROLLBACK state is either COMMIT or ROLLBACK:

All further SQL statements are rejected until the SQL application that issued the SQL CALL statement rolls back the unit of work. When control returns to the SQL application that issued the SQL CALL statement, the SQL application must roll back the unit of work. This can be done by issuing an SQL ROLLBACK statement or the equivalent IMS or CICS operation.

User-defined function

The external function that is indicated by *object-name* issued either a COMMIT or ROLLBACK statement.

object-name

The name of the object.

specific-name

The specific function name, which is unique within the schema.

sql-statement

The SQL statement that was issued.

System action

The statement cannot be processed.

Programmer response

Either remove all COMMIT and ROLLBACK statements from the stored procedure, or modify the client application so that it establishes an environment that allows the stored procedure to execute statements. Remotely called stored procedures can execute embedded COMMIT or ROLLBACK statements if the following conditions are met:

- The connection with the requester system must use one phase commit protocols.
- The requester system must indicate that commits are allowed by sending a DRDA RDBCMTOK=TRUE indication when the stored procedure is called.

For Db2 Connect requester systems, the client application must use either Connect Type 1 or

Remote Unit of Work connections. Other connections cause Db2 Connect to indicate that commits are not allowed, which will cause COMMIT and ROLLBACK statements in a stored procedure to fail.

SQLSTATE

38003, 2F003

[CONNECT statement \(Db2 SQL\)](#)

-763

**INVALID TABLE SPACE NAME
*space-name***

Explanation

The named table space is invalid.

space-name

The name of the table space.

Possible reasons for this error include the following situation:

- It is a LOB table space and therefore cannot reside in a work file database.
- It is a LOB table space and therefore cannot contain a non-auxiliary table.
- It is not a LOB table space and therefore cannot contain an auxiliary table.
- It is a LOB table space and LOGGED was specified, but the associated base table space is defined as NOT LOGGED.
- It is a LOB table space and COMPRESS YES was specified, but the associated base table space is not a universal table space.
- It is not a table space of a type that supports hash-organized tables. Tables can only be created with altered to hash-organization in a partition-by-range table space with absolute page numbers or a partition-by-growth table space.

System action

The statement cannot be processed.

Programmer response

Take the appropriate action:

- Create the LOB table space in a non-workfile database.
- Create the table in a non-LOB table space.
- Create the auxiliary table in a LOB table space.
- Create a LOB table space and do not specify LOGGED.
- For a hash-organized table, use a UTS that does not use relative page numbers and is not an XML or LOB table space.

Deprecated function:

Hash-organized tables are deprecated, and applications that run at APPLCOMPAT levelV12R1M504 or higher cannot create hash-organized tables or alter existing tables to use hash-organization. Existing hash-organized tables remain supported, but they will be unsupported in the future.

SQLSTATE

560A1

-764	A LOB TABLE SPACE AND ITS ASSOCIATED BASE TABLE SPACE MUST BE IN THE SAME DATABASE
------	---

Explanation

An attempt was made to create an auxiliary table in a LOB table space that is not in the same database as the associated base table space.

System action

The statement cannot be processed.

Programmer response

Correct the statement to specify a LOB table space in the same database as the associated base table space.

SQLSTATE

560A2

-765	TABLE IS NOT COMPATIBLE WITH DATABASE
------	--

Explanation

A CREATE TABLE or ALTER TABLE statement defines a LOB column in a table whose database attribute is ROSHARE OWNER or ROSHARE READ. This is not permitted.

System action

The statement cannot be processed.

Programmer response

If CREATE TABLE, either assign the table to an ROSHARE NONE database or create the table without a LOB column. If ALTER TABLE, redefine the column as a non-LOB column or move the table to an ROSHARE NONE database.

SQLSTATE

560A3

-766	THE OBJECT OF A STATEMENT IS A TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED
------	--

Explanation

The requested operation is not valid for the table that was specified in the SQL statement.

This error can occur when the statement violates one of the following requirements, depending on the type of table:

Accelerator-only table

An accelerator-only table must not be specified in any of the following statements:

- A CREATE SYNONYM statement to define a synonym.
- A CREATE TRIGGER statement to define a trigger for the accelerator-only table.
- A LOCK TABLE statement.
- A CREATE INDEX statement.

Archive table

An archive table must be the only table in the table space, and it must not be any of the following types of tables:

- An incomplete table
- An auxiliary table
- A clone table or a table with a clone defined on it
- A table that was implicitly created for an XML column
- A table that contains a security label column

A security label column cannot be added to an archive table.

Archive-enabled table

An archive-enabled table must be the only table in the table space, and it must not be any of the following types of tables:

- An incomplete table
- An auxiliary table
- A clone table or a table with a clone defined on it
- A table that was implicitly created for an XML column
- A table that contains a security label column

A security label column cannot be added to an archive-enabled table.

Auxiliary table

An auxiliary table for a LOB column must not be specified as the target of the following statements:

- ALTER TABLE
- CREATE ALIAS
- CREATE FUNCTION
- CREATE SYNONYM
- CREATE VIEW
- DELETE
- DESCRIBE TABLE
- INSERT
- MERGE
- SELECT

- TRUNCATE

- UPDATE

Attributes of an auxiliary table cannot be altered. However, the APPEND attributes of auxiliary tables can be altered.

Aliases and synonyms cannot be created on an auxiliary table.

Data in an auxiliary table cannot be accessed by specifying the auxiliary table name in the SELECT, INSERT, DELETE, UPDATE, MERGE, CREATE PROCEDURE, or CREATE FUNCTION statement. Data in an auxiliary table can be accessed only through operations on the base table columns.

CLUSTER cannot be specified on an ALTER TABLE statement if the table is an auxiliary table.

Implicitly created table for an XML column

An implicitly created table for an XML column must not be specified as the target of the following statements:

- ALTER TABLE
- CREATE ALIAS
- CREATE FUNCTION
- CREATE INDEX
- CREATE SYNONYM
- CREATE TRIGGER
- CREATE VIEW
- DELETE
- DESCRIBE TABLE
- INSERT
- MERGE
- REVOKE
- SELECT
- TRUNCATE
- UPDATE

Table with system-period data versioning

A table with system-period data versioning must be the only table in the table space, and it must not be any of the following types of tables:

- An incomplete table
- An auxiliary table
- A clone table or a table with a clone defined on it
- A table that was implicitly created for an XML column
- A table that contains a security label column

A security label column cannot be added to a system-period temporal table.

This error can also occur when a TRANSFER OWNERSHIP statement is specified for transferring the ownership of a table that contains a SECURITY LABEL column.

System action

The statement cannot be processed.

Programmer response

Correct the statement to specify the corresponding base table instead of the specified table, and resubmit the statement.

SQLSTATE

560A4

-767

MISSING OR INVALID COLUMN SPECIFICATION FOR INDEX *index-name*

Explanation

The CREATE INDEX statement failed for one of the following reasons:

- An index on a non-auxiliary table must specify the columns on which the index is defined.
- An index on an auxiliary table must not have a column specification.

System action

The statement cannot be processed.

Programmer response

Correct the syntax of the CREATE INDEX statement.

- To create an index on a non-auxiliary table, specify the columns on which the index is defined.
- To create an index on an auxiliary table, do not specify the name of any column.

SQLSTATE

42626

-768

AN AUXILIARY TABLE ALREADY EXISTS FOR THE SPECIFIED COLUMN OR PARTITION

Explanation

An attempt was made to create an auxiliary table, but an auxiliary table for the specified column or partition already exists. When the base table belongs to a non-partitioned table space, there can be only one auxiliary table per LOB column of the table. When the base table belongs to a partitioned table space, for any given LOB column, all values of the LOB column for a given partition are stored in their own auxiliary table. There must be one auxiliary table per partition of the base table space.

System action

The statement cannot be processed.

Programmer response

Check that the correct table name, column name, and if applicable, partition number have been specified. If the existing auxiliary table needs to have a different name, execute the RENAME TABLE statement to rename the auxiliary table.

SQLSTATE

560A5

-769

SPECIFICATION OF CREATE AUX TABLE DOES NOT MATCH THE CHARACTERISTICS OF THE BASE TABLE

Explanation

Either an attempt was made to create an auxiliary table

- using the PART clause and the specified base table is not partitioned or
- without using the PART clause and the specified base table is partitioned

If the base table is not partitioned, then the PART keyword is not allowed on the CREATE AUXILIARY TABLE statement. If the base table is partitioned, then the PART keyword must be specified.

System action

The auxiliary table was not created.

Programmer response

Check whether the name of the base table specified in the CREATE AUXILIARY TABLE statement is correct. If it is correct and the table is not partitioned, remove the PART clause from the statement. If it is correct and the table is partitioned, add the PART clause to the statement. If the table name is not correct, correct the name and also check that the correct column name is specified.

SQLSTATE

53096

-770	TABLE <i>table-name</i> CANNOT HAVE A LOB COLUMN UNLESS IT ALSO HAS A ROWID, OR AN XML COLUMN UNLESS IT ALSO HAS A DOCID COLUMN
-------------	--

Explanation

table-name

The name of the table.

An attempt was made to create a table, *table-name*, with a column that has a dependency on another type of column in the same table. This error can occur in the following situations:

- The statement attempted to create a table with a LOB column or to add a LOB column to a table, but the table does not have a ROWID column. A table with a LOB column must also have a ROWID column.
- The statement attempted to create a table with an XML column or to add an XML column to a table, but the table does not have a DOCID column. A table with an XML column must also have a DOCID column.

System action

The statement cannot be processed.

Programmer response

If creating a table, define an additional column for the ROWID or DOCID column in the same table.

SQLSTATE

560A6

-771	INVALID SPECIFICATION OF A ROWID COLUMN
-------------	--

Explanation

For an ALTER TABLE or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column cannot be added to a temporary table.
- A ROWID column cannot be specified in a referential-constraint clause as a column of a foreign key.
- A ROWID column cannot be a column of a primary key or unique key.
- A ROWID column cannot be a column in a table with an edit procedure that is defined with row attribute sensitivity.
- A ROWID column cannot be part of the implicit or explicit column list for fullselect in the *as-result-table* clause of a CREATE TABLE or DECLARE GLOBAL TEMPORARY TABLE statement.
- A ROWID column that is implicitly generated cannot be dropped.
- A ROWID column that is defined as GENERATED BY DEFAULT cannot be dropped if the table contains an implicitly generated ROWID column.
- A ROWID column cannot be dropped if the table contains LOB columns that are dependent on the ROWID column.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

-773	CASE NOT FOUND FOR CASE STATEMENT
-------------	--

Explanation

A case statement without an ELSE clause was specified in the body of an SQL routine. None of the conditions specified in the CASE statement were met.

System action

The statement cannot be processed.

Programmer response

Change the CASE statement to handle all of the conditions that can occur.

SQLSTATE

20000

-776	USE OF CURSOR <i>cursor-name</i> IS NOT VALID
-------------	--

Explanation

Cursor *cursor-name* is specified as the cursor name on a FOR statement in an SQL procedure. The cursor cannot be specified on a CLOSE, FETCH, or OPEN statement within the FOR statement.

System action

The statement cannot be processed.

Programmer response

Remove the CLOSE, FETCH, or OPEN statement.

SQLSTATE

428D4

-778	ENDING LABEL <i>label-name</i> DOES NOT MATCH THE BEGINNING LABEL
-------------	--

Explanation

The label that is specified at the end of a compound, WHILE, REPEAT, or LOOP statement in an SQL routine is not the same as the label at the beginning of the statement. The end label cannot be specified if the begin label is not specified.

label-name

The name given for the ending label.

System action

The statement cannot be processed.

User response

Ensure that the end label is the same as the begin label for the compound, WHILE, REPEAT, or LOOP statement.

SQLSTATE

428D5

-779	LABEL <i>label</i> SPECIFIED ON A GOTO, ITERATE, OR LEAVE STATEMENT IS NOT VALID
-------------	---

Explanation

Label *label* is specified as the target label for a GOTO, ITERATE or LEAVE statement. *label* is not defined, is not defined in a scope that is accessible to the current statement, or to the current statement, or it is not a valid label for the failing statement.

This error can occur with a GOTO, ITERATE or LEAVE statement for one of the following reasons:

- If the failing statement is in a condition handler, then *label* must be defined in that condition handler.
- If the failing statement is not in a condition handler, then *label* must not be defined in a condition handler.

Additionally, this error can be issued for ITERATE or LEAVE statements for one of the following reasons:

- If the failing statement is an ITERATE statement, then *label* must be defined as a label for a FOR, LOOP, REPEAT, or WHILE statement, and the ITERATE statement must be in that FOR, LOOP, REPEAT, or WHILE statement, or in a block of code that is directly or indirectly nested within that statement.
- If the failing statement is a LEAVE statement, then *label* must be defined as a label for a compound, FOR, LOOP, REPEAT, or WHILE statement, and the LEAVE statement must be in that compound, FOR, LOOP, REPEAT, or WHILE statement, or in a block of code that is directly or indirectly nested within that statement.

System action

The statement cannot be processed.

User response

Specify a valid label for the target of the GOTO, ITERATE, or LEAVE statement.

SQLSTATE

42736

-780	UNDO SPECIFIED FOR A HANDLER
-------------	-------------------------------------

Explanation

In an SQL routine, a compound statement contains an UNDO handler. UNDO handlers are not supported.

System action

The statement cannot be processed.

User response

Change the UNDO handler to a CONTINUE or EXIT handler.

SQLSTATE

428D6

-781	CONDITION <i>condition-name</i> IS NOT DEFINED OR THE DEFINITION IS NOT IN SCOPE
------	---

Explanation

A condition was specified in a handler declaration, SIGNAL, or RESIGNAL statement, but either the condition is not defined in the routine or the reference to the condition name is not in the scope of the declaration of the condition name.

condition-name

The name of the condition that is not defined.

System action

The statement cannot be processed.

User response

Define the condition using the DECLARE CONDITION statement in a compound statement, and verify that the reference is in the same scope as the declaration. Alternately, you can remove the reference to the condition.

SQLSTATE

42737

Related reference

[compound-statement \(Db2 SQL\)](#)

-782	A CONDITION OR SQLSTATE <i>condition-value</i> SPECIFIED IS NOT VALID
------	--

Explanation

An SQL routine specified a condition value that is not valid.

condition-value

Either a specific condition value, which is provided as an SQLSTATE value, or a general condition value, such as SQLEXCEPTION, SQLWARNING, or NOT FOUND.

The condition or SQLSTATE value is not valid for one of the following reasons:

- The handler declaration or condition declaration specifies an SQLSTATE value that is not valid.
- The condition or SQLSTATE value has already been specified by another handler in the same scope.
- The condition or SQLSTATE was specified in the same handler as SQLEXCEPTION, SQLWARNING, or NOT FOUND.

System action

The statement cannot be processed.

User response

Correct the condition or SQLSTATE value.

SQLSTATE

428D7

-783	SELECT LIST FOR CURSOR <i>cursor-name</i> IN FOR STATEMENT IS NOT VALID. COLUMN <i>column-name</i> IS NOT UNIQUE
------	---

Explanation

The SELECT list in the FOR statement must contain unique column names. The SELECT list specified either contains duplicate column names or unnamed expressions.

- If two column names are the same, the column name is *column-name*.
- If the problem is the result of unnamed expressions then *N is returned for *column-name*.

System action

The statement cannot be processed.

Programmer response

Specify unique column names in the SELECT list specified in the FOR statement.

SQLSTATE

42738

**-784 CONSTRAINT *constraint-name*
CANNOT BE DROPPED.****Explanation**

A constraint that is implicitly generated when a BUSINESS_TIME period is defined cannot be dropped using an ALTER TABLE statement with either a DROP CHECK or DROP CONSTRAINT clause.

constraint-name

The name of the constraint that cannot be dropped.

System action

The statement cannot be processed.

User response

No action is required.

SQLSTATE

42860

Related reference

[ALTER TABLE statement \(Db2 SQL\)](#)

**-785 USE OF SQLCODE OR SQLSTATE IS
NOT VALID****Explanation**

The use of SQLCODE or SQLSTATE in an SQL routine body is invalid for one of the following reasons:

- SQLCODE or SQLSTATE was specified as a parameter name.
- SQLCODE is not declared as INTEGER in a return-codes-declaration clause.
- SQLSTATE is not declared as CHAR(5) in a return-codes-declaration clause.
- SQLCODE or SQLSTATE is assigned the value NULL.

System action

The statement cannot be processed.

User response

Correct the parameter list, declaration of an SQLCODE or SQLSTATE variable, or correct the assignment of a value to an SQLCODE or SQLSTATE variable.

SQLSTATE

428D8

**-787 RESIGNAL STATEMENT ISSUED
OUTSIDE OF A HANDLER****Explanation**

The RESIGNAL statement, specified in an SQL procedure, must be specified inside a handler.

System action

The statement cannot be processed.

Programmer response

Remove the RESIGNAL statement or use a SIGNAL statement. Try the request again.

SQLSTATE

OK000

**-788 THE SAME ROW OF TARGET TABLE
table-name WAS IDENTIFIED
MORE THAN ONCE FOR AN
UPDATE, DELETE, OR CHANGE
OPERATION OF THE MERGE
STATEMENT****Explanation**

The ON *search-condition* of the MERGE statement matched a single row from the target table with multiple rows of the source *table-reference*. This could result in the target row being operated on more than once with an update or delete operation, and is not allowed.

table-name

The name of the target table of the MERGE statement.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions:

- Correct the search condition to ensure that each row in the target table matches only one row in the source table.
- Aggregate the rows in the source table that match the row in the target table by using GROUP BY functions.
- Use the ROW_NUMBER() OLAP expression to generate unique rows.

[CREATE PROCEDURE statement \(overview\) \(Db2 SQL\)](#)

-797 THE TRIGGER *trigger-name* IS DEFINED WITH AN UNSUPPORTED TRIGGERED SQL STATEMENT

Explanation

The trigger definition includes an unsupported triggered SQL statement. The SQL statements allowed as a triggered SQL statement are defined in the appropriate CREATE TRIGGER (basic or advanced) trigger topic. The *SQL-trigger-body*, and *triggered-*

SQL-statement syntax fragments, and the associated descriptions, document additional rules about what is allowed in the body of a trigger.

System action

The CREATE TRIGGER statement cannot be executed, and the trigger is not created.

Programmer response

Check the triggered SQL statements in the trigger for any statement that is not listed in [CREATE TRIGGER statement \(basic trigger\) \(Db2 SQL\)](#) or [SQL-procedure-statement \(SQL PL\) \(Db2 SQL\)](#), and remove the statement.

SQLSTATE

42987

[CREATE TRIGGER statement \(basic trigger\) \(Db2 SQL\)](#)
[SQL-procedure-statement \(SQL PL\) \(Db2 SQL\)](#)

-798 A VALUE CANNOT BE SPECIFIED FOR COLUMN *column-name* WHICH IS DEFINED AS GENERATED ALWAYS

Explanation

When inserting or updating a row in a table, a value was specified for a column that is defined with GENERATED ALWAYS attributes, its value is not being set with the DEFAULT keyword, and:

- Extended indicator variable values are not enabled.
- Extended indicator variable values are enabled, but neither of the expected values DEFAULT (-5) or UNASSIGNED (-7) were provided.

column-name

The name of the column.

GENERATED ALWAYS columns should not be specified in the column list for an insert operation, or in the SET clause for an update operation unless the keyword DEFAULT is specified.

System action

The statement cannot be processed.

Programmer response

Remove the column from the column list or SET clause, or specify DEFAULT as the column value.

You can use the `OVERRIDING USER VALUE` clause on an `INSERT` statement as a possible solution for this situation.

SQLSTATE

[INSERT statement \(Db2 SQL\)](#)

[UPDATE statement \(Db2 SQL\)](#)

-802 **EXCEPTION ERROR *exception-type* HAS OCCURRED DURING *operation-type* OPERATION ON *data-type* DATA, POSITION *position-number***

Explanation

An exception error has occurred in the processing of an SQL arithmetic function or arithmetic expression. The exception error occurred in one of the following areas:

- In the `SELECT` list of an SQL `SELECT` statement.
- In the search condition of a `SELECT`, `UPDATE`, `MERGE`, or `DELETE` statement.
- In the `SET` clause of the `UPDATE` operation.
- During the evaluation of an aggregate function.

Parts of *exception-type*, *operation-type*, *data-type*, and *position-number* might not be returned to the SQL communication area, depending on where the error was detected.

exception-type

Indicates the type of error.

Possible values for *exception-type* are:

- `FIXED POINT OVERFLOW`
- `DECIMAL OVERFLOW`
- `ZERO DIVIDE`
- `DIVIDE EXCEPTION`
- `EXPONENT OVERFLOW`
- `INVALID OPERATION`
- `SUBNORMAL`
- `UNDERFLOW`
- `OVERFLOW`
- `OUT OF RANGE`

operation-type

Indicates the operation that was being performed at the time of the error. Possible *operation-type* includes the following arithmetic operations:

- `ADDITION`
- `SUBTRACTION`
- `MULTIPLICATION`
- `DIVISION`
- `NEGATION`

operation-type might also be one of the following operations:

- A built-in function
- An aggregate function
- Java conversion

data-type

The data types of the items being manipulated.

Possible values for *data-type* include the following data types:

- `BIGINT`
- `INTEGER`
- `SMALLINT`
- `DECIMAL`
- `FLOAT`

The data type displayed in the message might indicate the data type of the temporary internal copy of the data, which can differ from the actual column or literal data type due to conversions by Db2.

position-number

The position of the expression in a `SELECT` list if the error was in the `SELECT` list of an outer `SELECT` statement.

System action

The statement cannot be processed. In the case of an insert or update operation, no data is updated or deleted. If the statement was a cursor-controlled `FETCH`, the cursor will remain open unless the exception occurred while processing an aggregate function (indicated by *operation-type* of `AGGREGATE FUNCTION`), in which case the cursor will be closed. If the cursor is closed, subsequent attempts to use that cursor without first doing an `OPEN` for it receive an `SQLCODE -501`. If the statement was a cursor-controlled `OPEN`, the cursor will remain closed.

Programmer response

Examine the SQL statement to see if the cause of the problem can be determined. The problem might be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

If the arithmetic expression in error was within the SELECT list of the outer SELECT statement, it is advisable to include an indicator variable for all expressions in the SELECT list. This allows processing to continue so that non-error column and expression values can be returned.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

If *exception-type* is FIXED POINT OVERFLOW, *operation-type* is COLUMN FUNCTION, and the function is COUNT(*), specify COUNT_BIG(*) instead.

Problem determination

A fixed point overflow can occur during any arithmetic operation on BIGINT, INTEGER, or SMALLINT fields.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data field size. A zero divide occurs on a division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, for example, the magnitude of the result exceeds approximately 7.2E+75.

A decimal overflow exception can occur under either of the following circumstances:

- One or more non-zero digits are lost because the destination field in any decimal operation is too short to contain the result.
- A Java stored procedure or user-defined function sets a decimal value in an output parameter that has a precision or scale too small for the value. *operation-type* is Java conversion. *data-type* is DECIMAL. *position-number* indicates which parameter of the CALL statement or user-defined function invocation is in error.

Any of the exception or overflow conditions can occur during the processing of a built-in function. If the *operation-type* is FUNCTION, the error occurred while processing either an input, intermediate, or final value. The exception can occur because the value of a parameter is out of range.

SQLSTATE

22012 if ZERO DIVIDE.

22003 if other than ZERO DIVIDE.

-803	AN INSERTED OR UPDATED VALUE IS INVALID BECAUSE THE INDEX IN INDEX SPACE <i>indexspace-name</i> CONSTRAINS COLUMNS OF THE TABLE SO NO TWO ROWS CAN
-------------	---

CONTAIN DUPLICATE VALUES IN THOSE COLUMNS. RID OF EXISTING ROW IS X *record-id*

Explanation

The table that is the object of the insert or update operation is constrained to have unique values in certain columns. Completion of the requested operation would result in duplicate values.

indexspace-name

The name of a hash overflow index or the name of the index space that contains the unique index that enforces a primary key.

record-id

The record ID of the row where the duplicate values would exist.

When *indexspace-name* identifies a hash overflow index, the error occurred because a table with hash organization cannot have two rows with identical hash key values.

If the index space is an XML index, the duplicate values can be caused by the values in the XML document or by the result of data type conversion and rounding.

Otherwise, a primary key, unique constraint, or unique index exists over one or more columns of the table. The operation cannot be performed because one or more values would have produced a duplicate key in the unique index or constraint.

If a view is the object of the insert or update statement, the table that defines the view is constrained. The update might also be caused by a delete operation of a parent row that cascades to a dependent row with a delete rule of SET NULL.

System action

The statement cannot be processed.

Programmer response

Examine the definitions for UNIQUE INDEX or the HASH key that is specified in the index space that is identified by *indexspace-name* to determine the uniqueness constraint that is imposed. Refer to SYSIBM.SYSINDEXES for the index space name and the associated index name.

Update operation

Verify that the specified operation is consistent with the uniqueness constraint. If this does not indicate the error, examine the object table to determine the cause of the problem.

Insert operation

Examine the object table to determine which values violate the uniqueness constraint. If the INSERT statement contains a subquery, match the contents of the table addressed by the subquery and the contents of the object table to determine the cause of the problem.

Delete operation

Examine the index key columns in the table that defines the index. These columns contain a foreign key, which when set NULL on a cascade delete from the object table, causes the duplicate values.

Merge operation

Verify that the specified operation is consistent with the uniqueness constraint. If this does not indicate the error, examine the object table to determine the cause of the problem. In very rare cases, the error can be caused by another INSERT/UPDATE statement which modified the object table during the processing of MERGE statement. Under such circumstances, examine your applications and make appropriate changes to handle concurrency. For example, changing the isolation level or running the MERGE statement again might avoid the problem.

SQLSTATE

23505

[SYSINDEXES catalog table \(Db2 SQL\)](#)

-804	AN ERROR WAS FOUND IN THE APPLICATION PROGRAM INPUT PARAMETERS FOR THE SQL STATEMENT, REASON <i>reason</i>
-------------	---

Explanation

The call parameter list or the SQLDA is invalid.

- The call parameter list, which is created by the precompiler, might be invalid if the application programmer has modified the output of the precompiler, used a variable name beginning with 'SQL' in the application program, or overwritten the call parameter list in some other way.
- The SQLDA, which is created by the application program, has an invalid data type or data length.
- The value of SQLDABC is not consistent with the value of SQLD.

The following is the list of reason codes:

01

Open issued for non-cursor.

02

Close issued for non-cursor.

03

Prepare of EXECUTE IMMEDIATE.

04

Statement is not recognized.

05

No statement string present.

06

Bad SQLDA format in parameter list.

07

SQLDA length is invalid.

08

Unrecognized input data type.

09

Invalid length for input variable.

10

Invalid data length for output variable.

11

The value of SQLDABC is not consistent with the value of SQLD.

12

Invalid input data pointer. If the error occurs in a REXX application, a value might not have been set for an input host variable or indicator variable.

13

Invalid output data pointer.

14

SQLN has too many items for SQLDABC.

15

Input RDI pointer is invalid.

16

Unrecognized output data type.

17

The value of the 7th byte of SQLDAID is not consistent with the data types contained in the SQLDA. The SQLDA contains a LOB type host variable, but the 7th byte of SQLDAID is not set to '2' or greater to indicate that the extended SQLVARs have been allocated.

18

An ARRAY SQLTYPE was specified in an SQLDA.

19

Invalid program name.

System action

The statement cannot be processed.

System programmer response

Examine the application program for any of the errors noted under the explanation above. In general, the application programmer should not attempt to modify the output of the precompiler.

SQLSTATE

07002

-805	PACKAGE NAME <i>location-name.collection- id.dbrm-name.consistency-token</i> NOT FOUND IN PLAN <i>plan-name</i>. REASON <i>reason-code</i>
------	---

Explanation

An application program attempted to use a package that was not found.

location-name.collection-id.dbrm-name.consistency-token

The package that was not found. The *collection-id* is blank if the CURRENT PACKAGESET special register was blank for the local program execution.

plan-name

The name of the plan.

reason-code

A numeric value that indicates the reason for the failure.

01

- The package name was not found because there is no package list for the plan.

Problem determination: Query 2

Corrective action: Add the PKLIST option with the appropriate package list entry to the REBIND subcommand and rebind the application plan that is identified by *plan-name*.

02

The DBRM name *dbrm-name* did not match an entry in the package list. Any of the following conditions could be the problem:

BIND conditions

- The *collection-id* in the package list was not correct when the application plan that is identified by *plan-name* was bound.

Problem determination: Query 2

Corrective action: Correct the collection ID of the entry in the PKLIST option and use the REBIND subcommand to rebind

the application plan that is identified by *plan-name*.

- The *location-name* in the package list was not correct when the application plan that is identified by *plan-name* was bound.

Problem determination: Query 2

Corrective action: Correct the location name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan that is identified by *plan-name*.

- The *location-name* in the CURRENTSERVER option for the BIND subcommand was not correct when the application plan that is identified by *plan-name* was bound.

Problem determination: Query 3

Corrective action: Correct the location name in the CURRENTSERVER option and use the REBIND subcommand to rebind the application plan that is identified by *plan-name*.

Application conditions

- The CURRENT PACKAGESET special register was not set correctly by the application.

When using SET CURRENT PACKAGESET = :HV, be sure to use the correct encoding scheme, which must match the :HV in subsystem parameter options. This statement does not require package or DBRM bound into the plan, so it uses the encoding scheme defined for system. The same condition applies to SET CURRENT PACKAGE PATH.

Corrective action: Set the CURRENT PACKAGESET special register correctly.

- The application was not connected to the proper location.

Corrective action: Connect to the correct location.

03

The DBRM name that is identified by *dbrm-name* matched one or more entries in the package list and the search of those entries did not find the package. Any of the conditions that are listed for *reason-code* value 02 are possible causes for *reason-code* value 03, as are the following additional conditions:

- The DBRM of the version of the application program being executed was not bound. (A package with the same consistency token as that of the application program was not found.)

Problem determination: Query 4

Corrective action: Bind the DBRM of the version of the application program to be executed into the collection that is identified by *collection-id*.

- The incorrect version of the application program is being executed.

Corrective action: Execute the correct version of the application program. The consistency token of the application program is the same as the package that was bound.

04

The package does not exist at the remote site, which is identified by the *location-name* value.

Problem determination: Query 4

blank

The *reason-code* value is blank if the length of *location-name* is 16, the length of *collection-id* is 18, and the length of *dbrm-name* is 8 due to the length of SQLERRMT.

In a native SQL procedure, if the affected SQL statement follows a SET CURRENT PACKAGESET, SET CURRENT PACKAGE PATH, or CONNECT statement, or if it refers to an object on a remote server, additional packages must be bound using BIND COPY. Whenever the native SQL procedure is changed such that a regeneration is needed, the additional package also needs to be bound with the copy option.

System action

The statement cannot be processed.

Programmer response

Use the information that is provided for the *reason-code* to resolve the problem.

Problem determination

The following queries aid in determining the problem. Run these queries at the local location.

Query 2: Display the entries in the package list for the plan

```
SELECT LOCATION, COLLID, NAME
FROM SYSIBM.SYSPACKLIST
WHERE PLANNAME = 'plan-name';
```

If no rows are returned, then the plan was bound without a package list.

Query 3: Display the CURRENTSERVER value specified on the BIND subcommand for the plan.

```
SELECT NAME, CURRENTSERVER
FROM SYSIBM.SYSPLAN
WHERE NAME = 'plan-name';
```

Query 4: Determine if there is a matching package in SYSPACKAGE

If the package is remote, put the location name in the FROM clause.

If the *collection-id* value in the message is blank, use this version of the query:

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM location-name.SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token';
```

If the *collection-id* value in the message is not blank, use this version of the query:

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM location-name.SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token'
AND COLLID = 'collection-id';
```

If no rows are returned, the correct version of the package was not bound.

SQLSTATE

51002

-807	ACCESS DENIED: PACKAGE package-name IS NOT ENABLED FOR ACCESS FROM connection- type connection-name
-------------	--

Explanation

Access is denied for one of the following reasons:

- It is disabled, either from the 'connection-type' or from the 'connection-type' with the specific 'connection-name'.
- The attach library that you are using is from a previous release of Db2 that does not support the ENABLE and DISABLE options of the bind operation.

The variables are:

package-name

The package name (collection.package-id).

connection-type

One of the following: BATCH, DB2CALL, REMOTE, IMSBMP, IMSMPP, CICS, DLIBATCH, or UNKNOWN.

connection-name

Name of the connection that is restricted. If all connection names from a specific connection-type are restricted, this value is not specified.

System action

The statement is not executed and the package is not allocated.

System programmer response

One of the following:

- Rebind the package to enable it to execute with the required connection type and name.
- Check the SYSPLSYSTEM or SYSPKSYSTEM catalog table to find a connection from which the package can be executed.
- Correct the attach library.

SQLSTATE

23509

-808	THE CONNECT STATEMENT IS NOT CONSISTENT WITH THE FIRST CONNECT STATEMENT
-------------	---

Explanation

The CONNECT semantics that apply to an application process are determined by the first CONNECT statement executed (successfully or unsuccessfully) by the application process. One of the following rules was violated:

- A type 2 CONNECT statement cannot be executed after a type 1 CONNECT statement was executed.
- A type 1 CONNECT statement cannot be executed after a type 2 CONNECT statement was executed.

System action

The statement cannot be processed.

Programmer response

The probable cause of this error is that different programs in the application process were precompiled with different CONNECT options.

Ensure that the application process uses either type 1 or type 2 CONNECT statements and then resubmit the job. The type of CONNECT to be used is a precompiler option. The default is type 2 CONNECT.

SQLSTATE

08001

-811	THE RESULT OF AN EMBEDDED SELECT STATEMENT OR A SUBSELECT IN THE SET CLAUSE OF AN UPDATE STATEMENT IS A TABLE OF MORE THAN ONE ROW, OR THE RESULT OF A SUBQUERY OF A BASIC PREDICATE IS MORE THAN ONE VALUE
-------------	--

Explanation

Execution of an embedded SELECT statement or a subselect in the SET clause of an UPDATE statement has resulted in a result table that contains more than one row. Alternatively, a subquery contained in a basic predicate has produced more than one value.

System action

The statement cannot be processed.

Programmer response

Examine the syntax of the statement to ensure that it contains the proper condition specifications. If the statement syntax is correct, there might be a problem with the data that is causing more than one row or value to be returned when you do not expect it.

SQLSTATE

21000

-812	THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE A BLANK COLLECTION-ID WAS FOUND IN THE CURRENT PACKAGESET SPECIAL REGISTER WHILE TRYING TO FORM A QUALIFIED PACKAGE NAME FOR PROGRAM <i>program-name.consistency-token</i> USING PLAN <i>plan-name</i>
-------------	---

Explanation

The last entry or the only entry in the package list for the plan contained an asterisk (*) as the value of the collection ID. The CURRENT PACKAGESET special register must be set to a nonblank collection ID to form a qualified package name.

System action

The statement cannot be processed.

Programmer response

Set the CURRENT PACKAGESET special register to the correct collection ID, or ask your system administrator to check the plan's package list for correctness.

If this error occurs in an application that is running under the IBM Data Server Driver for JDBC and SQLJ, you might have too many concurrently open Statement, PreparedStatement, or CallableStatement objects. Modify your application to decrease the number of concurrently open objects, or run the DB2Binder utility again with a larger -size parameter value to increase the number of packages that are available to the driver.

SQLSTATE

22508

-817	THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE STATEMENT WILL RESULT IN A PROHIBITED DATA CHANGE OPERATION.
-------------	--

Explanation

The application attempted to execute an SQL statement that would result in updates to user data or to the subsystem catalog. This is prohibited for one of the following reasons:

- The application is running as an IMS inquiry-only transaction.
- The application is an IMS, CICS, or RRSF application that is attempting to update data at a remote DBMS that does not support two-phase commit.
- The application is attempting to update data at multiple locations and one of the locations does not support two-phase commit.
- A trigger defined with activation time BEFORE was activated and its triggered action caused updates to the database.
- The application is executing with a package that was bound with bind option DBPROTOCOL(DRDACBF), which enables package-based continuous block fetch. When package-based continuous block fetch is in effect, updates at a remote server are not allowed.
- A CREATE TABLE statement for an accelerator-only table was followed by a data change operation for an accelerator-only table.

These SQL statements include INSERT, UPDATE, MERGE, DELETE, CREATE, ALTER, DROP, GRANT, and REVOKE.

System action

The statement cannot be processed.

Programmer response

If the application is running as an IMS inquiry-only transaction, see your IMS system programmer about changing the inquiry-only status of the transaction under which your application is running.

If the IMS, CICS, or RRSF application is attempting a remote update, either the application must be changed to run as a local application on the server DBMS, or the server DBMS must be upgraded to support two-phase commit.

If the application is attempting to update data at multiple locations, either the application must be changed, or all DBMSs involved must be upgraded to support two-phase commit.

If the connection to the remote system is through VTAM®, ensure that the VTAM APPL statement specifies SYNCLVL=SYNCPT.

If the error is due to an invalid statement during a trigger activation, contact your system administrator to correct the trigger definition.

If the application package is bound with DBPROTOCOL(DRDACBF), take one of the following actions:

- Rebind the package without the DBPROTOCOL(DRDACBF) option to disable package-based continuous block fetch.
- Remove any SQL statements from the application that cause updates on the remote site, and prepare the application again.

SQLSTATE

25000

Related concepts

[The APPL statement \(Db2 Installation and Migration\)](#)

-818	THE PRECOMPILER-GENERATED TIMESTAMP x IN THE LOAD MODULE IS DIFFERENT FROM THE BIND TIMESTAMP y BUILT FROM THE DBRM z
-------------	--

Explanation

The timestamp that is stored in the application load module does not match the timestamp that is stored in the plan or package. If the timestamps do not match, the application is not allowed to process the SQL statement.

x

The timestamp that was generated by the precompiler. This timestamp is a Db2 internal timestamp. It does not have an external interpretation.

y

The bind timestamp. This timestamp is a Db2 internal timestamp. It does not have an external interpretation.

z

The name of the database request module (DBRM).

The SQL precompiler places timestamp *y* in the DBRM and timestamp *x* in the parameter list in the application program for each SQL statement. At bind time, Db2 stores the DBRM timestamp for run time use. At run time, timestamp *x* for the SQL statement being processed is compared with timestamp *y* derived from the DBRM *z* at bind time. If the two timestamps do not match, the DBRM and the application program were not the result of the same precompile operation.

This problem can occur in the following cases:

- The application was precompiled, compiled, and linked, but was not bound.
- The application was precompiled and bound, but was not compiled and linked for the application program.
- The application was bound using a DBRM that resulted from a different precompile of the application program than that which produced the object module that is linked into the application module.

System action

The statement cannot be processed.

Programmer response

Bind the application again, using the DBRM for the application program that matches the load module.

SQLSTATE

51003

-819

THE VIEW CANNOT BE PROCESSED BECAUSE THE LENGTH OF ITS PARSE TREE IN THE CATALOG IS ZERO

Explanation

SYSIBM.SYSVTREE.VTREE is a varying-length string column that contains the parse trees of views. In processing a view, the length control field of its parse tree was found to be zero.

System action

The statement cannot be processed.

Programmer response

This is a system error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SQLSTATE

58004

-820

THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE *catalog-table* CONTAINS A VALUE THAT IS NOT VALID IN THIS RELEASE

Explanation

A column of the indicated catalog table contains a value that prevents further processing of an SQL statement. The meaning of the value is unknown to the release of Db2. If a fall back has occurred, the value is probably the result of the use of new function prior to the fall back.

System action

The statement cannot be processed.

Programmer response

Verify that the statement refers to the intended tables or views and that the problem is the result of a fall

back. If this is the case, the statement cannot be corrected because it depends on a function that is not supported in the current release. If the problem is not the result of a fallback, -820 is a system error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SQLSTATE

58004

-822	THE SQLDA CONTAINS AN INVALID DATA ADDRESS OR INDICATOR VARIABLE ADDRESS
-------------	---

Explanation

The application program has placed an invalid address in the SQLDA.

System action

The statement cannot be processed.

Programmer response

Correct the application program such that valid addresses are placed in SQLDA.

SQLSTATE

51004

-840	TOO MANY ITEMS RETURNED IN A SELECT, INSERT LIST, FROM MERGE, OR FROM UNNEST
-------------	---

Explanation

The number of items returned in the SELECT list, specified in an INSERT list, specified in a MERGE statement, or returned from an invocation of UNNEST exceeds the allowable maximum of 750.

System action

The statement cannot be processed.

Programmer response

Determine whether all the information is actually needed. For example, the number of items that are returned by the SQL statement `SELECT * FROM A, B, C` is the sum of the number of columns in all three tables. Not all column data might be needed.

Rewrite the SQL statement so that only the necessary items of information are returned, or break the SQL statement into two or more statements.

SQLSTATE

54004

-842	A CONNECTION TO <i>location-name</i> ALREADY EXISTS
-------------	--

Explanation

One of the following situations occurred:

- A CONNECT statement identifies a location with which the application process has a private connection, using system-directed access.
- SQLRULES(STD) is in effect and a CONNECT statement identifies an existing SQL connection.
- A private connection, using system-directed access, cannot be established because of an existing SQL connection to that location.
- A CONNECT (type 2) request that includes the USER/ USING clause identifies an existing SQL connection.

System action

The statement cannot be processed.

Programmer response

The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If SQLRULES(STD) is in effect and the CONNECT statement identifies an existing SQL connection, replace the CONNECT with SET CONNECTION or change the option to SQLRULES(Db2).
- If the CONNECT statement identifies an existing private connection, destroy that connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement. If the SQL statements following the CONNECT can be executed using system-directed access, an alternative solution is to change the application to use that method.
- If system-directed access cannot be used, destroy the conflicting SQL connection (by using the RELEASE statement in a previous unit of work) before executing the SQL statement that requires system-directed access. An alternative solution is to change the application so that only application-directed access is used.
- Destroy the connection (by using the RELEASE statement in a previous unit of work) before

executing the CONNECT statement which includes the USER/USING clause.

Correct the error in the application, rebind the plan or package, and resubmit the job.

SQLSTATE

08002

-843	THE SET CONNECTION OR RELEASE STATEMENT MUST SPECIFY AN EXISTING CONNECTION
-------------	--

Explanation

One of the following rules was violated:

- A SET CONNECTION statement must identify an existing SQL connection of the application process.
- A RELEASE statement must identify an existing connection of the application process.

System action

The statement cannot be processed.

Programmer response

The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If the location name does not identify an existing SQL connection, replace the SET CONNECTION with a CONNECT statement.
- If RELEASE CURRENT was executed in the unconnected state or the specified location name does not identify an existing SQL or Db2 private connection, delete the RELEASE statement.

Correct the error in the application, rebind, the plan and resubmit the job.

SQLSTATE

08003

-845	A PREVIOUS VALUE EXPRESSION CANNOT BE USED BEFORE THE NEXT VALUE EXPRESSION GENERATES A VALUE IN THE CURRENT APPLICATION PROCESS FOR SEQUENCE <i>sequence-name</i>
-------------	---

Explanation

A PREVIOUS VALUE expression specified sequence *sequence-name*, but a value has not yet been

generated for this sequence. A NEXT VALUE expression must be issued in this application process to generate a value for this sequence before a PREVIOUS VALUE expression for the sequence can be issued.

This error can also occur after a sequence has been dropped, and the DROP statement is rolled back.

System action

The statement cannot be processed.

Programmer response

Issue at least one NEXT VALUE expression for a sequence before issuing any PREVIOUS VALUE expression for the same sequence in a connection.

SQLSTATE

51035

-846	INVALID SPECIFICATION OF AN IDENTITY COLUMN OR SEQUENCE OBJECT <i>object-type object-name</i>. REASON CODE = <i>reason-code</i>
-------------	--

Explanation

For an identity column or sequence, the specification of an attribute in a CREATE or ALTER statement might be invalid.

This message is also issued if *object-name* identifies a DB2_GENERATED_DOCID_FOR_XML column.

object-type

The type of object.

object-name

The name of the object.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The underlying data type of the identity column or sequence object is not supported. Identity columns and sequence objects support the following data types: SMALLINT, INTEGER, BIGINT, and DECIMAL (or NUMERIC) with a scale of zero.

2

The value for START WITH, INCREMENT BY, MINVALUE, MAXVALUE, or RESTART WITH is outside the range for the data type of the identity column or sequence object. If the sequence being altered is DSNSEQ_IMPLICITDB, the value for

MAXVALUE is outside the range in the range 1–60000, inclusive.

3

MINVALUE must be less than or equal to MAXVALUE.

4

An invalid value was specified for CACHE. The value must be an INTEGER with a minimum value of 2.

5

An edit procedure that is defined with row attribute sensitivity was specified for the identity column.

6

An identity column was specified for a global temporary table that was already defined by a CREATE GLOBAL TEMPORARY TABLE statement. This error could occur for a CREATE GLOBAL TEMPORARY TABLE statement, or an ALTER TABLE statement for a global temporary table when there is an attempt to add an identity column to an existing global temporary table that was already defined by a CREATE GLOBAL TEMPORARY TABLE statement.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

SQLSTATE

42815

-867	INVALID SPECIFICATION OF A ROWID COLUMN
-------------	--

Explanation

For an ALTER TABLE or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column can not be added to a temporary table.
- The *referential-constraint* clause can not specify a ROWID column as a column of a foreign key.
- A ROWID column can not be a column of a primary key.
- A ROWID column can not be a column in a table with an edit procedure that is defined with row attribute sensitivity.

If more than one exchange is attempted consecutively, then there must be a COMMIT between them. This COMMIT is already required before DML can be done. If a COMMIT is not done between exchanges, then a -909 SQL code will be issued.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

SQLSTATE

428C7

Related reference

[CREATE TABLE statement \(Db2 SQL\)](#)

-870	THE NUMBER OF HOST VARIABLES IN THE STATEMENT IS NOT EQUAL TO THE NUMBER OF DESCRIPTORS
-------------	--

Explanation

The number of host variables in the SQL statement does not match the number of host variable descriptors.

System action

The statement cannot be processed.

Programmer response

Correct the application program. The most likely cause of this problem is a missing colon before a host variable.

Problem determination

If the SQL statement is bound locally, descriptors are built by the Db2 precompiler. For a remote SQL statement, descriptors are built by DDF and are passed in the array SQLSTTVRB.

SQLSTATE

58026

-872	A VALID CCSID HAS NOT YET BEEN SPECIFIED FOR THIS SUBSYSTEM
-------------	--

Explanation

A valid CCSID was not specified on either the ASCII CCSID, EBCDIC CCSID, or UNICODE CCSID subsystem parameter on installation panel DSNTIPF.

System action

The statement cannot be processed.

Programmer response

Contact your system administrator to have the necessary CCSID defined for your system.

SQLSTATE

51032

-873	THE STATEMENT REFERENCED DATA ENCODED WITH DIFFERENT ENCODING SCHEMES OR CCSIDS IN AN INVALID CONTEXT
------	--

Explanation

The SQL statement references data from multiple encoding schemes or CCSIDs in a context where the reference is not allowed. This error can occur for one of the following reasons:

- The definition of a new table is specified to be 'like' an existing view which references data from multiple encoding schemes.
- The parent and child tables referenced in the definition of a referential constraint containing one or more non-numeric columns are encoded with different encoding schemes.
- The definition of a materialized query table uses a different encoding scheme than the containing table space.
- The SELECT statement references data that is encoded in multiple encoding schemes, and also contains an INSERT, DELETE, UPDATE, or MERGE statement that references data that is encoded with a single encoding scheme.
- An INSTEAD OF trigger is created on a view that references multiple encodings or CCSIDs.
- The GRAPHIC or VARGRAPHIC built-in function, or CAST specification, was invoked with numeric data for the first argument and the containing statement:
 - is a multiple encoding scheme statement but the application encoding scheme is not set to Unicode, or a CAST specification does not explicitly specify Unicode in the CCSID clause for the target data type.

- is a single encoding scheme statement and the statement references tables or views that are not Unicode.

For information about how to determine whether a context supports Unicode data, see [Encoding scheme and CCSID rules for strings \(Introduction to Db2 for z/OS\)](#).

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement.

SQLSTATE

53090

-874	THE ENCODING SCHEME SPECIFIED FOR THE <i>object-type</i> MUST BE THE SAME AS THE CONTAINING OR TARGET TABLE SPACE OR OTHER PARAMETERS
------	---

Explanation

A CCSID clause was incorrectly specified in one of the following situations:

- In a CREATE TABLE or ALTER TABLE statement:
 - CCSID ASCII was specified, and the containing table space is EBCDIC or UNICODE.
 - CCSID EBCDIC was specified, and the containing table space is ASCII or UNICODE.
 - CCSID UNICODE was specified, and the containing table space is ASCII or EBCDIC.
- In a fullselect that creates a table, the following items were not the same:
 - The encoding scheme of the result table of the fullselect
 - The encoding scheme in the CCSID clause (if specified)
 - The encoding scheme of the target table space
- In a CREATE TYPE statement for an array, the CCSID clause was specified for the data type of array elements and for the data type of the index. The CCSID specifications for the array elements and for the index were not the same.
- In an ALTER TABLESPACE statement with a MOVE TABLE clause, the CCSID attributes of the table space that is being altered (the source table space) were not the same as the CCSID attributes of the target table space.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement in one of the following ways:

- For a CREATE TABLE or ALTER TABLE statement, make the CCSID value in the CREATE TABLE or ALTER TABLE statement the same as the CCSID of the containing table space.
- For a fullselect that creates a table, make all of the following items the same:
 - The encoding scheme of the result table of the fullselect
 - The encoding scheme in the CCSID clause (if specified)
 - The encoding scheme of the target table space
- For a CREATE TYPE statement for an array, make the CCSID specification for the array elements and for the index the same.
- For an ALTER TABLESPACE statement with a MOVE TABLE clause, specify a target table space that has the same CCSID attributes as the source table space.

SQLSTATE

53091

-875 ***operand* CANNOT BE USED WITH THE ASCII DATA REFERENCED**

Explanation

ASCII data was referenced in one of the following situations:

- A LIKE predicate refers to a mixed data column in an ASCII table. The LIKE predicate is not supported for mixed ASCII data.
- A VARGRAPHIC function was specified for a column in an ASCII table. The VARGRAPHIC function is not supported for ASCII data.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement.

SQLSTATE

42988

-876

object-type* CANNOT BE CREATED OR ALTERED, REASON *reason-code

Explanation

The object in the SQL statement cannot be created or altered.

object-type

The type of object that could not be created or altered:

TYPE 1 INDEX

The object that the SQL statement attempted to create is a type 1 index.

INDEX

The object that the SQL statement attempted to create is an index.

TABLE

The object that the SQL statement attempted to create or alter is a table.

TABLESPACE

The object that the SQL statement attempted to alter is a table space.

reason-code

A value that indicates the reason for the failure.

TABLE DEFINED AS ASCII

The underlying table is defined as ASCII. Only type 2 indexes are supported for ASCII tables.

PIECESIZE IS NOT VALID

PIECESIZE is only valid for non-partitioned indexes.

COLUMN NAME IN EBCDIC EXCEEDS 18 BYTES, OR THE CONVERSION FROM UNICODE TO EBCDIC FAILED

The table that is being created or altered has an edit procedure that is defined with row attribute sensitivity, a field procedure, or a validation procedure. In these cases, the column name in EBCDIC cannot exceed 18 EBCDIC bytes in length, or the conversion of a column name from UNICODE to EBCDIC failed.

BASE TABLESPACE IS LOG YES, LOB TABLESPACE IS LOG NO

A spatial index cannot be created because the following table spaces have the indicated attributes:

- The table space that contains base table has the LOG YES (or LOGGED) attribute.
- The LOB table space that stores the LOB column has the LOG NO (or NOT LOGGED) attribute.

CONTAINS A SPATIAL COLUMN

The LOG YES attribute of a LOB table space cannot be altered to LOG NO if an index depends on the LOB column.

The LOG NO attribute of a table space cannot be altered to LOG YES if it contains a table with an index that depends on a LOB column of the table.

6

The value of one of the following subsystem parameters disallowed the definition of an index-controlled partitioned table:

PREVENT_NEW_IXCTRL_PART

The value of the PREVENT INDEX PART CREATE subsystem parameter disallowed the creation of an index-controlled partitioned table with a CREATE TABLE statement.

PREVENT_ALTERTB_LIMITKEY

The value of the PREVENT ALTER LIMITKEY subsystem parameter disallowed the alteration of the limit key of an index-controlled partitioned table with an ALTER TABLE statement.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement for the object that is being created or altered.

SQLSTATE

53092

-877

CCSID ASCII OR CCSID UNICODE IS NOT ALLOWED FOR THIS DATABASE OR TABLE SPACE

Explanation

The database or table space specified is required to be in EBCDIC.

System action

The statement cannot be processed.

Programmer response

Remove the CCSID ASCII or CCSID UNICODE clause from the statement.

SQLSTATE

53093

-878

THE *explain-object* USED FOR EXPLAIN MUST BE ENCODED IN UNICODE. IT CANNOT BE IN ASCII OR EBCDIC.

Explanation

An EXPLAIN table object was encoded in the wrong format. It must be encoded in Unicode for use with EXPLAIN.

explain-object

The name of the explain table object.

System action

The statement was not executed.

Programmer response

Migrate the current release format EXPLAIN tables to UNICODE for the current schema.

SQLSTATE

53094

-879

CREATE or ALTER STATEMENT FOR *object-name* CANNOT DEFINE A COLUMN, TYPE, VARIABLE, FUNCTION OR STORED PROCEDURE PARAMETER AS MIXED OR GRAPHIC WITH ENCODING SCHEME *encoding-scheme*

Explanation

A CREATE or ALTER TABLE statement or SQL variable declaration for *object-name* attempted to define a column, distinct type, or parameter of a user-defined function or stored procedure as mixed data or graphic when the system does not have an appropriate CCSID defined for the *encoding-scheme* encoding scheme.

- A CREATE TYPE statement cannot define a distinct type, on EBCDIC or ASCII data, with a source type of character FOR MIXED DATA, or GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA installation option is set to NO.

- A CREATE TYPE statement for an array type cannot be defined with EBCDIC or ASCII data, and with a data type for the array elements that is character FOR MIXED DATA, GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA installation option is set to NO. An associative array type cannot be defined with EBCDIC or ASCII data, and with a data type for the array index that is character FOR MIXED DATA, when the MIXED DATA installation option is set to NO.
- A CREATE FUNCTION or CREATE PROCEDURE statement cannot define a parameter or specify a RETURNS data type, for ASCII or EBCDIC data, as character FOR MIXED DATA, GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA installation option is set to NO.

This error occurs only when the encoding scheme that is in use is EBCDIC or ASCII. The MIXED DATA installation option does not affect Unicode data.

This error can occur when the a column, type, variable, or parameter is defined as character FOR MIXED DATA, even though the keywords FOR MIXED DATA do not appear in the failing statement. This situation occurs when the MIXED value in the application defaults module is YES. In this case, the default subtype for the character types is FOR MIXED DATA.

System action

The statement cannot be processed.

Programmer response

Contact your system administrator to properly set up the installation options, or change the data types of the elements in columns in your CREATE or ALTER statement.

SQLSTATE

53095

-880	SAVEPOINT <i>savepoint-name</i> DOES NOT EXIST OR IS INVALID IN THIS CONTEXT
-------------	---

Explanation

The RELEASE TO SAVEPOINT or ROLLBACK TO SAVEPOINT statement does not identify a savepoint that exists.

System action

Db2 does not process the statement.

Programmer response

Correct the statement to use a valid savepoint name.

SQLSTATE

3B001

-881	A SAVEPOINT WITH NAME <i>savepoint-name</i> ALREADY EXISTS, BUT THIS SAVEPOINT NAME CANNOT BE REUSED
-------------	---

Explanation

The SAVEPOINT statement uses the same savepoint name as another savepoint, and it cannot be created because at least one of the savepoints was defined with the UNIQUE clause to indicate that the name cannot be reused within the transaction.

System action

The statement is not executed and a new savepoint is not set. The old savepoint still exists.

Programmer response

Correct the statement. Either use a different savepoint name, or omit the UNIQUE clause if the other savepoint was created without the UNIQUE clause and your intention is to reuse that savepoint name.

SQLSTATE

3B501

-882	SAVEPOINT DOES NOT EXIST
-------------	---------------------------------

Explanation

A ROLLBACK TO SAVEPOINT statement was specified without a savepoint name to rollback to the last active savepoint, but no savepoint exists.

System action

The statement cannot be processed.

Programmer response

Correct the application logic to either set a savepoint or to not attempt to rollback to a savepoint.

SQLSTATE

3B502

-900	THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE
-------------	---

APPLICATION PROCESS IS NOT CONNECTED TO A SERVER

Explanation

A previous failure has placed the application process in the unconnected state. An unsuccessful request to switch the user in a trusted connection can cause the connection to go into an unconnected state. The only SQL statements that can be successfully executed from the unconnected state are CONNECT, COMMIT, ROLLBACK, and local SET statements.

System action

The statement cannot be processed.

Programmer response

It is possible that no response is required because checking for -900 is one way of detecting the unconnected state. If this error is the result of another situation, the logic of the application program must be changed.

SQLSTATE

08003

-901	UNSUCCESSFUL EXECUTION CAUSED BY A SYSTEM ERROR THAT DOES NOT PRECLUDE THE SUCCESSFUL EXECUTION OF SUBSEQUENT SQL STATEMENTS
-------------	---

Explanation

A system error occurred that prevented successful execution of the current SQL statement.

Multiple forms: This message has two forms. The form that is shown above applies if the SQL statement is not a query that was sent to an accelerator server. The following form applies if the SQL statement is a query that was sent to an accelerator server:

UNSUCCESSFUL EXECUTION CAUSED BY A SYSTEM ERROR THAT DOES NOT PRECLUDE THE SUCCESSFUL EXECUTION OF SUBSEQUENT SQL STATEMENTS
accelerator-info

accelerator-info

An error message that was returned by the accelerator server.

If the SQL statement is not a query that was sent to an accelerator server, possible causes for this error include:

- Statement length: The length of the SQL statement is either less than 0 or greater than the permitted maximum length for a statement.
- Distributed commit processing: Distributed commit processing encountered an error. All servers in the unit of work that support distributed two-phase commit back out the unit of work. If a server that does not support distributed two-phase commit has updates in the unit of work, that server must be queried to determine if its updates were committed or backed out.
- Incomplete post-processing work: The transaction is aborted and commit failed. Typical causes for incomplete post-processing include:
 - An update that changes the partition of a row
 - Resource availability
 - The existence of held cursors
 - Violations of uniqueness constraints

If the SQL statement is a query that was sent to an accelerator server, the error is returned because the accelerator server could not execute the query.

System action

The statement cannot be processed. A X'04E' abend might be requested for the application. The application program can have a recovery routine to recover from such an abend and can retry SQL statements.

The error does not prevent successful execution of further SQL statements.

Programmer response

If an abend occurred, notify the system programmer for analysis of the abend that caused this return code. Even if an abend occurred, an application program receiving this return code can retry and is not prohibited from executing further SQL statements.

If the error occurred during a commit, examine any detailed resource unavailable information that is posted to the system operator console or in the system services address space (*ssnmMSTR*) job log to determine if a resource unavailable problem prevented commit post-processing from completing.

If the error occurred for a query that was sent to an accelerator server, check whether the SQL statement

contains a logical error. An example of a logical error in an SQL statement is a division operation that results in division by 0. If you determine that your application is not the source of the error, contact IBM Support, and provide the value in the *accelerator-info* token.

SQLSTATE

58004

Related reference

[Db2 abend completion codes \(X'04E' and X'04F'\)](#)
X'04E' and X'04F' system abend completion codes identify internal errors encountered during Db2 operation, diagnostic information for problem determination, and subsystem actions initiated by the Db2 subcomponent involved in the error.

-902	POINTER TO THE ESSENTIAL CONTROL BLOCK (CT/RDA) HAS VALUE 0, REBIND REQUIRED
-------------	---

Explanation

Pointer to the essential control block, either the CT or the RDA, is zeros. This precludes the successful execution of the current SQL statement, as well as any subsequent SQL statements.

System action

The statement cannot be processed. The application program is not permitted to issue additional SQL statements. For example, a recovery routine associated with the application program may not issue additional SQL statements.

Programmer response

Rebind the failing application program and try again. If the problem persists, examine your DBRM and make sure it matches your program.

SQLSTATE

58005

-904	UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON <i>reason-code</i>, TYPE OF RESOURCE <i>resource-type</i>, AND RESOURCE NAME <i>resource-name</i>
-------------	---

Explanation

The SQL statement could not be executed because a required resource was not available.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381](#).

resource-type and *resource-name*

The type and name of the resource that the message identifies. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

When *resource-type* is 402, the value of *resource-name* is the z/OS Security Server return and reason codes for the unavailable resource.

When *reason-code* is 00E7000E and *resource-type* is 00001080, SQLCODE -904 was issued by IBM Db2 Analytics Accelerator for z/OS, and *resource-name* is message text from the accelerator that indicates the cause of the failure.

System action

The SQL statement cannot be processed.

If the SQL statement being processed was a cursor FETCH, Db2 closes the cursor.

Programmer response

Collect a listing of the SYSLOG data set for the period of time that spans the failure. Search the SYSLOG data set for messages that are related to the error.

Verify the identity of the resource that was not available. To determine why the resource was unavailable, refer to the specified *reason-code*.

If *resource-name* identifies the optimum buffer pool, either define the buffer pool with that name or create the table in a table space that is defined with that buffer pool.

If SQLCODE -904 was issued by IBM Db2 Analytics Accelerator for z/OS, contact IBM Support for IBM Db2 Analytics Accelerator for z/OS, and provide them with the *resource-name* message text.

SQLSTATE

57011

Related concepts

[Db2 reason codes](#)
Reason codes are typically presented as a value in a message that Db2 issues. The reason codes

provide specific details about the circumstances of a particular instance of the message.

[Resource types for messages and codes in Db2 for z/OS](#)

Various messages, reason codes, and SQL codes in Db2 for z/OS include type codes that identify particular types of resources. In some cases, specific resource names are also identified.

-501

THE CURSOR IDENTIFIED IN A FETCH OR CLOSE STATEMENT IS NOT OPEN

-905	UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = <i>resource-name</i> LIMIT = <i>limit-amount1</i> CPU SECONDS (<i>limit-amount2</i> SERVICE UNITS) DERIVED FROM <i>limit-source</i>
-------------	---

Explanation

The execution of the SQL statement was terminated because a resource limit was exceeded.

resource-name

The name of the resource whose limit was exceeded. It is also the name of the column in the Db2 table from which the limit was derived. The *resource-name* can be ASUTIME, which is the number of CPU seconds permitted for each SQL statement.

limit-amount1

The maximum number of CPU seconds permitted

limit-amount2

The maximum number in service units permitted

limit-source

The source used to derive the limit-amount: the name of a resource limit specification table, a system parameter, or the SYSIBM.SYSROUTINES catalog table. If the source is a system parameter, the resource limit specification table did not contain an applicable entry or an error occurred while accessing the table.

System action

If the *limit-source* was a resource limit specification table or a system parameter, the execution of this SQL statement is terminated.

In the case of a routine exceeded ASUTIME threshold, the current transaction is rolled back to the previous commit point. The thread is placed into a must rollback state, and no SQL statements can be processed before a ROLLBACK is issued.

A trace record containing more detailed information about this failure is generated. If an SQL cursor is associated with the failed instruction, its position is unchanged and a CLOSE or PREPARE statement can be issued. If any other operation is attempted with the cursor, it cannot be executed and SQLCODE -905 is returned. If there is no cursor, this statement was rolled back.

Programmer response

Determine why this SQL statement or stored procedure took so long and take appropriate action. Consider simplifying the SQL statement, restructuring tables and indexes, or contacting the installation group responsible for maintaining the resource limit specification tables.

If the *limit-source* was a resource limit specification table or a system parameter, the application program that receives this return code can execute additional SQL statements.

If SQLCODE -905 is issued in response to a statement that is monitored by the resource limit facility, increase the ASUTIME value that is specified for the routine in the resource limit table.

[00E70123](#)

-906	THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THIS FUNCTION IS DISABLED DUE TO A PRIOR ERROR
-------------	--

Explanation

Execution of the SQL statement failed because the requested function had been disabled by a prior error. This situation can arise if the application program has intercepted an abend (for instance, by an ON ERROR condition in a PL/I program) and continued to execute

SQL statements. This situation may also arise if a Db2 CICS transaction encountered a create thread error yet continued to issue SQL requests without issuing a SYNCPOINT ROLLBACK first.

System action

The statement cannot be processed.

Programmer response

In general, an application program should terminate upon receipt of this return code. All subsequent attempts by the application to execute other SQL statements will also fail with the same return code. In the case of a Db2 CICS transaction, if the SQLERRP field in the SQLCA contains the module name DSNCEXT1, the transaction may issue a SYNCPOINT ROLLBACK and continue processing. If the transactions chooses to ROLLBACK and continue processing, it must be capable of correcting the situation that caused the create thread error to occur originally.

SQLSTATE

51005

-907	AN ATTEMPT WAS MADE TO MODIFY THE TARGET TABLE, <i>table-name</i>, OF THE MERGE STATEMENT BY CONSTRAINT OR TRIGGER <i>trigger-name</i>.
-------------	--

Explanation

The MERGE statement caused a constraint or trigger to activate. The trigger attempted to update, insert into or delete from the target table or a table within the same table hierarchy of the MERGE statement. This is not allowed.

table-name

The name of the target table of the MERGE statement.

trigger-name

The name of the trigger that attempted to modify the target table.

System action

The statement cannot be processed.

Programmer response

Change the MERGE statement to remove the operation that causes the constraint or trigger to activate, or

alter the table that has the constraint or trigger to remove the reference to the target table.

SQLSTATE

27000

-908	<i>bind-type</i> ERROR USING <i>auth-id</i> AUTHORITY. BIND, REBIND OR AUTO-REBIND OPERATION IS NOT ALLOWED
-------------	--

Explanation

For BIND and REBIND, the indicated authorization ID is not allowed to perform the indicated bind-type against a plan or package. An entry in the resource limit specification table (RLST) prohibits binding and rebinding by this authorization ID, or all authorization IDs. For AUTO-REBIND, the system parameter controlling AUTO-REBIND operations is set to disallow AUTO-REBIND.

bind-type

Type of bind operation (BIND, REBIND or AUTO-REBIND).

auth-id

Authorization ID of the invoker of the BIND subcommand or primary authorization ID of the invoker of the plan for AUTO-REBIND operations.

System action

The plan or package is not bound.

System programmer response

If the indicated authorization id should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

SQLSTATE

23510

-909	THE OBJECT HAS BEEN DELETED OR ALTERED
-------------	---

Explanation

The application program has performed one of the following actions:

- Dropped or altered a table and then accessed it.
- Dropped or altered an index and then accessed the table on which the index was defined.

- Executed the EXCHANGE statement on a table more than once without executing a COMMIT statement between consecutive EXCHANGE statements.
- Executed the EXCHANGE statement on a table and then accessed it.

System action

The statement cannot be processed.

System programmer response

Correct the application program in one of the following ways:

- Do not drop or alter a table, and then access it in the same application program.
- Do not drop or alter an index, and then access the table on which it is defined in the same application program.
- If the application program contains consecutive EXCHANGE statements for a table, include a COMMIT statement between the EXCHANGE statements.
- If the applications contains an EXCHANGE statement and then accesses the table, add a COMMIT statement after the EXCHANGE statement and before accessing the table.

SQLSTATE

[EXCHANGE statement \(Db2 SQL\)](#)

-910	THE SQL STATEMENT CANNOT ACCESS AN OBJECT ON WHICH UNCOMMITTED CHANGES ARE PENDING
------	--

Explanation

The application program attempted to access an object that has been modified and the changes have not yet been committed. This error is issued in the following situations:

- An application program issues a DROP, ALTER, CREATE, or RENAME statement against an object, and then attempts to access that object before the operation is complete.
- An application program issues an ALTER or CREATE statement, and an INSERT, UPDATE, DELETE,

- MERGE, or SELECT statement is processed for the same object in the same commit scope.
- An application program issues a CREATE TABLE statement and an ALTER TABLE statement that creates a new table space version in the same commit scope.
- An application program issues a DROP, ALTER, CREATE, or RENAME statement against an object, and then attempts to access that object using an INSERT, UPDATE, DELETE, MERGE, or SELECT statement before the DROP, ALTER, CREATE, or RENAME statement completes.

System action

The statement cannot be processed.

Programmer response

Modify the logic of the application program, other than the logic for DROP, so that a COMMIT (or the IMS or CICS equivalent) is executed between the data definition statement and the failing SQL statement, or between the data manipulative statement and the data definition statement. In cases where open held cursors are associated with the failing SQL statement, the cursor must be closed prior to COMMIT.

For DROP, the logic of the application program should be modified so that no attempt is made to access an object after the DROP has been executed. **Attention:** DROP includes cases when rollback to a savepoint includes rolling back to a CREATE.

SQLSTATE

57007

-911	THE CURRENT UNIT OF WORK HAS BEEN ROLLED BACK DUE TO DEADLOCK OR TIMEOUT. REASON <i>reason-code</i> , TYPE OF RESOURCE <i>resource-type</i> , AND RESOURCE NAME <i>resource-name</i>
------	--

Explanation

The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381](#).

resource-type and resource-name

The type and name of the resource that the message identifies. For an explanation of *resource-*

type and *resource-name* values, see [Resource types](#).

Attention: The changes associated with the unit of work must be entered again.

SQLERRD(3) also contains the reason-code which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- 00C90088 - deadlock
- 00C9008E - timeout

The changes associated with the unit of work must be entered again.

System action

The statement cannot be processed. The application is rolled back to the previous COMMIT.

Programmer response

Collect a listing of the SYSLOG data set for the period of time that spans the failure. Search the SYSLOG data set for messages that are related to the error.

A long-running application, or an application that is likely to encounter a deadlock, should (if possible) issue frequent COMMIT commands. This can lessen the possibility of a deadlock occurring. See message DSNT376I for other possible ways to avoid future deadlocks or timeouts. On receipt of the SQLCODE -911, the application should, in general, terminate.

**UNSUCCESSFUL EXECUTION
CAUSED BY DEADLOCK OR
TIMEOUT. REASON CODE *reason-
code*, TYPE OF RESOURCE
resource-type, AND RESOURCE
NAME *resource-name***

Explanation

The application was the victim in a deadlock or experienced a timeout. The reason code indicates whether a deadlock or timeout occurred.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381](#).

resource-type and *resource-name*

The type and name of the resource that the message identifies. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

System action

The statement cannot be processed.

If the SQL statement being processed was a cursor FETCH, Db2 closes the cursor.

SQLERRD(3) also contains the *reason-code* value which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- 00C90088 - deadlock
- 00C9008E - timeout

Programmer response

Collect a listing of the SYSLOG data set for the period of time that spans the failure. Search the SYSLOG data set for messages that are related to the error.

The application should either commit or roll back to the previous COMMIT. Then, generally, the application should terminate. See message DSNT376I for possible ways to avoid future deadlocks or timeouts.

-917 BIND PACKAGE FAILED

Explanation

An error has occurred which prevents the package from being created. This SQLCODE can be issued during bind or commit processing.

System action

The bind fails and the package is not created. If issued during commit processing, all changes to the database are rolled back. If issued during bind processing, only package creation fails. Other changes within the logical unit of work are committable.

Programmer response

Correct the cause of the problem and try again.

Problem determination

Inspect the SQLCODES issued for the SQL statements of the package.

SQLSTATE

42969

-918 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE A CONNECTION HAS BEEN LOST

Explanation

Execution of the SQL statement failed because a communications link between the local Db2 and at least one remote server no longer exists. A previous failure caused this condition.

System action

In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer response

In general, an application program should issue a static ROLLBACK. Attempts by the application to issue SQL statements other than static ROLLBACK might fail. Once the static ROLLBACK is issued, the application can resume execution.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE

51021

-919 A ROLLBACK OPERATION IS REQUIRED

Explanation

The unit of work was placed in a state where a rollback operation is required. This can happen for the following reasons:

- An SQL statement updated a distributed database server, but the database server can be used only for read-only operations. Either updates are currently restricted to servers that support distributed two-phase commit and this application server does not support distributed two-phase commit, or updates are restricted to a single server that does not support distributed two-phase commit and this application server is not that server.

The unit of work must be terminated by a rollback operation because the update made (but not committed) at the application server cannot be committed consistently with other current or future updates made to this distributed unit of work.

- An abend occurred during the execution of a stored procedure, or a restricted SQL statement was issued from a stored procedure.
- An abend occurred during the execution of a function, or a restricted SQL statement was issued from a function.
- The unit of work is part of a Global Transaction, and another unit of work in the Global Transaction has initiated a ROLLBACK. All units of work in the Global Transaction must now ROLLBACK.

System action

In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer response

Correct the application, function, or stored procedure, rebind it, and resubmit the job.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE

56045

-922 **AUTHORIZATION FAILURE: *error-type* ERROR. REASON *reason-code***

Explanation

Authorization failed because of the error indicated by *error-type*

error-type

The types of authorization failure:

- User authorization
- Plan access
- Duplicate exit requested
- Installation error
- Connect

reason-code

The Db2 reason code associated with authorization failure

System action

The statement cannot be processed. The connection to Db2 is not established.

Programmer response

If *error-type* is 'USER AUTHORIZATION', the authorization-ID specified to Db2 through your attachment facility is not valid for Db2. Contact the system programmer or your CICS, IMS, or TSO system administrator.

If *error-type* is 'PLAN ACCESS', then the authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist. See your system administrator.

If *error-type* is 'DUPLICATE EXIT', then you requested a duplicate exit.

If *error-type* is 'INSTALLATION ERROR', a connection or sign-on exit denied your request. See your system programmer.

If *error-type* is 'CONNECT', an SQL CONNECT request failed to connect to the local Db2 with USER/USING specified. See the reason code for a description of the failure. The application program has been placed in the connectable and unconnected state. The only SQL statements that can be successfully completed in this state are CONNECT, COMMIT, ROLLBACK, and local SET statements. Any attempt to execute other SQL statements will result in an error (SQLCODE -900).

Any attempts to issue SQL statements following the -922 SQLCODE when *error-type* is not *Connect* cause unpredictable results.

SQLSTATE

42505

Related concepts

Db2 reason codes

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

Related information

-900

THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE APPLICATION PROCESS IS NOT CONNECTED TO A SERVER

-923 **CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name***

Explanation

The connection to Db2 failed for the reason indicated by *condition*.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, "Db2 reason codes," on page 381](#).

condition

- Db2 not up
- Db2 not operational
- Db2 shutdown in progress
- Db2 restricted access mode
- Allocation error
- Db2 - CICS attachment not up
- Db2 - CICS ENTRY disabled
- The object is dependent on facilities of a release of Db2 that is newer than the release that you are currently running (fall back).
- Db2 restarted in light mode

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, "Db2 reason codes," on page 381](#).

resource-type and resource-name

The type and name of the resource that the message identifies. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

Possible causes of an allocation error are:

- The application plan does not exist.
- A required database, table space, table, or index is unavailable.
- Data set allocation failed for a required data set.
- There is insufficient virtual storage.
- The application is trying to execute the plan from a system (environment) that was restricted when the plan was bound or rebound. Check the SYSPLSYSTEM table to determine from which systems (for example, IMS or CICS) the plan can be executed.

If the *condition* is "CICS attachment not up", then NAME indicates the Db2 subsystem that is not available. The *reason-code* indicates the reason the attachment is not available.

If the *condition* is "CICS entry disabled", then NAME indicates the entry that is disabled.

System action

The statement cannot be processed. The connection to Db2 is not established.

Programmer response

If the connection failed because either Db2 or a required database, table space, table, or index was unavailable, wait until it is available before invoking the application again.

If allocation failed for an application plan, REBIND the plan to determine the problem. Error messages are produced explaining why the plan could not be allocated.

For other types of allocation errors, installation action might be required to correct the problem.

For CICS attachment failures, resolve the primary cause as noted by the reason code. Then restart the attachment.

Problem determination

The *reason-code*, *resource-type*, and *resource-name* might not be available. If they are not available, nothing appears.

Any attempts to issue SQL statements after receiving SQLCODE -923 will cause unpredictable results.

SQLSTATE

57015

Related information

[-923](#)

CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name*

-924

DB2 CONNECTION INTERNAL ERROR, *function-code*, *return-code*, *reason-code*

Explanation

Connection to Db2 has failed because of an unexpected internal error, identified by the *reason-code* value.

System action

The statement cannot be processed. The connection to Db2 is not established.

Programmer response

The requested *function-code* and *return-code* values might provide additional information. Any attempts to issue SQL statements after the SQLCODE -924 might have unpredictable results.

SQLSTATE

58006

Related concepts

[Db2 reason codes](#)

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

-925

COMMIT NOT VALID IN IMS, CICS OR RRSF ENVIRONMENT

Explanation

An application executing in either an IMS or CICS environment or an application executing in an RRSF environment when Db2 is not the only resource manager has attempted to execute a COMMIT statement. The SQL COMMIT statement cannot be executed in these environments.

System action

The statement cannot be processed. No commit is performed.

Programmer response

The IMS, CICS or RRS protocols should be used to commit work in these environments.

If a stored procedure is being called from IMS or CICS, ensure that the stored procedure is not defined to perform a commit on return.

SQLSTATE

2D521

-926	ROLLBACK NOT VALID IN IMS, CICS OR RRSF ENVIRONMENT
-------------	--

Explanation

An application executing in either an IMS or CICS environment or an application executing in an RRSF environment when Db2 is not the only resource manager has attempted to execute a ROLLBACK statement. The SQL ROLLBACK statement cannot be executed in these environments.

System action

The statement cannot be processed. No rollback is performed.

Programmer response

The IMS, CICS or RRS protocols should be used to roll back work in these environments.

SQLSTATE

2D521

-927	THE LANGUAGE INTERFACE (LI) WAS CALLED WHEN THE CONNECTING ENVIRONMENT WAS NOT ESTABLISHED. THE PROGRAM SHOULD BE INVOKED UNDER THE DSN COMMAND
-------------	--

Explanation

In the TSO environment, the user has attempted to execute an application program without first establishing the correct execution environment by issuing the DSN command. In the IMS, CICS, RRSF, or call attachment facility (CAF) environment, the user

has attempted to execute an application program that is not using the correct language interface module.

System action

The statement cannot be processed.

Programmer response

In the TSO environment, Db2 application programs should be invoked under the RUN subcommand of the DSN command processor. In the IMS, CICS, RRSF, or CAF environment check that the application was link-edited with or is dynamically allocating the correct language interface module. The language interface modules required in each environment are as follows:

- TSO: DSNELI
- IMS: DFSLI000
- CICS: DSNCLI
- RRSF: DSNRLI
- CAF: DSNALI

The DYNAM option can result in the incorrect language interface module being loaded at run time.

SQLSTATE

51006

-929	FAILURE IN A DATA CAPTURE EXIT: <i>token</i>
-------------	---

Explanation

'token' is an information string provided by DPROP's exit routine which captures data changes in tables defined with DATA CAPTURE CHANGES.

System action

The information string is placed in the SQLERRM area of the SQLCA.

System programmer response

For documentation of the actions associated with this SQLCODE, refer to the Data Propagator (DPROP) publications.

SQLSTATE

58002

-939	ROLLBACK REQUIRED DUE TO UNREQUESTED ROLLBACK OF A REMOTE SERVER
-------------	---

Explanation

A dynamic commit was executed preceding the execution of this request. The remote server to which the application was CONNECTed during the dynamic COMMIT successfully committed. However, at least one other remote server (which was read-only) rolled back its portion of the distributed unit of work during the dynamic commit.

To ensure that an application that uses cursor-hold cursors does not incorrectly assume cursor position is being maintained at any remote server that rolled back, the application must perform a rollback operation.

Communications are still established with all remote servers.

System action

In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer response

Issue the appropriate (depending on the environment) request to cause a rollback. Re-establish any cursor positioning and continue the application with the first request that received the -939 SQLCODE.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE

51021

-947	THE SQL STATEMENT FAILED BECAUSE IT WILL CHANGE A TABLE DEFINED WITH DATA CAPTURE CHANGES, BUT THE DATA CANNOT BE PROPAGATED
-------------	---

Explanation

The DPROP SUPPORT option on the installation panel is set to 2 (support DPROP only). The SQL statement would have changed a table defined with DATA CAPTURE CHANGES. However, the data cannot be propagated because the SQL statement did not originate from an IMS subsystem, or monitor trace class 6 was not active at the beginning of the unit of work for that change.

System action

The statement cannot be processed.

System programmer response

Take one of the following actions:

- Change the installation option to 1 (no propagation) or 3 (permit changes from any subsystem).
- Change the application program that receives this SQLCODE so that it can be run in an IMS subsystem, and activate monitor trace class 6.

If the installation option is changed to 3, SQL changes to tables defined with DATA CAPTURE CHANGES are permitted from any subsystem, but they are not propagated unless the environment is set up for propagation.

SQLSTATE

56038

-948	DISTRIBUTED OPERATION IS INVALID
-------------	---

Explanation

The unit of work was initiated before DDF was started, and the application attempted to perform a distributed operation. The unit of work must be terminated by a rollback operation.

System action

In the IMS and CICS environments, all SQL statements are rejected until a rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer response

An application that performs local database updates before DDF is started cannot perform distributed operations within the same unit of work. The current unit of work must be terminated by a rollback operation and a new unit of work must be initiated before any SQL operations can be performed.

Restart the current unit of work.

SQLSTATE

56062

-950	THE LOCATION NAME SPECIFIED IN THE CONNECT STATEMENT IS
-------------	--

INVALID OR NOT LISTED IN THE COMMUNICATIONS DATABASE

Explanation

One of the following conditions applies:

- The location name is blank.
- The data type of the host variable is not character string.
- The length attribute of the host variable is greater than 16.
- The location name does not appear in the LOCATIONS column of the SYSIBM.LOCATIONS table, nor is it the name of the local Db2 subsystem.

System action

The statement cannot be processed. The application process is placed in the unconnected state.

Programmer response

If the location name is specified as the value of a host variable, ensure that the name is left justified in the host variable and, if necessary, padded on the right with blanks. If this is not the problem, either SYSIBM.LOCATIONS must be updated to include the specified name, or the specified name must be changed to match a name in SYSIBM.LOCATIONS.

SQLSTATE

42705

-951	OBJECT <i>object-name</i> OBJECT TYPE <i>object-type</i> IS IN USE AND CANNOT BE THE TARGET OF THE SPECIFIED ALTER STATEMENT
-------------	---

Explanation

The options for the SQL routine or trigger cannot be altered if the version of the routine is currently active under the same thread that issued the ALTER statement, and one or more of the options that is being altered result in the rebinding or regeneration of the package for the object.

object-name

The name of the object.

object-type

The type of object.

If the failing statement was either an ALTER statement with an ACTIVATE VERSION clause, the active version of a currently active object under nested routine invocation by the same thread cannot be changed.

System action

The statement cannot be processed.

Programmer response

Review the information about altering options and which alterations result in the rebinding or regeneration of associated packages.

Verify that the logic for nested routine invocation involving SQL routines and the ALTER statements are working as intended. With SQL procedures, pay additional attention to CALL :HV statements with the setting of special register CURRENT ROUTINE VERSION, as the combination of these statements can produce unwanted logic flows. If it is necessary to use multiple versions of the same SQL routine in the nested recursive chain, consider using CALL :HV and the special register CURRENT ROUTINE VERSION to control which version is used, instead of the ALTER ACTIVATE VERSION clause.

SQLSTATE

55007

Related reference

[ALTER PROCEDURE statement \(SQL - native procedure\) \(Db2 SQL\)](#)

-952	PROCESSING WAS INTERRUPTED BY A CANCEL REQUEST FROM A CLIENT PROGRAM
-------------	---

Explanation

A client program issued a cancel request that terminated processing of the SQL statement.

System action

The SQL statement was terminated and any changes made by that statement have been undone.

If an SQL cursor is associated with the interrupted SQL statement, Db2 closes the cursor.

SQLSTATE

57014

-981	THE SQL STATEMENT FAILED BECAUSE THE RRSAF CONNECTION IS NOT IN A STATE THAT ALLOWS SQL OPERATIONS, REASON <i>reason-code</i>.
-------------	---

Explanation

The application attempted to execute an SQL operation, but the Resource Recovery Services attachment facility (RRSAF) connection was not in a state that allows the processing of SQL statements.

System action

The statement cannot be processed.

Programmer response

Correct the error in the application, REBIND, and run the application again.

SQLSTATE

57015

Related concepts

[Implicit connections to RRSAF \(Db2 Application programming and SQL\)](#)

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

Related tasks

[Controlling RRSAF connections \(Db2 Administration Guide\)](#)

-989	AFTER TRIGGER <i>trigger-name</i> ATTEMPTED TO MODIFY A ROW IN TABLE <i>table-name</i> THAT WAS MODIFIED BY AN SQL DATA CHANGE STATEMENT WITHIN A FROM CLAUSE
-------------	--

Explanation

An SQL data change statement was specified in the FROM clause where FINAL TABLE was specified, but the underlying target base table of the SQL data change statement has an AFTER trigger defined which modifies the same table. This is disallowed.

System action

The statement cannot be processed.

Programmer response

Avoid using the SQL data change statement within a FROM clause, or change the trigger so that it does not modify the table that is the target of the SQL data change statement.

SQLSTATE:

560C3

-991	CALL ATTACH WAS UNABLE TO ESTABLISH AN IMPLICIT CONNECT OR OPEN TO DB2. RC1=<i>rc1</i> RC2=<i>rc2</i>
-------------	--

Explanation

Call attach attempted to perform an implicit connect and open as the result of an SQL statement. The connect or open failed with the returned values.

rc1

The value returned in FRBRC1 for the failed CONNECT or OPEN request.

rc2

The value returned in FRBRC2 for the failed CONNECT or OPEN request.

System action

The statement cannot be processed.

Programmer response

Verify that the application intended to use the call attachment facility (CAF) as the mechanism to connect to Db2. For functions or stored procedures running in the WLM-established stored procedure address space the application must be link-edited with or dynamically allocate the RRS attachment language interface module (DSNRLI), not CAF.

SQLSTATE

57015

-992	PACKAGE <i>package-name</i> CANNOT BE EXECUTED OR DEPLOYED ON LOCATION <i>location-name</i>
-------------	--

Explanation

A mismatch in Db2 code levels prevents the package from being executed or deployed.

package-name

The name of the package.

location-name

The Db2 system where the deployment or execution was attempted.

One of the following conditions has occurred:

- The package cannot be executed or deployed because of a mismatch in the level of the Db2 code between the system identified by *location-name*

and the current server. The current server and the system identified by *location-name* might be the same system.

- The representation of an SQL routine cannot be executed on the system. The package was bound at a different release or maintenance level than the system can support.

Deployment is the process of establishing an SQL routine at a remote location without regenerating the representation of that routine. The deployment requires that the remote server be able to understand the structures generated by the current server for the identified package. The difference in code level between the current server and the remote location makes this impossible. The difference might be in release levels or maintenance levels, but it is large enough that the package cannot be deployed from the current server to the remote location.

This condition might be specific to this particular package. Other packages might successfully be executed on this system or deployed from the current server to the remote location.

System action

The statement cannot be processed.

Programmer response

If this condition occurs when deploying a SQL routine, try again after Db2 at *location-name* is updated to the release or maintenance level that can support the package that is being deployed.

If this condition occurs in contexts other than deployment (for example, a package that was created prior to application of a PTF is no longer supported by the level of Db2 after the application of that PTF), then execute the ALTER PROCEDURE or ALTER FUNCTION statement with the REGENERATE clause for that version of the SQL routine at the current server to regenerate the package using the current maintenance level. The ALTER PROCEDURE or ALTER FUNCTION statement with the REGENERATE clause will cause a rebind of the package at the local server.

If the SQL routine required package replication at different servers, the process must be repeated for the regenerated SQL routine.

If variations of the package have been created locally with different collection IDs, those additional packages should also be explicitly rebound.

SQLSTATE

51008

-1403

**THE USERNAME AND/OR
PASSWORD SUPPLIED IS
INCORRECT**

Explanation

The username and/or password supplied is incorrect. If either a username or password is supplied, then both must be supplied and both must have a non-zero length.

System action

The statement cannot be processed.

User response

Supply the correct username and password combination.

SQLSTATE

08004

-1760

**CREATE PROCEDURE FOR
procedure-name MUST HAVE
VALID LANGUAGE AND EXTERNAL
CLAUSES**

Explanation

A LANGUAGE or EXTERNAL clause is missing in the CREATE statement for procedure *procedure-name*. This clause must be specified.

System action

The statement cannot be processed.

Programmer response

Change the CREATE statement to include the missing clause and reissue the statement.

SQLSTATE

42601

-2001

**THE NUMBER OF HOST VARIABLE
PARAMETERS FOR A STORED
PROCEDURE IS NOT EQUAL TO
THE NUMBER OF EXPECTED HOST
VARIABLE PARAMETERS. ACTUAL
NUMBER *sqldanum*, EXPECTED
NUMBER *opnum***

Explanation

Db2 received an SQL CALL statement for a stored procedure. However, the number of host variable parameters supplied on the CALL statement does not match the expected number of host variable parameters.

sqlданum

The number of host variable parameters as determined by examining the SQLDA.

opnum

The expected number of host variable parameters as determined by parsing the statement.

System action

The statement cannot be processed.

Programmer response

If the SQL CALL statement is coded incorrectly, modify the SQL application to provide the correct number of parameters on the SQL CALL statement.

SQLSTATE

53089

-4302 **JAVA STORED PROCEDURE OR USER-DEFINED FUNCTION *routine-name* (SPECIFIC NAME *specific-name*) HAS EXITED WITH AN EXCEPTION *exception-string***

Explanation

User-defined function or stored procedure *routine-name* exited with a Java exception that was not a java.sql.SQLException.

If present, *exception-string* contains as much as will fit of the toString() of the exception that was uncaught.

System action

Execution of the SQL statement is terminated.

Programmer response

The user-defined function or stored procedure probably needs to be corrected. See your database administrator, or the author of the routine to find out if the exception can be avoided, or if the user-defined function or stored procedure needs to be fixed before it can be used.

SQLSTATE

38000

-4700 **ATTEMPT TO USE NEW FUNCTION BEFORE FUNCTION LEVEL IS ACTIVATED**

Explanation

An attempt was made to use a new capability before the required function level is activated. Capabilities that are introduced in a Db2 function level cannot be used before that function level is activated.

System action

The statement cannot be processed.

Programmer response

Either delay running your program until the required function level is activated, or restrict your program to capabilities that are supported at the current function level.

SQLSTATE

56038

-4701 **TABLE SPACE PARTITIONS EXCEED SYSTEM LIMIT (*system-limit*) REASON *reason-code***

Explanation

system-limit

The system limit which was exceeded. The value can be a size or a number of partitions.

reason-code

Identifies the reason the that statement exceeded the *system-limit* value:

1

An ALTER TABLE statement attempted to add partitions to a partition-by-growth (PBG) table space, but the resulting total number of partitions would exceed the specified MAXPARTITIONS value for the table space.

2

An ALTER TABLE statement attempted to add partitions to a partition-by-range (PBR) or partitioned (non-UTS) table space, but the resulting total number of partitions would exceed the maximum number of supported partitions for a table space of that type.

3

An ALTER TABLE statement attempted to add partitions to an XML table space, but the resulting total number of partitions would exceed the maximum number that is supported.

4

An ALTER TABLE or CREATE INDEX statement attempted to create or change partition limit keys, but the internal storage for the limit keys in the object descriptor (OBD) would exceed the maximum supported size.

System action

The statement cannot be processed.

Programmer response

Correct the problem and reissue the statement. The corrective action to take depends on *reason-code* value:

1. Increase the number of maximum table space partitions by increasing the value of the MAXPARTITIONS to satisfy the constraint.
2. Increase the number of maximum table space partitions by changing the table space page size and DSSIZE. For more information, see [Limits in Db2 for z/OS \(Db2 SQL\)](#).
3. Increase the number of maximum XML table space partitions by changing the XML table space page size and DSSIZE. For more information, see [Limits in Db2 for z/OS \(Db2 SQL\)](#).
4. The attempted partition design is not supported by the internal storage for the limit keys in the object descriptor (OBD). Try adjusting the design to uses a smaller limit keys, fewer partitions, or both.

-4705

***option SPECIFIED ON ALTER
STATEMENT FOR object-name
(object-type) IS NOT VALID***

Explanation

An ALTER statement specified an option that is not valid for the type of routine or trigger.

option

The invalid option.

object-name

The name of the procedure, function, or trigger.

object-type

The type of object: procedure, function, or trigger.

The valid options vary by object type:

PROCEDURE

The options that can be specified when altering an SQL procedure depend on the type of the SQL procedure being changed. Two types of SQL procedures exist: native SQL procedures and external SQL procedures.

FUNCTION

The options that can be specified when altering an SQL scalar function depend on whether the SQL function is an inlined function or a compiled function.

TRIGGER

The options that can be specified when altering a trigger.

System action

The statement cannot be processed.

User response

Review the appropriate ALTER statement to determine which options can be changed for the specified object, correct the syntax, and reissue the statement.

SQLSTATE

530A3

Related reference

[Statements \(Db2 SQL\)](#)

-4706 THE STATEMENT FOR AN SQL ROUTINE OR ADVANCED TRIGGER CANNOT BE PROCESSED BECAUSE THE OPTIONS CURRENTLY IN EFFECT (ENVID *current-envid*) ARE NOT THE SAME AS THOSE THAT WERE IN EFFECT (ENVID *defined-envid*) WHEN THE OBJECT OR VERSION WAS FIRST DEFINED

Explanation

The statement attempted to recreate or alter a routine or advanced trigger, and the environment settings that are in effect for the current statement are not the same as when the object was first defined. The statement is a CREATE or ALTER statement.

current-envid

The environment settings that are in effect for the current statement.

defined-envid

The environment settings that were in effect when the object was first defined.

For the recreation or alteration of an object to be successful, the environment settings that are in effect for the statement must be the same as the environment settings that were in effect when the object was first defined if any of the following options are specified as part of the statement's *option-list* clause:

- QUALIFIER
- PACKAGE OWNER
- OPTHINT
- SQL PATH

- DECIMAL if the value includes a comma

This message can be issued when an object is recreated or altered, or when a specific version of an object is recreated or altered.

This message is also issued when the WLM FOR DEBUG MODE option is specified for a statement and the specified name cannot be represented correctly in the CCSID of the original statement that defined the object. The CCSIDs of the current statement and the original statement that defined the object are part of the environment settings identified by *current-envid* and *defined-envid*.

System action

The statement cannot be processed.

User response

Specify the name of an object that was created with the same environment settings in effect as the current settings, or do not specify the options named above.

SQLSTATE

530A4

-4727	SYSTEM PARAMETER <i>system-parameter</i> VALUE <i>parameter-value</i> IS INCONSISTENT WITH CLAUSE <i>clause</i> SPECIFIED ON <i>statement-name</i> STATEMENT.
-------	---

Explanation

A statement was processed with a clause that is invalid for the system parameter and parameter value that were used.

system-parameter

The name of the system parameter.

parameter-value

The value of the system parameter.

clause

The statement clause that is not permitted in this case.

statement-name

The name of the statement that was processed.

System action

The statement cannot be processed.

Programmer response

Review the syntax and parameter descriptions for the statement identified in the message, or contact the system administrator to find out more about the setting of the system parameter.

-4728	ANOTHER VERSION OF OBJECT <i>object-name</i> EXISTS AND IS DEFINED WITH AN INCOMPATIBLE OPTION. THE OPTION IS <i>option-name</i> .
-------	--

Explanation

The option that is identified by *option-name* must be the same for all versions of an SQL routine or advanced trigger.

System action

The statement cannot be processed.

User response

Query the applicable option on the existing versions of the SQL routine or advanced trigger and ensure the same option is used across all versions.

-4730	INVALID SPECIFICATION OF XML COLUMN <i>table-name.column-name</i> IS NOT DEFINED IN THE XML VERSIONING FORMAT, REASON <i>reason-code</i>
-------	---

Explanation

The indicated column is not valid in the context specified. The column must be defined in the XML versioning format.

table-name

The name of the table.

column-name

The name of the column.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 1
- The target of the SET assignment clause containing the XMLMODIFY function invocation is a column that is not XML in the versioning format. The target of an assignment involving an invocation of the XMLMODIFY function must be an XML column that is in the XML versioning format.
- 2
- A SELECT FROM UPDATE or SELECT FROM DELETE statement specified OLD TABLE, and referenced an XML column that is not defined in the XML versioning format.

System action

The statement cannot be processed.

User response

Correct the syntax, and reissue the statement.

- 1
- Change the SET assignment clause to specify an XML column that is defined in the XML versioning format, or remove the XMLMODIFY function in the assignment clause.
- 2
- Change the column specified in the SELECT FROM UPDATE or SELECT FROM DELETE statement to specify an XML column that is defined in the XML versioning format.

-4731	THE NATIVE SQL ROUTINE STATEMENT FOR PACKAGE <i>location-name.collection-id.program-name.consistency-token</i> STATEMENT NUMBER <i>statement-number</i> CANNOT BE PROCESSED.
-------	---

Explanation

The SQL routine for the statement must be running at the location where the statement is requested. Either no SQL routine is running at the indicated location, or the SQL routine that is running is not the SQL routine for the indicated package.

location-name

The name of the server where the statement cannot be processed.

collection-id

The name of the collection of the package that contains the statement that cannot be processed.

program-name

The name of the package that contains the statement that cannot be processed.

consistency-token

The consistency token of the package that contains the statement that cannot be processed.

statement-number

The package statement number of the statement that cannot be processed.

System action

The statement cannot be processed.

System programmer response

Take either of the following corrective actions:

- Use a BIND PACKAGE COPY command instead of the BIND PACKAGE DEPLOY command to bind the package at that location.
- Change the application logic to run the routine at that location where the statement executes.

SQLSTATE

THE MAXIMUM NUMBER OF ALTERS ALLOWED HAS BEEN EXCEEDED FOR *object-type*

Explanation

The ALTER statement cannot be processed because the maximum number of alters for the object has already been exceeded. This can occur for the following reasons:

- The SET DATA TYPE keyword was specified on an ALTER TABLE ALTER COLUMN statement, but the maximum number of ALTER statements for this table has already been reached.
- The statement attempts to alter an index, but the maximum number of ALTER statements for this index has already been reached.

System action

The statement cannot be processed.

Programmer response

Follow the instructions in [Removing in-use table space versions \(Db2 Administration Guide\)](#) to decrease the number of table version numbers.

SQLSTATE

-4733

THE ALTER TABLE STATEMENT CANNOT BE EXECUTED BECAUSE COLUMN *column-name* IS MIXED DATA, OR THE DATA TYPE OR LENGTH SPECIFIED DOES NOT AGREE WITH THE EXISTING DATA TYPE OR LENGTH

Explanation

The ALTER TABLE statement for column *column-name* could not be processed for one of the following reasons:

- the existing column is MIXED and the statement attempted to convert the column to SBCS. This conversion is not supported.
- the data type or length in the ALTER statement did not match the existing data type or length of the column in the table being altered.

System action

The statement cannot be processed.

Programmer response

Correct the SQL statement to specify a conversion that is supported.

SQLSTATE

429BQ

-4734

THE LOAD MODULE FOR THE PROCEDURE ASSUMES A PARAMETER VARCHAR OPTION THAT IS NOT CONSISTENT WITH THE OPTION SPECIFIED ON THE CREATE PROCEDURE STATEMENT FOR *procedure-name*

Explanation

The C load module for the SQL procedure was built assuming a PARAMETER VARCHAR option that is not the same as what was specified on the CREATE PROCEDURE statement for the procedure.

procedure-name

The name of the SQL procedure.

The PARAMETER VARCHAR option assumed when the load module for the procedure is created should be the same as the one that is specified when the procedure is defined to Db2. The consequences of a mismatch include errors at execution time, and invalid data output with no error to indicate that a problem exists.

System action

The statement cannot be processed.

Programmer response

Rebuild the procedure so that the options match.

SQLSTATE

560CU

**-4735 INVALID TABLE REFERENCE FOR
TABLE LOCATOR**

Explanation

At execution time, an SQL statement in the body of a routine has a *table-locator-reference* in the FROM clause to reference a transition table of the trigger invoking the routine. For example:

```
TABLE (table-locator-var LIKE table-name)
```

SQLCODE -4735 is issued when the definition of the table that follows the LIKE keyword is different than the definition of the table specified for the table locator parameter on the CREATE PROCEDURE or CREATE FUNCTION statement for the routine.

The use of TABLE LIKE syntax provides an implicit definition of the transition table. It specifies that the transition table has the same number of columns as the identified table or view. The columns must have the same data type, length, precision, scale, subtype, and encoding scheme as the identified table or view, as described in catalog tables SYSCOLUMNS and SYSTABLESPACES. The number of columns and the attributes of those columns are determined at the time the CREATE PROCEDURE or CREATE FUNCTION statement is processed. Any subsequent changes to the number of columns in the table or the attributes of those columns does not affect the parameters of the routine.

System action

The statement cannot be processed.

Programmer response

Change the table name in the table locator reference to the name of a table that has the same definition as the table name used on the CREATE PROCEDURE or CREATE FUNCTION statement for the table locator parameter.

**-4736 A PERIOD SPECIFICATION
OR PERIOD CLAUSE IS NOT
SUPPORTED AS SPECIFIED FOR
OBJECT *object-name*. REASON
CODE = *reason-code*.**

Explanation

A period specification or period clause is not valid as specified.

object-name

The name of the object.

reason-code

A numeric value that indicates why the period specification or period clause is invalid:

- 1**
In a CREATE FUNCTION statement for *object-name*, the definition of the function contains a period specification that is not supported. The routine body of an SQL scalar function must not contain a period specification or period clause. A RETURN statement in a table function must not contain a period specification.
- 2**
In a CREATE VIEW statement for *object-name*, a *fullselect* must not contain a period specification.
- 3**
In an UPDATE statement for the view *object-name*, the result table of the outer fullselect of the view definition, explicitly or implicitly, must include the start and end columns of the BUSINESS_TIME period.

System action

The statement cannot be processed.

User response

Either remove the period specification or period clause, or change the statement to reference a different object.

SQLSTATE

560CY

-4737 **STATEMENT *statement* IS NOT ALLOWED WHEN USING A TRUSTED CONNECTION**

Explanation

The *statement* was issued from a session that is using a trusted connection. This statement is not supported with trusted connections. The *statement* can be CREATE SYNONYM.

System action

The statement cannot be processed.

Programmer response

Change the statement to one that is supported when running under a trusted connection.

SQLSTATE

429BY

-4738 **TABLE *table-name* CANNOT BE DEFINED AS SPECIFIED IN THE *statement* STATEMENT IN A COMMON CRITERIA ENVIRONMENT**

Explanation

A CREATE, DECLARE, or ALTER statement attempted to define a new table or change an existing table in a Common Criteria environment, but the specification is not valid for one of the following reasons:

- A CREATE TABLE statement included an explicit list of column definitions, but did not include a security label column. In a Common Criteria environment each table must be defined with a security label column.
- A CREATE TABLE statement included a LIKE clause or AS FULLSELECT clause with the WITH NO DATA clause, to define a new base table. The LIKE clause and AS FULLSELECT fullselect clauses are not supported in a Common Criteria environment.
- A CREATE TABLE statement included an AS fullselect clause to define a materialized query table, and the WITH NO DATA clause was not specified. Materialized query tables are not supported in a Common Criteria environment.
- A DECLARE GLOBAL TEMPORARY TABLE statement included a LIKE clause, or AS FULLSELECT clause

with the WITH NO DATA clause to define a new temporary table. The LIKE clause and AS FULLSELECT clauses are not supported in a Common Criteria environment.

- An ALTER TABLE statement attempted to change a table to a materialized query table. Materialized query tables are not supported in a Common Criteria environment.

System action

The statement cannot be processed.

Programmer response

Change the statement so that it is valid in a Common Criteria environment.

- For a CREATE TABLE statement that includes a list of column definitions, if the statement is issued in a Common Criteria environment (DSN6SPRM COMCRIT=YES), then every table created must have a security label. Designate a column AS SECURITY LABEL or change the subsystem parameter.
- For a CREATE or DECLARE statement that includes a LIKE or AS FULLSELECT clause, remove the clause and explicitly specify the attributes of the table that is being defined.
- Do not issue a CREATE or ALTER TABLE statement that attempts to define a materialized query table in a Common Criteria environment.

SQLSTATE

56038

-4739 **ENVIRONMENT SETTINGS (IDENTIFIED BY ENVID *envid1*) USED BY *object-name* ARE NOT THE SAME AS THE ONES THAT WERE IN EFFECT (IDENTIFIED BY ENVID *envid2*) WHEN OTHER COLUMN MASKS AND ROW PERMISSIONS WERE DEFINED FOR TABLE *table-name***

Explanation

A CREATE MASK or CREATE PERMISSION statement was issued with environment settings that do not match the settings that were previously used. All column masks and row permissions defined for the same table must use the same set of environment settings. The set of environment settings is determined when the first column mask or row permission is defined for the table. To create a new column mask or row permission, the environment

settings in effect when the CREATE statement is issued must be the same as the environment set.

envid1

The environment settings that are used by the object that is identified by *object-name*.

object-name

The name of the object.

envid2

The environment settings that were in use when existing column masks and row permissions were defined for the table that is identified by *table-name*.

table-name

The name of the table.

The SYSIBM.SYSENVIRONMENT catalog table contains the list of environment settings. The following set of environment settings must be the same among the multiple column masks and row permissions that are defined for a single table:

- ENVID
- CURRENT_SCHEMA
- PATHSCHEMAS
- APPLICATION_ENCODING_CCSID
- ORIGINAL_ENCODING_CCSID
- DECIMAL_POINT
- MIN_DIVIDE_SCALE
- SQL_STRING_DELIMITER
- MIXED_DATA
- DECIMAL_ARITHMETIC
- DATE_FORMAT
- TIME_FORMAT
- ROUNDING

System action

The statement cannot be processed.

Programmer response

Use the values of *envid1* and *envid2* in the SQL error message to query the SYSIBM.SYSENVIRONMENT catalog table to locate the expected environment setting values. Correct the syntax, and reissue the statement.

[CREATE PERMISSION statement \(Db2 SQL\)](#)

-4742

THE STATEMENT CANNOT BE EXECUTED BY DB2 OR IN THE ACCELERATOR (REASON *reason-code*)

Explanation

A statement cannot be executed by Db2 or by an accelerator server.

The statement cannot be executed by Db2 if any of the following conditions are true:

- Special register CURRENT GET_ACCEL_ARCHIVE is set to YES, and the statement needs to access data that is stored only in the accelerator server.
- Special register CURRENT QUERY ACCELERATION is set to ALL, so the statement must be executed in the accelerator server.
- A function that was referenced can be run only on an accelerator server.
- The statement references an accelerator-only table.

The statement cannot be executed by an accelerator server if any condition that is indicated by a reason code is true.

reason-code

A numeric value that provides additional information about why the statement cannot be executed in the accelerator server.

Tip: If you need more information about why the statement cannot be executed in the accelerator, issue the EXPLAIN statement and examine the output in the [DSN_QUERYINFO_TABLE](#) table.

1

No active accelerator server was found or the table was not enabled for query acceleration when the statement was executed.

2

The CURRENT QUERY ACCELERATION special register is set to NONE.

3

Db2 classified the query as a short-running query, or Db2 determined that sending the query to an accelerator server provided no performance advantage.

4

The query is not read-only.

6

The cursor is defined as scrollable or is a rowset-positioned cursor.

- 7** The query references objects with multiple encoding schemes.
- 8** The FROM clause of the query specifies a *data-change-table-reference*.
- 9** The query contains a nested table expression.
- 10** The query contains a recursive reference to a common table expression.
- 11** The query contains an unsupported expression. The text of the expression is in QI_DATA.
- 12** The query references a table that has any of the following characteristics:
- Is not defined in the accelerator server
 - Is defined in a different accelerator server from another table in the query
 - Is defined in the accelerator server, but is not enabled for query acceleration
- 13** The accelerator server that contains the tables that are referenced in the query is not started.
- 14** A column that is referenced in the query was altered in Db2 after the data was loaded in the accelerator server.
- 15** The query uses functionality that is available only in Db2 10 or later, and the functionality is not supported by the accelerator server.
- 17** The query is an INSERT from SELECT statement. Subsystem parameter QUERY_ACCEL_OPTIONS does not specify option 2 to enable the acceleration of INSERT from SELECT statements.
- 18** The query uses functionality that is available only in Db2 11 or later, and the functionality is not supported by the accelerator server.
- 19** The accelerator server is not at the correct level and does not support a function in the SQL statement.
- 20** The query is a rowset cursor that is declared WITH RETURN, executes remotely, or executes under an SQL PL routine.
- 21** The query contains a correlated subquery that is not supported for acceleration.
- 22** The statement references an accelerator-only table, but the statement cannot run on the accelerator. For example:
- MERGE statement references an accelerator-only table.
 - UPDATE or DELETE statement references an accelerator-only table, but the target table of the UPDATE, DELETE is a normal Db2 table: UPDATE DB2_TABLE SET .. (SELECT .. FROM ACCEL_ONLY_TABLE).
 - INSERT, UPDATE or DELETE of a *row-fullselect* with subselect. UPDATE ACCEL_ONLY_TABLE SET (C1, C2) = (SELECT C3, C4 FROM TABLE2);
 - INSERT, UPDATE or DELETE statement references an accelerator-only table containing one or more LOB columns.
- 23** The SELECT INTO statement is bound for acceleration but is run as a remote SELECT INTO statement, which is not supported for acceleration.
- 24** The DDL or DML statement cannot run on the accelerator because the connection to the accelerator server does not allow updates. This problem can occur when a two-phase commit requester (for example, a Db2 for z/OS requester) connects to a Db2 for z/OS server to run a DDL or DML statement on an accelerator.
- 25** The statement contains a reference to a column with an unsupported data type.
- 26** The CREATE TABLE statement clause IN ACCELERATOR specifies an accelerator alias that resolves to more than one accelerator and at least one of the following conditions is true:
- Your Db2 function level is lower than V12R1M509.
 - The SYSACCEL.SYSACCELERATEDTABLES table does not have the FEATURE column.
- 27** The DROP TABLE statement specifies a referencing accelerator-only table, which cannot be removed by using the DROP TABLE statement.

28

The SQL INSERT, UPDATE, or DELETE statement references a high availability accelerator-only table (AOT) that is defined in multiple accelerators and one of the following conditions is true:

- Neither the CURRENT ACCELERATOR special register nor the ACCELERATOR bind option is used.
- The CURRENT ACCELERATOR special register or the ACCELERATOR bind option specifies one of the following values:
 - An alias that resolves to multiple accelerators. The alias must resolve to one V7 or later accelerator.
 - An accelerator that is not a V7 or later accelerator. A V7 or later accelerator is required to execute the SQL statement.
 - An accelerator that does not exist or is not available when the SQL statement is executed.
 - An accelerator that is not qualified to execute the SQL statement for a high availability AOT.

29

During a Db2 for z/OS special runtime incremental bind of a static query that was originally bound for acceleration with the QUERYACCELERATION bind option value of ELIGIBLE or ENABLE (not ENABLEWITHFAILBACK), the query cannot be bound for acceleration to the target accelerator that Db2 has selected for this particular run of the query. This special incremental bind usually occurs for one of the following reasons:

- The user table has been dropped and re-created in Db2 for z/OS but has not been refreshed in the target accelerator since the last time the static query was bound for acceleration.
- The archive status of the user table in the target accelerator has changed since the last time the static query was bound for acceleration.

Failure to bind the static query for acceleration during this incremental bind can occur if the user table in the target accelerator is down-level from the current definition of that table in the Db2 for z/OS catalog. This failure might also occur due to other reasons.

30

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this

query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The Db2 change might or might not be related to the Db2 accelerated table that is referenced in the query.

31

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query that specifies both an accelerator-only table (AOT) and a Db2 accelerated table. The query will not be accelerated and cannot be run in Db2. The same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The change might or might not be related to the Db2 accelerated table that is referenced in the query.

32

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted accelerator-only table (AOT) change. This uncommitted change resulted in the creation of an accelerator database *snapshot isolation* (SI) for this unit of work before the query was run. This accelerator database SI can prevent committed and replicated Db2 changes, made either by this transaction or by a different transaction, from being available to the accelerated query, even if the Db2 changes are replicated to the accelerator before the query is run there.

33

The query could not run on the accelerator due to different reasons on different versions of the accelerator.

34

The statement included an expression that can run on an accelerator server only when the CURRENT QUERY ACCELERATION special register is set to ALL, ENABLE, or ELIGIBLE. However, the CURRENT QUERY ACCELERATION special register is set to NONE or ENABLE WITH FAILBACK.

See the programmer responses for the two different REASON_CODE values for the corresponding version of the accelerator.

- 35** The query uses functionality that is available only in Db2 12 or later, and the accelerator server does not support the functionality.
- 36** The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES; however, either an active V7 or later accelerator was not found or the table was not enabled for query acceleration in the V7 or later accelerator when the statement was executed.
- 37** The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator that contains the tables of the query is not started.
- 38** The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator is not at the correct level.
- 39** The query uses functionality that is available only in Db2 13 or later, and the accelerator server does not support the functionality.
- 40** FL 503 Query acceleration is requested for a query that specifies an IN list predicate that has more than 32,767 (32K) elements, but no version 7 accelerator exists or is active using version 7 behavior for this Db2 for z/OS subsystem. The query cannot be run on an accelerator. An IN list predicate that has more than 32K elements is an accelerator-only function, so the query also cannot run in Db2 for z/OS.
- 41** FL 503 A query references a view that was created with a *fullselect* that specified an IN list predicate that contained more than 32,767 (32K) elements, which is supported as an accelerator-only function, but use of the view is disabled due to one of the following conditions:
- The query acceleration value for the query was NONE. For more information, see [Enabling acceleration of SQL queries \(Db2 Performance\)](#).
 - Option 12 was not specified in the list of values for the [QUERY_ACCEL_OPTIONS](#) subsystem parameter.
 - The query did not run at application V13R1M503 or higher.
 - No version 7 accelerator that uses V7 behavior currently exists for the Db2 for z/OS subsystem.
- The failing SQL statement with the view reference is an INSERT, UPDATE, or DELETE statement. These statements are not supported by Db2 for z/OS or an accelerator for a view that contains an IN list predicate with more than 32,767 (32K) elements.
- 42** The SYSACCEL.SYSACCELERATORS or SYSACCEL.SYSACCELERATEDTABLES tables are not found.
- 43** Accelerator-shadow table for a Db2 table is not at the correct SUPPORTLEVEL value for LOB columns. Db2 table name is: *table-name*
- A query result contains a LOB column or expression in the output select list, but the associated accelerator-shadow table is not at a SYSACCELERATEDTABLES.SUPPORTLEVEL of 8 or higher, which indicates that the shadow table has LOB support enabled. The ENABLE_LARGE_OBJECT_DATATYPE_SUPPORT accelerator configuration must be 'true' for an Accelerator before the accelerator-shadow table is loaded.
- 44** The value of the CURRENT rules special register must be set to 'STD' to define an accelerator-only table that contains a LOB column.

System action

The statement cannot be processed.

Programmer response

Use the reason code to determine the cause of the failure, and take the appropriate action:

- 1** Start the accelerator server or enable the table for query acceleration.
- 2** Set the CURRENT QUERY ACCELERATION special register to ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL.
- 3** None.
- 4** Ensure that the query meets the criteria for a read-only query. See the information on read-only cursors in [DECLARE CURSOR statement \(Db2 SQL\)](#).

- 6** Remove the SCROLL clause or WITH ROWSET POSITIONING clause from the cursor declaration.
- 7** Ensure that all objects to which the query refers have the same encoding scheme.
- 8** Rewrite the FROM clause of the query so that it does not include a *data-change-table-reference* clause.
- 9** Ensure that the FROM clause of the query does not contain a subquery.
- 10** Ensure that the FROM clause of the query does not reference a common table expression.
- 11** Remove the unsupported functionality from the query.
- 12** Ensure that all tables that are referenced by the query are in the same accelerator server, and that all tables are enabled for query acceleration.
- 13** Start the accelerator server that contains the tables that are referenced in the query.
- 14** Load the altered table into the accelerator server again.
- 15** Ensure that the query does not use any functionality that is not supported by the accelerator server.
- 17** Enable the acceleration of INSERT from SELECT statements by updating subsystem parameter QUERY_ACCEL_OPTIONS to include option 2.
- 18** Ensure that the query does not use any functionality that is not supported by the accelerator server.
- 19** Update the accelerator server to enable acceleration of the SQL statement that contains the function text or expression text. Check that your QUERY_ACCEL_OPTIONS values are properly specified. Pay special attention to options 4, 7, and 13 which, if not set properly, can cause -4742 with return code 19.
- 20** If the rowset cursor query usage cannot be changed, use QUERY ACCELERATION NONE.
- 21** Rewrite the correlated subquery that is not supported for acceleration as a JOIN expression. For some examples, see [How IBM Db2 Analytics Accelerator for z/OS handles correlated subqueries](#).
- 22** Ensure the statement does not reference an accelerator-only table, or replace the accelerator-only table with a Db2 table so that the query can be executed in Db2.
- 23** Remove the SELECT INTO statement, or REBIND the package with bind option QUERYACCELERATION(NONE). If the program is an SQL PL procedure or function, use one of the following methods instead of using BIND or REBIND PACKAGE:
 - Alter the procedure or function by using ALTER PROCEDURE or ALTER FUNCTION
 - Drop and then re-create the procedure or function by using CREATE PROCEDURE or CREATE FUNCTION
- 24** Issue the DDL or DML statement directly from the Db2 for z/OS server or from a requester that does not require two-phase commit protocols, for example, the IBM Data Server Driver for JDBC.
- 25** Remove the reference to the column with an unsupported data type.
- 26** Take one of the following actions:
 - Ensure that the IN ACCELERATOR clause in the CREATE TABLE statement specifies one accelerator or an alias that resolves to only one accelerator.
 - Upgrade your Db2 function level to V12R1M509 and add the FEATURE column to the SYSACCEL.SYSACCELERATEDTABLES table.
- 27** To drop a referencing accelerator-only table, invoke the IBM Db2 Analytics Accelerator for z/OS ACCEL_REMOVE_REFERENCE_TABLES stored procedure.
- 28** Set the CURRENT ACCELERATOR special register or ACCELERATOR bind option to specify an accelerator or an alias that resolves to only one accelerator that meets all of the following requirements:
 - It must be a V7 or later accelerator.

- It must be available.
- It must be qualified to execute the SQL INSERT, UPDATE, or DELETE statement for the high availability accelerator-only table (AOT).

29

Take one of the following actions:

- Rebind the Db2 application package for the static query with bind option QUERYACCELERATION(ENABLEWITHFAILBACK).
- If a Db2 for z/OS accelerator contains a down-level version of the referenced user table, take one of the following actions on that accelerator:
 - Refresh and reload the user table in that accelerator to match the current table definition that is in the Db2 for z/OS catalog.
 - Permanently remove the user table from that accelerator.

For more information about the actions on the accelerator, see [IBM Db2 Analytics Accelerator for z/OS documentation](#).

After completing one of these actions, rerun the application for the static query.

If the QUERYACCELERATION bind option is set to ENABLEWITHFAILBACK, failure to accelerate the query results in failback to Db2 and the query is run only on Db2 for z/OS. This failure does not return an error code for your application. If you are using the ENABLEWITHFAILBACK setting and the conditions for reason code 29 occur during the special incremental bind, the query is run only on Db2 for z/OS and SQLCODE -4742 is not returned for your application or transaction.

30

Either commit the previous Db2 change in the Db2 unit of work before running the query to be accelerated, or do not specify an accelerator WAITFORDATA delay for this unit of work.

31

Either commit the previous Db2 change in the Db2 unit of work before running the query to be accelerated, or do not specify an accelerator WAITFORDATA delay for this unit of work.

32

Either commit the previous accelerator-only table (AOT) change in the Db2 unit of work before running the query, or do not specify an accelerator WAITFORDATA delay for this unit of work.

33

Request EXPLAIN output and check the REASON_CODE column in the DSN_QUERYINFO_TABLE table. For situations that

result in reason code 33, two rows are returned with different REASON_CODE values:

- A row that contains the REASON_CODE value that explains why the query cannot run on an accelerator version earlier than V7.
- A row that contains the REASON_CODE value that explains why the query cannot run on a V7 or later accelerator. In this case, the error description might be prefixed by (Vx) to indicate the specific accelerator version. The (Vx) prefix is displayed only when reason code 33 is returned by the original query.

See the programmer responses for the two different reason codes for the corresponding version of the accelerator.

34

Set the CURRENT QUERY ACCELERATION special register to ALL, ENABLE, or ELIGIBLE to execute passthrough-only expressions.

35

Ensure that the query does not use any functionality that is not supported by the accelerator server.

36

Start the V7 or later accelerator or enable the table for query acceleration.

37

Start the V7 or later accelerator that contains the tables that are referenced in the query.

38

Update the V7 or later accelerator server to enable acceleration of the SQL statement that contains the function text or expression text. Verify that your QUERY_ACCEL_OPTIONS values are specified properly.

39

Ensure that the query does not use any functionality that is not supported by the accelerator server.

40

[FL 503](#) Ensure that all of the following requirements and conditions are satisfied at the time when a query that specifies the IN list predicate containing more than 32,767 (32K) elements is prepared, bound, or specified in the *fullselect* of a CREATE VIEW statement:

- An IBM Db2 Analytics Accelerator for z/OS version 7 server is active using version 7 accelerator behavior for this Db2 for z/OS subsystem.
- All tables referenced in the query are added and loaded to the version 7 accelerator, and the target accelerator was started successfully

at least once for this Db2 for z/OS subsystem before the query is prepared or bound.

41

FL 503 Ensure that all of the following requirements and conditions are satisfied at bind or prepare time for the query that references a view that was created with a *fullselect* that specified an IN list predicate containing more than 32,767 (32K) elements:

- Query acceleration is enabled and requested for the query. For more information, see [Enabling acceleration of SQL queries \(Db2 Performance\)](#).
- The application runs at Db2 application compatibility level V13R1M503 or higher.
- Option 12 is specified in the list of values for the [QUERY_ACCEL_OPTIONS](#) subsystem parameter.
- The target IBM Db2 Analytics Accelerator for z/OS version 7 accelerator still exists and is active using version 7 accelerator behavior for this Db2 for z/OS subsystem.

If the failing SQL statement is an SQL INSERT, UPDATE, or DELETE statement for this view reference, remove the SQL INSERT, UPDATE, or DELETE because these operations are not supported for a view that contains an IN predicate with an IN list that contains more than 32,767 (32K) elements.

If the query or statement references more than one view, and you do not know which view definition contains the IN list with more than 32K elements, prepare or bind the query or statement again with EXPLAIN enabled to generate a row for the statement in the [DSN_QUERYINFO_TABLE](#) table. For that row in [DSN_QUERYINFO_TABLE](#) in Db2 for z/OS, the [REASON_CODE](#) column contains value 41 and the [QI_DATA](#) column contains a reason description followed by the name of the first or only referenced view that contains this type of IN list predicate.

42

Ensure that all tables that are required for query acceleration are created. For more information, see [Tables that support query acceleration \(Db2 SQL\)](#).

43

Ensure that the accelerator is IBM Db2 Analytics Accelerator 8 or later and the [ENABLE_LARGE_OBJECT_DATATYPE_SUPPORT](#) configuration is set to 'true' before loading the accelerator-shadow table.

44

Set the CURRENT RULES special register to 'STD' before defining an accelerator-only table that contains a LOB column.

ATTEMPT TO USE NEW FUNCTION WHEN THE APPLICATION COMPATIBILITY SETTING IS SET FOR A PREVIOUS LEVEL

Explanation

An application or SQL object attempted to use a Db2 capability that is not supported by the current application compatibility (APPLCOMPAT) level. An example of this situation is an SQL statement that uses a reserved word that will be accepted a valid SQL syntax at a higher APPLCOMPAT level.

This message can be issued for a data definition statement that specifies functionality, or attempts to alter an existing object definition, that requires a higher APPLCOMPAT setting than is currently in use.

If the message is issued for a CREATE TRIGGER or ALTER TRIGGER statement and the APPLCOMPAT level is V11R1 or lower, the following situations might apply:

- The trigger body contains an SQL PL statement.
- The trigger body contains an SQL statement that was not allowed in a trigger body in Db2 11.
- The MODE DB2SQL clause is not present.
- An unsupported trigger option that was not allowed in Db2 11 was specified. The only trigger options that are allowed in Db2 11 are SECURED and NOT SECURED.

This message can be issued for an ALTER statement if the CURRENT APPLICATION COMPATIBILITY special register value is lower than the APPLCOMPAT level of the existing object definition. Altering an object might result in this error even if the content of the ALTER statement is valid at the current level. The errors can occur when the existing object definition contains some functionality that requires a higher level than the CURRENT APPLICATION COMPATIBILITY special register setting.

System action

The statement cannot be processed.

Programmer response

Check the APPLCOMPAT level of your application or SQL object, and take one of the following actions:

- Rebind the application or modify the SQL object to use an APPLCOMPAT level that supports the capability.
- Remove use of the unsupported capability from the application or SQL object.

If an application receives this error for an SQL statement where it was expecting an invalid syntax error such as -104 or -199 at a lower Db2 code level, take the following actions:

- Update the application to expect the SQLCODE -4743 error when it runs at the current Db2 code level.
- Verify that the application will receive a correct result if the SQL statement is accepted at the higher APPLCOMPAT level, and take appropriate action.

Tip: For best results, configure your development environment to use the lowest application compatibility level that the application will run at in the production environment. For dynamic SQL, remember to consider the application compatibility levels of client and NULLID packages. If you develop and test applications at a higher application compatibility level and try to run them at a lower level in production, you are likely to encounter SQL code -4743 and other errors when you deploy the applications to production.

For more information, see [Application compatibility \(APPLCOMPAT\) levels in Db2 13 \(Db2 Application programming and SQL\)](#).

-4744

THE STATEMENT EXPLICITLY OR IMPLICITLY REFERENCED TEMPORAL TABLE *table-name* IN AN UNSUPPORTED CONTEXT. REASON CODE *reason-code*.

Explanation

A reference to the specified temporal table is not supported.

table-name

The name of the table.

reason-code

A numeric value that indicates why the reference is not supported. *reason-code* can have one of the following values:

1

A system-period temporal table cannot be referenced in the body of an SQL table function when both of the following conditions are true:

- The CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value.
- The SYSTIMESENSITIVE bind option is set to YES.

2

An application-period temporal table cannot be referenced in the body of an SQL table function when both of the following conditions are true:

- The CURRENT TEMPORAL BUSINESS_TIME special register is set to a non-null value.
- The BUSTIMESENSITIVE bind option is set to YES.

3

A system-period temporal table cannot be referenced in the definition of a row permission or column mask when all of the following conditions are true:

- The row permission or column mask is activated by a data change statement or query.
- The CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value.
- The SYSTIMESENSITIVE bind option is set to YES.

4

An application-period temporal table cannot be referenced in the definition of a row permission or column mask when all of the following conditions are true:

- The row permission or column mask is activated by a data change statement or query.
- The CURRENT TEMPORAL BUSINESS_TIME special register is set to a non-null value.
- The BUSTIMESENSITIVE bind option is set to YES.

System action:

The statement cannot be processed.

User response

Change the query or statement to remove the reference to the temporal table and specify another table.

-4746

THE STATEMENT CANNOT BE PROCESSED FOR AN ACCELERATED QUERY. REASON CODE *reason-code*.

Explanation

The statement that involves an accelerated query cannot be processed for the reason indicated by *reason-code*.

reason-code

A numeric value that indicates why the statement cannot be processed. *reason-code* can have one of the following values:

1

The only FETCH statement that is allowed for a rowset cursor that is run by the accelerator is FETCH NEXT ROWSET.

2

The FOR *n* ROWS clause must be specified on a FETCH NEXT ROWSET statement for a rowset cursor that is run by the accelerator.

3

The value of *n* in the FOR *n* ROWS clause of a FETCH NEXT ROWSET statement does not match the value in the previous FETCH NEXT ROWSET statement.

4

Target host variables must be specified for a FETCH NEXT ROWSET statement for a rowset cursor that is run by the accelerator.

20

Option QUERY ACCELERATION or GET_ACCEL_ARCHIVE is used but is invalid because the Db2 system parameter ACCEL is set to NO, and the Db2 subsystem is not enabled for query acceleration.

21

Option QUERY ACCELERATION or GET_ACCEL_ARCHIVE is used but is invalid because the Db2 table SYSACCEL.SYSACCELERATEDPACKAGES or its indexes do not exist or are not defined correctly.

22

The Db2 table SYSACCEL.SYSACCELERATEDPACKAGES or its indexes do not exist or are not defined correctly.

23

Option QUERY ACCELERATION or GET_ACCEL_ARCHIVE is used but is invalid because the Db2 SYSACCEL tables or indexes do not exist or are not defined correctly.

24

The Db2 SYSACCEL tables or indexes do not exist or are not defined correctly.

Note: Reason codes 20 through 24 apply to the CREATE PROCEDURE and ALTER PROCEDURE statements for native SQL procedures or to the CREATE FUNCTION and ALTER FUNCTION statements for SQL scalar functions. They also apply to a remote bind request with Db2 for z/OS as the target. These reason codes map to the following BIND or REBIND PACKAGE messages: DSNT320I, DSNT321I, DSNT322I, DSNT323I, and DSNT324I.

System action:

The statement cannot be processed.

User response

Use the reason code to determine the cause of the failure and take the appropriate action.

-4747 **THE CREATE OR ALTER TABLE STATEMENT FAILED BECAUSE SOME FUNCTIONALITY WAS SPECIFIED IN THE TABLE DEFINITION THAT IS NOT SUPPORTED WITH THE TABLE TYPE. UNSUPPORTED FUNCTIONALITY:***functionality-keyword*.

Explanation

An accelerator-only table cannot be defined with the following keywords or clauses:

- APPEND
- AUDIT
- BUFFERPOOL
- CHECK constraint
- COMPRESS
- DATA CAPTURE
- DSSIZE
- EDITPROC
- FIELDPROC
- FOREIGN KEY
- GENERATED
- HASH
- IMPLICITLY HIDDEN
- IN TABLESPACE
- INLINE LENGTH
- KEY LABEL
- LOGGED or NOT LOGGED
- MEMBER CLUSTER
- PARTITION BY
- PERIOD
- PRIMARY KEY
- TRACKMOD
- UNIQUE
- VALIDPROC
- VOLATILE
- WITH DEFAULT

System action

The statement cannot be processed.

Programmer response

Respond to this message in one of the following ways:

- Reissue the CREATE TABLE statement without specifying the unsupported functionality given in the message token *functionality-keyword*.

SQLSTATE

429CB

-4749 **PACKAGE =** *package-name* **bind-type ERROR WITH APREUSESOURCE(*copy-type*), THE copy-type COPY DOES NOT EXIST**

Explanation

The package copy that was specified for the APRESOURCE bind option does not exist.

package-name

The name of the package.

bind-type

The type of bind command.

copy-type

The type of package copy.

System action

The statement cannot be processed.

User response

Provide a package name and copy type that exists.

-4750 **csect-name PACKAGE package-name SWITCH TO THE copy-indicator COPY FAILED. THIS COPY IS NOT EXECUTABLE WITHOUT AN EXPLICIT REBIND OR AUTOBIND (REASON =** *reason-code***).**

Explanation

The package copy specified is invalid because VALID = 'N', or because the package copy was bound in a release earlier than Db2 11.

csect-name

The name of the control section that issued the message.

package-name

The name of the package.

reason-code

A numeric value that indicates why the copy is not executable.

01

The copy is invalid.

02

The copy is from a prior release that is no longer executable without an explicit REBIND or automatic bind.

System action

The command cannot be completed.

User response

Use a package copy where SYSPACKAGE.VALID='Y' and the RELBOUND value corresponds to Db2 11 or later. Alternately, you can use REBIND PACKAGE with APREUSE(ERROR) and specify a particular copy with the APREUSESOURCE option to optimize the statement by using the access path as input.

RACROUTE FASTAUTH REQUEST FAILED WITH SYSTEM AUTHORIZATION FACILITY RETURN CODE *saf-return-code* SECURITY SERVER RETURN CODE *security-server-return-code* SECURITY SERVER REASON CODE *security-server-reason-code*.**

Explanation

key-label-name is specified in the SQL *statement* for *object-name* that can be used during allocation of the data set associated with the object. Authorization ID *auth-id* does not have access in the security server to use the *key-label-name*.

auth-id

The authorization ID that must be permitted access to the key label being used.

key-label-name

The key label specified for the data set.

object-name

The name of the data set encrypted.

saf-return-code

The error code that was returned from system authorization facility (SAF).

security-server-return-code

The return code that was returned from a security server such as RACF.

security-server-reason-code

The reason code that was returned from a security server such as RACF.

statement

The statement that can't be processed.

System action

The statement cannot be processed.

Programmer response:

To correct the error, permit access by the authorization ID to the key label in the security server.

-4756 **INVALID COMBINATION OF REPLICATION OVERRIDES IN EFFECT WHEN A DATA CHANGE OPERATION IS ATTEMPTED**

Explanation

A data change operation was specified for a system-period temporal table and an invalid combination of replication overrides are in effect. The error can be issued for the following operations.

An insert or update operation specified a value for a row-begin, row-end, transaction-start-ID, or a generated expression column, and a replication override setting is not in effect for the application compatibility level.

- For an application that is run with application compatibility 502 (or lower), the SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPO RALHISTORY stored procedure was not invoked before the data change operation and the SYSIBMADM.REPLICATION_OVERRIDE built-in global variable is set to 'Y'. This combination is not supported.
- For an application that is run with application compatibility 503 (or higher), the SYSIBMADM.REPLICATION_OVERRIDE built-in global variable is set to 'N' and the SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPO RALHISTORY stored procedure has been invoked. This combination is not supported.

A delete operation was specified for a system-period temporal table and an invalid combination of replication overrides are in effect.

- For an application that is run with application compatibility 502 (or lower), the SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPO RALHISTORY stored procedure was not invoked and the SYSIBMADM.REPLICATION_OVERRIDE built-in global variable is set to 'Y'. This combination is not supported.
- For an application that is run with application compatibility 503 (or higher), the SYSIBMADM.REPLICATION_OVERRIDE built-in global variable is 'N' and the

SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPO
RALHISTORY stored procedure has been invoked.
This combination is not supported.

System action

The statement cannot be processed.

Programmer response

Change your application in one of the following ways:

- Use a valid replication override for the application compatibility level that is in effect
- Run the application at an application compatibility level that is appropriate for the replication override that is used by the application

SQLSTATE

-4758	INVALID SPECIFICATION ON CREATE STATEMENT. (REASON CODE <i>reason-code</i>)
--------------	--

Explanation

The CREATE PROCEDURE statement included an invalid specification. This error is issued for the situation identified by the reason code.

reason-code

01

The SPECIFIC clause was specified with a value that is not the same as the procedure name. The specific name for a procedure must be the same as the procedure name.

02

A CREATE statement with an OR REPLACE clause attempted to replace an existing procedure. A procedure with the same name exists, but is a different type of procedure than what is specified in the CREATE statement. An external procedure can only be replaced if the new definition is also for an external procedure. Likewise, a native SQL procedure can only be replaced if the new definition is also for a native SQL procedure.

03

A CREATE statement with an OR REPLACE or SPECIFIC clause was specified on a CREATE PROCEDURE statement for an external SQL procedure.

System action

The SQL statement cannot be executed.

Programmer response:

Correct the identified problem with the statement and retry the statement.

SQLSTATE

530A3

A BIND PACKAGE or SERVICE, or a REBIND PACKAGE command failed because the option *option1-name* is specified without specifying the option *option2-name*.

bind-type

The type of bind subcommand: BIND or REBIND

option1-name,option2-name

The bind option name.

System action

The named package or service is not bound.

User response:

Change the command to specify both options or remove the option indicated in *option1-name*.

SQLSTATE

56095

-5001	TABLE <i>table-name</i> IS NOT VALID
--------------	---

Explanation

The table designator was specified as the operand of the built-in function RID, ROW CHANGE TIMESTAMP expression, or ROW CHANGE TOKEN expression. The table designator that you specified or the table name you entered is not valid for one of the following reasons:

- The name is not defined to be a table designator in this SQL statement.
- The table designator cannot be referenced where it is specified in the SQL statement.
- An unexposed name is used as a table-designator. In this case, the statement does not conform to the guidelines for using only unique exposed names as qualifiers.
- An alias or synonym cannot be used as a table designator.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

SQLSTATE

[MERGE statement \(Db2 SQL\)](#)

-7008	<i>object-name</i> NOT VALID FOR OPERATION (<i>reason-code</i>)
--------------	--

Explanation

The object that is specified is not valid for the requested operation.

object-name

The name of the object.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

10

A CREATE VIEW statement was issued, but the view cannot be created because a view cannot be defined on another view for which an INSTEAD OF trigger exists.

17

A CREATE TRIGGER statement was issued, but the trigger cannot be created because an INSTEAD OF trigger cannot be defined on a view that has other views dependent on it, or the view references an accelerator-only table, or an AFTER trigger cannot be defined on a table that has a clone defined.

18

A CREATE INDEX or ALTER INDEX statement was issued for an index on a table that is not empty. One of the columns in the index key is a row change timestamp column that was added to the table after it was created. Issue REORG on the table space containing the table, and then try to create the index.

19

A MERGE statement was issued, but the target of a MERGE statement cannot be a view that has an instead of trigger defined for it.

20

No index expression-based index can be created after the inline length is altered until the base table is reorganized.

51

A CREATE VIEW statement was issued, but the view cannot be created because a view cannot be defined on another view for which an INSTEAD OF trigger exists.

52

A CREATE TRIGGER statement was issued, but the trigger cannot be created because an INSTEAD OF trigger cannot be defined on a view that has other views dependent on it, or the view references an accelerator-only table, or an AFTER trigger cannot be defined on a table that has a clone defined.

62

A DELETE statement with a fetch-clause was issued, and the target of the statement is

a view that is defined with an INSTEAD OF trigger. A DELETE statement with a fetch-clause is not supported when issued against a view that is defined with an INSTEAD OF trigger.

System action

The statement cannot be processed.

Programmer response

Specify an object for which the operation would be allowed, and reissue the statement.

SQLSTATE

55019

-16000	AN XQUERY EXPRESSION CANNOT BE PROCESSED BECAUSE THE <i>context-component</i> COMPONENT OF THE STATIC CONTEXT HAS NOT BEEN ASSIGNED. ERROR QNAME = err:XPST0001
---------------	--

Explanation

Static analysis of an expression relies on a component of the static context, context-component, that has not been assigned a value.

System action

The XQuery expression cannot be processed.

Programmer response

Assign a value to the *context-component*.

SQLSTATE

10501

-16001	AN XQUERY EXPRESSION STARTING WITH TOKEN <i>token</i> CANNOT BE PROCESSED BECAUSE THE FOCUS COMPONENT OF THE DYNAMIC CONTEXT HAS NOT BEEN ASSIGNED. ERROR QNAME = err:XPDY0002
---------------	---

Explanation

Evaluation of the expression starting with token *token* requires that the focus component of the dynamic context be assigned. The token is being considered as the beginning of a path expression which does not

have an associated context item or context sequence. This might be the result of not specifying an XQuery context item expression in the passing clause or the value of the XQuery context item expression is a null value. Another common cause of this error is that the value in the XPath expression was intended to be a literal string but delimiting quotation characters are missing.

System action

The XQuery expression cannot be processed.

Programmer response

Pass a value that is not null as the XQuery context item expression to XMLQuery or XMLEExists.

SQLSTATE

10501

-16002	AN XQUERY EXPRESSION HAS AN UNEXPECTED TOKEN <i>token</i> FOLLOWING <i>text</i>. EXPECTED TOKENS MAY INCLUDE: <i>token-list</i>. ERROR QNAME= ERR:XPST0003
---------------	---

Explanation

The *token* that follows *text* is not valid where it occurs in the expression. The *token-list* includes one or more possible tokens that are valid replacements for the unexpected token.

System action

The XQuery expression cannot be processed.

Programmer response

Use the correct syntax for the expression.

SQLSTATE

10505

-16003	AN EXPRESSION OF DATA TYPE <i>value-type</i> CANNOT BE USED WHEN THE DATA TYPE <i>expected-type</i> IS EXPECTED IN THE CONTEXT. ERROR QNAME= err:XPTY0004
---------------	--

Explanation

An XQuery expression includes a value of the type *value-type* in a context where the expected type is

expected-type. The following situations might cause this error:

- For a constructor function of an XML Schema atomic type, atomization to its argument must not result in more than one atomic value.
- The cast of a value of *value-type* to target *expected-type* must be a supported cast.

System action

The XQuery expression cannot be processed.

Programmer response

Specify a value of the correct type.

SQLSTATE

10507

-16005	AN XQUERY EXPRESSION REFERENCES AN ELEMENT NAME, ATTRIBUTE NAME, TYPE NAME, FUNCTION NAME, NAMESPACE PREFIX, OR VARIABLE NAME <i>undefined-name</i> THAT IS NOT DEFINED WITHIN THE STATIC CONTEXT. ERROR QNAME= ERR:XPST0008
--------	--

Explanation

During the static analysis phase, the static context is used to resolve element names, attribute names, type names, function name, namespace prefixes, and variable names. If an expression uses an *undefined-name* that is not found in the static context, a static error is raised.

System action

The XQuery expression cannot be processed.

Programmer response

Use a name that is defined within the static context. If the QName includes a prefix, verify that the namespace prefix has been bound to a namespace through a namespace declaration. If the error resulted from a variable reference, verify that the variable is in-scope for the expression.

SQLSTATE

10506

-16007	-16007 THE XQUERY PATH EXPRESSION REFERENCES AN
--------	---

AXIS *axis-type* THAT IS NOT SUPPORTED. ERROR QNAME = *err:XQST0010*

Explanation

The *axis-type* that is specified is not supported because Db2 XQuery does not support the Full Axis Feature. The supported axes include child, attribute, descendant, self, descendant-or-self, and parent.

System action

The XQuery expression cannot be processed.

Programmer response

Specify an axis that is supported.

SQLSTATE

10505

-16009	AN XQUERY FUNCTION NAMED <i>function-name</i> WITH <i>number-of-params</i> PARAMETERS IS NOT DEFINED IN THE STATIC CONTEXT. ERROR QNAME= <i>err:XPST0017</i>
--------	--

Explanation

In a call to the function *function-name*, the expanded QName and *number-of-params* do not match the function name and number of parameters of a function signature in the static context.

System action

The XQuery expression cannot be processed.

Programmer response

Try one of the following actions:

- Verify that you are passing the correct number of parameters to the function call.
- If the function call uses a function name with no prefix, verify that the local name of the function matches a function that is in the default function namespace, or use the correct prefix.

SQLSTATE

10506

-16011	THE RESULT OF AN INTERMEDIATE STEP EXPRESSION IN AN XQUERY
--------	--

PATH EXPRESSION CONTAINS AN ATOMIC VALUE. ERROR QNAME = *err:XPTY0019*

Explanation

Each intermediate step in an XQuery expression must evaluate to a sequence of XQuery nodes. Such sequences might be empty. They must not include any XQuery atomic values.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the expression to ensure that each intermediate step in an XQuery expression returns a sequence of nodes.

SQLSTATE

10507

-16012	THE CONTEXT ITEM IN AN AXIS STEP MUST BE A NODE. ERROR QNAME = <i>err:XPTY0020</i>
---------------	---

Explanation

In an axis step, the context item, which is the item currently being processed, must be a node of the XQuery Data Model.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the axis step or the input to ensure that the context item is a node.

SQLSTATE

10507

-16015	AN ELEMENT CONSTRUCTOR CONTAINS AN ATTRIBUTE NODE NAMED <i>attribute-name</i> THAT FOLLOWS AN XQUERY NODE THAT IS NOT AN ATTRIBUTE NODE. ERROR QNAME = <i>err:error-name</i>
---------------	---

Explanation

The content sequence of an element constructor contains an attribute node that follows an XQuery node that is not an attribute node.

attribute-name

The name of the attribute node.

err:error-name

The error. Expected values are:

err:XQTY0024

The content sequence of an element constructor contains an attribute node that follows an XQuery node that is not an attribute node. Attribute nodes can occur only at the beginning of the content sequence.

err:XUTY0004

The content of an insertion sequence based on the source expression of an insert expression or a replace expression contains an attribute node that follows an XQuery node that is not an attribute node. Attribute nodes can occur only at the beginning of the insertion sequence.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the content sequence to ensure that attribute nodes follow other attribute nodes.

SQLSTATE

10507

-16016	THE ATTRIBUTE NAME <i>attribute-name</i> CANNOT BE USED MORE THAN ONCE IN AN ELEMENT CONSTRUCTOR. ERROR QNAME = <i>err:XQTY0025</i>
---------------	--

Explanation

An XQuery expression uses an attribute-name more than once in an element constructor. This is not allowed because the attribute names that are used in an element constructor must be unique.

System action

The XQuery expression cannot be processed.

Programmer response

Specify a unique name for each attribute.

SQLSTATE

10503

-16020	THE CONTEXT NODE IN A PATH EXPRESSION THAT BEGINS WITH AN INITIAL "/" OR "//" DOES NOT HAVE AN XQUERY DOCUMENT NODE ROOT. ERROR QNAME = <i>err:XPDY0050</i>
---------------	--

Explanation

The root node above the context node in an absolute path expression (The symbols / or // at the beginning of the path expression) must be an XQuery document node.

System action

The XQuery expression cannot be processed.

Programmer response

Change each path expression that begins with an initial "/" or "/" so that the context node has a root node that is an XQuery document node.

SQLSTATE

10507

-16022	OPERANDS OF TYPES <i>xquery-data-types</i> ARE NOT VALID FOR OPERATOR <i>operator-name</i> . ERROR QNAME = <i>err:XPTY0004</i>
---------------	---

Explanation

One or both operands of the operator have invalid data types. The following situations might cause this error:

- The types of the operands are not a valid combination for the given operator. For example, the operands of an arithmetic operator are not of numeric types. Or a comparison operator compares xs:string with xs:integer.
- One or both operands of an arithmetic operator are a sequence of more than one items, but the given operator requires single item operands. The notation (item(), item()+) represents the type of a sequence of more than one item.
- The content sequence of a document node constructor (e.g XMLDOCUMENT) cannot contain attribute nodes.

System action

The XQuery expression cannot be processed.

Programmer response

Use operands that have the correct types for the operator.

SQLSTATE

10507

-16023	THE XQUERY PROLOG CANNOT CONTAIN MULTIPLE DECLARATIONS FOR THE SAME NAMESPACE PREFIX <i>ns-prefix</i>. ERROR QNAME = <i>err:XQST0033</i>
---------------	---

Explanation

The prolog contains multiple declarations for the namespace prefix *ns-prefix*. Although a namespace declaration in a prolog can override a prefix that has been predeclared in the static context, the same namespace prefix cannot be declared more than once in the prolog.

System action

The XQuery expression cannot be processed.

Programmer response

Remove any extra declarations for the prefix from the prolog, or change the prefix that is assigned to the extra declarations. Verify that the prefixes used in the query reference the correct namespaces.

SQLSTATE

10503

-16024	THE NAMESPACE PREFIX <i>prefix-name</i> CANNOT BE REDECLARED OR CANNOT BE BOUND TO THE SPECIFIED URI. ERROR QNAME = <i>err:XQST0070</i>
---------------	--

Explanation

A namespace declaration cannot redeclare the predefined namespace prefixes XML or XMLNS. If the prefix name is not XML, then it cannot be bound to the namespace URI 'http://www.w3.org/XML/1998/namespace'. No prefix can be bound to the namespace URI 'http://www.w3.org/2000/xmlns/' either.

System action

The XQuery expression cannot be processed.

Programmer response

Perform one of the following actions:

- If the prefix name is XML or XMLNS, then change the prefix name to a different namespace prefix or remove the namespace declaration.
- If the namespace URI is 'http://www.w3.org/XML/1998/namespace' or 'http://www.w3.org/2000/xmlns/', then change the namespace URI specified in the declaration of the namespace prefix.

SQLSTATE

10503

-16026 **THE NAME *attribute-name* IS USED FOR MORE THAN ONE ATTRIBUTE IN THE CONSTRUCTOR FOR THE ELEMENT NAMED *element-name*. ERROR QNAME=err:XQST0040**

Explanation

The name *attribute-name* in the element *element-name* cannot be used more than one time. Element constructors must use unique names for attributes.

attribute-name

The name of the attribute that is not unique.

element-name

The name of the element that contains non-unique attribute names.

System action

The XQuery expression is not processed.

User response

No action is required.

Programmer response

Update the expression so that all attributes in the element have unique names.

SQLSTATE

10503

-16029 **TWO OR MORE NAMESPACES WITHIN THE SAME XQUERY ELEMENT CONSTRUCTOR USE THE SAME NAMESPACE PREFIX *prefix-name*. ERROR QNAME=err:XQST0071**

Explanation

The namespace prefix *prefix-name* cannot be used more than one time in a single XQuery element constructor. A *prefix-name* of "xmlns" indicates that more than one default namespace is specified in the XQuery element constructor.

prefix-name

The name of the namespace prefix that is not unique.

System action

The XQuery expression is not processed.

User response

No action is required.

Programmer response

Use unique namespace prefixes for local namespace declarations in the element constructor. Verify that the expression does not include more than one local namespace declaration that has no prefix.

SQLSTATE

10503

-16031 **XQUERY LANGUAGE FEATURE USING SYNTAX *string* IS NOT SUPPORTED**

Explanation

The XQuery expression includes the syntax indicated in *string* that is defined by the standard XQuery language specifications but is not supported in Db2.

System action

The XQuery expression cannot be processed.

Programmer response

Remove the unsupported expression starting with the syntax string from the XQuery expression.

SQLSTATE

10509

-16032 **THE STRING *string* IS NOT A VALID URI. ERROR QNAME = *err*:XQST0046**

Explanation

A namespace declaration or namespace declaration attribute specifies a string value that is not a valid URI.

System action

The XQuery expression cannot be processed.

Programmer response

Specify a string value that is a valid URI. A valid URI must conform to the generic URI syntax specified by the World Wide Web Consortium (W3C).

SQLSTATE

10504

-16033	THE TARGET DATA TYPE <i>type-name</i> OF A CASTABLE EXPRESSION IS NOT AN ATOMIC DATA TYPE DEFINED FOR THE IN-SCOPE XML SCHEMA TYPES OR IS A DATA TYPE THAT CANNOT BE USED IN A CASTABLE EXPRESSION. ERROR QNAME=err:XPST0080
---------------	---

Explanation

The castable expression specifies a target data type that cannot be used. The predefined XML schema types `xs:anySimpleType` and `xd:anyAtomicType` cannot be used as the target type of a castable expression. If the data type is not one of these restricted types, then either the data type is not defined for the in-scope XML schema types or the data type is not an atomic type.

type-name

The name of the target data type used in the expression.

System action

The XQuery expression is not processed.

User response

No action is required.

Programmer response

If the target data type is `xs:anySimpleType` or `xd:anyAtomicType`, specify a different target data type or remove the castable expression.

If the target data type is not defined by the in-scope XML types, specify a data type that is in scope or change the XML schema to include the data type.

If the target data type is not atomic, specify a different target data type or remove the castable expression.

SQLSTATE

10507

-16036	THE URI THAT IS SPECIFIED IN A NAMESPACE DECLARATION CANNOT BE A ZERO-LENGTH STRING
---------------	--

Explanation

The URI that is specified in a namespace declaration must be a valid URI that conforms to the generic URI syntax specified by the World Wide Web Consortium (W3C). The URI cannot be a zero-length string.

System action

The XQuery expression cannot be processed.

Programmer response

Specify a valid URI in the namespace declaration.

SQLSTATE

10504

-16038	THE ARGUMENTS OF FN:DATETIME HAVE DIFFERENT TIMEZONES. ERROR QNAME=ERR:FORG0008.
---------------	---

Explanation

The function `fn:dateTime` includes arguments that reference different time zones. The time zone of either argument might be an explicit part of the value or the result of using the implicit time zone for the XQuery execution environment for the argument.

System action

The XQuery expression is not processed.

Programmer response

Make sure that the same time zone is used for both arguments of function `fn:dateTime`.

SQLSTATE

10608

-16041 AN IMPLICIT OR EXPLICIT INVOCATION OF THE fn:boolean FUNCTION IN THE XQUERY EXPRESSION COULD NOT COMPUTE THE EFFECTIVE BOOLEAN VALUE OF THE SEQUENCE. ERROR QNAME=err:FORG0006

Explanation

The effective boolean value of the argument passed to fn:boolean could not be computed. The effective boolean value can be computed only if the sequence operand is one of the following sequences:

- An empty sequence
- A sequence where the value of the first item is a node
- A singleton sequence with a value of type xs:string, xdt:untypedAtomic or a type derived from one of these types
- A singleton sequence with a value of any numeric type or derived from any numeric type

System action

The XQuery expression is not processed.

User response

No action is required.

Programmer response

Determine the possible expressions within the XQuery expression where an effective boolean value is calculated either implicitly or explicitly. An implicit invocation of the fn:boolean function can occur when processing the following types of expressions:

- The logical expressions AND and OR
- An fn:not function invocation
- The WHERE clause of an FLWOR expression
- Certain types of predicates, such as a[b]
- Conditional expressions, such as IF

Ensure that the sequence operand of each effective boolean value calculation has a valid sequence operand, as described in the explanation.

SQLSTATE

10608

-16046 A NUMERIC XQUERY EXPRESSION ATTEMPTED TO DIVIDE BY ZERO. ERROR QNAME = err:FOAR0001

Explanation

A division or modulus operation attempted to divide an integer or decimal value by zero.

System action

The XQuery expression cannot be processed.

Programmer response

Use a value for the divisor that is not equal to zero.

SQLSTATE

10601

-16047 AN XQUERY EXPRESSION RESULTED IN ARITHMETIC OVERFLOW OR UNDERFLOW. ERROR QNAME= err:FOAR0002

Explanation

An arithmetic operation resulted in a number that either exceeded the maximum or was below the minimum value allowed.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the expression to result in a number that does not result in an arithmetic overflow or underflow.

SQLSTATE

10601

-16048 AN XQUERY PROLOG CANNOT CONTAIN MORE THAN ONE *declaration-type* DECLARATION. ERROR QNAME = error-qname

Explanation

An XQuery prolog contained more than one declaration of a particular type.

declaration-type

The type of declaration. Only one declaration of the indicated type is permitted in the XQuery prolog. Possible declaration values include:

- copy-namespaces
- default element namespaces
- boundary-space

error-qname

The XML qualified name (QName) static error, such as err:XQST0055, err:XQST0066, and err:XQST0068.

System action

The XQuery expression cannot be processed.

Programmer response

Remove extra declarations from the prolog.

SQLSTATE

10502

-16049 **THE LEXICAL VALUE *value* IS NOT VALID FOR THE *type-name* DATA TYPE IN THE FUNCTION OR CAST. ERROR QNAME= *err:FOCA0002***

Explanation

A cast expression or function call includes a value that does not have the correct lexical form for the *type-name* data type.

System action

The XQuery expression cannot be processed.

Programmer response

Try one of the following actions:

- If the error results from a function invocation, verify that the string parameters used for QNames or local names have the correct lexical form.
- If the error results from a cast expression, verify that the source value is not one of the special float or double values NaN, INF, or -INF.

SQLSTATE

10602

-16051 **THE VALUE *value* OF DATA TYPE *source-type* IS OUT OF RANGE FOR AN IMPLICIT OR EXPLICIT CAST TO TARGET DATA TYPE *target-type*. ERROR QNAME = *err:error-qname***

Explanation

An XQuery expression requires that the *value* with a data type of *source-type* be cast, either implicitly or explicitly to the target data type *target-type*. The value is outside the defined range of values for that data type.

This error could be returned for a variety of error QNames such as FOAR0002, FOCA0001, or FOCA0003.

System action

The XQuery expression cannot be processed.

Programmer response

Change the XQuery expression to use a target data type with a range that supports the specific value, or change the value to be within the defined range of the target data type.

SQLSTATE

10602

-16052 **NAN CANNOT BE USED AS A FLOAT OR DOUBLE VALUE IN A DATETIME OPERATION. ERROR QNAME=ERR:FOCA0005.**

Explanation

The value "NaN" was passed as an argument to a datetime operation, but that value is not valid for datetime operations.

System action

The XQuery expression was not processed.

Programmer response

Pass a valid float or double value to the datetime operation.

SQLSTATE

10602

-16055 **AN ARITHMETIC OPERATION INVOLVING A DATETIME VALUE RESULTED IN OVERFLOW. ERROR QNAME=ERR:FODT0001.**

Explanation

An arithmetic operation involving a datetime value returned a number that exceeded the maximum value allowed.

System action

The XQuery expression was not processed.

Programmer response

Modify the XQuery expression so that the result does not exceed the maximum allowed value.

SQLSTATE

10605

-16056	AN ARITHMETIC OPERATION INVOLVING A DURATION VALUE RESULTED IN OVERFLOW. ERROR QNAME=ERR:FODT0002.
---------------	---

Explanation

An arithmetic operation involving a duration value returned a number that exceeded the maximum value allowed.

System action

The XQuery expression was not processed.

Programmer response

Modify the XQuery expression so that the result does not exceed the maximum allowed value.

SQLSTATE

10605

-16057	A TIMEZONE VALUE IS NOT VALID. ERROR QNAME=ERR:FODT0003.
---------------	---

Explanation

An XQuery expression specifies a time zone value that is less than -PT14H00M or greater than PT14H00M.

System action

The XQuery expression was not processed.

Programmer response

Specify a time zone value that is greater than or equal to -PT14H00M and less than or equal to PT14H00M.

SQLSTATE

10605

-16061	THE VALUE <i>value</i> CANNOT BE CONSTRUCTED AS, OR CAST (USING AN IMPLICIT OR EXPLICIT CAST) TO THE DATA TYPE <i>data-type</i>. ERROR QNAME = <i>err:FORG0001</i>
---------------	---

Explanation

An XQuery expression attempted to use the value *value* as a *data-type* value but the value is not valid for the data type. The following situations might cause this error:

- A *value* was explicitly passed to a cast function or specified in a cast expression with a target data type of *data-type*.
- An expression that included *value* implicitly cast the value to the target data type of *data-type*. Many XQuery expressions use implicit casting to process the expressions. For example, implicit casting is used in general comparisons of numeric values that require the values to be of data type xs:double.

System action

The XQuery expression cannot be processed.

Programmer response

Try one of the following actions:

- If the error occurs in an expression that casts from one primitive type to another, verify that casting from the source type to the target type is supported. If the cast is not supported, either remove the expression or cast the value to a different data type.
- Check for expressions that would result in implicit casting with values that may not conform to the data type of the implicit cast and add conditions to the expression to avoid the error.

SQLSTATE

10608

-16065	AN EMPTY SEQUENCE CANNOT BE CAST TO THE DATA TYPE <i>data-type</i>, ERROR QNAME = <i>err:FORG0006</i>
---------------	--

Explanation

A namespace declaration or namespace declaration attribute specifies a string value that is not a valid URI.

System action

The XQuery expression cannot be processed.

Programmer response

Specify a string value that is a valid URI. A valid URI must conform to the generic URI syntax specified by the World Wide Web Consortium (W3C).

SQLSTATE

10608

-16066	THE ARGUMENT PASSED TO THE AGGREGATE FUNCTION <i>function-name</i> IS NOT VALID. ERROR QNAME = <i>err:FORG0006</i>
---------------	---

Explanation

The argument that was passed to the aggregate function *function-name* is not valid because the argument does not meet any of the conditions that are required for arguments to the function *function-name*.

System action

The XQuery expression cannot be processed.

Programmer response

If the function is fn:sum, verify that the following conditions are met:

- All items in the input sequence must be numeric or derived from a single base type.
- The type must support addition.
- The values must all be promotable to a single common type if the input sequence contains numeric values.

SQLSTATE

10608

-16067	THE FLAGS ARGUMENT VALUE PASSED TO THE FUNCTION <i>function-name</i> IS NOT VALID. ERROR QNAME = <i>err:FORX0001</i>
---------------	---

Explanation

The function *function-name* includes a value that was passed to the function as a regular expression flag parameter. However, the string that was passed to the function includes characters that are not defined as flags.

Programmer response

Modify the function call to pass in a string argument that contains only characters that are defined as flags. Valid characters include s, m, i or x.

SQLSTATE

10609

-16068	THE REGULAR EXPRESSION ARGUMENT VALUE PASSED TO THE FUNCTION <i>function-name</i> IS NOT VALID. ERROR QNAME = <i>err:FORX0002</i>
---------------	--

Explanation

The value that was passed to the function *function-name* is not valid according to the rules that are specified for regular expressions in XQuery. These rules are based on the regular expression syntax specified for XML Schemas, with some extensions added to the syntax to accommodate XQuery.

One reason that this error can occur is if the regular expression has more than 64 characters with a code point higher than X'FF'.

Programmer response

Specify a valid value for the regular expression.

SQLSTATE

10609

Related concepts

[Regular expressions \(Db2 Programming for XML\)](#)

-16069	A REGULAR EXPRESSION ARGUMENT <i>value</i> PASSED TO THE FUNCTION <i>function-name</i> MATCHES A ZERO-LENGTH STRING. ERROR QNAME = <i>err:FORX0003</i>
---------------	---

Explanation

The value that was specified for the pattern parameter in a call to the function *function-name* matches a zero-length string. A zero-length string is not a valid pattern for this function because the pattern will never match a substring in the input string.

Programmer response

Pass a valid pattern to the function call, or remove the function call from the expression.

SQLSTATE

10609

-16075	THE SEQUENCE TO BE SERIALIZED CONTAINS AN ITEM THAT IS AN ATTRIBUTE NODE. ERROR QNAME = err:SEN0001
---------------	--

Explanation

A request was made to serialize an XML value. The XML value is a sequence containing an item that is an XQuery attribute node. There is no defined sequence normalization for an attribute node as an item in a sequence and therefore the sequence cannot be serialized.

System action

The statement cannot be processed.

User response

Remove any items in the sequence containing just an attribute node or do not attempt to serialize the sequence.

SQLSTATE

2200W

-16080	AN XQUERY <i>expression-type</i> UPDATING EXPRESSION IS USED IN AN INVALID CONTEXT. ERROR QNAME=err:XUST0001.
---------------	--

Explanation

An updating expression is specified in an invalid context.

expression-type

The type of expression.

Only the following contexts are valid:

- The *xquery-update-constant* of an XMLMODIFY function.
- The return clause of a FLWOR expression.
- The then and else clauses of a conditional statement. The then and else clauses must contain either an updating expression or an empty sequence expression.

- An operand of a comma expression. The operand must be either an updating expression or an empty sequence expression.

System action

The XQuery expression cannot be processed.

Programmer response

Correct the expression that is indicated by *expression-type*. Use *expression-type* only in contexts that allow an updating expression.

SQLSTATE

10701

Related concepts

-16083 **INCOMPATIBLE EXPRESSION-TYPE EXPRESSIONS EXIST IN THE XQUERY-UPDATE-CONSTANT IN THE XMLMODIFY FUNCTION. QNAME=err:error-name.**

Explanation

The *xquery-update-constant* in the XMLMODIFY function includes multiple *expression-type* expressions that operate on the same target node. These basic updating expressions are not compatible, because the result would be non-deterministic, based on the order of processing the *expression-type* expressions.

error-name

An error identifier that indicates the reason why the expression is not valid.

XUTY0016

The *expression-type* is a replace expression, and there exist at least two replace expressions, without keyword values specified, that apply to the same target node.

XUTY0017

The *expression-type* is a replace value of expression, and there exist two or more replace expressions, with keyword values specified, that apply to the same target node.

System action

The XQuery expression cannot be processed.

Programmer response

Change the expression in the *xquery-update-constant* in the XMLMODIFY FUNCTION to ensure that no two *expression-type* expressions have the same target node.

SQLSTATE

10704

Related reference

-16085 **THE TARGET NODE OF AN XQUERY *expression-type* EXPRESSION IS NOT VALID. ERROR QNAME=err:error-name.**

Explanation

The target node of a basic updating expression is not valid.

expression-type

The type of expression.

error-name

An error identifier that indicates the reason why the expression is not valid.

XUTY0005

The value of *expression-type* is "insert into", "insert as first into", or "insert as last into" and the target node of an insert expression is not a single element node or document node.

XUTY0006

The value of *expression-type* is "insert before" or "insert after" and the target node of an insert expression that specifies before or after is not a single element, text, processing-instruction, or comment node whose parent property is not empty.

XUTY0007

The value of *expression-type* is "delete" and the target expression does not return a sequence of zero or more nodes.

XUTY0008

The value of *expression-type* is "replace" or "replace value of" and the target node of a replace expression is not a single node or is a document node.

XUTY0009

The value of *expression-type* is "replace" and the parent property of the target node of a replace expression is empty.

XUDY0020

The value of *expression-type* is "delete" and the parent property of the target node of a delete expression is empty.

XUTY0022

The value of *expression-type* is "insert into", "insert as first into", or "insert as last into" the insertion sequence includes attribute nodes and the target node of an insert expression is a document node.

XUDY0027

The value of *expression-type* is "insert before", "insert after", "insert into", "insert as first into", "insert as last into", "replace", or "replace value of" and the target node is empty.

XUDY0029

The value of *expression-type* is "insert before" or "insert after" and the parent property of the target node of an insert expression is empty.

XUDY0030

The value of *expression-type* is "insert before" or "insert after", the insertion sequence includes attribute nodes, and the parent node of the target node is a document node.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the expression to use a valid target node.

SQLSTATE

10703

-16086	THE REPLACEMENT SEQUENCE OF A REPLACE EXPRESSION CONTAINS INVALID NODES FOR THE SPECIFIED TARGET NODE. ERROR QNAME=err:error-name.
---------------	---

Explanation

A node in the replacement sequence cannot be used to replace the target node.

error-name

An error identifier that indicates the reason why the expression is not valid.

XUDY0010

The value of keywords are not specified and the target node is not an attribute node. The replacement sequence must contain only element, text, comment, or processing instruction nodes, but at least one item in the sequence is an attribute node.

XUDY0011

The value of keywords are not specified and the target node is an attribute node. The replacement sequence must contain only attribute nodes, but at least one item in the sequence is not an attribute node.

System action

The XQuery expression cannot be processed.

Programmer response

Correct the source expression in the WITH clause of the replace expression to ensure that the replacement sequence contains only valid nodes for the target node.

SQLSTATE

10706

-16087	THE RESULT OF APPLYING THE UPDATING EXPRESSIONS IN THE XMLMODIFY FUNCTION IS NOT A VALID INSTANCE OF THE
---------------	---

XQUERY AND XPATH DATA MODEL. ADDITIONAL INFORMATION: *information-1, information-2.* ERROR QNAME=err:XUDY0021.

Explanation

The result of applying the updating expressions contained in the XMLMODIFY function would result in an invalid instance of the XQuery and XPath data model.

information-1 and information-2

Additional information that was provided, which can help identify the constraint violation in the XQuery and XPath data model instance.

System action

The XQuery expression cannot be processed.

Programmer response

Modify the updating expressions in the XMLMODIFY function to ensure that the resulting instance of the XDM is correct.

SQLSTATE

10707

-16088	AN <i>expression-type</i> EXPRESSION HAS A BINDING OF A NAMESPACE PREFIX <i>prefix-string</i> TO NAMESPACE URI <i>uri-string</i>, INTRODUCED TO AN ELEMENT NAMED <i>element-name</i>, THAT CONFLICTS WITH AN EXISTING NAMESPACE BINDING OF THE SAME PREFIX TO A DIFFERENT URI IN THE IN-SCOPE NAMESPACES OF THAT ELEMENT NODE. ERROR QNAME=err:XUDY0023.
---------------	---

Explanation

An expression has introduced a new namespace binding for a prefix into an element node that conflicts with one of the existing namespace bindings of the in-scope namespaces of that node.

expression-type

The type of expression.

prefix-string

The prefix.

uri-string

The URI in the new namespace binding.

element-name

The name of the XML element.

The element node could be the target in the updating expression or the parent of the target in the updating expression. For example, an insert expression might insert an attribute into an existing element. If the QName of the inserted attribute binds prefix P to some URI, but an in-scope namespace of the element node binds the same prefix P to a different URI, a conflict is detected and this error is issued.

System action

The XQuery expression cannot be processed.

Programmer response

If the expression is intentionally introducing a new namespace binding, modify the expression so that it uses a namespace prefix that is different from all existing prefixes of the in-scope namespaces of the indicated element. Otherwise, modify the expression so that the binding of the prefix string uses the same URI as the existing namespace binding of the in-scope namespaces of the indicated element.

SQLSTATE

10708

-16089 **AN *expression-type* EXPRESSION AND POSSIBLY OTHER UPDATING EXPRESSIONS IN AN XMLMODIFY FUNCTION INTRODUCE CONFLICTING NAMESPACE BINDINGS INTO AN ELEMENT NAMED *element-name*. THE PREFIX *prefix-string* IS BOUND TO *uri-string* WHILE ANOTHER BINDING OF THE SAME PREFIX USES A DIFFERENT NAMESPACE URI. ERROR QName=err:XUDY0024.**

Explanation

The combined effect of updating expressions in the XMLMODIFY function has been to introduce conflicting namespace bindings into an element node.

expression-type

The type of expression.

element-name

The name of the XML element.

prefix-string

The prefix.

uri-string

The URI in the current namespace binding.

Possible causes for this error include:

- Two attributes might have been inserted whose QNames have the same namespace prefix but different namespace URIs.
- If *expression-type* is "insert" or "replace", the conflicting namespace bindings might be between two attribute nodes in the sequence of attribute nodes in the insertion sequence or replacement sequence.
- A namespace binding might have been introduced to the indicated element for an attribute node that was inserted or replaced by another updating expression in the same XMLMODIFY function.

System action

The XQuery expression cannot be processed.

Programmer response

If the expression is intentionally introducing a new namespace binding, modify the expression so that it uses a namespace prefix that is different from all other prefixes used in the updating expressions of the same XMLMODIFY function that have the indicated element as the target or parent of an attribute node target. Otherwise, modify the expression so that the binding of the prefix uses the same URI as the other namespace bindings used in the updating expressions of the same XMLMODIFY function that have the indicated element as the target or parent of an attribute node target.

-16246 **INCOMPLETE ANNOTATION MAPPING AT OR NEAR LINE *lineno* IN XML SCHEMA DOCUMENT *uri*. REASON CODE = *reason-code*.**

Explanation

The annotation mapping the XML schema item near *line* in *uri*, to a database object is missing some information. Possible values for reason code include:

1. A rowset name is not specified or is not fully qualified.
2. Any mapping must specify either a target column or a condition. Neither a target column nor a condition is specified.
3. The annotation has an unexpected format.

The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Modify the annotations in the XML schema. Possible actions based on the *reason-code* include:

1. Specify a rowset name or fully qualify the rowset name.
2. Specify either a target column or a condition.
3. Correct the format of the annotation.

Consult annotated XML schema documentation on the specified annotation to make sure that all required components have supplied values.

---------------	--

Explanation

Annotation at or around line *lineno* in XML schema document *uri* maps a XML schema type *source-data-type* to an incompatible SQL type *target-data-type*. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Consult annotated XML schema documentation on compatibility between XML schema types and SQL types. Correct the annotation appropriately.

SQLSTATE

225DE

-16248	UNKNOWN ANNOTATION <i>annotation-name</i> AT OR NEAR LINE <i>lineno</i> IN XML SCHEMA DOCUMENT <i>uri</i>
---------------	--

Explanation

The annotated XML schema document *uri* contains an error in the annotation at or near the line containing *lineno*. The unrecognized name given in the annotation tag is *annotation-name*.

The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

System action

The XML schema is not enabled for decomposition. The XSR_COMPLETE invocation fails with this SQLCODE.

User response

Consult annotated XML schema documentation for list of legal annotations and their syntax. Correct or remove the unknown annotation.

SQLSTATE

225DE

-16249	THE <i>db2-xdb:expression</i> ANNOTATION <i>expression</i> AT OR NEAR LINE <i>lineno</i> IN XML SCHEMA DOCUMENT <i>uri</i> IS TOO LONG.
---------------	--

Explanation

String length of the specified expression exceeded the maximum allowed. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition. The XSR_COMPLETE invocation fails with this SQLCODE.

User response

Consult annotated XML schema documentation on the limit for strings specified in *db2-xdb:expression* expression annotations. Correct the expression appropriately.

SQLSTATE

225DE

-16250 **THE *db2-xdb:defaultSQLSchema* WITH VALUE *schema-name* AT OR NEAR LINE *lineno* IN XML SCHEMA DOCUMENT *uri* CONFLICTS WITH ANOTHER *db2-xdb:defaultSQLSchema* SPECIFIED IN ONE OF THE XML SCHEMA DOCUMENTS WITHIN THE SAME XML SCHEMA.**

Explanation

There can only be one value for the *db2-xdb:defaultSQLSchema* annotation across all XML schema documents that comprise an annotated XML schema. The specified SQL schema name *schema-name* at or near the line number *lineno* in the XML schema document *uri* conflicts with another value for *db2-xdb:defaultSQLSchema* annotation in this or another XML schema document of the XML schema. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Correct the annotated XML schema such that all specifications of *db2-xdb:defaultSQLSchema* are consistent.

SQLSTATE

225DE

-16251 **DUPLICATE ANNOTATION DEFINED FOR *object-name* AT OR NEAR *location* IN XML SCHEMA DOCUMENT *uri***

Explanation

There is more than one annotation for *object-name* in the annotated XML schema. A duplicate annotation has been found for this object at or around *location* in XML schema document *uri*. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

System action

The XML schema is not enabled for decomposition. The XSR_COMPLETE invocation fails with this SQLCODE.

Programmer response

Correct the annotated XML schema by removing the duplicate annotation from the XML schema documents of the XML schema.

SQLSTATE

225DE

-16252 **THE *db2-xdb:rowSet* NAME *rowset-name* SPECIFIED AT OR NEAR LINE *lineno* IN THE XML SCHEMA DOCUMENT *uri* IS ALREADY ASSOCIATED WITH ANOTHER TABLE**

Explanation

A rowset in an annotated XML schema must correspond to exactly one table. The rowset declaration at or near line *lineno* declares an association between rowset *rowsetname* and the table specified in the enclosing *db2-xdb:table* annotation. The specified rowset has already been associated to a different table in another *db2-xdb:table* annotation. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Correct the annotated XML schema such that each rowset name is uniquely associated with exactly one table across the annotated XML schema documents of the XML schema.

SQLSTATE

225DE

-16253 **THE *db2-xdb:condition* ANNOTATION *condition* AT OR NEAR LINE *lineno* IN XML SCHEMA DOCUMENT *uri* IS TOO LONG.**

Explanation

The length of the string associated with *db2-xdb:condition* that starts with *condition* exceeds the maximum allowed. The *db2-xdb:condition* is found

at or around line number *lineno* in XML schema document *uri*. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Reduce the size of the condition string for db2-xdb:condition in the XML schema document. Consult annotated XML schema documentation on the limit for strings specified in db2-xdb:condition annotations.

SQLSTATE

225DE

-16254	A db2-xdb:locationPath locationpath AT OR NEAR LINE lineno IN XML SCHEMA DOCUMENT uri IS NOT VALID WITH REASON CODE reason-code.
--------	--

Explanation

A value specified in the annotated schema for db2-xdb:locationPath is not valid. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS. Possible values for reason code include:

1. Some element or attribute has a namespace prefix that is not mapped to a URI. All namespace prefixes used in the location path must have been associated with a namespace in the XML schema document containing the annotation specifying this location path.
2. Invalid syntax for a location path.
3. The specified path does not match any possible path from a root node to a location where the element or attribute may appear in an instance document.

System action

The XML schema is not enabled for decomposition. The XSR_COMPLETE invocation fails with this SQLCODE

User response

Modify the annotations in the XML schema. Possible actions based on the reason-code include:

1. Ensure that namespace prefixes in the db2-xdb:locationPath are correct or add a declaration for the missing namespace.

2. Ensure that the syntax of the value for db2-xdb:locationPath is valid syntax for a location path.
3. Ensure that the value for db2-xdb:locationPath corresponds to a possible path from the root node to the element or attribute at the end of the location path.

SQLSTATE

225DE

-16255	A db2-xdb:rowSet VALUE rowset-name USED AT OR NEAR LINE lineno IN XML SCHEMA DOCUMENT uri CONFLICTS WITH A db2-xdb:table ANNOTATION WITH THE SAME NAME.
--------	---

Explanation

The annotated XML schema contains a db2-xdb:table annotation which declares a table named *rowsetname*, but the annotated XML schema does not have any db2-xdb:rowSet annotation declaration to associate *rowsetname* to any table. If a rowset is not declared in any db2-xdb:table annotation, it is implicitly associated to a table with the same name qualified by the value of db2-xdb:defaultSQLSchema. The annotated XML schema cannot use a db2-xdb:rowSet annotation that relies on an implicit association between a rowset and a table with the same name of *rowset-name*, and at the same time declare a table named *rowset-name* using a db2-xdb:table annotation. The XML schema document can be determined by matching *uri* to the SCHEMALOCATION column of table SYSIBM.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Correct the annotated XML schema by adding a db2-xdb:rowSet child element to the db2-xdb:table element with name *rowset-name*. This will explicitly associate the rowset to the table.

SQLSTATE

225DE

-16257	XML SCHEMA FEATURE feature SPECIFIED IS NOT SUPPORTED FOR DECOMPOSITION.
--------	--

Explanation

Decomposition on an XML schema with *feature* is not supported. This feature is used in the XML schema. In some cases, the presence of the unsupported feature

in the XML schema results in failure to enable for decomposition. In other cases, having annotations in the decomposition namespace on the unsupported feature results in failure to enable for decomposition.

System action

The XML schema is not enabled for decomposition. The XSR_COMPLETE invocation fails with this SQLCODE.

User response

Remove the feature from the XML schema or remove the decomposition annotations associated with the feature, as appropriate. Consult decomposition documentation on the restrictions on use of the specified XML schema feature.

SQLSTATE

225DE

-16258	THE XML SCHEMA CONTAINS A RECURSIVE ELEMENT WHICH IS AN UNSUPPORTED FEATURE FOR DECOMPOSITION. THE RECURSIVE ELEMENT IS IDENTIFIED AS <i>elementnamespace : elementname</i> OF TYPE <i>typenamespace : typename</i> .
--------	---

Explanation

XML schemas with recursive elements are not supported for decomposition. At least one recursive element was found identified as *elementnamespace:elementname* of type *typenamespace:typename*.

The XML schema is not enabled for decomposition.

User response

Remove the use of recursion from the XML schema.

SQLSTATE

225DE

-16259	INVALID MANY-TO-MANY MAPPINGS DETECTED IN XML SCHEMA DOCUMENT <i>uri1</i> NEAR LINE <i>lineno1</i> AND IN XML SCHEMA DOCUMENT <i>uri2</i> NEAR LINE <i>lineno2</i> .
--------	--

Explanation

The two identified annotations specify an invalid many-to-many relationship between elements that map to the same rowset. If two element declarations have a sequence model group as their lowest common ancestor then only one of the paths from the element declaration up to that model group can have *maxOccurs>1* on one or more elements declarations or modelgroups in that path. The XML schema documents can be determined by matching *uri1* and *uri2* to the SCHEMALOCATION column of catalog view SYSCAT.XSROBJECTCOMPONENTS.

The XML schema is not enabled for decomposition.

User response

Correct the annotations such that there are no many-to-many mappings. Consult annotated XML schema documentation for rules on mapping elements and attributes.

sqlcode: -16259

sqlstate: 225DE

-16260	XML SCHEMA ANNOTATIONS INCLUDE NO MAPPINGS TO ANY COLUMN OF ANY TABLE.
--------	--

Explanation

The XML schema contains no annotations that map an XML element or attribute to any column of any table.

The XML schema is not enabled for decomposition since it provides no information for performing decomposition.

User response

Add annotations to the XML schema so that at least one XML element or attribute is mapped to a column of a table.

SQLSTATE

225DE

-16262	THE ANNOTATED XML SCHEMA HAS NO COLUMNS MAPPED FOR ROWSET <i>rowsetname</i> .
--------	---

Explanation

The set of annotations involving rowset *rowsetname* contain no mappings to any column. In order for a rowset to be target for decomposition, at least one column must be mapped to some XML element or attribute.

User response

Add an annotation that maps a column of the specified rowset to some XML element or attribute. If the rowset is not intended to be a target for decomposition, remove references to the rowset from the annotated XML schema.

SQLSTATE

225DE

-16265	THE XML DOCUMENT CANNOT BE DECOMPOSED USING XML SCHEMA <i>xsobject-name</i> WHICH IS NOT ENABLED OR IS INOPERATIVE FOR DECOMPOSITION.
---------------	--

Explanation

The XML schema identified by *xsobject-name* is not in the correct state to perform decomposition. The XML schema could be in one of the following states:

- Not enabled for decomposition (possibly never enabled)
- Disabled for decomposition
- Inoperative for decomposition because of changes to the definitions of one or more tables specified in the annotations.

Decomposition can only be performed using XML schemas that are enabled for decomposition.

XML decomposition was not started.

User response

Ensure that the XML schema is enabled for decomposition before attempting to use it for decomposition of an XML document. The decomposition status of an XML schema can be checked by selecting the DECOMPOSITION column of SYSCAT.XSROBJECTS for the XML schema identified by *xsobject-name*.

SQLSTATE

225DE

-16266	AN SQL ERROR OCCURRED DURING DECOMPOSITION OF DOCUMENT <i>docid</i> WHILE ATTEMPTING TO INSERT DATA. INFORMATION RETURNED FOR THE ERROR INCLUDES SQLCODE <i>sqlcode</i>, SQLSTATE <i>sqlstate</i>, AND MESSAGE TOKENS <i>token-list</i>.
---------------	---

Explanation

An SQL error occurred during decomposition of an XML document with document identifier *docid*. The error occurred while attempting an SQL insert operation based on some piece of data from the XML document. Some possible causes: format of data is incompatible with the target column's data type; length of data exceeds column size; providing null value for a column defined as non-null. The *sqlcode*, *sqlstate* and message token list (each token is separated by the vertical bar character) are provided. The message tokens may be truncated. See the corresponding message for the *sqlcode* for further explanation of the error.

The XML document *docid* was not decomposed.

User response

Check the message associated with the SQLCODE. Follow the action suggested by that message. See db2diag.log for complete information about the error condition.

SQLSTATE

225DE

-20003	GBPCACHE NONE CANNOT BE SPECIFIED FOR TABLESPACE OR INDEX IN GRECP
---------------	---

Explanation

GBPCACHE NONE was specified on an ALTER TABLESPACE or ALTER INDEX statement, but the table space, index, or the partition to be altered is in GRECP.

System action

The statement cannot be processed.

User response

Use the START DATABASE command to recover the table space or index from the GRECP then STOP the table space or index before reissuing the ALTER statement.

SQLSTATE

560A7

-20004	8K or 16K BUFFERPOOL PAGESIZE INVALID FOR A WORKFILE OBJECT
---------------	--

Explanation

This message is issued when a statement specifies an 8K or 16K pagesize in the BUFFERPOOL clause for a workfile object. The error can occur for the following SQL statements:

- A CREATE or ALTER DATABASE statement.
- A CREATE or ALTER TABLESPACE statement.

System action

The statement cannot be processed.

User response

Correct the statement to specify a 4K or 32K bufferpool pagesize.

SQLSTATE

560A8

**-20005 THE INTERNAL ID LIMIT OF
 limit HAS BEEN EXCEEDED FOR
 OBJECT TYPE *object-type***

Explanation

An internal ID is used to uniquely identify objects of type *object-type*. The limit for internal IDs for this type of object is *limit*, and this limit has been exceeded.

This could occur during a CREATE ALIAS, CREATE FUNCTION, CREATE PROCEDURE, CREATE SEQUENCE, CREATE TYPE, or CREATE or ALTER TABLE statement that defines an identity column.

System action

The SQL statement cannot be executed.

Programmer response

Drop objects of *object-type* that are not being used, and retry the statement.

SQLSTATE

54035

**-20008 ATTEMPT TO USE UNSUPPORTED
 FEATURE *msg-token*. REASON
 CODE: *reason-code***

Explanation

The statement attempted to use a feature or format that is not supported.

msg-token

Text that identifies the unsupported feature.

reason-code

A numeric value that identifies the unsupported feature:

- 1** The statement attempted to call the SYSPROC.XSR_COMPLETE stored procedure and specified 1 for fourth argument value, which indicates use of the XML schema decomposition feature. The only supported value for this argument is 0. The XMLTABLE function replaces use of XSR_COMPLETE for XML schema decomposition, which is not supported beginning in DB2 10.
- 2** The table that is indicated by *msg-token* is defined with a format that is no longer supported by EXPLAIN. Only one instance of this message is issued per package for EXPLAIN tables in supported formats during bind or rebind.
- 3** TYPE 1 indexes are no longer supported. Only TYPE 2 can be specified, beginning in DB2 version 6.
- 4** The SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPLORALHISTORY stored procedure is no longer supported beginning with Db2 12 V12R1M503.
- 5** Synonyms are deprecated and cannot be created with application compatibility V12R1M504 or higher.
- 6** Hash-organized tables are deprecated and cannot be created with application compatibility V12R1M504 or higher.
- 7** Partitioned (non-UTS) table spaces are deprecated and cannot be created with application compatibility V12R1M504 or higher.
- 8** New tables cannot be created in non-UTS table spaces with application compatibility V12R1M504 or higher.

System action

The statement or EXPLAIN operation cannot be processed.

Programmer response

Take appropriate action based on the *reason-code* value. In most cases, remove references to the unsupported clause or keyword from the SQL statement, to avoid using the unsupported feature.

For *reason-code* 2, either migrate the EXPLAIN tables to the current format or redefine them by dropping and re-creating them in the required format. For more information, see [Migration step 21: Convert EXPLAIN tables to the current format \(Db2 Installation and Migration\)](#).

For reason code 4, update your application to use the SYSIBMADM.REPLICATION_OVERRIDE built-in global variable instead of the SYSPROC.SET_MAINT_MODE_RECORD_NO_TEMPORA LHISTORY stored procedure.

-20016	THE VALUE OF THE INLINE LENGTH ASSOCIATED WITH <i>object-name</i> IS TOO BIG OR THE INLINE LENGTH CLAUSE IS NOT ALLOWED IN THE CONTEXT.
---------------	--

Explanation

The inline length that is associated with the distinct type or column is too large or is invalid in the current context.

object-name

The name of the object.

Possible causes for this error include:

- A CREATE TYPE statement specifies the INLINE LENGTH attribute, but the source data type is not LOB.
- A CREATE TABLE statement specifies the INLINE LENGTH attribute, but the data type is not LOB.
- An ALTER TABLE statement with ADD COLUMN specifies an INLINE LENGTH attribute, but the data type is not LOB.

- A CREATE TABLE statement, an ALTER TABLE statement with an ADD attribute, or a CREATE TYPE statement specifies an inline length that is greater than the maximum length.
- An ALTER TABLE statement attempted to alter the inline length of a non-LOB column.
- The INLINE attribute is not allowed for basic row format (BRF).

System action

The statement cannot be processed.

User response

Correct the syntax, and reissue the statement.

SQLSTATE

429B2

Related reference

-20058

THE FULLSELECT SPECIFIED FOR MATERIALIZED QUERY TABLE *table-name* IS NOT VALID.

Explanation

The materialized query table definition has specific rules regarding the contents of the fullselect, and the fullselect that was specified did not conform to these rules.

table-name

The name of the materialized query table.

General restrictions: The following restrictions apply:

- The length of each result column of the fullselect must not be 0.
- The fullselect cannot contain a column of a LOB or XML data type.
- No more than one table in the fullselect can contain a security label column.
- The fullselect must not contain a period specification.
- The object that is specified in the FROM clause of the fullselect cannot be a view with columns of length 0.
- The fullselect cannot contain a reference to a created global temporary table, a declared global temporary table, an accelerator-only table, or another materialized query table.
- The fullselect cannot directly or indirectly reference a base table that has been activated for the row or column access control or a base table for which a row permission or a column mask has been defined.
- The fullselect must not refer to host variables or include parameter markers.
- The fullselect must not refer to global variables.
- The fullselect must not include the following built-in functions: AI_ANALOGY, AI_COMMONALITY, AI_SEMANTIC_CLUSTER, or AI_SIMILARITY.

Additional restrictions when ENABLE QUERY OPTIMIZATION is in effect:

- The fullselect must be a subselect.
- The outermost SELECT list of the subselect must not reference data that is encoded with different CCSID sets.
- The subselect cannot include the following:
 - A special register
 - A scalar fullselect
 - A row change timestamp column
 - A ROW CHANGE expression

- An expression for which implicit time zone values apply (for example, cast a timestamp to a timestamp with time zone)
- The RAND built-in function
- The RID built-in function
- A user-defined scalar or table function that is not deterministic or that has external actions
- Any predicates that include a subquery
- A *row-value-expression* in a predicate
- A join using the INNER JOIN syntax, or an outer join
- A lateral correlation
- a nested table expression or view that requires temporary materialization
- A direct or indirect reference to a table that uses activated row or column access controls, or a table for which row or column access controls have been defined.
- A FETCH FIRST clause
- A reference to a global variable
- A collection-derived table (UNNEST)
- A GROUPING SETS or *super-groups* clause
- A reference to the LISTAGG, MEDIAN, PERCENTILE_CONT, or PERCENTILE_DISC function
- If a table with a security label is referenced, the security label column must be referenced in the outer select list of the subselect.
- If the subselect references a view, the fullselect in the view definition must satisfy all other restrictions.

System action

The statement cannot be processed.

Programmer response

Change the fullselect in the CREATE TABLE or ALTER TABLE statement so that it conforms to the rules listed above.

-20070	AUXILIARY TABLE <i>table-name</i> CANNOT BE CREATED BECAUSE COLUMN <i>column-name</i> IS NOT A LOB COLUMN
---------------	--

Explanation

An auxiliary table cannot be created for a non-LOB column. A CREATE AUXILIARY TABLE statement must refer to a LOB column in the associated base table.

System action

The statement cannot be processed. The specified table was not created.

Programmer response

Change the name of the column to correctly refer to a LOB column in the base table.

SQLSTATE

53098

-20071	WLM ENVIRONMENT NAME MUST BE SPECIFIED <i>function-name</i>
---------------	--

Explanation

The WLM ENVIRONMENT option was not specified on CREATE FUNCTION, CREATE PROCEDURE, or CREATE TRIGGER for an advanced trigger, and there is no default WLM environment for the installation.

System action

The statement cannot be processed.

Programmer response

Select a WLM ENVIRONMENT name and include it in the CREATE FUNCTION statement, CREATE PROCEDURE statement, or CREATE TRIGGER statement for an advanced trigger. Contact your system administrator to find out the names of the WLM environments that have been defined for your installation.

SQLSTATE

53099

-20072	<i>csect-name bind-type bind-subtype</i> ERROR USING <i>authorization-id</i> AUTHORITY. OPERATION IS NOT ALLOWED ON A <i>package-type</i> PACKAGE <i>package-name</i>
---------------	--

Explanation

The bind subcommand *bind-type* with *bind-subtype* is not valid for the type of package specified for one of the following reasons:

- The subcommand REBIND TRIGGER PACKAGE can be used only for trigger packages that were created prior to Db2 12 with new function activated, or basic triggers.
- The subcommand BIND PACKAGE DEPLOY can be used only for SQL functions or native SQL procedure packages, or for advanced triggers.
- The subcommand FREE PACKAGE can be used only for packages that are not associated with triggers, native SQL procedures, or compiled SQL functions.
- The DROP PACKAGE statement cannot be used to drop a REST SERVICE package. Use subcommand FREE SERVICE instead

csect-name

The name of the control section that issued the message.

bind-type

The type of bind subcommand: REBIND, FREE, or DROP.

bind-subtype

The subtype of bind subcommand: TRIGGER or DEPLOY.

authorization-id

The authorization ID that is attempting the prohibited action.

If you are using a trusted context, the token *authorization-id* might return a role instead of an authorization ID. A role is returned if a role was in effect and the authorization checking is performed against the role rather than the authorization ID of the session when the condition was encountered.

role-name

The name of the role, in the format: 'Role: role-name'

package-type

The type of package: trigger, SQL function, native SQL procedure, or REST SERVICE.

package-name

The name of the package, in the format 'collection.package'.

System action

The package that is specified is not deployed, rebound, or freed.

System programmer response

Use the appropriate rebind subcommand to rebind the package:

- For a trigger package that was created prior to Db2 12 with new function activated, or a basic trigger, use the REBIND TRIGGER PACKAGE subcommand.
- For an advanced trigger package that was created starting in Db2 12 with new function activated, use the REBIND PACKAGE subcommand.
- For any other type of package, use the REBIND PACKAGE subcommand.
- To drop a REST SERVICE, use the FREE SERVICE subcommand instead of the DROP SERVICE statement.

SQLSTATE

56052

-20073	THE FUNCTION <i>function-name</i> CANNOT BE ALTERED BECAUSE IT IS REFERENCED IN EXISTING VIEW OR MATERIALIZED QUERY TABLE DEFINITIONS
---------------	--

Explanation

The *function-name* in an ALTER FUNCTION statement cannot be altered to NOT DETERMINISTIC or EXTERNAL ACTION. It is referenced in one or more existing view definitions or materialized query table definitions.

System action

The statement cannot be processed.

Programmer response

Drop the views that reference the function before issuing the ALTER FUNCTION statement. Drop the materialized query tables that reference the functions or alter the materialized query tables that reference the functions into base tables before issuing the ALTER FUNCTION statement.

SQLSTATE

42927

-20074	THE OBJECT <i>object-name</i> CANNOT BE CREATED BECAUSE THE FIRST THREE CHARACTERS ARE RESERVED FOR SYSTEM OBJECTS
---------------	---

Explanation

An attempt was made to create an object, but the name that was specified cannot be used because it begins with reserved characters.

object-name

The name of the object.

The following restrictions apply to object names:

Reserved prefix "SYS"

With a few exceptions, the string "SYS" is not permitted in the first three characters of an object name.

This message is also issued for a GRANT statement in response to an attempt to grant the CREATEIN, ALTERIN or DROPIN privileges on a schema with the "SYS" prefix. The same restrictions apply in this case.

Prefix "DSN"

A database name cannot consist of the string "DSN" followed by five digits.

Role names

Role names cannot start with any of the following strings:

- ACCESSCTRL
- DATAACCESS

- DBADM
- DBCTRL
- DBMAINT
- NONE
- NULL
- PACKADM
- PUBLIC
- SECADM
- SQLADM
- SYS

This condition is similar to the condition reported in precompiler message DSNH794I.

System action

The statement cannot be processed.

Programmer response

Select a name that does not start with a reserved string.

SQLSTATE

42939

Related reference

[Statements \(Db2 SQL\)](#)

[Reserved schema names and reserved words in Db2 for z/OS \(Db2 SQL\)](#)

[Administrative authorities in Db2 for z/OS \(Managing Security\)](#)

-20091	A VIEW NAME WAS SPECIFIED AFTER LIKE IN ADDITION TO THE INCLUDING IDENTITY COLUMN ATTRIBUTES CLAUSE
---------------	--

Explanation

The LIKE clause specified the name of a view in combination with the INCLUDING IDENTITY COLUMN ATTRIBUTES clause. This usage is not supported.

System action

The statement cannot be processed.

Programmer response

Remove the INCLUDING IDENTITY COLUMN ATTRIBUTES clause and resubmit the statement to copy the existing view definition without the identity column attributes.

In the case of DECLARE GLOBAL TEMPORARY TABLE, it is possible to get the identity column attributes for a column of a view using the AS *subselect* clause with INCLUDING IDENTITY COLUMN ATTRIBUTES instead. For example:

```
DECLARE GLOBAL TEMPORARY TABLE ....
AS (SELECT * FROM view-name) DEFINITION ONLY
INCLUDING IDENTITY COLUMN ATTRIBUTES
```

SQLSTATE

560AD

-20092	A TABLE OR VIEW WAS SPECIFIED IN THE LIKE CLAUSE, BUT THE OBJECT CANNOT BE USED IN THIS CONTEXT
--------	---

Explanation

The LIKE clause specified the name of a table or view that is not valid for one of the following reasons:

- If the object is a view, it is not allowed in the LIKE clause because the view includes a ROWID or XML column. This is not supported.
- If the object is a table, it is not allowed in the LIKE clause because it is defined as a clone of another table.

System action

The statement cannot be processed.

Programmer response

Specify the name of a view that does not contain a ROWID column (or distinct type column for which the source type is ROWID), or specify the name of a table and resubmit the statement.

Specify the name of a table that is not a clone table, if you specified a table in the LIKE clause that is defined as the clone of another table.

SQLSTATE

560AE

-20093	THE TABLE <i>table-name</i> CANNOT BE CONVERTED TO OR FROM A MATERIALIZED QUERY TABLE, OR THE MATERIALIZED QUERY TABLE PROPERTY CANNOT BE ALTERED. REASON CODE = <i>reason-code</i> .
--------	---

Explanation

The ALTER TABLE statement was not able to make one of the following changes:

- Change a table from a materialized query table to a base table.
- Change a base table to a materialized query table.
- Change the materialized query table properties.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 2 The table is not a materialized query table, and DROP MATERIALIZED QUERY is specified.
- 4 The table has at least one trigger defined.
- 5 The table has at least one check constraint defined.
- 6 The table has at least one unique constraint or index or has hash organization.
- 7 The table has at least one referential constraint defined.
- 8 The table is referenced in one of the following definitions:
 - The definition of an existing materialized query table
 - The definition of a view when altering to a system-maintained materialized query table
- 9 The table is referenced directly or indirectly (through a view, for example) in the fullselect.
- 10 The table is already a materialized query table.
- 11 The number of columns of the existing table does not match the number of columns that are defined in the select list of the fullselect.
- 12 The data types of the columns of the existing table do not exactly match the corresponding columns in the select list of the fullselect.
- 13 The column names of the columns of the existing table do not exactly match the corresponding column names in the select list of the fullselect.

- 14** The nullability, default, or other characteristics of the columns of the existing table do not match the characteristics of the corresponding columns in the select list of the fullselect.
- 15** The conversion cannot be performed if the same ALTER TABLE statement has other table alterations.
- 16** The table is not a materialized query table, and alteration of materialized query table properties was specified.
- 17** The table identifies a base table that is activated for row or column access control or for which a row permission or a column mask is defined.
- 19** The table cannot be defined as a materialized query table because it is a system-period temporal table, a history table, an archive-enabled table, or an archive table.

System action

The statement cannot be processed.

Programmer response

Take the action that corresponds to the *reason-code* value:

- 2** You do not need to convert this table. No action is required.
- 4** Drop any triggers, and resubmit the ALTER TABLE statement.
- 5** Drop any check constraints, and resubmit the ALTER TABLE statement.
- 6** Drop any unique constraint and unique indexes, and resubmit the ALTER TABLE statement.
- 7** Drop the referential constraints, and resubmit the ALTER TABLE statement.
- 8** Drop the materialized query table that references the table, and resubmit the ALTER TABLE statement.

- 9** A materialized query table cannot reference itself. Modify the fullselect to remove the direct or indirect reference to the table that is being altered.
- 10** The operation is not allowed since the table is already a materialized query table.
- 11** Modify the fullselect to include the correct number of columns in the select list.
- 12** Modify the fullselect so that the result column data types exactly match the data types of the corresponding existing columns.
- 13** Modify the fullselect so that the result column names exactly match the column names of the corresponding existing columns.
- 14** The table cannot be converted to a materialized query table unless the nullability characteristics can be matched. Create a new materialized query table instead.
- 15** Perform the other table alterations in an ALTER TABLE statement that do not include the ADD MATERIALIZED QUERY clause.
- 16** Take one of the following actions:
- Correct the table name to specify a materialized query table.
 - Use the ALTER TABLE statement to convert the table to a materialized query table with the required properties.
- 17** Take one of the following actions:
- Deactivate the access control and drop row permissions and column masks for the table.
 - Choose a different base table to convert to a materialized query table.
- 19** Take one of the following actions:
- Correct the table name to specify a table that is not a system-period temporal table, a history table, an archive-enabled table, or an archive table.
 - Alter the system-period temporal table with an ALTER TABLE statement that includes a DROP VERSIONING clause.

- Alter the archive-enabled table with an ALTER TABLE statement that includes a DISABLE ARCHIVE clause.

-20094 **THE COLUMN *column-name* IS A GENERATED COLUMN AND CANNOT BE USED IN THE BEFORE TRIGGER *trigger-name*.**

Explanation

The value for the indicated column is generated using an expression and cannot be named in the column name list of a BEFORE UPDATE trigger or set in a BEFORE trigger.

column-name

The name of the column.

trigger-name

The name of the trigger.

System action

The statement cannot be processed.

User response

Remove either the generated column from the column name list or the SET assignment statement that sets the new transition variable of a generated column, then resubmit the statement.

SQLSTATE

42989

-20100 **AN ERROR OCCURRED WHEN BINDING A TRIGGERED SQL STATEMENT. INFORMATION RETURNED: SECTION NUMBER : *section-number* SQLCODE *sqlerror*, SQLSTATE *sqlstate*, AND MESSAGE TOKENS *token-list***

Explanation

During execution of a CREATE TRIGGER statement, the SQL statements specified in the triggered action are bound into a trigger package. During that processing, an error was discovered in one of those statements.

section-number

The section number associated with the failing triggered SQL statement.

sqlcode

The SQLCODE received when binding the statement.

sqlstate

The corresponding SQLSTATE for the SQLCODE received when binding the statement.

token-list

The list of tokens from the original SQL error. This list might be truncated.

System action

The CREATE TRIGGER statement was not processed. The trigger and the trigger package were not created.

Programmer response

Use the section number determine the failing triggered SQL statement. Refer to the explanation of the reported SQLCODE. Follow the action suggested by that message.

SQLSTATE

56059

-20101 **THE FUNCTION *function-name* FAILED WITH REASON *reason-code***

Explanation

The statement attempted to process a function, but processing failed.

function-name

The name of the function that could not be processed, either a Db2 for z/OS function or a Db2 DLL and routine.

reason-code

A hexadecimal value that indicates the reason for the failure. Possible values are Db2 for z/OS codes 00E73001, 00E73002, 00E73003, and 00E73004, and the following values:

00A0C11C

CELAAUTH services attempted to load a DLL that does not exist. The DLL load failed.

The DLL is identified by the first part of the *function-name* value: *dll-name!routine-name*.

00A103B0

All existing Language Environment® environments are in use and the maximum number of Language Environments permitted has been reached. No additional environments can be created.

00A14348

During CELAAUTH services infrastructure initialization, CELAAUTH attempted to load the 64-bit Language Environment library. However, the load failed.

00D50006

The XMLPARSE or DSN_XMLVALIDATE function might be called implicitly. This reason code might also be issued when the XMLPARSE or DSN_XMLVALIDATE functions are implicitly invoked.

00D50007

The XMLPARSE or DSN_XMLVALIDATE function might be called implicitly. This reason code might also be issued when the XMLPARSE or DSN_XMLVALIDATE functions are implicitly invoked.

00D50008

The XMLPARSE or DSN_XMLVALIDATE function might be called implicitly. This reason code might also be issued when the XMLPARSE or DSN_XMLVALIDATE functions are implicitly invoked.

00D50009

The XMLPARSE or DSN_XMLVALIDATE function might be called implicitly. This reason code might also be issued when the XMLPARSE or DSN_XMLVALIDATE functions are implicitly invoked.

00D5000A

The XMLPARSE or DSN_XMLVALIDATE function might be called implicitly. This reason code might also be issued when the XMLPARSE or DSN_XMLVALIDATE functions are implicitly invoked.

System action

The statement cannot be processed.

Programmer response

Correct the condition that is described by the *reason-code* value.

00A0C11C

Make sure that the DLL that is identified by *function-name* is properly installed and is accessible to the Db2 subsystem.

00A103B0

No immediate action is required. If this situation occurs frequently, consider increasing the LEMAX parameter, which controls the maximum number of environments within the Db2 subsystem.

00A14348

Make sure that CELQLIB is in the library load search path.

**CREATE OR ALTER STATEMENT
FOR ROUTINE *routine-name*
SPECIFIED THE *option* OPTION
WHICH IS NOT ALLOWED FOR THE
TYPE OF ROUTINE**

Explanation

An option was specified that is not allowed for the type of routine being created or altered.

- MODIFIES SQL DATA is not allowed for table functions.
- ALLOW PARALLEL is not allowed for table functions.
- CARDINALITY is not allowed for non-table functions.
- LANGUAGE SQL is not allowed for non-SQL functions or procedures.
- LANGUAGE specifying something other than SQL is not allowed for SQL functions or procedures.
- LANGUAGE JAVA is not allowed for table functions.
- PARAMETER STYLE JAVA is not allowed for table functions.
- STOP AFTER FAILURE, STOP AFTER *n* FAILURES, or CONTINUE AFTER FAILURE are not allowed for sourced functions or SQL functions.

System action

The statement cannot be processed.

Programmer response

Remove the option from the statement and reissue the failing statement.

SQLSTATE

42849

-20104	AN ATTEMPT TO ALTER A CCSID FROM <i>from-ccsid</i> TO <i>to-ccsid</i> FAILED
---------------	---

Explanation

The statement attempted to alter the CCSID for a database or table space and the statement failed.

from-ccsid represents the CCSID that is currently in use for the database or table space.

to-ccsid is the CCSID that specified on the alter statement.

System action

The statement cannot be processed.

Programmer response

The SQL REFERENCE contains a list of CCSIDs that can be specified on this statement. Only these CCSIDs can be altered, and then, only to the corresponding value listed in the table. Altering the CCSID of a database

or table space to a value not listed in the table is not permitted.

SQLSTATE

42856

-20106	THE CCSID FOR THE TABLE SPACE OR DATABASE CANNOT BE CHANGED BECAUSE THE TABLE SPACE OR DATABASE ALREADY CONTAINS A TABLE THAT IS REFERENCED IN EXISTING VIEW, OR MATERIALIZED QUERY TABLE DEFINITIONS OR AN EXTENDED INDEX
---------------	---

Explanation

An ALTER statement cannot be used to alter the CCSID for a table space or database that contains a table that is referenced in an existing view, or materialized query table definitions, a table that already has an extended index, or a table that contains a LOB column.

System action

The statement cannot be processed.

Programmer response

To alter the CCSID for the specified space, complete the following steps:

1. Drop any existing view or materialized query table definitions that refer to tables contained in the identified space.
2. Drop all of the extended indexes created on the table.
3. Drop any LOB columns.
4. Reissue the ALTER statement.

SQLSTATE

42945

-20107	HOST VARIABLE OR PARAMETER NUMBER <i>position-number</i> CANNOT BE USED AS SPECIFIED BECAUSE REASON <i>reason</i>
---------------	--

Explanation

Db2 received data that could not be used as specified in the statement because it is not convertible to an acceptable format in this machine environment.

position-number identifies either the host variable number (if the message is issued as a result of an

INSERT, UPDATE, MERGE, DELETE, SELECT, SET, or VALUES statement), or the parameter number (if the message is issued as the result of a CALL statement, or the invocation of a function).

reason

01

IEEE (BFP) floating point instructions or instruction emulation is not available. This support is called the basic-floating-point-extensions facility, and is discussed in detail in [z/Architecture Principles of Operation](#).

System action

The statement cannot be processed.

Programmer response

This host variable or parameter requires machine instructions that are not available on this machine. These instructions must be available to Db2 to perform the requested operation. Run this statement on a machine that is capable of supporting the required operations. Contact your system administrator.

SQLSTATE

53022

-20108	A RESULT SET CONTAINS AN UNSUPPORTED DATA TYPE IN POSITION NUMBER <i>position-number</i> FOR CURSOR <i>cursor-name</i> OPENED BY STORED PROCEDURE <i>procedure-name</i>
---------------	--

Explanation

Stored procedure *procedure-name* cannot return one or more query result sets. *cursor-name* indicates the first query result set that the stored procedure cannot return. The column at *position-number* in the query result set contains a data type that is not supported by the requester or the server.

System action

The CALL statement cannot be executed.

Programmer response

Modify the stored procedure at the server to return result sets that include only data types that are supported by the requester. You may also upgrade the level of code at the requester to one that supports the data type(s) that were returned by the server.

SQLSTATE

56084

-20110	CANNOT IMPLICITLY CONNECT TO A REMOTE SITE WITH A SAVEPOINT OUTSTANDING
---------------	--

Explanation

The statement referenced an object at a remote DBMS with an alias or a three-part name when an active savepoint exists. Such a reference requires an implicit connection to the remote DBMS, which is not allowed when there is an outstanding savepoint.

System action

The statement cannot be processed.

Programmer response

Either release the savepoint, or move the data.

SQLSTATE

51036

-20111	CANNOT ISSUE SAVEPOINT, RELEASE SAVEPOINT, ROLLBACK TO SAVEPOINT FROM A TRIGGER, FROM A USER-DEFINED FUNCTION, OR FROM A GLOBAL TRANSACTION
---------------	--

Explanation

The following statements cannot be used in the body of a trigger, global transaction, or user-defined function:

- SAVEPOINT
- RELEASE SAVEPOINT
- ROLLBACK TO SAVEPOINT

System action

The statement cannot be processed.

Programmer response

Correct the logic of the application program so that this error does not occur.

SQLSTATE

3B503

[RELEASE SAVEPOINT statement \(Db2 SQL\)](#)

[ROLLBACK statement \(Db2 SQL\)](#)

-20117	A WINDOW SPECIFICATION FOR AN OLAP SPECIFICATION IS NOT VALID. REASON CODE = <i>reason-code</i>.
---------------	---

Explanation

The window specification (OVER clause) of an OLAP specification invocation is not correctly specified.

reason-code

The incorrect specification:

- 1**
RANGE or ROWS is specified without an ORDER BY clause in the window specification.
- 2**
RANGE is specified and the ORDER BY clause in the window specification includes more than one sort key expression.
- 3**
RANGE is specified and the data type of the range value cannot be used in a subtraction expression with the data type of the sort key expression in the ORDER BY clause in the window specification.

System action

The statement cannot be processed.

Programmer response

Take the action that corresponds to the *reason-code* value:

For *reason-code*:

- 1**
Add a window ORDER BY clause to each window specification that specifies RANGE or ROWS.
- 2**
Ensure that each window specification that includes RANGE has exactly one sort key expression in the window ORDER BY clause.
- 3**
For each window specification that includes RANGE, ensure that the range value can be subtracted from the sort key expression in the window ORDER BY clause, which must be a numeric type or datetime type. For datetime sort key expressions, the range value must be

the specific datetime duration decimal type with the correct precision and scale.

SQLSTATE

428EZ

-20120	AN SQL TABLE FUNCTION MUST RETURN A TABLE RESULT.
---------------	--

Explanation

An SQL function that specifies TABLE in the RETURNS clause must return a result that is a table.

System action

The statement cannot be processed.

User response

Either remove the TABLE keyword from the RETURNS clause to make it a scalar function or specify a fullselect in the RETURN statement of the TABLE function body.

SQLSTATE

428F1

-20123	CALL TO STORED PROCEDURE <i>procedure-name</i> FAILED BECAUSE THE RESULT SET RETURNED FOR CURSOR <i>cursor-name</i> IS SCROLLABLE, BUT THE CURSOR IS NOT POSITIONED BEFORE THE FIRST ROW
---------------	---

Explanation

A scrollable result set for a cursor has been returned by a call to a stored procedure, and one or more of these cursors is not positioned before the first row.

procedure-name

The name of the stored procedure.

cursor-name

The name of the cursor.

System action

The call to the stored procedure was unsuccessful. All result set cursors that are defined in the stored procedure were closed before returning to the caller. The scrollable cursor can not be used to fetch from the result set. Actions completed by the stored procedure are not rolled back, and any external actions initiated by the stored procedure have completed because the

error was detected upon completion of the stored procedure.

Programmer response

Modify the content of the stored procedure to ensure that the result set cursors are positioned before the first row before returning to the caller.

SQLSTATE

560B1

Related reference
[CALL statement \(Db2 SQL\)](#)

-20124	OPEN CURSOR <i>cursor</i> FAILED BECAUSE THE CURSOR IS SCROLLABLE BUT THE CLIENT DOES NOT SUPPORT THIS
---------------	---

Explanation

The cursor *cursor* has been defined as scrollable, but the client is downlevel and does not support scrollable cursors. The DRDA Application Requester is not able to process scrollable result sets.

System action

The statement cannot be processed.

Programmer response

Modify the definition of the cursor to not be scrollable.

SQLSTATE

560B2

-20125	CALL TO STORED PROCEDURE <i>procedure-name</i> FAILED BECAUSE THE RESULT SET FOR CURSOR <i>cursor-name</i> IS SCROLLABLE, BUT THE CLIENT DOES NOT SUPPORT THIS, REASON <i>reason-code</i>.
---------------	---

Explanation

A scrollable result set for a cursor has been returned by a CALL for a stored procedure, but the cursor has an attribute or is in a state that prevents it from being returned to the calling application.

procedure-name
The stored procedure that failed.

cursor-name
The scrollable cursor.

reason-code

A numeric value that indicates the reason for the failure. Possible values are:

- 0**
The cursor is scrollable, but the client is downlevel and does not support scrollable cursors. The DRDA Application Requester is not able to process scrollable result sets
- 1**
The cursor is declared on a server different from the one on which the stored procedure executes, and it contains one or more columns with an SQL type of XML. The calling application might be executing on the local Db2 system or on another DRDA requester system. The stored procedure executed one or more remote FETCH requests against the cursor, and the last remote FETCH request had one or more binary XML targets. Because the cursor is declared on another server, the last stored procedure FETCH request defines the format of XML data returned by the DRDA server to be binary XML. Returning such a cursor as a result set is not allowed for the local Db2 system or for the DRDA requester on which the calling application is executing.

System action

The statement cannot be processed. All result set cursors that are defined in the stored procedure were closed before returning to the caller. The scrollable cursor cannot be used to FETCH from the result set. Actions that were completed by the stored procedure are not rolled back, and any actions that were initiated by the stored procedure have completed because the error was detected at the end of the execution of the stored procedure.

Programmer response

Take the action that corresponds to the *reason-code* value:

- 0**
Modify the content of stored procedure *procedure-name* to not define result set cursors as scrollable.
- 1**
Make sure that fetches performed by the stored procedure do not cause the server to return XML columns as binary XML data.

SQLSTATE

560B3

-20127	VALUE SPECIFIED ON FETCH STATEMENT FOR ABSOLUTE OR RELATIVE IS TOO LARGE FOR DRDA
---------------	--

Explanation

The value that was specified after ABSOLUTE or RELATIVE on a FETCH statement is larger than 64 bits. DRDA limits this specification to 64 bits.

System action

The statement cannot be processed.

Programmer response

Modify the scroll specification on the FETCH statement.

SQLSTATE

54051

-20142	SEQUENCE <i>sequence-name</i> CANNOT BE USED AS SPECIFIED
---------------	--

Explanation

The sequence was referenced in a context in which it cannot be used.

sequence-name

The name of the sequence.

The sequence was an invalid reference to a system-generated sequence object. The sequence was generated by the system for one of the following column types: catalog, identity, or DB2_GENERATED_DOCID_FOR_XML. These sequences cannot be referenced in:

- An ALTER SEQUENCE statement
- A DROP SEQUENCE statement
- A COMMENT statement to specify a comment for a sequence
- A CREATE ALIAS statement to define an alias for a sequence
- A GRANT or REVOKE statement that references the sequence
- A NEXT VALUE or PREVIOUS VALUE expression.

This error can also be issued when Db2 is implicitly creating a sequence which makes the incomplete definition of an existing alias for a sequence invalid, because an alias for a sequence cannot be defined on a system-generated sequence.

System action

The statement cannot be processed.

Programmer response

Specify the name of a user-defined sequence object in this context.

SQLSTATE

428FB

-20143	THE ENCRYPTION OR DECRYPTION FUNCTION FAILED, BECAUSE THE ENCRYPTION PASSWORD VALUE IS NOT SET
---------------	---

Explanation

The ENCRYPTION PASSWORD value is not set.

System action

The statement cannot be processed.

Programmer response

Issue the SET ENCRYPTION PASSWORD statement to set the ENCRYPTION PASSWORD value. The length of the PASSWORD must be a minimum of 6 bytes and a maximum of 127 bytes.

SQLSTATE

51039

-20144	THE ENCRYPTION IS INVALID BECAUSE THE LENGTH OF THE PASSWORD WAS LESS THAN 6 BYTES OR GREATER THAN 127 BYTES
---------------	---

Explanation

The data must be encrypted with a password length in the range 6–127 bytes.

System action

The statement cannot be processed.

Programmer response

Ensure that your password length is between 6 and 127 bytes in length.

SQLSTATE

428FC

-20146	THE DECRYPTION FAILED. THE DATA IS NOT ENCRYPTED
---------------	---

Explanation

The data must be encrypted before it is decrypted.

System action

The statement cannot be processed.

Programmer response

Ensure that the data being decrypted has been encrypted using the ENCRYPT_TDES built-in-function.

SQLSTATE

428FE

-20147	THE ENCRYPTION FUNCTION FAILED. MULTIPLE PASS ENCRYPTION IS NOT SUPPORTED
---------------	--

Explanation

Data that has already been encrypted, cannot be encrypted again.

System action

The statement cannot be processed.

Programmer response

Ensure that the data that is being encrypted has not already been encrypted.

SQLSTATE

55048

-20148	A RETURN STATEMENT DOES NOT EXIST OR WAS NOT INVOKED DURING THE EXECUTION OF ROUTINE <i>routine-name</i> WITH SPECIFIC NAME <i>specific-name</i>.
---------------	--

Explanation

The SQL function must contain at least one RETURN statement and a RETURN statement must be processed when the function is invoked.

routine-name

The name of the routine

specific-name

The specific function name, which is unique within the schema

System action

The statement cannot be processed.

User response

Ensure that a RETURN statement is executed when the function is invoked.

SQLSTATE

429BD

-20163	HEXADECIMAL CONSTANT GX IS NOT ALLOWED
---------------	---

Explanation

A hexadecimal graphic string constant, GX, was used in a statement when one of the following two conditions was true:

- The MIXED DATA installation option is set to NO.
- The application encoding scheme is UNICODE.
- The GX constant was specified as a column default value in a WITH DEFAULT clause.
- The GX constant was specified as a limit key value in an ENDING AT clause.

System action

The statement cannot be processed.

Programmer response

If your data is not graphic, use an X hexadecimal constant instead of a GX constant. If your MIXED DATA installation option is set to NO, contact your system administrator to set up the installation options properly for use with the GX constant. If your application encoding scheme is UNICODE, use a UX hexadecimal constant instead of GX.

SQLSTATE

560B9

-20165	AN SQL DATA CHANGE STATEMENT WITHIN A FROM CLAUSE IS NOT ALLOWED IN THE CONTEXT IN WHICH IT WAS SPECIFIED
---------------	--

Explanation

An SQL data change statement cannot be specified in the FROM clause in specific contexts.

The SQL data change statement must be the only *table-reference* in the FROM clause that is used in:

- the outer fullselect of a SELECT statement (a subselect)
- a SELECT INTO statement

An SQL data change statement cannot be specified in the FROM clause of a fullselect that is used in the default clause of the definition of a global variable.

System action

The statement cannot be processed.

Programmer response

Change the statement so that the SQL data change statement within a FROM clause is used in a supported context or is the only *table-reference* in the FROM clause.

SQLSTATE

428FL

-20166	AN SQL DATA CHANGE STATEMENT WITHIN A SELECT SPECIFIED A VIEW <i>view-name</i> WHICH IS NOT A SYMMETRIC VIEW OR COULD NOT HAVE BEEN DEFINED AS A SYMMETRIC VIEW
---------------	--

Explanation

The target view of the SQL data change statement within a SELECT statement must be defined WITH CASCADED CHECK OPTION, or the fullselect in the view definition (or the fullselect of a view definition of a referenced view) must be able to be defined using WITH CASCADED CHECK OPTION.

A symmetric view is a view defined implicitly or explicitly with the WITH CASCADED CHECK OPTION.

System action

The statement cannot be processed.

Programmer response

Do not use the SQL data change statement within a SELECT with the specified view.

SQLSTATE

428FM

-20177	SET DATA TYPE CLAUSE ON ALTER TABLE SPECIFIED FLOATING POINT, BUT THIS CHANGE IS DISALLOWED
---------------	--

Explanation

The SET DATA TYPE clause of an ALTER TABLE statement specified floating point as the new data type. However, there is an existing unique index or constraint that is defined on the column. This type of change is not allowed when unique indexes or constraints are defined on the column to be changed.

Programmer response

Change the statement to specify a different compatible data type, and resubmit the statement.

SQLSTATE

530A1

-20178	VIEW <i>view-name</i> ALREADY HAS AN INSTEAD OF <i>operation</i> TRIGGER DEFINED
---------------	---

Explanation

The view *view-name* already has an INSTEAD OF trigger defined for the indicated operation (UPDATE, DELETE, INSERT). Only one INSTEAD OF trigger can be defined for each operation on the view.

System action

The statement cannot be processed. The INSTEAD OF trigger was not created.

Programmer response

If a new INSTEAD OF trigger is required, drop the existing trigger and then create the new trigger.

SQLSTATE

428FP

-20179	THE INSTEAD OF TRIGGER CANNOT BE CREATED BECAUSE THE VIEW <i>view-name</i> IS DEFINED USING THE WITH CHECK OPTION
---------------	--

Explanation

An INSTEAD OF trigger cannot be defined on a symmetric view, which is a view defined using WITH CHECK OPTION. It also cannot be defined on a view on which a symmetric view has been defined directly or indirectly. The view *view-name* might be the target view of the INSTEAD OF trigger, or it might be a view that depends directly or indirectly on the target view of the trigger.

System action

The statement cannot be processed. The INSTEAD OF trigger was not created.

Programmer response

The INSTEAD OF trigger cannot be defined on the view unless the symmetric view is replaced by a view that is not symmetric. The view has to be dropped and re-created in order to allow an INSTEAD OF trigger.

SQLSTATE

428FQ

-20180	COLUMN <i>column-name</i> IN TABLE <i>table-name</i> CANNOT BE ALTERED AS SPECIFIED
---------------	--

Explanation

The column could not be altered.

column-name

The name of the column.

table-name

The name of the table that contains the column.

Possible reasons for this error include a violation of one of the following restrictions:

- ALTER COLUMN cannot be specified in an ALTER TABLE statement if any of the following conditions are true:
 - The table is defined with DATA CAPTURE CHANGES.
 - The column is involved in a referential integrity constraint (either as part of the parent key or foreign key).
 - The column is involved in an extended index definition.
 - The column has a field procedure defined.
 - The column is an identity column or a row change timestamp column.

- The column is a LOB column that is referenced in an expression-based index, and the change would reduce the inline length of the column.
- The table is defined as a history table, system-period temporal table, archive table, or archive-enabled table.
- The column is defined as ROW BEGIN, ROW END, or TRANSACTION START ID.
- The column is involved in a hash key definition.
- The table is referenced, directly or indirectly, in the definition of a materialized query table.
- The column is a generated expression column.
- ALTER COLUMN cannot be specified in an ALTER TABLE statement with either a SET NOT NULL or SET DATA TYPE clause if the column is defined as part of a period definition.
- ALTER COLUMN cannot be specified in an ALTER TABLE statement with a DROP DEFAULT or SET DATA TYPE clause if both of the following conditions are true:
 - The table is defined with DATA CAPTURE CHANGES.
 - The subsystem parameter RESTRICT_ALT_COL_FOR_DCC is set to YES.
- SET DATA TYPE cannot be specified in an ALTER TABLE statement if any of the following conditions are true:
 - The table is a materialized query table.
 - The table has an edit procedure or valid procedure.
 - The column is involved in an extended index definition.
 - VARBINARY was specified as the target data type and the column is defined with the following attributes:
 - As CHAR FOR BIT DATA, VARCHAR FOR BIT DATA, or BINARY
 - With the DESC attribute in an index

System action

The statement cannot be processed.

Programmer response

Perform one of the following actions:

- Change the name of the column in the statement to a column that can be altered.
- Drop and re-create the table with the necessary attributes.

- If the column is used in an index that contains an expression, drop the index and alter the column with the necessary attributes. Then, re-create the index.

SQLSTATE

428FR

[CREATE TABLE statement \(Db2 SQL\)](#)

-20181 **COLUMN CANNOT BE ADDED TO INDEX *index-name***

Explanation

An attempt was made to add a column to an index, but the column could not be added.

index-name

The name of the index.

The column could not be added because of limitations on the clause specified for the ALTER INDEX statement:

ALTER INDEX ADD COLUMN

The column cannot be added for any of a variety of reasons, including those shown below:

- The index is an auxiliary index.
- The index enforces uniqueness of values for a ROWID column.
- The index is a partitioning index, and index-based partitioning is being used.
- The index is an XML index.
- The index is an extended index.
- The index is defined with a period with the WITHOUT OVERLAPS clause.
- The index has at least one INCLUDE column.
- The index enforces a primary key, unique key, or referential constraint.
- The index is required for a temporal referential constraint.

ALTER INDEX ADD INCLUDE

The column cannot be added for any of a variety of reasons, including those shown below:

- The index is an auxiliary index.
- The index is a non-unique index.
- The index is a partitioning index, and index-based partitioning is being used.

- The index is an XML index.
- The index is an extended index (such as an expression-based index).
- The index is defined with a period with the WITHOUT OVERLAPS clause.
- The index is required for a temporal referential constraint.

System action

The statement cannot be processed.

Programmer response

Change the statement to refer to an index that can have a column added to it, or drop and re-create the index, including all of the required columns.

SQLSTATE

428FS

[ALTER INDEX statement \(Db2 SQL\)](#)

-20182 **PARTITIONING CLAUSE *clause* ON *stmt-type* STATEMENT FOR *index-name* IS NOT VALID**

Explanation

The *values* PARTITIONING clause was not accepted on CREATE or ALTER INDEX statement for one of the following reasons:

- On ALTER INDEX, if the table uses *table-based* CONTROLLED partitioning, or if the index is a partitioning index created in Version 8 or later releases.
- On CREATE INDEX, *values* partitioning attributes were specified on a previous CREATE or ALTER TABLE statement for the table.
- On CREATE INDEX, if the partitioning scheme of the index is predetermined by that of the underlying data.
- On ALTER TABLE, when altering partition limit key values, if there are any large object (LOB) columns in the table.

System action

The statement cannot be processed.

Programmer response

Change the name of the index to an index for which the *values* partitioning clause would be valid, and resubmit the statement.

SQLSTATE

530A2

-20183	THE PARTITIONED, ADD PARTITION, ADD PARTITIONING KEY, ALTER PARTITION, ROTATE PARTITION, OR PARTITION BY RANGE CLAUSE SPECIFIED ON CREATE OR ALTER FOR <i>table-name</i> IS NOT VALID
--------	---

Explanation

A clause was specified for a statement, but the clause is not valid for the indicated table.

table-name

The name of the table.

The PARTITIONED, ADD PARTITION, ADD PARTITIONING KEY, ALTER PARTITION, and ROTATE PARTITION clauses cannot be specified on ALTER TABLE, CREATE INDEX, or CREATE TABLE in the following cases:

- The table is a non-partitioned table.
- The table is a materialized query table or a materialized query table is defined on this table. This restriction does not apply if the clause was an ALTER PARTITION clause to alter the limit key or a ROTATE PARTITION clause to rotate partitions.
- The table is in a partition-by-growth table space. (If a PARTITION BY size clause was specified on the CREATE TABLE statement, the table is created in a partition-by-growth table space.)
- The ENDING clause of the ADD PARTITION clause on the ALTER TABLE statement cannot be specified for the partition-by-growth table space.
- The ENDING clause of the ADD PARTITION clause on the ALTER TABLE statement must be specified for the partition-by-range table space.
- The index is defined with the BUSINESS_TIME WITHOUT OVERLAPS clause.
- The ADD PARTITIONING KEY clause cannot be specified if the table is already complete by having established either table-based partitioning or index-based partitioning.
- The ADD PARTITION clause must not be specified for an implicitly created XML table that is defined with range partitioning.

- The ROTATE PARTITION clause cannot be specified if:
 - The table definition is incomplete.
 - The table contains only one partition.

System action

The statement cannot be processed.

SQLSTATE

428FT

-20185	CURSOR <i>cursor-name</i> IS NOT DEFINED TO ACCESS ROWSETS, BUT A CLAUSE WAS SPECIFIED THAT IS VALID ONLY WITH ROWSET ACCESS
--------	--

Explanation

The FOR ROW *n* OF ROWSET clause was specified on a FETCH statement, but the cursor is not defined for rowset access.

System action

The statement cannot be processed.

Programmer response

Remove the FOR *n* ROWS clause from the FETCH statement, or redefine the cursor for multiple row access with the WITH ROWSET POSITIONING clause on DECLARE CURSOR or PREPARE.

SQLSTATE

24518

-20186	A CLAUSE SPECIFIED FOR THE DYNAMIC SQL STATEMENT BEING PROCESSED IS NOT VALID
--------	---

Explanation

A clause was not valid for one of the following reasons:

On PREPARE statements:

- A FOR SINGLE ROW or FOR MULTIPLE ROWS clause was specified. However, the statement that was being prepared was not a FOR *n* ROWS form of INSERT statement or a MERGE statement.
- An ATOMIC or NOT ATOMIC clause was specified. However, the statement that was being prepared was not a FOR *n* ROWS form of INSERT statement.

- A *rowset-positioning* clause was specified. However, the statement that was being prepared was not a *select-statement*.
- A cursor was defined with SENSITIVE DYNAMIC or SENSITIVE STATIC, but the *select-statement* contained an SQL data change statement, such as an INSERT, UPDATE, MERGE, or searched DELETE statement.
- A SENSITIVE DYNAMIC clause and SCROLL clause were specified. However, the content of the query requires the use of a temporary table for processing.
- A SENSITIVE DYNAMIC clause and an OFFSET clause, or a FETCH clause were specified.

This error can be issued when one of the conflicting clauses is specified in the statement being prepared and the other clause is specified as a prepare attribute, or when one clause is specified as a prepare attribute and the other clause is specified as part of the declaration of a cursor.

On EXECUTE statements:

- A *source-row-data* clause was specified. However, the statement that was being executed was not a FOR *n* ROWS form of INSERT statement or a MERGE statement.
- A *source-row-data* clause was not specified. However, the statement that was being executed was a FOR *n* ROWS form of INSERT statement or MERGE statement and FOR MULTIPLE ROWS was specified as part of the ATTRIBUTES clause on the PREPARE statement.
- A FOR *n* ROWS clause was specified. However, the statement that was being executed was not a FOR *n* ROWS form of INSERT statement.
- A FOR *n* ROWS clause was specified. However, the statement that was being executed was not a FOR *n* ROWS form of INSERT statement that was prepared with FOR MULTIPLE ROWS specified as part of the ATTRIBUTES clause on the PREPARE statement.
- A FOR *n* ROWS clause was specified. However, the INSERT statement or the MERGE statement that was being executed also contained a FOR *n* ROWS clause.
- Host-variable arrays were provided. However, the FOR *n* ROWS clause was not specified (on either the EXECUTE or INSERT or MERGE statement).

System action

The statement cannot be processed.

Programmer response

Remove the clause that was not valid in the context in which it was used.

-20200

THE INSTALL OR REPLACE OF *jar-id* WITH URL *url* FAILED DUE TO REASON *reason-code*-(*reason-string*).

Explanation

The URL that was specified on the install or replace JAR procedure did not identify a valid JAR file.

jar-id

Name of the JAR that was specified for SQLJ.INSTALL_JAR or SQLJ.REPLACE_JAR

url

Up to 80 characters of the URL are displayed.

The following list shows the possible values for *reason-code* -(*reason-string*):

1 (FILE NOT FOUND)

No HFS file was found with the name specified.

2 (URL FORMAT)

The URL must begin with 'file:/' or 'file://'.

3 (FILE SIZE)

The file must not be larger than 100MB.

System action

The statement cannot be processed.

User response

Reissue the install or replace the JAR procedure with a URL that identifies a valid JAR file.

SQLSTATE

46001

-20201

THE INSTALL, REPLACE, REMOVE, OR ALTER OF *jar-name* FAILED DUE TO REASON *reason-code*-(*reason-string*).

Explanation

The JAR name *jar-name* that was specified on the alter, install, replace, or remove JAR procedure is not valid. For example, this message is issued for the following reasons:

- The JAR name has the improper format.
- The JAR cannot be installed because it already exists.
- The JAR cannot be altered, replaced, or removed because it does not exist.

The following list shows the possible values for *reason-code-(reason-string)*:

1 (UNDEFINED JAR)

A JAR with the name specified on ALTER_JAVA_PATH, REPLACE_JAR, or REMOVE_JAR does not exist in Db2.

2 (SCHEMA LENGTH)

In the *jar-name* parameter, the schema delimiter period('.') appears after more than 128 bytes, but the schema has a maximum length of 128 bytes.

3 (NAME LENGTH)

In the *jar-name* parameter, more than 128 bytes appear after the schema delimiter or the default schema is used, and the JAR name exceeds the maximum length of 128 bytes.

4 (PARSER ERROR)

During ALTER_JAVA_PATH, INSTALL_JAR, or REMOVE_JAR processing, the Db2 parser was invoked and returned an error message. This error can occur due to invalid characters or an invalid length of the *jar-name* parameter.

5 (DUPLICATE JAR)

A JAR with the name specified on INSTALL_JAR already exists in Db2.

System action

The statement cannot be processed.

User response

Take the following actions as appropriate:

- Ensure that the JAR identifier has the correct format.
- If the JAR already exists, remove it before you reinstall it.
- If you want to alter, remove, or replace procedures within the JAR, ensure that the JAR exists.

SQLSTATE

46002

-20202

THE REMOVE OF *jar-name* FAILED
AS *class* IS IN USE

Explanation

The specified JAR file is currently in use by an existing routine.

jar-name

The JAR that is being removed.

class

The string, 'CLASS'

System action

The statement cannot be processed.

User response

Ensure that all routines that reference the JAR file that is being removed are dropped, and resubmit the remove procedure.

SQLSTATE

46003

-20203

USER-DEFINED FUNCTION OR
PROCEDURE *name* HAS A JAVA
METHOD WITH AN INVALID
SIGNATURE. THE ERROR IS AT OR
NEAR PARAMETER *number*. THE
SIGNATURE IS *signature*.

Explanation

The signature of the java method that was used to implement the function or procedure was invalid. For example, the method may have parameters that are not mappable to the parameters on the corresponding CREATE PROCEDURE statement.

name

identifies the specific name of the external Java function or procedure whose signature caused the error

number

indicates the position of the parameter within the signature closest to the error

signature

provides at most the first 100 characters of the invalid signature

System action

The statement cannot be processed.

Programmer response

Reissue the corresponding CREATE statement specifying parameters that match the Java method, or correct the specified procedure or function signature.

SQLSTATE

46007

-20204	THE USER-DEFINED FUNCTION OR PROCEDURE <i>routine-name</i> WAS UNABLE TO MAP TO A SINGLE JAVA METHOD
---------------	---

Explanation

A CREATE or ALTER FUNCTION or PROCEDURE statement for *routine-name* specified a Java method in the EXTERNAL NAME clause that cannot be used. The EXTERNAL NAME clause did not contain a matching Java method, or contained more than one matching Java method.

System action

The statement cannot be processed.

Programmer response

The EXTERNAL NAME clause of the identified function or procedure must be altered to uniquely identify a valid Java method for the routine, or the Java class must be changed to have a single method with the specified or implicit signature.

SQLSTATE

46008

-20207	THE INSTALL OR REMOVE OF <i>jar-name</i> SPECIFIED THE USE OF A DEPLOYMENT DESCRIPTOR.
---------------	---

Explanation

The DEPLOY or UNDEPLOY parameter of the install or remove jar procedure for *jar-name* was non-zero. Use of deployment descriptors is not supported, and this parameter must be zero.

System action

The JAR is not installed, or removed.

User response

Reissue the INSTALL_JAR or REMOVE_JAR procedure call with the DEPLOY or UNDEPLOY parameter set to zero.

SQLSTATE

46501

-20210	THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS PRECOMPILED AT A LEVEL THAT IS INCOMPATIBLE WITH THE CURRENT VALUE OF THE ENCODING BIND OPTION OR SPECIAL REGISTER
---------------	---

Explanation

The SQL statement was precompiled at a level prior to DB2 version 7, but the current value of the ENCODING bind option or special register does not represent the system EBCDIC CCSIDs. The information that is necessary to execute the SQL statement is unavailable for processing, and the SQL statement cannot be successfully completed. Additional processing of the SQL statement is terminated.

An application that was precompiled prior to DB2 version 7 may not be bound, either implicitly or explicitly, with an ENCODING bind option of anything other than ENCODING(EBCDIC) or ENCODING(*ccsid*) where *ccsid* represents the system EBCDIC CCSID. If the value of MIXED DATA for the system is YES, then *ccsid* must be the default EBCDIC mixed CCSID. Otherwise, *ccsid* must be the default EBCDIC single byte CCSID.

System action

The statement cannot be processed.

Programmer response

To correct the situation, you can:

- Precompile the program again using the current precompiler and reissue the BIND command
- Reissue the BIND command using ENCODING(EBCDIC) or ENCODING(*ccsid*) where *ccsid* represents the system EBCDIC CCSID.

SQLSTATE

560B8

-20211	THE SPECIFICATION ORDER BY, OFFSET, OR FETCH FIRST N ROWS ONLY IS INVALID
---------------	--

Explanation

An ORDER BY, OFFSET, or FETCH FIRST *n* ROWS ONLY clause is not allowed:

- In the outer fullselect of a view definition
- In a subselect that is not the outermost fullselect
- In the outer fullselect in the RETURN statement of an SQL table function

An OFFSET or FETCH FIRST *n* ROWS ONLY clause is not allowed:

- In the outer fullselect of a materialized query table definition

System action

The statement cannot be processed.

Programmer response

Correct the failing statement. If the failing statement is CREATE VIEW, specify the invalid clause in SQL statements that refer to the view instead.

SQLSTATE

428FJ

-20212 **USER-DEFINED ROUTINE *name* ENCOUNTERED AN EXCEPTION ATTEMPTING TO LOAD JAVA CLASS *class-name* FROM JAR *jar-name*. ORIGINAL EXCEPTION: *exception-string***

Explanation

A Java exception occurred while Db2 was trying to load a Java class. The error can occur when loading the class that is identified in the EXTERNAL NAME clause, or a referenced class.

The error can also occur when accessing the installed JAR identified in the EXTERNAL NAME clause, or an installed JAR in the Java path of the installed JAR that referenced this class. Possible reasons why this message could occur include:

- A class was not found.
- An I/O error occurred when the class loader reads the JAR file.
- An SQL error occurred when the BLOB that contains the JAR file from the Db2 catalog is being read by the class loader.

name

The specific name of the external Java function or procedure that caused the ClassNotFoundException.

class-name

The Java class that Db2 was trying to load when the error occurred.

jar-name

The JAR file that the class was being loaded from (if any JAR files happen to be involved in the class loading process).

exception-string

The partial text of the underlying JAVA exception of the toString(), which resulted in this ClassNotFoundException (if any class is found in the search).

System action

The statement cannot be processed. A DSNX961 message describing the error will be displayed on the z/OS system console.

Programmer response

Correct the condition that is reported by the *exception-string*.

SQLSTATE

46103

-20213 **STORED PROCEDURE *procedure-name* HAS RETURNED A DYNAMIC RESULT SET, PARAMETER *number*, THAT IS NOT VALID**

Explanation

A Java Stored Procedure has either returned a DYNAMIC RESULT SET parameter that is not an instance of the Java class that was used by the JDBC driver to represent a ResultSet, or it returned a DYNAMIC RESULT SET produced by a nested stored procedure.

procedure-name

identifies the external Java procedure whose returned parameter caused the error.

number

indicates the position of the parameter whose returned class was invalid.

System action

The CALL statement fails.

Programmer response

Recreate the Java method to make all returned DYNAMIC RESULT SET parameters be instances of the class produced by the Db2 Universal JDBC Driver (com/ibm/db2/jcc/t2zos/SPResultSet), and not be a DYNAMIC RESULT SET from a nested stored procedure.

SQLSTATE

46502

-20223	THE OPERATION FAILED. ENCRYPTION FACILITY NOT AVAILABLE <i>return-code, reason- code</i>
---------------	---

Explanation

The encryption facility is not available, or not able to service the encryption or decryption request.

System action

The statement cannot be processed.

Programmer response

If the encryption facility is not installed, install it before you use the ENCRYPT_TDES, DECRYPT_BINARY, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB, HASH_CRC32, HASH_MD5, HASH_SHA1, HASH_SHA256 functions or data set encryption. If the encryption facility is installed, verify that it is working correctly. The *return-code* and *reason-code* might give further information about why this message was issued.

Check for RACF and Db2 messages on the console for additional information.

SQLSTATE

560BF

-20224	ENCRYPTED DATA THAT WAS ORIGINALLY A BINARY STRING CANNOT BE DECRYPTED TO A CHARACTER STRING
---------------	---

Explanation

The DECRYPT_BIT, DECRYPT_CHAR, or DECRYPT_DB function was invoked with an argument that represents an encrypted string that was originally a binary string. A binary string cannot be cast to a character string using the DECRYPT_BIT, DECRYPT_CHAR, or DECRYPT_DB function.

System action

The statement cannot be processed.

Programmer response

The encrypted value can only be decrypted using the DECRYPT_BINARY function.

SQLSTATE

22528

-20227	REQUIRED CLAUSE IS MISSING FOR ARGUMENT <i>number OF expression</i>
---------------	--

Explanation

The *expression* expression requires that a clause be specified for argument *number*.

- If *expression* is XMLATTRIBUTES, then an AS clause is required for the XML attribute name.
- If *expression* is XMLFOREST, then an AS clause is required for the XML element name.

System action

The statement cannot be processed.

Programmer response

Correct the statement by providing the required clause for the argument.

SQLSTATE

42633

-20228	A STACKED DIAGNOSTICS AREA IS NOT AVAILABLE
---------------	--

Explanation

A stacked diagnostics area is only accessible from within a handler in a native SQL routine.

System action

The statement was processed.

Programmer response

Modify the application logic so that the STACKED diagnostic is only accessed from within a handler. If the routine is an external SQL procedure, STACKED cannot be used.

SQLSTATE

0Z002

-20232	CHARACTER CONVERSION FROM CCSID <i>from-ccsid</i> TO <i>to-ccsid</i> FAILED WITH ERROR CODE <i>error-code</i> FOR TABLE <i>dbid.obid</i> COLUMN <i>column-number</i> REQUESTED BY <i>csect-name</i>
---------------	--

Explanation

A conversion error occurred during the conversion of a string to a different coded character set.

from-ccsid

identifies the coded character set of the string to be converted.

to-ccsid

identifies the coded character set to which it must be converted.

error-code

indicates the type of error as defined as follows:

- 8 - Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 20 -Conversion procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).
- 24 - The conversion services have not been setup correctly or the conversion is not supported.

dbid.obid

gives the database id and the table obid of the object with the conversion error. This could be either the target or the source of the conversion.

column-number

gives the column number of the failing object. This could be either the target or the source of the conversion.

csect-name

describes the reason codes returned from Db2. Reason codes returned from Db2 begin with 'DSN'

and identify the context in which the conversion was requested. Values other than those that start DSN' are returned from other Db2 platforms and are described in the documentation for the platform.

System action

The statement cannot be processed.

Programmer response

If the error-code is 24 and the conversion request is correct, you might need to set up character conversion.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data](#) (Collecting data).

SQLSTATE

57017

Related concepts

-20235	THE COLUMN <i>column-name</i> CANNOT BE ADDED, ALTERED, or DROPPED BECAUSE <i>table-name</i> IS A MATERIALIZED QUERY TABLE
---------------	---

Explanation

The alter table statement attempted to add, alter, or drop column *column-name* of materialized query table *table-name*. This is not allowed.

System action

The statement cannot be processed.

Programmer response

Columns of materialized query tables cannot be added, altered, or dropped. Alter the materialized query table to become a regular table before adding, altering, or dropping a column.

SQLSTATE

428FY

-20240 **INVALID SPECIFICATION OF A SECURITY LABEL COLUMN** *table-name.column-name* **REASON CODE** *reason-code*

Explanation

For a security label column the specification of an attribute in a CREATE TABLE, or ALTER TABLE, DECLARE GLOBAL TEMPORARY TABLE, or CREATE GLOBAL TEMPORARY TABLE statement might be invalid.

table-name

The name of the table.

column-name

The name of the column.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The underlying data type of the security label column is not supported. A security label column must be defined as CHAR(8) for single-byte data.

2

An edit procedure that is defined with row attribute sensitivity was specified for the table with a security label column.

3

A security label column must be defined as NOT NULL WITH DEFAULT.

4

A security label column DEFAULT cannot be altered.

5

A security label column cannot be defined for a created global temporary table.

6

The data type of a security label column cannot be altered.

7

A security label column cannot be defined for a table that is the source for a materialized query table.

8

A check constraint cannot specify a security label column.

9

A security label column cannot be defined for an accelerator-only table.

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and resubmit the statement.

SQLSTATE

42963

-20248 **ATTEMPTED TO EXPLAIN STATEMENT WITH STMTID OR STMTOKEN *ID-token* BUT THE REQUIRED EXPLAIN INFORMATION IS NOT ACCESSIBLE. REASON** *reason-code*

Explanation

The EXPLAIN statement cannot be executed because the required EXPLAIN information is not accessible for reason identified by the *reason-code* value.

ID-token

The identifier or token of the SQL statement.

reason-code

One of the following values:

01

The current user is not authorized to capture to invoke EXPLAIN for the qualified statement in the dynamic statement cache.

02

The dynamic statement cache contains no qualified statements.

07

The current user is not authorized to invoke EXPLAIN for the stabilized dynamic query.

08

The SYSIBM.SYSDYNQRY catalog table contains no qualified statements.

09

The identified statement is not an explainable statement.

System action

The statement cannot be processed.

Programmer response

If the *reason-code* value indicates an authorization problem, complete the following steps:

1. Correct the authorization problem and reissue the EXPLAIN statement.
2. Re-prepare the statement that is to be explained.

SQLSTATE

26501

-20249 **THE PACKAGE *package-name* NEEDS TO BE REBOUND IN ORDER TO BE SUCCESSFULLY EXECUTED (*required-maintenance*)**

Explanation

A version inconsistency exists between one or more SQL statements in a package and the system that is attempting to process the statement or statements.

package-name

The name of the package that contains the statement or statements.

required-maintenance

An IBM APAR number that identifies required maintenance, if applicable.

Possible reasons for this message include:

- The package was bound on a system with an older maintenance level that is no longer supported.
- The package was bound on a newer maintenance level, but it was sent to execute on a system with an older maintenance level.
- The package contains a static cursor statement that was bound on a system with an older release than the UPDATE or DELETE WHERE CURRENT OF cursor statement.

System action

The statement cannot be processed.

Programmer response

Take the action that is indicated by the *required-maintenance* value:

An APAR number

Review the instructions provided with the indicated APAR, and apply the APAR to the data sharing member where the SQL code is issued.

Any other value

Rebind the package on a system with the appropriate maintenance level.

SQLSTATE

560C5

-20252 **DIAGNOSTICS AREA FULL. NO MORE ERRORS CAN BE RECORDED FOR THE NOT ATOMIC STATEMENT**

Explanation

A statement with the NOT ATOMIC CONTINUE ON SQLEXCEPTION clause encountered more errors than could be recorded in the diagnostics area. NOT ATOMIC processing with CONTINUE ON SQLEXCEPTION allows Db2 to continue processing a statement after one or more errors is encountered. Db2 will continue processing until it is no longer able to record errors in the diagnostic area (See the GET DIAGNOSTICS statement for information on how to retrieve error information). When Db2 is no longer able to record error diagnostics, processing of the statement is terminated, and this error is returned.

System action

The statement is terminated.

Programmer response

Analyze the warning and error conditions using the GET DIAGNOSTICS statement. Determine how to change the statement to eliminate or reduce the number of warnings and errors. It is up to the programmer to determine if a ROLLBACK or COMMIT should be issued for this message. Either is appropriate depending on the application logic.

SQLSTATE

429BI

-20257 **FINAL TABLE IS NOT VALID WHEN THE TARGET VIEW *view-name* OF THE SQL DATA CHANGE**

STATEMENT IN A FULLSELECT HAS AN INSTEAD OF TRIGGER DEFINED

Explanation

The fullselect includes an INSERT, UPDATE, or MERGE statement that targets a view that has an INSTEAD OF trigger defined for the SQL data change operation. The FINAL TABLE results of an INSTEAD OF trigger cannot be returned.

System action

The statement cannot be processed.

Programmer response

Drop the INSTEAD OF trigger, and reissue the statement.

SQLSTATE

428G3

-20258	INVALID USE OF INPUT SEQUENCE ORDERING
--------	---

Explanation

The ORDER BY clause specifies INPUT SEQUENCE, and the FROM clause of the fullselect does not specify an INSERT or MERGE statement. If the input data is not specified using a VALUES clause, or a fullselect with an ORDER BY clause on the outermost fullselect, then the ORDER BY INPUT SEQUENCE clause has no effect.

System action

The statement cannot be processed.

Programmer response

Specify a valid sort key or ensure that the input to the INSERT is a VALUES clause or an ordered fullselect.

SQLSTATE

428G4

-20260	THE ASSIGNMENT CLAUSE OF THE UPDATE OPERATION AND THE VALUES CLAUSE OF THE INSERT OPERATION MUST SPECIFY AT LEAST ONE COLUMN THAT IS NOT AN INCLUDE COLUMN
--------	---

Explanation

The SQL data change statement specified INCLUDE columns, and the only assignments are made to INCLUDE columns. At least one of the assignments in a data change statement must be to a column of the target of the data change statement.

System action

The statement cannot be processed.

Programmer response

Change the statement to specify an assignment to a column of the target of the UPDATE operation.

SQLSTATE

428G5

-20264	FOR TABLE <i>table-name</i> , <i>primary-auth-id</i> WITH SECURITY LABEL <i>primary-auth-id-seclabel</i> IS NOT AUTHORIZED TO PERFORM <i>operation</i> ON A ROW WITH SECURITY LABEL <i>row-seclabel</i> . THE RECORD IDENTIFIER (RID) OF THIS ROW IS <i>rid-number</i> .
--------	--

Explanation

primary-auth-id attempted an MLS READWRITE operation on a row without having the proper Multilevel Security (MLS) authorization. The RID identifies this row.

The RID might be *N when a RID identifier is not available for the row.

System action

The operation that was attempted could not be performed.

Programmer response

If this user is authorized to perform this operation, ensure that this user has been properly defined to MLS. If the row data needs to be viewed, use DSN1PRINT.

In the case of a view or cursor, where the primary authorization ID is able to access more rows than it can update or delete, you can add the WHERE clause to limit the rows accessed, based on the security label of the primary authorization ID. The security label can be retrieved using GETVARIABLE(SYSIBM.SECLABEL).

SQLSTATE

42512

-20265 **SECURITY LABEL IS *reason* FOR *primary-auth-id***

Explanation

User *primary-auth-id* has a blank security label, or the security label is not accessible. *reason* is BLANK or INACCESSIBLE.

System action

The operation that was attempted could not be performed.

Programmer response

Ensure the value that was specified for the security label of this user is a valid security label. If it is valid, then this error may be caused if the SECLABEL class in the Security Server has not been activated.

SQLSTATE

42501

-20266 **ALTER VIEW FOR *view-name* FAILED**

Explanation

An ALTER VIEW statement was issued for *view-name*, but the view cannot be successfully regenerated.

System action

The statement cannot be processed.

SQLSTATE

560C7

-20267 **THE FUNCTION *function-name* (SPECIFIC *specific-name*) MODIFIES SQL DATA AND IS INVOKED IN AN ILLEGAL CONTEXT. REASON CODE *reason-code***

Explanation

The function is defined with the MODIFIES SQL DATA option. A function that is defined with MODIFIES SQL DATA is only allowed in:

- VALUES clause of an insert operation
- SET clause of an update operation

- VALUES statement in a trigger
- SET assignment statement
- CALL procedure statement

function-name

The name of the function.

specific-name

The specific function name, which is unique within the schema.

reason-code

A numeric value that indicates the reason for the failure.

1

The function is referenced in the DEFAULT clause of the definition of a global variable.

5

The select list of a fullselect that contains an OFFSET clause.

System action

The statement cannot be processed.

Programmer response

Remove the reference to the function from the DEFAULT clause of the definition of the global variable.

SQLSTATE

429BL

[CREATE VARIABLE statement \(Db2 SQL\)](#)
[CREATE FUNCTION statement \(overview\) \(Db2 SQL\)](#)

-20275 **The XML NAME *xml-name* IS NOT VALID. REASON CODE = *reason-code***

Explanation

The statement contains an invalid XML name.

xml-name

The invalid name string.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The value "xmlns" is used either as an attribute name or as a prefix for an element or attribute name.

- 2 The namespace prefix in a qualified name is not declared within its scope.
- 3 The name for an element or attribute is not an XML QName.
- 4 The name of the XML processing instruction is not an XML NCName.
- 5 The name of the XML processing instruction cannot contain the letter string "xml" in any combination of upper or lower case characters.
- 6 The name for an argument of XMLTABLE, XMLQUERY or XMLEXISTS expression is not an XML NCName.

System action

The statement cannot be processed.

Programmer response

Correct the XML name and resubmit the statement.

SQLSTATE

42634

-20276 **The XML namespace prefix *xml-namespace-prefix* is not valid.**
Reason code = *reason-code*

Explanation

The XML namespace prefix violates the constraint that is indicated by the reason code.

xml-namespace-prefix

The XML namespace prefix.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 1 The namespace prefix contains a colon.
- 2 The namespace prefix is named xml or xmlns.
- 3 Duplicate namespace prefixes were declared.

System action

The statement cannot be processed.

Programmer response

Perform the action that corresponds to the reason code.

- 1 Choose a name that does not include a colon.
- 2 Do not name the namespace prefix xml or xmlns.
- 3 Declare only one namespace prefix.

SQLSTATE

42635

-20279 **THE VIEW *view-name* CANNOT BE ENABLED FOR QUERY OPTIMIZATION. REASON CODE = *reason-code***

Explanation

The view cannot allow the ENABLE QUERY OPTIMIZATION option because the fullselect does not conform to the set of queries that can take advantage of this capability.

view-name

The view that cannot be enabled for query optimization.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 1 The view directly or indirectly references an existing materialized query.
- 2 The view references a random function or a function with external action.
- 3 The view is inoperative.

System action

The statement cannot be processed.

Programmer response

Perform the action that corresponds to the reason code.

- 1 Remove the reference to the materialized query table.

2

- Remove the following references from the query that defines the view:
- A reference to a random function
 - A reference to a function with an external action

3

Correct the condition that caused the view to be inoperative.

SQLSTATE

428G8

-20281	primary-auth-id DOES NOT HAVE THE MLS WRITE-DOWN PRIVILEGE
--------	---

Explanation

This operation requires the Multilevel Security write-down privilege.

System action

This operation cannot be performed.

Programmer response

Ensure that the user has the MLS write-down privilege when write-down is in effect.

SQLSTATE

42513

-20283	A DYNAMIC CREATE STATEMENT CANNOT BE PROCESSED WHEN THE VALUE OF CURRENT SCHEMA DIFFERS FROM CURRENT SQLID
--------	---

Explanation

A dynamic CREATE statement was issued when the value of the CURRENT SCHEMA special register contained a value different from the content of the CURRENT SQLID special register.

System action

The statement cannot be processed.

Programmer response

Change the value of the CURRENT SCHEMA special register to be the same as the content of the CURRENT SQLID special register.

SQLSTATE

429BN

-20286	DB2 CONVERTED STRING <i>token-type token</i> FROM <i>from-ccsid</i> TO <i>to-ccsid</i>, AND RESULTED IN SUBSTITUTION CHARACTERS
--------	--

Explanation

A conversion error occurred during the conversion of a string for *token-type token* to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

token-type
The type of token.

token
The token that was converted.

from-ccsid
The coded character set of the string to be converted.

to-ccsid
The coded character set to which the string must be converted.

System action

The statement cannot be processed.

Programmer response

Ensure that the data that is provided to Db2 can be converted from *from-ccsid* to *to-ccsid* without data loss.

If the -20286 code was issued during the conversion of security labels, use only security labels that characters that are not substituted during conversion from one CCSID to another. For example, the following national characters might be substituted:

- @ (X'7C')
- # (X'7B')
- \$ (X'5B')

-20289 **INVALID STRING UNIT *unit*
SPECIFIED FOR FUNCTION
*function-name***

Explanation

The statement invoked a built-in function using a string unit that is not valid with the type of data that is provided to the function. This can occur for the following reasons:

- Binary data was specified with *unit*. CODEUNITS16, or CODEUNITS32 are not valid with binary string data.
- Graphic data was specified with OCTETS as the string length unit. OCTETS is not valid with graphic data.

System action

The statement cannot be processed.

Programmer response

Change the invocation of the function to remove the invalid string length unit or change it to a valid unit for the data type being processed.

SQLSTATE

428GC

-20295 **THE EXECUTION OF A BUILT IN
FUNCTION *function* RESULTED IN
AN ERROR REASON CODE *reason-
code***

Explanation

The execution of a built-in function (BIF), *function*, resulted in an error. The reason code, *reason-code*, further explains the reason for the error:

4

A string longer than allowed returned as a result of an UPPER or LOWER function execution. Correct the usage of the function by using a varying-length string long enough to contain the expanded result.

System action

The statement cannot be processed.

Programmer response

Correct the use of the built-in function, *function*.

SQLSTATE

22531

-20300 **THE LIST OF COLUMNS SPECIFIED
FOR THE *clause* CLAUSE IS NOT
ALLOWED IN COMBINATION WITH
THE LIST OF COLUMNS FOR THE
PARTITIONING KEY FOR THE
TABLE.**

Explanation

The list of columns that was specified for a clause is not valid when used with the list of columns of the partitioning key for the table.

clause

The clause that was specified

When the PARTITION BY RANGE and ORGANIZE BY KEY SEQUENCE clauses are used on the same table and the column list for the PARTITION BY RANGE clause includes a single column, the hash key must have that column as its first hash key column

When the PARTITION BY RANGE and ORGANIZE BY HASH clauses are used on the same table, the column list for the PARTITION BY RANGE clause must be identical to or be a subset of the column list for the ORGANIZE BY HASH clause and the column names must be in the same order.

System action

The statement cannot be processed.

User response

Change the list of columns in the appropriate clause or clauses.

SQLSTATE

428GD

-20304 **INVALID INDEX DEFINITION
INVOLVING AN XMLPATTERN
CLAUSE OR A COLUMN OF DATA
TYPE XML. REASON CODE =
*reason-code***

Explanation

A column defined with a data type of XML is included (or missing) in the columns for the index. The index definition is not valid for one of the following possible reason codes:

- 2 An XMLPATTERN clause is present but multiple index columns are specified.
- 4 An XMLPATTERN clause is present but the single index column specified is not defined with data type XML.
- 5 The path expression specified for the XMLPATTERN Clause does not start with a '/' or '//'.
- 6 The pattern expression does not have a name test or kind test following the '/'.
- 7 The pattern expression uses an unsupported axis in an axis step. Only forward axes child, attribute, descendant, self and descendant-or-self are supported.
- 8 The pattern expression specifies an invalid kind test or some syntax that is not a valid name test or kind test supported in a pattern expression.
- 9 The pattern expression specifies a predicate (an expression enclosed in square brackets). Predicates are not supported in a pattern expression of an XMLPATTERN clause.
- 10 The pattern expression includes XQuery syntax that is not supported in an XMLPATTERN clause and is not specifically covered by one of the other reason codes.
- 11 On a z/OS database server, the pattern expression exceeds the limit of 50 steps if the pattern expression does not contain a function, or 44 steps if it contains a function.
- 12 The argument of the function in the pattern expression does not conform to the required syntax, or the index data type is not correct.

System action

The statement cannot be processed.

User response

Modify the statement based on the reason specified by the *reason-code*. Use one of the following suggestions to modify the statement:

- 2 If the index is intended as a key for XML data, ensure that only one column defined with a data type of XML is specified. Otherwise, remove the XMLPATTERN clause.
- 4 Either remove the XMLPATTERN clause or change the specified column to a single column defined with a data type of XML.
- 5 Ensure that the pattern expression begins with '/' or '//'. The XQuery syntax for which '/' or '//' is an abbreviation is not supported in the XMLPATTERN clause of the CREATE INDEX statement.
- 6 Add a name test or kind test following the '/' in the pattern expression.
- 7 Remove any reverse axes from the pattern expression. For example, 'parent::' must not be used as an axes in a pattern expression.
- 8 Check the pattern expression for kind tests or name tests that do not match the syntax specification of the XMLPATTERN clause of the CREATE INDEX statement. Correct or remove unsupported syntax.
- 9 Remove any predicates from the pattern expression in the XMLPATTERN clause.
- 10 Change the pattern expression to remove any syntax that is not valid according to the syntax specification of the XMLPATTERN clause of the CREATE INDEX statement. If the pattern expression includes an asterisk character (*), ensure that the name tests in the pattern expression correctly use the wildcard. If used with a QName, there must be a colon before or after the wildcard character, otherwise it is considered a multiplication operator. Remove any attempt to use the asterisk as a multiplication operator from the pattern expression. You should also ensure that the XMLPATTERN clause does not include other XQuery operators, XQuery functions or XQuery FLWR (for, let, where, return) expressions.
- 11 Reduce the number of steps in the pattern expression. If the value that is to be indexed in the XML documents is longer than 50 steps when the pattern does not contain a function or longer than 44 steps when the pattern does contain a function, the index cannot be created.

12

Check the argument of the function in the pattern expression that does not conform to the required syntax of the XMLPATTERN clause of the CREATE INDEX statement, and check the index data type. Correct or remove unsupported syntax, or modify the index data type.

SQLSTATE

429BS

-20305 **AN XML VALUE CANNOT BE INSERTED OR UPDATED BECAUSE OF AN ERROR DETECTED WHEN INSERTING OR UPDATING THE INDEX IDENTIFIED BY *index-id* ON TABLE *table-name*. REASON CODE = *reason-code***

Explanation

The insertion or update of an XML value failed during insertion or update of the specified index. The statement cannot proceed, and the table and index remain unchanged.

index-id

The index ID.

table-name

The name of the table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

One or more XML node values in an XML value being inserted or updated exceeds a length constraint imposed by the identified index. The index on an XML column is defined to use the SQL type VARCHAR with a specific length specified. The length of one or more XMLPATTERN result values exceeds the user-specified length constraint for the VARCHAR data type.

4

At least one XML node value is a valid XML value that cannot be cast to the index data type for the identified index. That value is outside the supported range of values.

6

One or more XML node values are XML values, but those XML values span multiple records. Db2 cannot create an index key on an XML value that spans multiple records.

System action

The statement cannot be processed.

Programmer response

Use the following query to determine the table name and index ID:

```
SELECT NAME as IndexName,
       TBNAME as TableName
FROM SYSIBM.SYSINDEXES
WHERE index-id;
```

Take the action indicated by the reason code:

1

Use the XML pattern information to identify the set of matching XML nodes to inspect to determine which string values are beyond the limit of the length constraint specified by the index.

4

Use the XML pattern information to identify the set of matching XML nodes to inspect and compare against the data type specified for the identified index. Determine which node values exceed the range of values supported by Db2 for the index data type.

6

Use the XML pattern information to identify the set of matching XML nodes to inspect to determine which values might be spanning multiple records. Generally, large values might lead to multiple records. Large values might arise from a single large text node, or an element node with many descendant text nodes.

SQLSTATE

23525

-20306 **AN INDEX ON AN XML COLUMN CANNOT BE CREATED BECAUSE OF AN ERROR DETECTED WHEN INSERTING THE XML VALUES INTO THE INDEX. REASON CODE = *reason-code***

Explanation

The statement cannot proceed and the table remains unchanged. The schema data type and schema identifier are not applicable for all reason codes. See specific reason codes for details. The creation of the index on an XML column failed for one of the following possible reason codes:

1

One or more XML node values in an XML value being inserted or updated exceeds a length

constraint imposed by the index that is being created. The index on an XML column is defined to use the SQL type VARCHAR with a specific length specified. The length of one or more XMLPATTERN result values exceeds the user-specified length constraint for the VARCHAR data type.

4

One or more XML node values is a valid XML value but cannot be cast to the index data type for the index being created because of Db2 limitations. Db2 does not support the entire range of XML values.

System action

The statement cannot be processed.

Programmer response

Determine the XMLPATTERN clause from the index definition.

1

Use the XML pattern information to identify the set of matching XML nodes to inspect to determine which string values are beyond the limit of the length constraint specified by the index.

4

Use the XMLPATTERN information to identify the set of matching XML nodes to inspect and compare against the data type specified for the index being created. Determine which node values exceed the range of values supported by Db2 for the index data type.

SQLSTATE

23526

-20310	THE REMOVE OF <i>jar-name1</i> FAILED, AS IT IS IN USE BY <i>jar-name2</i>
---------------	---

Explanation

The JAR being removed exists in the JAVA path of another JAR.

jar-name1

The JAR being removed.

jar-name2

A JAR file that contains a JAVA path with a reference to *jar-name1*.

System action

The statement cannot be processed.

User response

Remove the dependency by altering the JAVA path for JAR*jar-name2* so it does not include the reference to *jar-name1*.

SQLSTATE

4600C

-20311	THE VALUE PROVIDED FOR THE NEW JAVA PATH IS ILLEGAL
---------------	--

Explanation

The Java path cannot be resolved for one of the following reasons:

- The provided value for the Java path is not valid. The value must be either a blank or a zero-length string.
- The Java path does not conform to its required syntax.

System action

The statement cannot be processed.

User response

Based on the specific error, correct the Java path by using one of the following solutions:

- Change the specified value to a blank or a zero-length string.
- Change the Java path to conform to its required syntax.

SQLSTATE

4600D

-20312	THE ALTER OF JAR <i>jar-id</i> FAILED BECAUSE THE SPECIFIED PATH REFERENCES ITSELF
---------------	---

Explanation

You attempted to alter the JAR *jar-id* to contain a JAVA path that references the *jar-id*. A JAR cannot have a path that contains a reference to itself.

jar-id

The JAR file that is being altered. The reference to the *jar-id* also appears in a specified Java path.

System action

The statement cannot be processed.

User response

Correct the specified JAVA path value so that it does not reference the JAR that is being altered.

SQLSTATE

4600E

-20313	DEBUG MODE OPTION FOR OBJECT <i>object-name</i> CANNOT BE CHANGED
---------------	--

Explanation

The object, *object-name*, was originally created with DISABLE DEBUG MODE. An object created with this attribute cannot be changed to either ALLOW DEBUG MODE or DISALLOW DEBUG MODE with an ALTER statement.

System action

The statement cannot be processed.

User response

To change the setting of the DEBUG MODE option, drop and re-create the object with the correct option.

SQLSTATE

55058

-20314	THE PARAMETER LIST (OR AN OPTION) DOES NOT MATCH THE PARAMETER LIST (OR OPTION) FOR ALL OTHER VERSIONS OF ROUTINE <i>routine-name</i>
---------------	--

Explanation

An inconsistency exists between the parameters for the currently active version of the routine and other versions of the routine. This error can be issued for any of the following reasons:

- The number of parameters, data types, CCSID specifications, and character data attributes (FOR BIT, SBCS, or MIXED DATA) in the parameter list must be the same as the attributes of the corresponding parameters of the currently active version of the routine and all of the other existing versions of the routine.
- The data type, CCSID specification, and character data attributes (FOR BIT, SBCS, or MIXED DATA) for the RETURNS parameter must be the same as the attributes of the RETURNS parameter of the

currently active version of the routine and all of the other existing versions of the routine.

- An ALTER PROCEDURE statement was specified with the PARAMETER CCSID clause with a value that is different from the value determined when the procedure was initially created.
- An existing routine is defined with a table parameter.

System action

The statement cannot be processed.

User response

Correct the specification of the parameter list or RETURNS clause, or change or remove the PARAMETER CCSID clause.

SQLSTATE

428GH

-20315	THE CURRENTLY ACTIVE VERSION FOR OBJECT <i>object-name</i> (<i>object- type</i>) CANNOT BE DROPPED
---------------	---

Explanation

One of the following has occurred:

- An ALTER statement for the SQL routine or trigger specified a DROP VERSION clause that identified the currently active version to be dropped. You cannot drop the active version of a routine or advanced trigger.
- A CREATE TRIGGER statement with an OR REPLACE clause was specified without a VERSION clause and the existing trigger is defined with more than a single version. This combination is not supported.
- A CREATE TRIGGER statement with an OR REPLACE clause was specified without a VERSION clause and the existing trigger is defined with a single version but the version id is not V1. This combination is not supported.

object-name

The name of the routine or trigger.

object-type

The type of routine or trigger.

System action

The statement cannot be processed.

User response

To drop all of the versions of the object, drop the object without identifying a particular version.

To drop the currently active version and make a different version active, complete the following steps:

1. Issue the ALTER statement for the object with the ACTIVATE VERSION clause. This statement changes which version is active.
2. Issue the ALTER statement for the object with a DROP VERSION clause. This statement identifies and drops the previously active version.

[Statements \(Db2 SQL\)](#)

-20326	AN XML ELEMENT NAME, ATTRIBUTE NAME, NAMESPACE PREFIX, OR URI ENDING WITH <i>string-end</i> EXCEEDS THE LIMIT OF 1000 BYTES
---------------	--

Explanation

The Db2 database manager generated an internal identifier for an element name, attribute name, namespace prefix, or URI. After conversion of the identifier to the Unicode UTF-8 encoding scheme, the length of the identifier exceeded the limit of 1000 bytes.

string-end

The ending characters of the string that exceeded the limit.

System action

The statement cannot be processed.

User response

Modify the element name, attribute name, namespace prefix, or URI to be shorter. Issue the SQL statement again.

SQLSTATE

54057

-20327	THE DEPTH OF AN XML DOCUMENT EXCEEDS THE LIMIT OF 128 LEVELS
---------------	---

Explanation

An XML document that is being parsed or validated, or an XML value that is being stored, is nested too deep.

System action

The statement cannot be processed.

User response

For a document or constructed XML value, reduce the number of levels of elements and attributes that are used.

SQLSTATE

54058

-20328	THE DOCUMENT WITH TARGET NAMESPACE <i>namespace</i> AND SCHEMA LOCATION <i>location</i> HAS ALREADY BEEN ADDED FOR THE XML SCHEMA IDENTIFIED BY <i>schema name</i>
---------------	---

Explanation

This error can occur while invoking the XSR_ADDSCHEMADOC stored procedure. There cannot be two documents with the same *targetnamespace* and *schemalocation* within an XML schema.

System action

The operation fails with this SQLCODE.

Programmer response

Change either the *namespace* or *schemalocation* of the document that is being added.

SQLSTATE

42749

-20329	THE COMPLETION CHECK FOR THE XML SCHEMA FAILED BECAUSE ONE OR MORE XML SCHEMA DOCUMENTS IS MISSING. ONE MISSING XML SCHEMA DOCUMENT IS IDENTIFIED BY <i>uri-type</i> AS <i>uri</i>
---------------	---

Explanation

The XML schema registration completion processing determined that more than one XML schema document is required for a complete XML schema. The processing also determined that at least one XML schema document is missing from the XML schema repository. The missing XML schema document is identified by the *uri type* with value *uri*. The reference

to the missing XML schema document may be included in one of the XML schema documents that is defined for the XML schema.

System action

The invocation of SYSPROC.XSR_COMPLETE fails with this SQLCODE.

Programmer response

Add any missing XML schema documents to the XML schema repository, and then re-invoke SYSPROC.XSR_COMPLETE.

SQLSTATE

428GI

-20330	THE <i>object-type</i> IDENTIFIED BY XML <i>uri-type1 uri1</i> AND XML <i>uri-type2 uri2</i> IS NOT FOUND IN THE XML SCHEMA REPOSITORY
--------	--

Explanation

The processing of the statement or command required the use of an XML SCHEMA from the XML schema repository that could not be found. *uri-type1* is NAMESPACE and *uri-type2* is LOCATION. If either value was null on the request, the corresponding *uri1* or *uri2* is the empty string.

object-type
The type of object.

uri-type1
NAMESPACE.

uri1
The URI that corresponds to the namespace. If *uri-type1* was null on the request, *uri1* is an empty string.

uri-type2
LOCATION.

uri2
The URI that corresponds to the location. If *uri-type2* was null on the request, *uri2* is an empty string.

System action

The statement cannot be processed.

Programmer response

Add the missing XML schema to the XML schema repository, and reissue the statement.

SQLSTATE

4274A

22532

-20331	THE XML COMMENT VALUE <i>string</i> IS NOT VALID
--------	--

Explanation

The XML comment cannot contain two adjacent hyphens and cannot end in a hyphen.

System action

The statement cannot be processed.

User response

Ensure the value for the XML comment is valid.

SQLSTATE

2200S

-20332	THE XML PROCESSING INSTRUCTION VALUE <i>string</i> IS NOT VALID
--------	---

Explanation

The XML processing instruction must not contain the substring ">".

System action

The statement cannot be processed.

User response

Ensure the value for the XML processing instruction is valid.

SQLSTATE

2200T

-20335	MORE THAN ONE <i>xsobject-type</i> EXISTS IDENTIFIED BY XML <i>uri-type1 uri1</i> AND <i>uri-type2 uri2</i> EXISTS IN THE XML SCHEMA REPOSITORY.
--------	--

Explanation

There is more than one registered XML schema that matches the URIs used to identify it.

xsobject-type
The type of object.

uri-type1
Either NAMESPACE or null.

uri1
The XML schema target namespace. If *uri-type1* was null on the request, *uri1* is an empty string.

uri-type2
Either LOCATION or null.

uri2
The XML schema location. If *uri-type2* was null on the request, *uri2* is an empty string.

System action

The invocation of DSN_XMLVALIDATE fails with this SQLCODE.

Programmer response

Use the unique XML schema ID to identify the XML schema.

SQLSTATE

22533

-20338	THE DATA TYPE OF EITHER THE SOURCE OR TARGET OPERAND OF AN XMLCAST SPECIFICATION MUST BE XML
--------	--

Explanation

The XMLCAST specification must have one operand that has the data type XML. The XMLCAST operation can be from one the following:

- an XML type value to an SQL type value
- from an SQL type value to and XML type value

The XMLCAST specification also accepts having both the source and target operands as XML, but if you specify the source and target operands as XML, then no actual casting operation is performed.

System action

The expression cannot be processed.

Programmer response

If both operands are SQL data types other than XML, then use the CAST specification. Otherwise, change the XMLCAST specification so that at least one operand is the XML data type.

SQLSTATE:
42815

-20339	XML SCHEMA <i>name</i> IS NOT IN THE CORRECT STATE TO PERFORM OPERATION <i>operation</i>
--------	--

Explanation

The operation *operation* cannot be performed on the XML schema identified by *name* because it is not in the correct state. For example, the XML schema has already been completed and the operation is attempting to add additional XML schema documents.

System action

operation is failed with this SQLCODE.

Programmer response

If the schema has not yet been completed, invoke SYSPROC.XSR_COMPLETE and try the *operation* again. If the schema has already been completed and needs to be updated, you must first remove it or register it using a different name.

SQLSTATE

55063

-20340	XML SCHEMA <i>xmlschema-name</i> INCLUDES AT LEAST ONE XML SCHEMA DOCUMENT IN NAMESPACE <i>namespace</i> THAT IS NOT CONNECTED TO THE OTHER XML SCHEMA DOCUMENTS
--------	--

Explanation

The XML schema identified by identifier *xmlschema-name* includes multiple XML schema documents. At least one of these XML schema documents is not connected to the other XML schema documents registered to this XML schema.

System action

The XSR_COMPLETE call fails with this SQLCODE.

Programmer response

Correct the XML schema documents, or add a new XML schema document, so that all XML schema documents in an XML schema are connected using import, include, or redefine, beginning from the primary schema document. Use SYSPROC.XSR_REMOVE to remove the invalid schema and re-invoke the XSR stored procedures to register it with the corrected and/or new XML schema documents.

SQLSTATE

22534

-20342 **AUTHORIZATION ID *auth-ID* DOES NOT HAVE THE REQUIRED PRIVILEGE *privilege-name* ON OBJECT *object-name* OF TYPE *type-name* FOR OWNERSHIP TRANSFER.**

Explanation

A TRANSFER OWNERSHIP statement is issued to transfer ownership to authorization ID *auth-ID*. The transfer failed due to one or more of the following conditions:

- The authorization ID does not have the required privilege to own the object.
- The authorization ID does not have the required privilege to specify a different schema for the ownership transfer of a table or a view.
- The current owner does not have the required privilege to maintain the dependency on the package.

If the ownership is transferred to a role, the role name is returned as a single token in the format of ROLE: *role-name*.

System action

The statement cannot be processed.

Programmer response

Grant authorization ID *auth-ID* all the privilege on object *object-name* that is required for the ownership transfer.

SQLSTATE

42514

-20345 **THE XML VALUE IS NOT A WELL-FORMED DOCUMENT WITH A SINGLE ROOT ELEMENT**

Explanation

Db2 attempted to use an XML value that was not well-formed.

Well-formed XML is required when:

- Storing an XML value into a table.
- Processing an XML value that has been returned from a remote site within an SQL procedural language stored procedure.

System action

The statement cannot be processed.

User response

Modify the XML value so that it is well-formed with a single root element.

SQLSTATE

2200L

-20353 **AN OPERATION INVOLVING COMPARISON CANNOT USE OPERAND *name* DEFINED AS DATA TYPE *type-name***

Explanation

The use of the value identified by *name* defined as data type *type-name* is not permitted in an operation that involves comparisons. This error can be returned for an expression that results in a *type-name* data type in the following contexts:

- A SELECT DISTINCT statement.
- A GROUP BY clause.
- An ORDER BY clause.
- An aggregate function with DISTINCT.
- A SELECT or VALUES statement of a set operator other than UNION ALL.

System action

The statement cannot be processed.

Programmer response

The requested operation on the data type *type-name* is not supported. You can change the data type of the value to a data type that is supported using a cast or some other function.

SQLSTATE

42818

-20354 **INVALID SPECIFICATION OF A ROW CHANGE TIMESTAMP COLUMN FOR TABLE *table-name***

Explanation

The specification of a row change timestamp column is invalid. The specification is invalid because a row change timestamp column cannot be:

- A column of a foreign key.

- A column of a partitioning key for a table that uses index-controlled partitioning.
- Defined for a temporary table.

The specification might also be invalid because a row change timestamp column cannot have a FIELDPROC defined for it.

System action

The statement cannot be processed.

Programmer response

Correct the syntax and resubmit the statement.

SQLSTATE

429BV

-20355	THE STATEMENT COULD NOT BE PROCESSED BECAUSE ONE OR MORE IMPLICITLY CREATED OBJECTS ARE INVOLVED <i>reason-code</i>
--------	---

Explanation

The statement failed for one of the following reasons, indicated by the *reason-code*:

- 1 The statement attempted to create a table or a table space within a database that was implicitly created by Db2.
- 2 The statement attempted to define a new column (using CREATE or ALTER TABLE) as LONG VARCHAR or LONG VARGRAPHIC, but the associated table space was implicitly created by Db2.
- 3 The statement attempted to create an auxiliary table or auxiliary index because these objects have already been implicitly created by Db2.
- 4 The statement attempted to drop a LOB table space, auxiliary table, or auxiliary index that was implicitly created by Db2.
- 5 The statement attempted to alter an implicitly created hash overflow index, either by adding the clustering option, by adding columns, or by making it padded.

6

The statement attempted to transfer the ownership of a table space or a table that was implicitly created by Db2.

System action

The statement cannot be processed.

User response

Change the statement to refer to an object that is not involved with implicitly created objects.

SQLSTATE

429BW

-20356	THE TABLE WITH DBID = <i>dbid</i> AND OBID = <i>obid</i> CANNOT BE TRUNCATED BECAUSE DELETE TRIGGERS EXIST FOR THE TABLE, OR THE TABLE IS THE PARENT TABLE IN A REFERENTIAL CONSTRAINT
--------	--

Explanation

The TRUNCATE statement could not be processed for one of the following reasons:

- The TRUNCATE statement would result in the activation of DELETE triggers, but the statement specified RESTRICT WHEN DELETE TRIGGERS, either implicitly or explicitly. This can occur when enabled DELETE triggers exist for the table to be truncated, and the result of the TRUNCATE statement would activate the triggers.
- The table to be truncated is the parent table of a child table, regardless of whether the child table contains rows or not, that are in a referential constraint.

dbid.obid Gives the database id and the table obid of the object with the truncation error.

System action

The statement cannot be processed.

User response

If the statement failed because of the existence of DELETE triggers, specify the IGNORE DELETE TRIGGERS clause on the TRUNCATE statement. If the statement failed because of referential constraints, use the ALTER TABLE statement to drop the referential integrity constraints, and then re-issue the TRUNCATE statement.

SQLSTATE

428GJ

-20361 **AUTHORIZATION ID *authorization-name* IS NOT DEFINED FOR THE TRUSTED CONTEXT *context-name***

Explanation

authorization-name attempted to reuse a trusted connection using trusted context *context-name*. The trusted context name *context-name* cannot be used under the *authorization-name*.

This error can also occur for one of the following reasons:

- The authorization ID is allowed to use the trusted context, but authentication is required and the request to switch users did not include the authentication token.
- The authorization ID is allowed to use the trusted context, but the security label for the user is not one of the RACF SECLABEL values defined for the user.
- The authorization ID is allowed to use the trusted context, but the trusted context is disabled.
- The system authorization ID attribute of the trusted context object associated with the trusted connection has been changed.
- The trusted context object associated with the trusted connection has been dropped.

System action

The statement cannot be processed.

Programmer response

Establish a valid authorization ID to be associated with the trusted connection.

- If the authorization ID is valid but requires authentication, provide the authentication token.
- If the trusted context object is either disabled, dropped, or its system authorization ID is altered, then only the authorization ID that established the trusted connection is allowed. Provide this authorization ID.
- If the authorization ID is valid but requires a RACF security label, then define the security label in RACF for the authorization ID.

SQLSTATE

42517

-20362 **ATTRIBUTE *attribute-name* WITH VALUE *value* CANNOT BE DROPPED BECAUSE IT IS NOT PART OF THE DEFINITION OF TRUSTED CONTEXT *context-name***

Explanation

Attribute *attribute-name* was specified for a trusted context, but the trusted context is not defined with an attribute with this name.

System action

The statement cannot be processed.

Programmer response

Remove the name of the unsupported attribute and re-issue the statement.

SQLSTATE

4274C

-20363 **ATTRIBUTE *attribute-name* WITH VALUE *value* IS NOT A UNIQUE SPECIFICATION FOR TRUSTED CONTEXT *context-name***

Explanation

During the create or alter of a trusted context *context-name*, a duplicate value was specified for the *attribute-name* attribute. Attribute *attribute-name* was specified for the trusted context with value *value*, but the combination is not unique. Each pair of attribute name and value must be unique for a trusted context.

System action

The statement cannot be processed.

Programmer response

Remove the non-unique specification of *attribute-name* and *value* and re-issue the statement.

SQLSTATE

4274D

-20365 **A SIGNALING NAN WAS ENCOUNTERED, OR AN EXCEPTION OCCURRED IN AN ARITHMETIC OPERATION OR FUNCTION INVOLVING A DECFLOAT**

Explanation

A signaling NaN (sNaN) was encountered in an expression, arithmetic operation, or function. This message could also be issued because an expression, arithmetic operation, or function involving a DECFLOAT column or value resulted in an exception. In either case, the result is a NAN, and an error is issued.

System action

The statement cannot be processed. In the case of an INSERT, MERGE, or UPDATE operation, no data is updated or deleted. If the statement is a cursor-controlled FETCH, then the cursor will remain open, unless the exception occurred while processing an aggregate function. If the exception occurred while processing an aggregate function, it is indicated by an operation-type of AGGREGATE FUNCTION. If this is the case, the cursor will be closed. If the cursor is closed, subsequent attempts to use that cursor without first doing an OPEN for it, receive an SQLCODE-501. If the statement was a cursor-controlled OPEN, then the cursor will remain closed.

User response

Examine the expression which prompted the warning to see if the cause of the problem can be determined. The problem might be data-dependent, in which case you must examine the data that was being processed at the time the error occurred.

If the arithmetic expression in error was within the SELECT list of the outer SELECT statement, then you should include an indicator variable for all expressions in the SELECT list. This allows processing to continue so that non-error column and expression values can be returned.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

SQLSTATE:

22502

-20366 **TABLE WITH DBID=*database-id* AND OBID=*object-id* CANNOT BE TRUNCATED BECAUSE UNCOMMITTED UPDATES EXIST ON THE TABLE WITH 'IMMEDIATE' OPTION SPECIFIED IN THE STATEMENT**

Explanation

A TRUNCATE statement was issued with the IMMEDIATE option, but the statement could not be processed.

database-id

The database ID.

object-id

The table object ID (OBID) of the object with the truncation error.

A TRUNCATE statement with the IMMEDIATE option cannot be processed if either of the following are true:

- Any table in the same table space as the target table has uncommitted CREATE, ALTER or DROP changes.
- Any table in the same table space as the target table has uncommitted data changes.

System action

The statement cannot be processed.

User response

Issue a COMMIT statement, and then issue the TRUNCATE statement with the IMMEDIATE option.

SQLSTATE

57007

AN ALTER TRUSTED CONTEXT STATEMENT FOR *context-name* ATTEMPTED TO REMOVE THE LAST CONNECTION TRUST ATTRIBUTE ASSOCIATED WITH THE TRUSTED CONTEXT

Explanation

An ALTER TRUSTED CONTEXT statement for *context-name* specified the DROP ATTRIBUTES clause that would have resulted in removing the last connection trust attribute defined for the trusted context. This result is not allowed.

System action

The statement cannot be processed.

Programmer response

Specify the ADD ATTRIBUTES clause to specify new values for the connection trust attributes being removed, or, use the ALTER ATTRIBUTES clause to specify new values without needing a DROP ATTRIBUTES clause.

SQLSTATE

428GK

-20372	THE SYSTEM AUTHID CLAUSE OF A CREATE OR ALTER TRUSTED CONTEXT STATEMENT FOR <i>context-name</i> SPECIFIED <i>authorization-name</i>, BUT ANOTHER TRUSTED CONTEXT IS ALREADY DEFINED FOR THAT AUTHORIZATION ID.
---------------	---

Explanation

A CREATE or ALTER TRUSTED CONTEXT statement for *context-name* specified SYSTEM AUTHID *authorization-name*, but this authorization ID is already defined to use a different trusted context. A system authorization ID that is defined as the SYSTEM AUTHID for a trusted context cannot be associated with any other trusted context as the SYSTEM AUTHID.

System action

The statement cannot be processed.

Programmer response

Change the authorization ID to be the system authorization ID for the trusted context and reissue the CREATE or ALTER statement.

SQLSTATE

428GL

-20373	A CREATE OR ALTER TRUSTED CONTEXT STATEMENT SPECIFIED <i>authorization-name</i> MORE THAN ONCE OR THE TRUSTED CONTEXT IS ALREADY DEFINED TO BE USED BY THIS AUTHORIZATION ID, PROFILE NAME, OR PUBLIC.
---------------	---

Explanation

The statement specified that *authorization-name* be allowed to use the trusted context, but cannot due to one of the following reasons:

- The specified authorization ID, profile name, or PUBLIC is already defined to use the trusted context
- The profile name or authorization ID was specified more than once in the statement

The authorization ID, profile name, or PUBLIC must not already be allowed to use the trusted context, and, it can only be specified once within a statement for a trusted context.

The token *authorization-name* might return a RACF profile name. A profile name is returned as a single token in the following format: PROFILE: *profile-name*.

System action

The statement cannot be processed.

Programmer response

Complete one of the following actions based on what the error is:

- If an ALTER TRUSTED CONTEXT statement that contained an ADD USE FOR clause, and the trusted context already was defined for use by that authorization ID, profile name, or PUBLIC, use the REPLACE USE FOR clause instead to redefine the usage characteristics for the specified users to use the trusted context.
- If the authorization ID, profile name, or PUBLIC was specified more than once, remove the extra specification of *authorization-name*, and re-issue the statement.

SQLSTATE

428GM

-20374	AN ALTER TRUSTED CONTEXT STATEMENT FOR <i>context-name</i> SPECIFIED <i>authorization-name</i> BUT THE TRUSTED CONTEXT IS NOT CURRENTLY DEFINED TO BE USED BY THIS AUTHORIZATION ID, PROFILE NAME, OR PUBLIC
---------------	---

Explanation

An ALTER TRUSTED CONTEXT statement for *context-name* attempted to replace or remove the ability for *authorization-name* to use the trusted context, but the specified authorization ID, profile name, or PUBLIC is not currently defined to use the trusted context.

The token *authorization-name* might return a RACF profile name. A profile name is returned as a single token in the following format: PROFILE: *profile-name*.

System action

The statement cannot be processed.

Programmer response

Complete one of the following actions based on what the error is:

- If an ALTER TRUSTED CONTEXT statement that contained a REPLACE USE FOR clause, and the trusted context was not already defined for use by that authorization ID, profile name, or PUBLIC, use the ADD USE FOR clause instead to define the trusted context to be used by the specified users.
- If the ALTER TRUSTED CONTEXT statement contained the DROP USE FOR clause, none of the specified authorization IDs, profile name, or PUBLIC were currently defined to use the trusted context.

SQLSTATE

428GN

-20377	AN ILLEGAL XML CHARACTER <i>hex-char</i> WAS FOUND IN AN SQL/XML EXPRESSION OR FUNCTION ARGUMENT THAT BEGINS WITH STRING <i>start-string</i>
---------------	---

Explanation

An SQL expression, XML expression, or function attempted to convert an SQL string value from one of the arguments to an XML string, but the string included a character at Unicode code point *hexchar* that is not a legal XML 1.0 character. The character is included in a string that begins with the string *start-string*. The value for *hex-char* represents a Unicode character code point in the form "#xH", where H is a hexadecimal character. The following set of characters, expressed in Unicode are allowed: #x9 | #xA | #xD | [#x20-#xD7FF] | [#xE000-#xFFFD] | [#x10000-#x10FFFF]

System action

The statement cannot be processed.

User response

Remove the illegal character *hex-char* or replace it with a character that is allowed.

SQLSTATE

0N002

-20379	AN AUTHORIZATION ID OR A ROLE CANNOT USE ITS SECADM
---------------	--

AUTHORITY TO TRANSFER THE OWNERSHIP OF AN OBJECT TO ITSELF.

Explanation

An authorization ID or a role that has the SECADM authority cannot transfer the ownership of an object to itself. It can transfer the ownership of the object to another authorization ID or role.

System action

The statement cannot be processed.

Programmer response

Choose a different authorization ID or role as the new owner of the object.

SQLSTATE

42502

-20380	ALTER INDEX WITH REGENERATE OPTION FOR <i>index-name</i> FAILED. INFORMATION RETURNED: SQLCODE <i>sqlcode</i>, SQLSTATE <i>sqlstate</i>, MESSAGE TOKENS <i>token-list</i>
---------------	--

Explanation

An ALTER INDEX statement was issued for *index-name*, but the index cannot be successfully regenerated.

System action

The statement cannot be processed.

Programmer response

Drop and re-create the index.

SQLSTATE

560CC

-20381	ALTER INDEX WITH REGENERATE OPTION IS NOT VALID FOR <i>index-name</i>
---------------	--

Explanation

The REGENERATE option is allowed only if the index is an expression-based index.

System action

The statement cannot be processed.

Programmer response

Change the statement so that it refers to an index that can be regenerated.

SQLSTATE

530A5

-20382	CONTEXT ITEM CANNOT BE A SEQUENCE WITH MORE THAN ONE ITEM
---------------	--

Explanation

The initial context item specified as an argument of XMLQUERY function, or the XMLEXISTS predicate, is a sequence of more than one item.

System action

The statement cannot be processed.

User response

Specify a sequence with a single item as the context item.

SQLSTATE

2200V

-20385	THE STATEMENT CANNOT BE PROCESSED BECAUSE THERE ARE PENDING DEFINITION CHANGES FOR OBJECT <i>object-name</i> OF TYPE <i>object-type</i> (REASON <i>reason-code</i>)
---------------	--

Explanation

The statement could not be processed because definition changes are pending for the indicated object.

object-name

The name of the object that has pending definition changes.

object-type

The type of object that *object-name* is.

reason-code

A numeric indicator that provides a more detailed explanation for why the statement was not processed.

- 1** An ALTER statement cannot contain a mixture of immediate and pending options.
- 2** An ALTER TABLE statement is not allowed when either of the following conditions is true:
 - The ALTER TABLE statement is issued with immediate options and definition changes are pending for the table space or any objects within the table space.
 - The ALTER TABLE statement is issued with any option, immediate or pending, and a MOVE TABLE operation is pending for the table.
- 3** A CREATE TABLE statement is not allowed if any definition changes are pending for the table space.
- 4** A DROP TABLE statement is not allowed if the containing table space is not being implicitly dropped and any definition changes are pending for the table space.
- 5** An ALTER TABLESPACE statement to change from a Db2-managed data set to a user-managed data set is not allowed if any definition changes are pending for the table space unless the table space uses partition-by-growth organization.
- 6** An ALTER INDEX statement to change from a Db2-managed data set to a user-managed data set is not allowed if any definition changes are pending for the index or table space.
- 7** A pending option is not allowed if the table space is in an incomplete state.
- 8** A pending option is not allowed if the table contained in the table space or associated with the index is in an incomplete state.

An ALTER TABLE statement with a DROP COLUMN clause is not allowed if the table definition is in an incomplete state.
- 9** An ALTER INDEX statement to change from COMPRESS NO to COMPRESS YES is not allowed if any definition changes are pending for the index.
- 10** An ALTER INDEX statement to change PIECESIZE is not allowed if any definition

changes are pending for the index or the table space.

11

A RENAME TABLE or RENAME INDEX statement is not allowed if any definition changes are pending for the object.

13

An ALTER INDEX REGENERATE statement is not allowed if any definition changes are pending for the table space or objects within the table space.

14

An ALTER INDEX ADD COLUMN statement is not allowed if any definition changes are pending for the table space or objects within the table space.

15

An ALTER TABLESPACE statement to change FREEPAGE is not allowed if any definition changes are pending for the table space.

16

An ALTER TABLESPACE statement to change CCSID is not allowed if any definition changes are pending for the table space or table.

17

A CREATE INDEX statement is not allowed if any definition changes are pending for the table space or any objects within the table space.

18

A DROP INDEX statement is not allowed when all of the following conditions are true:

- The index is a unique index defined on a ROWID column that is defined as GENERATED BY DEFAULT
- Definition changes are pending for the table space or any objects within the table space.
- The table space was explicitly created.

19

A DROP INDEX statement is not allowed when both of the following conditions are true:

- The index is an empty index on an auxiliary table that resides in an explicitly-created LOB table space.
- Definition changes are pending for the base table space or any objects within the base table space.

20

A DROP TABLE statement is not allowed when both of the following conditions are true:

- The table is an empty auxiliary table.

- Definition changes are pending for the base table space or any objects within the base table space.

21

A CREATE VIEW statement is not allowed if any pending definition changes exist for the column.

22

A CREATE TRIGGER statement that creates an INSTEAD OF trigger is not allowed if the view is dependent on any tables with pending definition changes.

23

A CREATE TRIGGER statement is not allowed if the triggering table has pending definition changes.

24

A CREATE PERMISSION statement is not allowed on a table if the table or any referenced tables have pending definition changes.

25

A CREATE MASK statement is not allowed on a table if the table or any referenced tables have pending definition changes.

26

A CREATE FUNCTION statement that creates an SQL table function is not allowed if any referenced tables have pending definition changes.

27

A CREATE TABLE statement or an ALTER TABLE statement that defines a materialized query table is not allowed if any referenced tables have pending definition changes.

28

After RECOVER is run on the specified table space to a point in time before materialization of pending definition changes, and before REORG is run on the table space to complete the recovery, none of the following statements are allowed:

- An ALTER TABLESPACE statement with the DROP PENDING CHANGES clause.

The following statements are not allowed on objects in the table space:

- CREATE TABLE
- ALTER TABLE
- RENAME
- DROP TABLE

The following statements are not allowed on indexes on tables in the table space:

- CREATE INDEX
- ALTER INDEX

The following statements are not allowed on auxiliary objects that are associated with the table space:

- CREATE AUXILIARY TABLE
- ALTER TABLE
- DROP TABLE

- 29** There are pending definition changes for the associated table.
- 30** An ALTER TABLESPACE statement to change DSSIZE at the partition level is not allowed if any definition changes are pending for the table space.
- 31** An ALTER TABLE statement to alter limit key is not allowed if there are pending changes due to the insertion of new partitions.
- 32** An ALTER INDEX statement that changes an index to NOT PADDED is not allowed if the index references a column that has pending definition changes.
- 33** A CREATE TABLE or ALTER TABLE statement is not allowed if a FOREIGN KEY clause references a parent column that has pending definition changes.
- 35** An ALTER INDEX statement to change DSSIZE at the index level is not allowed if there is any pending definition change for the index or table space.
- 36** ALTER TABLE ADD PARTITION ENDING AT x or ALTER TABLE ADD PARTITION ENDING AT x ALTER PARTITION n ENDING at y is not allowed on a partition-by-range table space that has unmaterialized limit key changes at the last logical partition.
- 37** A data definition statement for an object is not allowed if the object references a table space that has a pending MOVE TABLE operation, or if the object references a table or index in a table space that has a pending MOVE TABLE operation.
- 38** An ALTER TABLESPACE statement that results in a pending definition change for a LOB table

space is not allowed if the table space contains an auxiliary table that has an index with data sets that are not yet defined.

- 39** An ALTER TABLE statement with the ALTER PARTITIONING clause is not allowed if the object references a table space that has a pending MAXPARTITIONS or SEGSIZE change.
- 40** An ALTER TABLE statement with the ADD PARTITION or ALTER PARTITION clause is not allowed if the object references a table space that has a pending change of the partitioning scheme from PBG to PBR.
- 41** An ALTER TABLE ADD CLONE statement is not allowed on the base table if an associated LOB or XML table space has pending definition changes.
- 42** An ALTER TABLE statement with the ALTER PARTITIONING TO PARTITION BY GROWTH clause is not allowed if the object references a table space that has a pending change to insert a partition, alter a partition limit key, alter to relative page number, or change partitioning scheme from PBG to PBR.

System action

The statement cannot be processed.

User response

Take the action that corresponds to the *reason-code* value:

- 1 Separate the options so that all of the immediate options are in one ALTER statement that is processed first, and all of the pending options are in a separate ALTER statement that is issued afterward.
- 2
 1. Use REORG TABLESPACE with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to apply all pending definition changes for the table space and its objects.
 2. Issue the ALTER TABLE statement with immediate options for the table.
- 3 Specify a different table space that does not have any pending definition changes and process the statement again.

4

1. Use ALTER TABLESPACE DROP PENDING CHANGES to drop the pending definition changes for the table space.
2. Issue the DROP TABLE statement for the table.

6, 9, or 11

1. Apply all pending definition changes to the table, the index, or the table space and index, as appropriate:
 - If no pending changes exist for the table space, use REORG INDEX with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to apply all pending definition changes for the index.
 - If pending changes exist for the table space, use REORG TABLESPACE with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to apply all pending definition changes for the index and table space.
2. Process the statement again.

7

Check the status of the table space definition, which is indicated in the STATUS column of the SYSIBM.SYSTABLESPACE table. Complete or correct the table space definition and process the statement again.

8

Check the status of the table definition, which is indicated in the TABLESTATUS column of the SYSIBM.SYSTABLES table. Complete or correct the table definition and process the statement again.

28

Run REORG TABLESPACE with SHRLEVEL REFERENCE on the entire table space to remove the REORG-pending (REORP) restrictive state, and to complete the point-in-time recovery process. Then execute the SQL statement that caused this error again.

29

Apply all pending definition changes to the associated table, and process the statement again.

38

Re-create the auxiliary index with DEFINE YES or re-create the LOB table space as DEFINE NO.

All other values

1. Run REORG TABLESPACE with SHRLEVEL CHANGE or SHRLEVEL REFERENCE to apply all pending definition changes.
2. Process the statement again.

-20398	ERROR ENCOUNTERED DURING XML PARSING AT LOCATION <i>n text</i>
---------------	---

Explanation

XML parsing failed during Db2 processing.

n

A byte offset into the XML code being processed after the conversion of the XML to codepage UTF-8.

text

Additional information describing the parsing error. This information includes the z/OS XML System Services return and reason code.

System action

The statement cannot be processed.

User response

Correct the XML coding and re-issue the SQL statement.

SQLSTATE

2200M

-20399	ERROR ENCOUNTERED DURING XML VALIDATION: LOCATION <i>n</i>; TEXT: <i>text</i>; XSRID <i>schema-ID</i>
---------------	--

Explanation

XML parsing failed during validation.

n

A byte offset into the XML instance document that is being validated after the conversion of the XML to codepage UTF-8.

text

Additional information describing the parsing error. Db2 might also include a text description of the error when possible. The Db2 special register value CURRENT LOCALE_LC_CTYPE is used to determine the language of the error message from the XML parser. If this value is not set, the default language is EN_US.

schema-ID
The schema ID of the XML schema against which the instance XML document is being validated.

System action

The statement cannot be processed.

Programmer response

Update the XML instance document to correct the problem and resubmit the statement.

SQLSTATE

2201R

-20400 XML SCHEMA ERROR *n text*

Explanation

The XML schema document did not process.

n
Location of the error in the schema document being processed.

text
Additional information describing the parsing error. This information includes the XML4J parser error codes and text. The special register value CURRENT LOCALE_LC_CTYPE is used to determine the language of the error message from the XML parser. If this value is not set, the default language is EN_US.

Attention: For Db2, there is not a value for *n* (offset), so Db2 will return *N. In the future, if there is a value for the location, Db2 will be able to plug it in for the first token.

System action

The statement cannot be processed.

User response

Correct the problem with the XML schema document and re-issue the invocation of the SYSPROC.XSR_COMPLETE stored procedure.

SQLSTATE

2200M

-20409 AN XML DOCUMENT OR CONSTRUCTED XML VALUE CONTAINS A COMBINATION OF XML NODES THAT CAUSES AN

INTERNAL IDENTIFIER LIMIT TO BE EXCEEDED

Explanation

An internal identifier that must be associated with each XML node of an XML value cannot be generated because the combination of the number of levels of XML nodes and the number of children nodes within these levels causes the identifier to overflow.

System action

The statement cannot be processed.

Programmer response

For a document or constructed XML value, reduce the number of levels of XML nodes or the number of children nodes especially at the deeper levels of XML nodes.

SQLSTATE

560CG

-20410 THE NUMBER OF CHILDREN NODES OF AN XML NODE IN AN XML VALUE HAS EXCEEDED THE LIMIT NUMBER OF CHILDREN NODES

Explanation

An expression generated an XML value with an XML node that has a number of children nodes. This number exceeds the limit of $2^{32} - 1$ children nodes.

System action

The XQuery expression cannot be processed.

Programmer response

Rewrite the expression generating the XML value such that the number of children nodes does not exceed the limit.

SQLSTATE

560CH

-20411 A FETCH CURRENT CONTINUE OPERATION WAS REQUESTED FOR *cursor-name* BUT THERE IS NO PRESERVED, TRUNCATED DATA TO RETURN

Explanation

The application issued a FETCH request with the CURRENT CONTINUE clause for cursor *cursor-name*, however, there is no preserved, truncated data that can be returned. One of the following errors might have occurred:

- An operation has occurred since the previous FETCH for this cursor that caused Db2 to discard the preserved, truncated data.
- CONTINUE was specified on the FETCH statement, but the previous FETCH for this cursor did not specify the WITH CONTINUE clause to enable preservation of truncated data.
- The cursor is open but not positioned on a row.
- A FETCH WITH CONTINUE was executed successfully, but the LOB or XML columns were not truncated.

System action

The statement is not processed. No data is written to the output host variable referenced on the FETCH.

Problem determination

Verify that the application has successfully completed a FETCH using the WITH CONTINUE clause, and, that it received a truncation warning for a LOB or XML column prior to performing the FETCH CURRENT CONTINUE operation. This verification can be done by checking the SQLWARN1 field in the SQLCA following the FETCH and by examining the output length for LOB and XML columns.

SQLSTATE

24524

-20412	SERIALIZATION OF AN XML VALUE RESULTED IN CHARACTERS THAT COULD NOT BE REPRESENTED IN THE TARGET ENCODING
---------------	--

Explanation

Serialization of XML data may require conversion to an encoding different from the source UTF-8 encoding. If characters exist in the source encoding that cannot be represented in the target encoding, code page conversion produces substitution characters which are not allowed in the result of XML serialization.

System action

The statement cannot be processed.

Programmer response

Choose a target encoding that can represent all characters in the XML value. Unicode encodings are recommended as they can represent all characters.

SQLSTATE

2200W

-20422	A CREATE TABLE, DECLARE GLOBAL TEMPORARY TABLE, or ALTER TABLE STATEMENT FOR <i>table-name</i> WOULD RESULT IN A TABLE WITH ALL THE COLUMNS DEFINED AS HIDDEN
---------------	--

Explanation

An attempt was made to run one of the following statements:

- A CREATE TABLE or DECLARE GLOBAL TEMPORARY TABLE statement that would create a table in which all of the columns are considered hidden. This can occur when A CREATE TABLE statement specifies HIDDEN as a part of the definition of all of the columns.
- An ALTER TABLE statement with a DROP COLUMN clause that would drop a column from a table where all of the remaining columns are defined as HIDDEN.

This process is not allowed. At least one column in a table must not be defined as hidden.

System action

The statement cannot be processed.

Programmer response

Verify that the resulting table definition includes at least one column that is not defined as hidden.

SQLSTATE

428GU

-20423	ERROR OCCURRED DURING TEXT SEARCH PROCESSING (<i>server</i>, <i>index-name</i>, <i>text</i>)
---------------	---

Explanation

An error occurred during the text search processing of a CONTAINS or SCORE function.

server

The server the error was encountered on.

index-name

The name of the index used in the text search processing. Note: include schema and period with the index name in a single token.

text

The text returned from the OmniFind text search product. The text is in the language specified by the CURRENT LOCALE_LC_CTYPE special register.

System action

The statement cannot be processed.

Programmer response

Contact your system administrator to check that the OmniFind text search product is successfully installed. Refer to the documentation for the OmniFind text search product for more information about *text*.

SQLSTATE

38H10

-20424	TEXT SEARCH SUPPORT IS NOT AVAILABLE <i>reason-code</i>
---------------	--

Explanation

A problem with one of the text search administration tables used by Db2 was detected. The *reason-code* provides more information about the error situation:

1

One of the text search administration tables was not found (SYSIBMTS.SYSTEXTINDEXES, SYSIBMTS.SYSTEXTCOLUMNS, SYSIBMTS.SYSTEXTSTATUS, SYSIBMTS.SYSTEXTCONNECTINFO, or SYSIBMTS.SYSTEXTSERVERS).

2

There are no rows in the SYSIBMTS.SYSTEXTSTATUS text search administration table.

3

The SYSTEMSTATUS column in the SYSIBMTS.SYSTEXTSTATUS table has a value of -1 indicating that text search support is not installed.

4

The SYSTEMSTATUS column in the SYSIBMTS.SYSTEXTSTATUS table has a value of

0 indicating that the support for text search is 'stopped'.

5

The SYSTEMSTATUS column in the SYSIBMTS.SYSTEXTSTATUS table has an invalid value.

6

There are no rows in the SYSIBMTS.SYSTEXTCONNECTINFO table.

7

No OmniFind servers have been defined.

8

All servers have reached the maximum number of indexes.

9

The Db2 local location name is not defined.

10

The Db2 local host IP address is not defined.

System action

The statement cannot be processed.

Programmer response

Contact your system administrator to make sure that support for text searching is successfully setup on your system.

SQLSTATE

38H11

-20425	<i>column-name</i> (IN <i>table-name</i>) WAS SPECIFIED AS AN ARGUMENT TO A TEXT SEARCH FUNCTION, BUT A TEXT INDEX DOES NOT EXIST FOR THE COLUMN
---------------	---

Explanation

A CONTAINS or SCORE text search function specified *column-name* (in table *table-name*) as an argument, but a text index does not exist for this column. Therefore, text search processing cannot be performed for the column. It is possible that the column or table is not registered to OmniFind.

System action

The statement cannot be processed.

Programmer response

Make sure that the column and table are registered to OmniFind.

SQLSTATE

---------------	--

Explanation

Either the target namespace URI that was specified following the URI keyword or the schema location URI that was specified following the LOCATION keyword is an empty string.

System action

The statement cannot be processed.

Programmer response

Make sure that every target namespace URI and every schema location URI in the XMLSCHEMA clause is a valid URI, and that it is not an empty string.

SQLSTATE

428GV

-20430	GLOBAL VARIABLE <i>variable-name</i> CANNOT BE SET IN THIS CONTEXT.
---------------	--

Explanation

An attempt was made to set the value of the identified global variable in one of the following contexts:

- An autonomous procedure is executing.

variable-name

Identifies a global variable that exists at the current server.

System action

The statement cannot be processed.

Programmer response

Remove any direct or indirect calls to an autonomous procedure that includes an assignment to a global variable.

SQLSTATE

428GX

-20433	AN UNTYPED EXPRESSION WAS SPECIFIED, BUT AN ASSUMED DATA TYPE CANNOT BE DETERMINED FROM ITS USE
---------------	--

Explanation

An untyped expression was specified and Db2 cannot determine the data type. This error can occur with a MERGE statement when an untyped expression like

a parameter or the NULL keyword is specified for a column of the source data, and the column of the source data is referenced in multiple contexts with different assumed data types.

System action

The statement cannot be processed.

Programmer response

Specify an explicit CAST specification to provide the correct data type for the expression.

SQLSTATE

429C1

-20434	AN UPDATE OPERATION HAS SET ALL OF ITS TARGET COLUMNS TO UNASSIGNED
---------------	--

Explanation

Extended indicator variables are enabled, and all of the target columns in the assignment clause of an UPDATE or MERGE statement were set to UNASSIGNED. At least one of the extended indicator variable's values must be something other than UNASSIGNED.

System action

The statement cannot be processed.

System programmer response

Correct the value and reissue the statement.

SQLSTATE

22540

Related reference

[MERGE statement \(Db2 SQL\)](#)

[UPDATE statement \(Db2 SQL\)](#)

-20435	THE SELECT CLAUSE INCLUDES MULTIPLE INVOCATIONS OF THE ARRAY_AGG FUNCTION. ALL INVOCATIONS THAT EXPLICITLY SPECIFY AN ORDER BY CLAUSE MUST SPECIFY THE SAME ORDER.
---------------	---

Explanation

The SELECT clause includes multiple invocations of the ARRAY_AGG function. One of the following conditions is also true:

- More than one invocation of the ARRAY_AGG function includes an ORDER BY clause. The sort keys in some of those ORDER BY clauses specify different sort orders. The sort orders in all ORDER BY clauses in the ARRAY_AGG function invocations must be the same.

System action

The statement cannot be processed.

Programmer response

Take one of the following actions:

- Change the sort keys in the ORDER BY clauses of the ARRAY_AGG invocations in the SELECT list so that they are all identical.
- Remove the ORDER BY clause from all except one ARRAY_AGG invocation in the SELECT list.

SQLSTATE

428GZ

Related reference

[ARRAY_AGG aggregate function \(Db2 SQL\)](#)

[XMLAGG aggregate function \(Db2 SQL\)](#)

-20436	THE DATA TYPE SPECIFIED FOR AN ARRAY TYPE IS NOT VALID.
---------------	--

Explanation

The data type that is specified for an array in one of the following contexts is not valid:

- CREATE TYPE statement
- Array constructor
- Argument to UNNEST
- Argument to ARRAY_AGG
- Target of ARRAY_AGG

The following restrictions apply to the data type for an array:

- These data types are not supported:
 - ROWID
 - XML
 - A user-defined data type other than an array data type
- The data type for an array index of an associative array must be INTEGER or VARCHAR, with a length attribute no greater than 32704.

System action

The statement cannot be processed.

Programmer response

Use a supported data type.

SQLSTATE

429C2

Related reference

[Array constructor \(Db2 SQL\)](#)
[collection-derived-table \(Db2 SQL\)](#)
[CREATE TYPE statement \(Db2 SQL\)](#)

-20437	AN ARRAY INDEX CANNOT BE APPLIED TO AN OBJECT THAT IS NOT AN ARRAY.
---------------	--

Explanation

A reference of the form *object[array-index]* was specified, but the object is not an array. An index cannot be specified for an object that is not an array type.

System action

The statement cannot be processed.

Programmer response

Change the variable or parameter to a variable or parameter of type ARRAY.

SQLSTATE

428H0

Related concepts

[Array types and values \(Db2 SQL\)](#)
[Variables \(Db2 SQL\)](#)

-20438	THE DATA TYPE OF THE EXPRESSION FOR AN ARRAY INDEX VALUE IS NOT CASTABLE TO THE DATA TYPE OF THE ARRAY INDEX.
---------------	--

Explanation

If the object is an ordinary array, the data type of the expression that is specified for an array index value, in syntax of the form *object[array-index]*, cannot be cast to the INTEGER data type.

If the object is an associative array, the data type of the expression that is specified for an array index value cannot be cast to the INTEGER or VARCHAR data type.

System action

The statement cannot be processed.

Programmer response

Change the expression for the value of the array index to an expression with a data type that is supported:

- For an ordinary array, the data type of the expression that is specified for the array index value must be castable to the INTEGER data type.
- For an associative array, the data type of the expression that is specified for the array index value must be castable to the INTEGER or VARCHAR data type.

SQLSTATE

428H1

Related concepts

[Casting between data types \(Db2 SQL\)](#)

-20439	AN ARRAY INDEX VALUE, <i>value</i>, IS NULL OR OUT OF RANGE, OR AN ARRAY ELEMENT WITH THAT INDEX VALUE DOES NOT EXIST.
---------------	---

Explanation

One of the following situations exists:

- For a FETCH, SELECT INTO, VALUES INTO, or SET assignment statement where the target is an array element, the value of the array index is null.
- For an array element specification for an ordinary array, the value of an array index is null or out of range.
- For an array element specification for an associative array, the value of an array index is null, is out of range, or does not exist in the array.
- For the second argument to the TRIM_ARRAY function, the value of an array index is null or out of range.

value

The array index value that is out of range, or the index value for the array element that does not exist.

System action

The statement cannot be processed.

Programmer response

Take the appropriate action, depending on the context in which the array index value is used:

- For a FETCH, SELECT INTO, VALUES INTO, or SET assignment statement where the target is an array element, and an array index value is null, specify a non-null value for the array index value.
- For an array element specification for an ordinary array:
 - Specify an array index value that is not null.
 - Specify an array index value that is greater than or equal to 1 and the less than or equal to the cardinality of the array.
- For an array element specification for an associative array:
 - Specify an array index value that is not null.
 - Specify an array index value for an array element that exists in the array.
 - If the array index data type is INTEGER, specify a value that is a number within the range of integers.
- For the second argument of the TRIM_ARRAY function, specify a value that is greater than or equal to 1, and less than or equal to the cardinality of the array.

SQLSTATE

2202E

Related reference

- [Array element specification \(Db2 SQL\)](#)

-20440	THE ARRAY VALUE WITH CARDINALITY <i>cardinality</i> HAS TOO MANY ELEMENTS FOR THE REQUESTED OPERATION. THE MAXIMUM NUMBER OF ELEMENTS ALLOWED FOR THE REQUESTED OPERATION IS <i>value</i>.
---------------	---

Explanation

A cast operation cannot be performed because the operation would cause elements of the array to be truncated.

cardinality

The cardinality of the array value on which an operation is being performed.

value

The maximum number of array elements on which the operation can be performed.

Truncation of the array value is not allowed where the array value is used. The array value is being used in one of the following contexts:

- An argument to a procedure call or function invocation
- The result of an invocation of the ARRAY_AGG function
- The result of an array constructor that is used as a source value for a SET *assignment-statement* statement
- An argument to a cast specification

The input to the cast operation contains too many array elements, or the target is defined with a maximum cardinality that is too small.

System action

The statement cannot be processed.

Programmer response

Examine the SQL statement to determine where truncation of the array can occur. Reduce the cardinality of the input array, or increase the cardinality that the target can support.

SQLSTATE

2202F

Related concepts

-20441	<i>type-name</i> TYPE IS NOT VALID WHERE SPECIFIED. REASON CODE <i>reason-code</i>.
---------------	--

Explanation

The identified data type is not valid in the specified context for the reason indicated by the reason code.

type-name

The name of the array type.

reason-code

A numeric value that indicates the reason that the statement cannot be executed. Possible values are:

1

- One of the following situations occurred:
- An array data type was specified in an unsupported context. An array data type can be specified in multiple contexts within SQL PL, including the following contexts:
 - A parameter to a non-inline SQL function
 - A return data type from a non-inline SQL function
 - A parameter to an SQL procedure
 - An SQL variable that is declared in an SQL function
 - An SQL variable that is declared in an SQL procedure
 - A global variable

Some of the contexts in which an array data type is not supported are:

- A parameter or variable for an external routine
- A parameter for an inline SQL function
- A return type of an inline SQL function
- A column in a table
- The SELECT list of the outer fullselect of a scrollable cursor

A value that is not an array value was specified for the UNNEST operator. An array value is the only type of value that is allowed for the UNNEST operator.

2

A global variable was defined as a distinct type. A global variable cannot be defined as a distinct type.

3

An untyped array value was specified in an unsupported context.

4

A non-array value was specified in a context where an array value is expected.

5

An array global variable, or element of an array global variable, was specified in an unsupported context. An array global variable, or element of an array global variable, that is the target of a FETCH statement must be specified only in an SQL PL context. An EXECUTE or OPEN statement that specifies an

array global variable or element of an array global variable in the USING clause can only be issued in an SQL PL context.

System action

The statement cannot be processed.

Programmer response

See the documentation for the SQL statement on which the error occurred for a complete list of restrictions on the use of the identified data type. Change the SQL statement to use the data type in a supported context.

-20442

THERE IS NOT ENOUGH STORAGE TO REPRESENT THE ARRAY VALUE.

Explanation

The amount of memory that is required to represent an array value is larger than the maximum allowed for the system.

System action

The statement cannot be processed.

Programmer response

Examples of actions that you can take are:

- Reduce the number of elements in the array or the size of some of the elements.

- Correct the statement that is attempting to create the array value.

SQLSTATE

57011

Related reference

[CREATE TYPE statement \(array type\) \(Db2 SQL\)](#)

-20444 **AN ERROR OCCURRED IN A KEY-EXPRESSION EVALUATION IN *index-name* INFORMATION RETURNED: SQLCODE: *sqlcode*, SQLSTATE: *sqlstate*, MESSAGE TOKEN *token-list* AND RID X *rid***

Explanation

During evaluation of an index key-expression for a data change statement, an SQL error condition was encountered:

index-name

The index involved when the error occurred.

sqlcode

The SQLCODE received by the key-expression evaluation.

sqlstate

The corresponding SQLSTATE for the SQLCODE received by the key-expression evaluation.

token-list

The list of tokens from the original SQL error. This list might be truncated.

rid

The RID of the row which fails the key-expression evaluation.

System action

The statement cannot be processed.

System programmer response

Use the index name and RID number to determine the failing row of the table. If the index definition is available, use the column values of the failing row to determine the failing key-expression.

Programmer response

Contact your database administrator to determine why the index specified in the message received the error.

SQLSTATE

560CM

-20447

FORMAT STRING *format-string* IS NOT VALID FOR THE *function-name* FUNCTION

Explanation

An invalid format string was specified for the function.

format-string

The invalid format string. The format might be invalid for one or more of the following reasons:

- The format string contains unsupported format elements or separator characters.
- The format string does not contain a format element, is the empty string, or is all blanks.
- The length of the format string argument exceeds the maximum allowable length.
- A format element is specified multiple times.
- The format string contains too many format elements.
- The format string contains multiple format elements that represent the same component. For example, the `TIMESTAMP_FORMAT` function must not specify both `YYYY` and `YY`, which are format elements to indicate the year, in the format string.
- A parameter marker was specified for the first argument and the format string includes a time zone format element

function-name

The name of the function.

System action

The statement cannot be processed.

Programmer response

Change the format string argument for the function.

SQLSTATE:

22007

Related reference

[Built-in functions and functions that are supplied with Db2 \(Db2 SQL\)](#)

-20448

***string-expression* CANNOT BE INTERPRETED USING FORMAT STRING *format-string* FOR THE `TIMESTAMP_FORMAT` FUNCTION.**

Explanation

The string expression that was specified for the `TIMESTAMP_FORMAT` function cannot be interpreted

with the specified format string to produce a timestamp value.

function-name

The name of the function. The name used to invoke the function could also be TO_DATE or TO_TIMESTAMP.

string-expression

The string expression.

Possible reasons for this error include:

- The string expression is too long or too short for the specified format string.
- The string expression does not conform to the template specified in the format string. For example, 92007 is not a valid value for YYYY, which indicates the year.
- A value in the string expression is not valid for the corresponding format element in the format string. For example, 45 is not a valid value for DD, which indicates the day of the month.

System action

The statement cannot be processed.

Programmer response

Change the format string argument for the function.

SQLSTATE:

22007

-20457	THE PROCEDURE <i>procedure-name</i> HAS ENCOUNTERED AN UNSUPPORTED VERSION, <i>version</i>, FOR PARAMETER <i>number</i>
---------------	--

Explanation

The version, *version*, specified for the parameter in ordinal position *number* is not supported by the procedure *procedure-name*.

User response

Call the procedure and specify a supported version number for the parameter. The highest supported version number for the parameter can be obtained by calling the procedure and specifying NULL for the value of this parameter.

SQLSTATE

38554

-20465	THE BINARY XML VALUE IS INCOMPLETE OR CONTAINS UNRECOGNIZED DATA AT LOCATION <i>position</i> WITH THE HEX DATA <i>text</i>
---------------	---

Explanation

An error occurred when processing a binary XML value.

position

A byte offset into the binary XML value.

text

The first eight bytes of XML data in hexadecimal. If the unrecognized data is located within the last eight bytes of the binary XML data, only the data starting at the location *position* up to the end of the binary XML data is returned.

System action

The statement cannot be processed.

Programmer response

Modify the binary XML value so that it conforms to the binary XML format, or change the application to use the textual XML format for data transfer.

SQLSTATE

22541

-20467	THE STATEMENT WAS NOT EXECUTED BECAUSE AN EXPRESSION IS NOT A CONSTANT OR VARIABLE. THE INVALID EXPRESSION IS IN THE STATEMENT NEAR THE SYNTAX ELEMENT <i>syntax-element</i>
---------------	---

Explanation

The expression in the statement near the syntax element *syntax-element* must result in a single value, and must consist of one of the following elements:

- A constant
- A special register
- A parameter marker
- A variable
- A deterministic function with no external action
- An expression whose operands are any of the above elements

The expression cannot include any of the following elements:

- A column name
- A non-deterministic function
- A function with external action
- An expression whose operands are any of the above

System action

The statement cannot be processed.

User response

Change the statement to specify an expression that results in a single value, and contains only elements in the list of allowed elements. Issue the statement again.

SQLSTATE

428H7

-20469 **ROW OR COLUMN ACCESS CONTROL CANNOT BE ACTIVATED FOR TABLE *table-name* FOR REASON *reason-code*. *object-type* *object-name* IS NOT IN A VALID STATE FOR ACTIVATING ACCESS CONTROL FOR THIS TABLE**

Explanation

Row access control cannot be activated explicitly or implicitly, or column access control cannot be activated explicitly for the table.

table-name

The name of the table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

36

The *object-name* view is defined on the table and the view is defined with the WITH CHECK OPTION clause.

37

The *object-name* trigger is defined for the table and the trigger is not defined as secure.

38

A view is defined on the table, the *object-name* trigger is defined for that view, and the trigger is not defined as secure.

39

The table is directly or indirectly referenced in the definition of a materialized query table.

40

The table is a created temporary table.

41

The table has a row permission or a column mask that is not valid because a previous attempt to regenerate it was unsuccessful.

42

The table cannot be activated for the row access control because the table contains a security label column.

43

The table cannot be activated for the row access control or column access control, because the table is a system-period temporal table, history table, archive-enabled table, or archive table.

79

The table cannot be activated for the row access control or column access control because the table has been granted federated access to another Db2 for z/OS subsystem in IBM Db2 Analytics Accelerator.

object-type

The type of object.

object-name

The name of the object.

System action

The statement cannot be processed.

Programmer response

Correct the error and reissue the statement to activate row or column access control for the table. For the invalid state, disable the row permission or column mask. Then, drop and re-create it with the modified definition.

SQLSTATE

55019

***object-type1* *object-name1* MUST BE DEFINED AS SECURE BECAUSE *object-type2* *object-name2* IS DEPENDENT ON IT.**

Explanation

An object that must be defined as secure is not defined as secure.

object-type1 and *object-name1*

The type and name of the object that must be defined as secure, but that is not.

object-type2 and *object-name2*

The type and name of the object that depends on the object that is identified by *object-name1*.

The object that is identified by *object-name2* depends on *object-name1* for row or column access control.

In most cases, *object-type2* is a row permission or column mask. But if *object-type2* is a sourced user-defined function, *object-name2* must be referenced in a row permission or column mask and *object-name1* must be the underlying source of the user-defined function.

System action

The statement cannot be processed.

Programmer response

Alter the object that is identified by *object-name1* to make it secure.

SQLSTATE

428H8

-20471	THE INSERT OR UPDATE IS NOT ALLOWED BECAUSE A RESULTING ROW DOES NOT SATISFY ROW PERMISSIONS.
---------------	--

Explanation

Row access control is enforced for the object of the insert or update operation. Consequently, all attempts to insert or update rows in that table are checked to ensure that the resulting rows conform to the row permissions defined for that table.

System action

The statement cannot be processed. No insert or update operations were performed, and the contents of the table remain unchanged.

Programmer response

Examine the definitions of the row permissions to determine why the requested insert or update operation was not successful. This error might be a data-dependent condition.

SQLSTATE

22542

-20472	PERMISSION OR MASK <i>object-name</i> CANNOT BE ALTERED AS SPECIFIED. REASON CODE <i>reason-code</i>.
---------------	--

Explanation

The ALTER MASK or ALTER PERMISSION statement could not be processed.

object-name

The name of the object.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 1**
A default row permission cannot be altered.
- 2**
ENABLE cannot be specified because the object is invalid after a previous attempt to regenerate it was unsuccessful.

System action

The statement cannot be processed.

Programmer response

Specify the name of a row permission that can be changed. For the invalid state, disable the row permission or column mask, then drop and re-create it with the modified definition.

SQLSTATE

428H9

-20474 **PERMISSION OR MASK CANNOT BE CREATED FOR THE *object-name* OBJECT OF THE *object-type* TYPE. REASON CODE *reason-code*.**

Explanation

The CREATE PERMISSION or CREATE MASK statement cannot be processed.

object-name

The name of the object.

object-type

The type of object.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The definition references the table for which the row permission or the column mask is being defined.

2

The definition references a table function or a collection-derived table (UNNEST).

3

The definition references a user-defined function that is not secure.

4

The definition references one of the following functions:

- A function that is defined as not deterministic
- A function that is defined to have an external action
- A function that is defined with the MODIFIES SQL DATA option

5

The definition references an OLAP specification.

6

The definition references an XMLEXISTS predicate.

7

The definition references a ROW CHANGE expression.

8

The definition references a sequence reference.

9

The definition references a created or declared temporary table.

10

The definition references a table that was implicitly created for an XML column.

11

The definition references * or name .* in a SELECT clause.

12

The definition references a column that is defined with a FIELDPROC.

13

The definition references a language element that requires multiple encoding scheme processing.

14

The definition references an ordinary SQL identifier that contains a dash (-).

16

The body of a row permission or column mask includes a period specification.

17

One of the following situations occurred:

- An attempt was made to create a row permission or column mask on one of the following table types:
 - A table that is defined with a period
 - A history table
 - An archive-enabled table
 - An archive table
 - An accelerator-only table

You cannot create row permissions or column masks on these types of tables.
- An attempt was made to implicitly create a default row permission for an ACTIVATE ROW ACCESS CONTROL specification.

18

The definition references a Db2 11 Unicode column in an EBCDIC table.

19

A column mask cannot be defined for a Db2 11 Unicode column in an EBCDIC table.

32

The column for which the mask is defined was done so with a field procedure (FIELDPROC).

33

The data type of the return expression is not the same as the data type of the column on which the column mask is defined.

34

The length attribute of the return expression is not the same as the length attribute of the column on which the column mask is defined.

35

The null attribute of the return expression is not the same as the null attribute of the column on which the column mask is defined.

36

The subtype, encoding scheme, or CCSID of the return expression is not the same as the corresponding attribute of the column on which the column mask is defined.

37

An attribute of the return expression is not the same as the corresponding attribute of the column on which the column mask is defined. The attribute is not one of the attributes that are described in reason codes 33-36.

39

The definition references an accelerator-only table.

51

A row permission cannot be created for a table that has a security label column.

52

A row permission cannot reference a table that has a security label column.

53

GROUPING SETS or *super-groups* cannot be specified in the definition of a column mask or a row permission control.

54

The definition references the AI_ANALOGY, AI_COMMONALITY, AI_SEMANTIC_CLUSTER, or AI_SIMILARITY function.

System action

The statement cannot be processed.

Programmer response

Correct the syntax, and reissue the statement.

-20476	THE <i>function-name</i> FUNCTION WAS INVOKED WITH AN INVALID FORMAT STRING <i>format-string</i>.
---------------	--

Explanation

An invalid format string was specified for the *function-name* function.

function-name

The name of the function. The value is either VARCHAR_FORMAT or DECFLOAT_FORMAT, even if the name used to invoke the function was TO_CHAR or TO_NUMBER.

format-string

The invalid format string.

A valid format string for the VARCHAR_FORMAT function must:

- Have a data type length not greater than 254 bytes
- Contain only supported format elements.
- Not result in a string with an actual length that is greater than the length attribute of the result

A valid format string for the DECFLOAT_FORMAT function must:

- Have a data type length not greater than 254 bytes
- Contain at least one format element
- Contain only supported format elements.

System action

The statement cannot be processed.

User response

Change the format string argument of the *function-name* function.

SQLSTATE

22018

Related reference

[DECFLOAT_FORMAT scalar function \(Db2 SQL\)](#)

[VARCHAR_FORMAT scalar function \(Db2 SQL\)](#)

-20477	THE <i>function-name</i> FUNCTION IS NOT ABLE TO USE FORMAT STRING <i>format-string</i> TO INTERPRET THE ARGUMENT <i>string-expression</i>.
---------------	--

Explanation

The *function-name* function was invoked with *format-string* and *string-expression*. This *function-name* value is DECFLOAT_FORMAT, even if the name used to invoke the function is TO_NUMBER. The value of the argument *string-expression* cannot be interpreted with the format string *format-string* to produce a DECFLOAT(34) value. This error can occur for any of the following reasons:

- *string-expression* is too long for the specified format string
- *string-expression* does not conform to the template specified in the format string; for example: Too many digits were specified in string-expression for the corresponding format element in the format string, such as in the specific case where 1234 is not a valid value for 999
- A value in *string-expression* is not valid for the corresponding format element in the format string, such as in the specific case where \$ is not a valid value for S

System action

The statement cannot be processed.

User response:

Change the arguments of the *function-name* function to valid values.

SQLSTATE

-20478	THE STATEMENT CANNOT BE PROCESSED BECAUSE COLUMN MASK <i>mask-name</i> (DEFINED FOR COLUMN <i>column-name</i>) EXISTS AND THE COLUMN MASK CANNOT
---------------	---

BE APPLIED OR THE DEFINITION OF THE MASK CONFLICTS WITH THE REQUESTED STATEMENT. REASON CODE *reason-code*.

Explanation

The statement could not be processed because of a conflict with a column mask that is defined on a column.

mask-name

The name of the column mask.

column-name

The name of the column.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The result table of the select is derived from a set operation that involves one of the following set operators:

- EXCEPT ALL
- EXCEPT DISTINCT
- INTERSECT ALL
- INTERSECT DISTINCT

2

The column is referenced in the select list of the scalar fullselect and the result of the scalar fullselect expression is derived from one of the following set operators:

- EXCEPT ALL
- EXCEPT DISTINCT
- INTERSECT ALL
- INTERSECT DISTINCT

20

The result table is derived from a recursive common table expression and the column is specified in the fullselect of the recursive common table expression.

21

A column in the select list is an INCLUDE column for a data change statement that is derived from the column for which the mask is defined. The column mask cannot be applied in this context.

22

The result table is derived from a table function and the column was specified as an input argument to the table function.

23

A column in the select list is derived from an OLAP specification and the column is referenced in the partitioning expression or sort key expression of the OLAP specification.

24

The column is referenced in a WHEN clause of a CASE expression. [FL 506](#) This restriction is removed in application compatibility level V13R1M506 and higher, and the masked values are used to evaluate the WHEN clause.

27

A sort key expression for ARRAY_AGG, LISTAGG, PERCENTILE_CONT, PERCENTILE_DISC or a numeric expression for MEDIAN references a column for which a column mask is defined. [FL 506](#) This restriction is removed in application compatibility level V13R1M506 or higher, and the masked values are used to evaluate the expression.

30

An insert or update operation uses a masked value that is returned from the mask and column that are identified in the message, and the expression that is specified in the THEN or ELSE clause of the column mask definition is not a simple reference to the column.

When the object table is column access control activated, for an insert or update operation, the return expression in the column mask definition must be a simple reference to the column for which the mask is defined.

31

The query includes a GROUPING SETS, CUBE or ROLLUP clause.

System action

The statement cannot be processed.

Programmer response

Check the application compatibility value that is used by your application to ensure that it is set properly. The behavior of the statement might change based on the application compatibility level.

Take the action that corresponds to the *reason-code* value, and reissue the statement.

1

Either do not reference the column in the select list or do not use the set operation in this context.

2

Either do not reference the column in the select list of the scalar-fullselect expression or do not use

a set operator to derive the result of the scalar-fullselect expression in this context.

20

Either remove the reference to the column of the recursive common table expression from the select list or do not use the recursive common table expression in this context.

21

Either remove the INCLUDE column from the select list or do not derive the INCLUDE column from the column name.

22

Either do not reference the table function or do not specify the column as input to the table function.

23

Either do not reference the column in the OLAP expression or do not use the OLAP expression in this context.

24

Either change the query to remove the reference to the column in the CASE expression or do not reference the CASE expression in this context.
FL 506 This restriction is removed in application compatibility level V13R1M506 and higher, and the masked values are used to evaluate the WHEN clause.

30

Either change the statement to remove the reference to the column in the insert or update operation, or contact the security administrator to ask them to deactivate the column access control from the object table or modify the return expression in the column mask definition.

31

Remove the GROUPING SETS, CUBE or ROLLUP clause from the query.

THE SOURCE TABLE *table-name* CANNOT BE ALTERED AS SPECIFIED BECAUSE THE TABLE IS INVOLVED IN ROW OR COLUMN

**ACCESS CONTROLS. REASON
CODE *reason-code*.**

Explanation

An unsuccessful attempt was made to alter or rename a table that is involved in row or column access controls.

table-name

The name of the table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

The table is referenced in one or more column mask or row permission definitions.

2

A column in the table is referenced in one or more column mask or row permission definitions.

System action

The statement cannot be processed.

User response

Correct the syntax, and reissue the statement.

SQLSTATE

42917

-20487

**HASH ORGANIZATION CLAUSE IS
NOT VALID FOR *table-name***

Explanation

The table cannot be altered as specified.

table-name

The name of the table.

Possible causes for this error include:

- A clause was specified on an ALTER TABLE statement, but the attribute cannot be set or changed because the table is not defined with hash organization.
- ADD ORGANIZE BY HASH was specified on an ALTER TABLE statement, but the table is already defined with hash organization.
- ADD ORGANIZE BY HASH was specified on an ALTER TABLE statement, but the table is already defined with a clustering index. Hash organization cannot be added to a table with a clustering index.

- ADD ORGANIZE BY HASH was specified on an ALTER TABLE statement, but either the table is defined with APPEND YES, or it is a materialized query table.
- ADD ORGANIZE BY HASH was specified on an ALTER TABLE statement, but the table is defined in a table space that is defined with MEMBER CLUSTER. Or, hash organization was specified on a CREATE TABLE statement that specifies a table space which is defined with MEMBER CLUSTER.
- HASH SPACE was specified on a table that is not defined to be organized by hash. If the table is not defined with hash organization, the HASH SPACE keyword is invalid in a partition element.
- HASH SPACE was specified on a table that resides in a table space which is not in reordered row format.
- ADD ORGANIZE BY HASH was specified on an ALTER TABLE statement, but the table is defined in a table space that is defined to use Huffman compression, or hash organization was specified on a CREATE TABLE statement that specifies a table space which is defined to use Huffman compression.

System action

The statement cannot be processed.

User response

Either correct the syntax of the statement or specify a different table. Then reissue the statement.

-20488	SPECIFIED HASH SPACE IS TOO LARGE FOR THE IMPLICITLY CREATED TABLE SPACE. REASON <i>reason-code</i>. (PARTITION <i>partition-number</i>)
---------------	---

Explanation

Db2 attempted to implicitly create a table space, but the specified hash space is too large for the associated table space.

reason-code

A numeric value that indicates the type of table space:

- 1** A partition-by-range table space.
- 2** A partition-by-growth table space.

partition-number

For a partition-by-range table space, *partition-number* value indicates the partition for which the HASH SPACE value is too large. For partition-by-growth table spaces, the partition number is not relevant, and is indicated as *N.

System action

The statement cannot be processed.

User response

Take either of the following actions:

- Explicitly create a table space with a larger DSSIZE specification, and specify that table space in the CREATE TABLE statement.
- Reduce the HASH SPACE specification.

-20490	A VERSIONING CLAUSE WAS SPECIFIED FOR TABLE <i>table-name</i>, BUT THE TABLE CANNOT BE USED AS A SYSTEM PERIOD TEMPORAL TABLE. REASON CODE = <i>reason-code</i>.
---------------	---

Explanation

The ALTER TABLE statement attempted to make the table into a system-period temporal table, but the table definition is not valid.

table-name

The name of the table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

- 1** The table is already defined as a system-period temporal table or history table.
- 2** The table does not have a SYSTEM_TIME period or a transaction start ID column. A system-period temporal table must have both a SYSTEM_TIME period and a transaction start ID column.
- 3** The table is a materialized query table.

- 5 The transaction-start-ID column must be defined with the same data type, length, precision, and scale as the row-begin column and row-end column of the SYSTEM_TIME period in the table.
- 8 The table is an archive-enabled table or an archive table.

System action

The statement cannot be processed.

User response

Correct the syntax, and resubmit the statement.

-20491	INVALID SPECIFICATION OF PERIOD <i>period-name</i> . REASON CODE = <i>reason-code</i> .
--------	---

Explanation

The specification of an attribute in a CREATE or ALTER statement for a period is invalid.

- period-name***
The period that contains the invalid specification.
- reason-code***
A numeric value that indicates why the attribute might be invalid:

- 1 The start column name must not be the same as the end column name for the period.
- 2 The name of a column in a period must not be the same as a column used in the definition of another period for the table.
- 3 The data type, length, precision, and scale for the start column must be the same as for the end column.

- 5 For a BUSINESS_TIME period, the column must not be a column defined with a GENERATED clause.
- 6 For a SYSTEM_TIME period, the attributes of the start column and end column must be one of the combinations:
 - The start column definition is GENERATED ALWAYS AS ROW BEGIN and the end column definition is GENERATED ALWAYS AS ROW END.
 - The start column definition is GENERATED BY DEFAULT AS ROW BEGIN and the end column definition is GENERATED BY DEFAULT AS ROW END.

System action

The statement cannot be processed.

User response

Correct the syntax, and resubmit the statement.

SQLSTATE

-20522 **INVALID SPECIFICATION OF WITHOUT OVERLAPS OR PERIOD CLAUSE. REASON CODE *reason-code*.**

Explanation

The specification of the WITHOUT OVERLAPS clause was invalid.

reason-code

The reason why the specification was invalid:

2

The columns of the specified period must not be specified in the constraint clause.

3

WITHOUT OVERLAPS can be specified in a CREATE INDEX statement only if the index is defined as UNIQUE. It cannot be specified if the index is defined as UNIQUE WHERE NOT NULL.

5

The columns of the specified period must not be specified in the index specification.

7

WITHOUT OVERLAPS cannot be specified for an index that is defined with PARTITION BY RANGE.

8

A key expression that is not a simple column reference must not be specified for the key or index when WITHOUT OVERLAPS is also specified.

9

WITH OVERLAPS can be specified in a CREATE INDEX statement only if the index is not defined as UNIQUE or UNIQUE WHERE NOT NULL.

10

WITHOUT OVERLAPS cannot be specified for an index, if the table is defined with a partitioning key that includes any columns of the BUSINESS_TIME period.

System action

The statement cannot be processed.

User response

Correct the syntax, and resubmit the statement.

SQLSTATE

428HW

-20523 **TABLE *table-name* WAS SPECIFIED AS A HISTORY TABLE, BUT THE TABLE DEFINITION IS NOT VALID FOR A HISTORY TABLE. REASON CODE = *reason-code*.**

Explanation

A table is specified as a history table in a CREATE TABLE statement or an ALTER TABLE statement, but the table definition is invalid.

table-name

The name of the table.

reason-code

A numeric value that indicates the requirement that might make the definition invalid:

1

The table must not be any of the following tables:

- System-period temporal table. The table was defined as a system-period temporal table by a previous statement, or the current statement defines the table as a system-period temporal table.
- History table.
- Declared global temporary table.
- Created global temporary table.
- Materialized query table.
- View.
- Auxiliary table.
- Clone table.
- Table that has a clone.
- Table that was implicitly created for an XML column.
- An archive-enabled table or archive table.

2

The table definition must be complete.

3

The table must be the only table in the table space.

4

The table must not contain any of the following columns:

- Identity column
- Row change timestamp column
- Row begin column
- Row end column
- Transaction start ID column
- Generated expression column

- 5 The table must not include a period definition.
- 6 The table must not be involved in any referential integrity constraints.
- 7 The history table must have the same number and order of columns as the table that is to be used as a system-period temporal table.
- 8 The table must not contain a security label column.
- 9 If a column in the system-period temporal table is defined as ROWID, the corresponding history column must be defined as ROWID with the GENERATED ALWAYS attribute.
- 10 The corresponding columns of the system-period temporal table and associated history table must have the same value for the following attributes:
- Column name
 - Data type
 - Data type length (excluding inline LOB length or XML length in the base table), precision, and scale
 - Null attribute
 - Hidden attribute
 - Field procedure
 - FOR MIXED, BIT, or SBCS DATA attribute and CCSID
- 11 The table must not have a column mask or row permission.

System action

The statement cannot be processed.

User response

Correct the syntax, and resubmit the statement.

-20524	INVALID PERIOD SPECIFICATION OR PERIOD CLAUSE FOR PERIOD <i>period-name</i>. REASON CODE = <i>reason-code</i>.
---------------	---

Explanation

A period specification or period clause is invalid.

period-name

The period that is invalid.

reason-code

A numeric value that indicates why the period is invalid:

- 1** The period name was specified more than one time for the table reference.
- 2** The SYSTEM_TIME period was specified, but the table is not a system-period temporal table.
- 3** *period-name* violated the following requirement: each expression must return a value of a built-in data type and can contain any of the following supported operands:
 - A constant
 - A special register
 - A variable, which can be either a host variable, an SQL variable, an SQL parameter, a transition variable, or a global variable
 - A parameter marker
 - A CAST specification, where the cast operand is a supported operand
 - An expression that uses arithmetic operators and operands
 - A scalar function whose arguments are supported operands (Nested function invocations are not permitted.)

These rules have the following exceptions:

- A period specification or period clause for a view must not contain an untyped parameter marker.
- The source expression of SET CURRENT TEMPORAL BUSINESS_TIME and SET

CURRENT TEMPORAL SYSTEM_TIME statements must not contain a parameter marker or a transition variable.

- The scalar functions must not be AI_ANALOGY, AI_COMMONALITY, AI_SEMANTIC_CLUSTER, or AI_SIMILARITY.

4

The period specification or period clause was specified for a view where the view definition includes a user-defined function.

5

The precision of an expression must be greater than the precision of the columns of the period. If the expression is a string, it is first converted to a timestamp, and the value must not contain more significant fractional seconds digits than the precision of the column.

6

FOR SYSTEM_TIME was specified. However, the value of the CURRENT TEMPORAL SYSTEM_TIME special register is not null, and the SYSTIMESENSITIVE bind option is set to YES. Therefore, you cannot also explicitly specify FOR SYSTEM_TIME.

7

FOR BUSINESS_TIME was specified. However, the value of the CURRENT TEMPORAL BUSINESS_TIME special register is not null, and the BUSTIMESENSITIVE bind option is set to YES. Therefore, you cannot also explicitly specify FOR BUSINESS_TIME.

8

The period specification or period clause was specified for one of the following items:

- A table that is not an application-period temporal table
- A view for which an application-period temporal table is not referenced in the outermost FROM clause of the view definition, or an INSTEAD OF trigger is defined on the view.

9

An expression must not return a value with a time zone if the begin and end columns of the specified period are defined as timestamp without time zone.

System action

The statement cannot be processed.

User response

Correct the syntax and resubmit the statement.

THE REQUESTED ACTION IS NOT VALID FOR TABLE *table-name* BECAUSE THE TABLE IS THE WRONG TYPE OF TABLE. REASON CODE = *reason-code*

Explanation

The table cannot be used as specified.

table-name

The name of the table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

An ALTER TABLE statement with an ADD PERIOD clause was specified for a history table, an archive-enabled table, or an archive table. A period cannot be specified for these types of tables.

4

An ALTER TABLE statement with a DROP VERSIONING clause was specified, but the table is not a system-period temporal table.

5

An ALTER TABLE statement with a DROP VERSIONING clause was specified. However, system-period data versioning cannot be dropped if there are any triggers, functions, procedures, views, or materialized query tables that reference historical versions of rows in the table.

7

An ALTER TABLE statement with a ROTATE PARTITION clause was specified for a system-period temporal table, a history table, an archive-enabled table, or an archive table.

8

An ALTER TABLE statement with an ADD CLONE clause was specified for a system-period temporal table, a history table, an archive-enabled table, or an archive table.

9

A TRUNCATE statement attempted to truncate a system-period temporal table. A system-period temporal table cannot be truncated.

10

An ALTER TABLESPACE statement attempted to alter the CCSID of a table space that contains a system-period temporal table, a history table, an archive-enabled table, or an archive table.

11

A CREATE TABLE or ALTER TABLE statement attempted to define a referential constraint where either the parent or child table is a history table or an archive table.

13

An ALTER TABLE statement with an ADD COLUMN clause was specified for a history table or an archive table.

16

An ALTER TABLE statement was specified to add a generated column other than a ROWID to a system-period temporal table or archive-enabled table.

19

An ALTER TABLE statement with a DISABLE ARCHIVE clause was specified, but the table is not an archive-enabled table.

System action

The statement cannot be processed.

User response

Change the statement to specify the name of a table for which the action is valid, or specify a different action for the current table.

-20531	THE VERSION NUMBER <i>actual-version</i> SPECIFIED IN A BINARY XML VALUE IS NOT SUPPORTED.
---------------	---

**THE HIGHEST SUPPORTED
VERSION IS *supported-version*.**

Explanation

The version number contained in a binary XML value specifies a version of the binary XML specification that is not supported. The binary XML value cannot be parsed.

actual-version

The version that is specified.

supported-version

The highest version of the binary XML specification that is known to be supported.

System action

The statement cannot be processed.

Programmer response

Make sure that XML values either are formatted as binary XML data conforming to a version of the binary XML specification that the server supports or are formatted as textual XML data.

SQLSTATE

22544

-20535	THE DATA CHANGE OPERATION operation IS NOT SUPPORTED FOR THE TARGET OBJECT <i>object- name</i> BECAUSE OF AN IMPLICIT OR EXPLICIT SYSTEM PERIOD SPECIFICATION INVOLVING period-name. REASON CODE: reason-code.
---------------	---

Explanation

Db2 cannot perform the specified data change operation, because the target of the operation references a temporal table for which a period specification is in effect. The period specification was either implicitly specified by a special register or explicitly specified in the fullselect that was specified as the target.

operation

The data change operation.

object-name

The name of the target object.

period-name

The name of the period that is invalid. Possible values are BUSINESS_TIME or SYSTEM_TIME.

reason-code

A numeric value that indicates why the operation is invalid. *reason-code* can have one of the following values:

1

The data in a system-period temporal table cannot be changed when a period specification is in effect. In this case, this restriction was violated, because both of the following conditions exist:

- The data change operation directly or indirectly references a system-period temporal table. The target of the operation is one of the following objects:
 - A system period temporal table
 - A view that is defined with an outer fullselect that either directly or indirectly references a system-period temporal table in the FROM clause
- A period specification is in effect, because the CURRENT TEMPORAL SYSTEM_TIME special register contains a non-null value, and the SYSTIMESENSITIVE bind option is set to YES.

System action

The statement cannot be processed.

User response

Take the action for the specified reason code:

1

Take one of the following actions:

- Set the CURRENT TEMPORAL SYSTEM_TIME special register to the null value and try the data change operation again.
- If the statement is in a package that you do not want to be affected by the setting of the CURRENT TEMPORAL SYSTEM_TIME special register, bind the package with SYSTIMESENSITIVE NO.

-20539 **THE QUERY FAILED BECAUSE A NEGATIVE VALUE OR THE NULL VALUE IS USED IN THE *clause* CLAUSE**

Explanation

A query can include an OFFSET clause to begin fetching rows starting at a specified row number. A query can include a FETCH FIRST clause or a LIMIT clause, with or without an associated OFFSET clause, to control the number of rows that are returned from the query. The row count value for these clauses can be specified as a constant or variable that must be a positive numeric value or zero. The value must not be the null value.

clause

The clause that contains the negative value or the NULL value.

System action

The statement cannot be processed.

User response

Change the clause to specify a positive number or zero, and issue the query again.

SQLSTATE

2201W, 2201X

-20547 **THE STATEMENT FAILED BECAUSE THE TARGET OF AN ASSIGNMENT IS A READ-ONLY VARIABLE. VARIABLE NAME: *variable-name*.**

Explanation

Global variables can generally be used as the target of an assignment in various SQL statements, with the appropriate write access. However, the definition of some global variables makes them read-only. This applies to some built-in global variables and also to user-defined variables that are defined using the CONSTANT clause. A variable that is read-only cannot be used in an SQL statement as the target of an assignment.

variable-name

The name of the variable that is read-only.

System action

The statement cannot be processed.

Programmer response

Change the target variable to a variable that is not read-only.

SQLSTATE

428I3

Related reference

[Built-in global variables \(Db2 SQL\)](#)
[compound-statement \(Db2 SQL\)](#)

-20550 **AN ARGUMENT, OR COMBINATION OF ARGUMENTS, SPECIFIED FOR THE *operator-name* OPERATOR ARE NOT VALID.**

Explanation

An operator was specified with an argument, or combination of arguments, that are not valid in the context where they were used.

operator-name

The name of the operator with the invalid arguments.

If the operator name is UNNEST, the error was issued for one of the following reasons:

- More than one associative array argument was specified.
- One ordinary array argument was specified with an associative array argument.
- An argument must not include a scalar fullselect.

System action

The statement cannot be processed.

Programmer response

Change the array arguments or the operator.

If the operator name is UNNEST, take one of the following actions:

- Specify only one associative array argument.
- Specify ordinary array arguments only with other ordinary array arguments.
- Specify an expression that does not include a scalar fullselect.

SQLSTATE

428I4

-20551	CONSTRUCTING AN ASSOCIATIVE ARRAY FAILED BECAUSE THE INPUT DATA INCLUDES AT LEAST ONE DUPLICATE ARRAY INDEX VALUE. DUPLICATED INDEX VALUE: <i>value</i>.
---------------	---

Explanation

In an associative array, each element is associated with a unique index value. When the ARRAY_AGG aggregate function is used to construct an array, if more than one element is associated with the same array index value, only one of the element values can be included in the array. This potential loss of element data is the reason that index values must be unique within the input data that is used to construct an associative array.

value

The duplicate array index value.

System action

The statement cannot be processed.

User response

Change the input data so that there are no duplicate array index values. When you use the ARRAY_AGG aggregate function, you might need to add predicates to the query that produces the aggregation grouping sets to ensure that none of the rows include duplicate values for the *index-expression* argument of the ARRAY_AGG function.

-20553	AN ENABLE ARCHIVE CLAUSE WAS SPECIFIED FOR TABLE <i>table-name</i>, BUT THE TABLE CANNOT BE USED AS AN ARCHIVE-ENABLED TABLE. REASON CODE = <i>reason-code</i>.
---------------	--

Explanation

The ALTER TABLE statement attempted to define a table as an archive-enabled table, but the table definition is not valid.

table-name

The name of the table.

reason-code

A numeric value that identifies the reason for the error. *reason-code* can have one of the following values:

- 1**
The table is already defined as an archive-enabled table or an archive table.
- 3**
The table is a materialized query table.
- 4**
The table has a column mask or row permission.
- 8**
The table is a system-period temporal table or history table.
- 9**
The table includes a period definition.

System action

The statement cannot be processed.

User response

Correct the syntax and resubmit the statement.

-20554	TABLE <i>table-name</i> WAS SPECIFIED AS AN ARCHIVE TABLE, BUT THE TABLE DEFINITION IS NOT VALID FOR AN ARCHIVE TABLE. REASON CODE = <i>reason-code</i>.
---------------	---

Explanation

An ALTER TABLE statement attempted to define a table as an archive table, but the table definition is not valid.

table-name

The name of the table that was specified to be an archive table.

reason-code

A numeric value that identifies the reason for the error. *reason-code* can have one of the following values:

1

The table is an existing archive table or one of the following types of tables:

- Archive-enabled table. The table was defined as an archive-enabled table by a previous statement, or the current statement defines the table as an archive-enabled table.
- System-period temporal table.
- History table.
- Declared global temporary table.
- Created global temporary table.
- Materialized query table.
- View.
- Auxiliary table.
- Clone table.
- Table with a clone defined on it.
- Table that was implicitly created for an XML column.

None of these tables can be defined as an archive table.

2

The table has an incomplete table definition.

3

The table is not the only table in the table space. An archive table must be the only table in the table space.

4

The table contains an identity column, a row-begin column, a row-end column, a transaction-start-ID column, or a generated expression column. Archive tables cannot contain any of these columns.

5

The table includes a period definition, which is not allowed for an archive table.

6

The table is involved in a referential integrity constraint, which is not allowed for an archive table.

7

The archive table does not have the same number of columns as the table that is to be used as the archive-enabled table. Both of

these tables must have the same number of columns.

8

The table contains a security label column, which is not allowed in an archive table.

9

The table does not have a ROWID column to correspond to the one in the table that is to be used as the archive-enabled table. If the archive-enabled table has a ROWID column, the corresponding archive table column must be a ROWID column with the GENERATED ALWAYS attribute.

10

One of the following column attributes does not match the attribute for the corresponding column in the table that is to be used as the archive-enabled table:

- Name
- Data type
- Data type length (excluding inline LOB length or XML length in the base table), precision, and scale
- Null attribute
- Hidden attribute
- Field procedure
- FOR BIT, SBCS, or MIXED DATA attribute
- CCSID

These attributes for the corresponding columns of an archive-enabled table and the associated archive table must be the same.

11

The table has a column mask or row permission, neither of which are allowed for an archive table.

12

The table does not have a row change timestamp column to correspond to the one in the table that is to be used as the archive-enabled table. If the archive-enabled table has a row change timestamp column, the corresponding archive table column must be a row change timestamp column with the GENERATED ALWAYS attribute.

System action

The statement cannot be processed.

User response

Correct the syntax and resubmit the statement.

SQLSTATE

428HX

[ALTER TABLE statement \(Db2 SQL\)](#)

[CREATE TABLE statement \(Db2 SQL\)](#)

-20555 **AN ARCHIVE-ENABLED TABLE IS NOT ALLOWED IN THE SPECIFIED CONTEXT. REASON CODE *reason-code*.**

Explanation

The statement or query cannot reference an archive-enabled table for the indicated reason.

reason-code

A numeric value that identifies the reason for the error. *reason-code* can have one of the following values:

1

An SQL statement that requests historical data cannot reference both an archive-enabled table and a temporal table. (The temporal table can be either a system-period temporal table or an application-period temporal table.) For example, a query, a view definition, or an INSERT, UPDATE, or DELETE statement cannot reference both of these table types.

FL 507 SELECT statements are not subject to this restriction in the following specific situations, where no historical data is requested:

- If an application-period temporal table is referenced, a FOR BUSINESS TIME period is not specified, and the CURRENT TEMPORAL BUSINESS_TIME special register is NULL.
- If a system-period temporal table is referenced, a FOR SYSTEM TIME period is not specified, and the CURRENT TEMPORAL SYSTEM_TIME special register is NULL.
- If an archive-enabled table is referenced, the SYSIBMADM.GET_ARCHIVE global variable is set to 'N'.

2

An INSERT, UPDATE, or MERGE statement cannot reference an archive-enabled table as the target of its operation when the value of the SYSIBMADM.MOVE_TO_ARCHIVE global variable is Y.

3

An SQL table function cannot reference an archive-enabled table when both of the following conditions are true:

- The value of the SYSIBMADM.GET_ARCHIVE global variable is Y.
- The value of the ARCHIVESENSITIVE bind option is YES.

4

The definition of a row permission or column mask that is activated by a data change statement or query cannot reference an archive-enabled table when both of the following conditions are true:

- The value of the SYSIBMADM.GET_ARCHIVE global variable is Y.
- The value of the ARCHIVESENSITIVE bind option is YES.

System action

The statement cannot be processed.

User response

Change the query or statement to remove the reference to the archive-enabled table and specify another table.

THE OPERATION FAILED BECAUSE MULTIPLE RESULT VALUES CANNOT BE RETURNED FROM A SCALAR FUNCTION *function-name*.

Explanation

A scalar function was invoked with arguments that do not allow the return of multiple result values for a single invocation. The processing of the scalar function determined a result the consisted of multiple values.

function-name

Identifies the name of the function that returned the error.

System action

The statement cannot be processed.

User response

One of the following options can be used to avoid the error:

- Change the values of the input arguments to the scalar function to return a single value from the multiple value result.
- As an alternative to the scalar function invocation, create a user-defined table function, if possible, to return a result with multiple values.

**TABLE *table-name* CANNOT BE
DEFINED AS A DEPENDENT
OF REFERENTIAL CONSTRAINT
constraint-name. REASON *reason-
codereason-code*.**

Explanation

The object of an ALTER TABLE statement cannot be defined as a dependent table in a referential constraint for the reason indicated by the reason code.

table-name

The name of the table that is named as the dependent table.

constraint-name

The name of the referential constraint in which the altered table that is the dependent table.

reason-code

The reason for the message or SQL code, indicated by one of the following values:

1

PERIOD BUSINESS_TIME was specified as part of a temporal referential constraint definition that would result in a referential cycle. The parent and child tables must not be the same table in a temporal referential constraint, and the child table must not be a descendent, directly or indirectly, of another table that is a descendent of the parent table.

2

An index that enforces a temporal referential constraint contains an INCLUDE column. This is not allowed.

System action

The statement cannot be processed.

User response

Correct the constraint definition.

SQLSTATE

42915

-20577

**SQL DATA INSIGHTS HAS NOT
BEEN CONFIGURED IN Db2,
REASON *reason-code*.**

Explanation

An attempt was made to use an SQL Data Insights function, but failed due to one or more of the following reasons:

reason-code

- 3
SQL DI is not configured for this Db2.
- 4
SQL DI detects an incompatible SQL DI table.
- 5
SQL DI detects invalid values in the SQL DI tables.
- 6
SQL DI detects an incompatible code in z/OS.

System action

- For RC 3, run the DSNTIJAI job to configure this Db2 system to use SQL DI. Make sure that you have the database administrator authority.
- For RC 4, check that your Db2 code level is compatible with your SQL DI catalog tables. Update your Db2 by following the ++HOLD instructions in the latest PTF and retrain the model.
- For RC 5, verify that you have applied the latest PTFs for your SQL DI UI and z/OS. Retrain the model after both PTFs are successfully applied.
- For RC 6, check that the code levels of your Db2 and z/OS systems are compatible. Apply the latest z/OS PTF and retrain the model.

SQLSTATE

0A502

-20578 **MODEL COLUMNS CANNOT BE DETERMINED FOR FUNCTION *function-name*.**

Explanation

No model columns can be determined for the arguments of the SQL Data Insights function.

function-name

The name of the SQL Data Insights function.

Arguments of the SQL Data Insights functions must specify model columns. If the argument is a column name, the model column is that column name. The model column may also be specified on the function invocation using the USING MODEL COLUMN clause. Some SQL Data Insights functions infer the model column of arguments from other arguments of the function. Refer to the documentation of the specific function being invoked to understand how the model column of the arguments are determined.

System action

The statement that contains the function cannot be processed.

Programmer response

Correct the invocation of the function to ensure that the arguments have specified a model column or that they specify the arguments such that Db2 is able to infer the model columns. Once the corrections to the SQL are made, reissue the statement. Refer to the documentation of the specific function being invoked to understand how the model column of the arguments are determined.

SQLSTATE

428ID

-20579 **IN FUNCTION *function-name*
MODEL COLUMN *column-name*
FROM MODEL *model-name*
CANNOT BE USED, REASON
reason-code.**

Explanation

In an invocation of an SQL Data Insights function, a model column or model was not found or found to be not usable.

function-name

The name of the SQL Data Insights function in which *model-name* and *column-name* is referenced.

column-name

The model column that is not included in the model. *column-name* may be indicated as *N when it cannot be determined for some of reasons below.

model-name

The model table that does not include the model column *column-name*.

reason-code

A numeric value which indicates why the model or column cannot be used:

1

There is no model indicated by *model-name*.

2

The model *model-name* exists, but *column-name* is not a configured column in *model-name*.

3

The model *model-name* is not enabled.

4

The model *model-name* is incomplete.

5

The model columns specified in *function-name* are from different models. *model-name* and *column-name* indicate one model column that is different from other model columns specified in the function.

6

Illegal use of model column qualifier in *column-name*. The qualifier must refer to a table name or view name, or an alias to a table name or view name. It may not refer to a synonym name, or the correlation name of a table expression.

7

One argument to AI_SIMILARITY has a model column that was indicated as a primary key column during model training, and the other argument specifies a different model column.

8

For AI_ANALOGY, arguments *source-1* and *source-2* must use the same model column, and arguments *target-1* and *target-2* must use the same model column.

11

The specified function does not support a column that is assigned the SQL DI text data type.

System action

The statement that contains the function cannot be processed.

Programmer response

Review the reason indicated by *reason-code* and ensure that the model and model column referenced in the SQL Data Insights function refers to a model that has completed training. Correct the usage of the model columns in the function, if necessary.

SQLSTATE

428ID

-20580

IN AI FUNCTION *function-name*, ARGUMENT *n* IS NOT USABLE, REASON *reason-code*.

Explanation

An SQL Data Insights function specified an argument that cannot be used.

function-name

The name of the SQL DI function.

n

The numeric position of the argument that cannot be used.

reason-code

10

The *source-1* and *source-2* arguments to AI_ANALOGY must not be the same value. If the SQL DI data types of the model columns for *source-1* and *source-2* are numeric, their values, though different, may be treated as the same because they may belong to the same cluster during model training. See the Model details page of the SQL DI UI for more information how numeric values in a cluster are processed in function arguments.

SQLSTATE

428ID

-30000

EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: REASON *reason-code* (*sub-code*)

Explanation

A DRDA protocol error has resulted which prevented successful execution of the current SQL statement. The error was such that it will not preclude the successful execution of further SQL statements.

System action

The statement cannot be processed. The SQLCA is formatted. Message DSNL031I or DSNL032I, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer response

Notify the DBA for assistance in analysis of the SQL statement which yielded this SQLCODE.

Problem determination

The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the

remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server or possibly, by the local Db2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'1245' - PRCCNVRM
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two-byte 'sub-code' accompanies 'reason-codes' X'220A' (DSCINVRM), X'1245' (PRCCNVRM), and X'124C' (SYNTAXRM). In all other cases, the 'sub-code' is zero.

The 'sub-code' when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local Db2; it is X'02' if the error was detected by the remote server. The low-order byte is dependent on the 'reason-code' as follows:

- Description Error Code (DSCERRCD) if 'reason-code' = X'220A' (DSCINVRM).
- Syntax Error Code (SYNERRCD) if 'reason-code' = X'124C' SYNTAXRM).
- Conversational Protocol Error Code (PRCCVNCD) if 'reason-code' = X'1245' (PRCCNVRM).

For a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, and PRCCVNCD, see [DRDA Volume 3 "Distributed Data Management Architecture"](#) (Open Group Library - Data Management Standards).

SQLSTATE

58008

-30002 THE SQL STATEMENT CANNOT BE EXECUTED DUE TO A PRIOR CONDITION IN A CHAIN OF STATEMENTS

Explanation

An SQL statement was chained to PREPARE, but the PREPARE statement has received a warning SQLCODE that requires the program or user to either re-issue

the chained statement or issue a different SQL request. This error can occur only in a client/server environment.

- A distributed client using DRDA has chained an OPEN statement to a PREPARE, but the PREPARE statement received SQLCODE +495.

System action

The statement cannot be executed as chained.

Programmer response

The statement must be sent again as a separate request.

SQLSTATE

57057

-30005 EXECUTION FAILED BECAUSE FUNCTION NOT SUPPORTED BY THE SERVER: LOCATION *location-name* PRODUCT ID *product-identifier* REASON *reason-code* (*sub-code*)

Explanation

The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. The error was such that it will not preclude the successful processing of further SQL statements.

location-name

The name of the server that could not support the required database protocols to perform the requested function.

product-identifier

An alphanumeric string that identifies the product.

The product identifier (PRDID) value is an 8-byte character value in *pppvrrm* format, where: *ppp* is a 3-letter product code; *vv* is the version; *rr* is the release; and *m* is the modification level. For Db2 13 for z/OS, the modification level (0–9 or A–Z) indicates a specific function level. For example:

DSN13012 for V13R1M501.
DSN13011 for V13R1M500.
DSN13010 for V13R1M100.

For more information, see [Product identifier \(PRDID\) values in Db2 for z/OS \(Db2 Administration Guide\)](#).

reason-code

A numeric value that identifies the function. Possible values are:

0010
 LONG_STMTS
0020

sub-code

A single-byte value that indicates how the error was detected in the network. If no additional information is available, this value is 0.

'01'x

The local Db2 that is acting as the requester detected the error. The values that are provided for *location-name* and *product-identifier* identify the server in error.

'02'x

The server detected the error. The values that are provided for *location-name* and *product-identifier* identify the location and level of the local Db2 server.

'03'x or '04'x

An intermediate server (hop site) detected the error. The values that are provided for *location-name* and *product-identifier* identify the server in error.

System action

The statement cannot be processed. The SQLCA is formatted.

Programmer response

Notify the DBA for assistance in analyzing the SQL statement that prompted this SQLCODE.

Problem determination

Use the *reason-code* value that was specified in the code to determine which function was not supported. Use the *sub-code* value to further identify the problem.

SQLSTATE

56072

-30020	EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT CAUSED DEALLOCATION OF THE CONVERSATION: REASON <i>reason-code (sub-code)</i>
---------------	--

Explanation

A DRDA protocol error has occurred that prevented the successful execution of the current SQL statement or command, as well as any subsequent SQL statements.

The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute

the SQL statement. These represent internal errors detected at the remote server site or possibly, by the local Db2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1232' - AGNPRMRM
- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'0010' - FDODSC
- X'1218' - MGRDEPRM
- X'1245' - PRCCNVRM
- X'241A' - QRYDSC
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two byte sub-code accompanies 'reason codes'. The sub-code, when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local Db2; It is X'02' if the error was detected by the remote server. The low-order byte is dependent upon the 'reason code' as follows:

- Description Error Code (DSCERRCD) if reason code= X'220A' (DSCINVRM).
- Syntax Error Code (SYNERRCD) if reason code = X'124C' (SYNTAXRM).
- Conversational Protocol Error Code (PRCCVNCD) if reason code = X'1245' (PRCCNVRM).
- Manager Dependency Error Code (DEPERRCO) if reason code = X' 1218' (MGRDEPRM).

For a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, PRCCNVCD, and DEPERRCO, see [DRDA Volume 3 "Distributed Data Management Architecture"](#) (Open Group Library - Data Management Standards).

System action

The statement cannot be processed. The SQLCA is formatted and the conversation on which the error was detected is deallocated. Message DSNL031I or DSNL032I, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer response

The connection to the server has been broken, and the server has, therefore, rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

SQLSTATE

58009

-30021	EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: MANAGER <i>manager</i> AT LEVEL <i>level</i> NOT SUPPORTED ERROR
---------------	---

Explanation

A DRDA error occurred that prevented the successful execution of the current SQL statement or command and any subsequent SQL statements.

A manager-level conflict was detected during the processing of the DDM EXCSAT command. Refer to the [DRDA Volume 3 "Distributed Data Management Architecture"](#) (Open Group Library - Data Management Standards) for a detailed description of EXCSAT processing and errors.

The *manager* value is the 2-byte hexadecimal code point of the DDM manager class identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRVLV in the [DRDA Volume 3 "Distributed Data Management Architecture"](#) (Open Group Library - Data Management Standards) for the 2-byte hexadecimal values.

System action

The statement cannot be processed.

Programmer response

Notify the system programmer for analysis of the condition that caused this SQLCODE.

SQLSTATE

58010

-30025	EXECUTION FAILED BECAUSE FUNCTION IS NOT SUPPORTED BY THE SERVER WHICH CAUSED TERMINATION OF THE CONNECTION: LOCATION <i>location</i> PRODUCT ID <i>identifier</i> REASON <i>reason-code</i> (<i>sub-code</i>)
---------------	---

Explanation

The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. A new connection is required to allow the successful execution of further SQL statements.

location-name

The name of the server that could not support the required database protocols to perform the requested function.

identifier

A string in one of the following forms:

- *product-identifier*
- *product-identifier:clientapplcompat-value:package-applcompat-value*

product-identifier

An alphanumeric string that identifies the product.

The product identifier (PRDID) value is an 8-byte character value in *pppvrrm* format, where: *ppp* is a 3-letter product code; *vv* is the version; *rr* is the release; and *m* is the modification level. For Db2 13 for z/OS, the modification level (0–9 or A–Z) indicates a specific function level. For example:

DSN13012 for V13R1M501.

DSN13011 for V13R1M500.

DSN13010 for V13R1M100.

For more information, see [Product identifier \(PRDID\) values in Db2 for z/OS \(Db2 Administration Guide\)](#).

clientapplcompat-value

The client application compatibility value that is provided by a client application:

- For applications that use Java drivers, *clientapplcompat-value* is the value of the `clientApplCompat Connection` or `DataSource` property for the connection to the Db2 for z/OS data server.

- For applications that use other clients or drivers, such as the CLI driver, *clientapplcompat-value* is the value of the `ClientApplCompat` configuration keyword.

If the application does not provide a client application compatibility value, this value is an asterisk (*).

package-applcompat-value

The APPLCOMPAT bind option value for the package that was used to execute the first SQL statement in the application. For more information, see the following topics:

- [Application compatibility on Db2 for z/OS](#)
- [Setting the Db2 for z/OS application compatibility for your JDBC and SQLJ applications \(Db2 Application Programming for Java\)](#)

sub-code

A single-byte value that indicates how the error was detected in the network. If no additional information is available, this value is 0.

'01'x

The local Db2 that is acting as the requester detected the error. The values that are provided for *location-name* and *product-identifier* identify the server in error.

'02'x

The server detected the error. The values that are provided for *location-name* and *product-identifier* identify the location and level of the local Db2 server.

'03'x or '04'x

An intermediate server (hop site) detected the error. The values that are provided for *location-name* and *product-identifier* identify the server in error.

System action

The statement cannot be processed. The current unit of work is rolled back. The SQLCA is formatted.

If the *reason-code* is 0600, a companion DSNL076I message might also be issued to the Db2 server system console.

Programmer response

Contact the database administrator for assistance in analyzing the SQL statement that prompted this SQLCODE.

Problem determination

Use the *reason-code* value that was specified in the code to determine which function was not supported. Use the *sub-code* value to further identify the problem.

Database administrator response

If *reason-code* is 0600, use *clientapplcompat-value* and *package-applcompat-value* to determine the cause of the error and fix the problem:

- If *identifier* is in the format *product-identifier:clientapplcompat-value:package-applcompat-value*, *clientapplcompat-value* is greater than *package-applcompat-value*. *clientapplcompat-value* must be less than or equal to *package-applcompat-value*.

Determine whether the application uses any capabilities for which the minimum function level is greater than *package-applcompat-value*. Then take one of the following actions:

- If the application does not use any capabilities that require a higher application compatibility setting, change the client application compatibility setting to *package-applcompat-value*.
- If the application uses capabilities that require *clientapplcompat-value*, use a version of the IBM data server driver or client for which the package application compatibility is greater than or equal to *clientapplcompat-value*.

Query SYSIBM.SYSPACKAGES to find existing IBM data server driver or client packages at the right application compatibility level. If no packages exist, bind or rebind driver or client packages. For drivers only, you can use the DSNTIJLC job to bind copies of the driver packages, or the DSNTIJLR job to rebind the driver packages, at the correct application compatibility level.

If you bind copies of the driver packages, you need to modify the configuration keyword or bind option that controls the current package set so that applications use the correct set of driver packages.

See [Setting application compatibility levels for data server clients and drivers \(Db2 Application programming and SQL\)](#) for more information.

- If *identifier* is in the format *product-identifier*:package-applcompat-value*, a client

application compatibility value was not set for the application. In addition, *package-applcompat-value* is greater than V12R1M500, and the client or driver is not at a level that supports the package APPLCOMPAT level *package-applcompat-value*. Take one of the following actions.

- Upgrade the client or driver. Refer to [Setting application compatibility levels for data server clients and drivers \(Db2 Application programming and SQL\)](#) for information on required client driver levels.

Tip: It is recommended that after you upgrade the client or driver, set the client application compatibility level for the application to a value that is less than or equal to *package-applcompat-value*.

- If it is not yet possible to upgrade the client or driver, bind or rebind the client or driver packages with the APPLCOMPAT value set to V12R1M500 or lower.

For drivers only, you can use the DSNTIJLC job to bind copies of the driver packages, or the DSNTIJLR job to rebind the driver packages, at the correct application compatibility level.

If you bind copies of the driver packages, you need to modify the configuration keyword or bind option that controls the current package set so that applications use the correct set of driver packages.

56073

-30030	COMMIT REQUEST WAS UNSUCCESSFUL, A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED, THE CONVERSATION HAS BEEN DEALLOCATED. ORIGINAL SQLCODE= <i>original-sqlcode</i> AND ORIGINAL SQLSTATE= <i>original-sqlstate</i>
--------	--

Explanation

The application requested COMMIT operation was unsuccessful and the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation did not complete successfully but the SQLCODE returned from the remote server was greater than or equal to zero. The unit of work has been rolled back and the connection with the remote server has been deallocated.

System action

An alert was generated. A DSNL031I message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with -30030 and the SQLSTATE returned by the AS is replaced with '158013' and the connection with the remote server has been deallocated.

The SQLCODE and SQLSTATE values that were returned from the remote server are stored in the SQLERRM field in a string of the following format:

```
'original-sqlcode 'FF'X original-sqlstate'
```

Programmer response

Notify the system programmer for assistance in analyzing the trace data that was generated.

SQLSTATE

58013

-30040	EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS. REASON <i>reason-code</i> TYPE OF RESOURCE <i>resource-type</i> RESOURCE NAME <i>resource-name</i> PRODUCT ID <i>product-identifier</i> RDBNAME <i>rdbname</i>
--------	--

Explanation

The SQL statement or command requires a non-RDB resource that is currently unavailable.

reason-code
The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381](#).

resource-type and resource-name
The type and name of the resource that the message identifies. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

product-identifier
An alphanumeric string that identifies the product.

The product identifier (PRDID) value is an 8-byte character value in *pppvrrm* format, where: *ppp* is a 3-letter product code; *vv* is the version; *rr* is the release; and *m* is the modification level. For Db2

13 for z/OS, the modification level (0–9 or A–Z) indicates a specific function level. For example:

DSN13012 for V13R1M501.
DSN13011 for V13R1M500.
DSN13010 for V13R1M100.

For more information, see [Product identifier \(PRDID\) values in Db2 for z/OS \(Db2 Administration Guide\)](#).

rdbname

A sixteen-byte string that identifies the RDBNAME.

System action

The statement cannot be processed. The local Db2 is disconnected from the remote server.

Programmer response

Verify the identify of the resource that was not available. The reason the resource is unavailable is identified by the *reason-code* value.

Collect the following diagnostic items to help determine the cause of the unavailable resource:

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the reason code received.

SQLSTATE

57012

-30041	EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS AND SQL STATEMENTS. REASON <i>reason-code</i> TYPE OF RESOURCE <i>resource-type</i> RESOURCE NAME <i>resource-name</i> PRODUCT ID <i>product-identifier</i> RDBNAME <i>rdbname</i>
---------------	---

Explanation

The SQL statement or command requires a non-RDB resource that is currently unavailable.

reason-code

The Db2 reason code value that indicates the reason for the failure. For explanations of reason codes, see [Part 2, “Db2 reason codes,” on page 381](#).

resource-type and resource-name

The type and name of the resource that the message identifies. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

product-identifier

An alphanumeric string that identifies the product.

The product identifier (PRDID) value is an 8-byte character value in *pppvrrm* format, where: *ppp* is a 3-letter product code; *vv* is the version; *rr* is the release; and *m* is the modification level. For Db2 13 for z/OS, the modification level (0–9 or A–Z) indicates a specific function level. For example:

DSN13012 for V13R1M501.
DSN13011 for V13R1M500.
DSN13010 for V13R1M100.

For more information, see [Product identifier \(PRDID\) values in Db2 for z/OS \(Db2 Administration Guide\)](#).

rdbname

A sixteen-byte string that identifies the RDBNAME.

System action

The statement cannot be processed. The local Db2 is disconnected from the remote server.

Programmer response

Verify the identity of the resource that was not available. The reason the resource is unavailable is identified by the *reason-code* value:

Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the reason code received.

SQLSTATE

57013

-30045	EXECUTION FAILED BECAUSE THE DEFINITION OF OBJECT <i>object-name</i> OF TYPE <i>object-type</i> BEING ACCESSED AT <i>server-name-1</i> DIFFERS FROM THE DEFINITION OF THE OBJECT AT <i>server-name-2</i>
---------------	---

Explanation

The definition of the object, *object-name*, at *server-name-1* does not match the definition of the object

at *server-name-2*. *object-name* must have identical definitions at both servers if either of the following SQL statement processing occurs, otherwise, the attempt to access *object-name* will fail:

- An SQL statement is system directed at *server-name-2* to run at *server-name-1*, and *object-name* is referenced or updated in the processing of that statement.
- An SQL statement is processed at *server-name-1* which is local to the application, and prior SQL statements of the application session had been directed to run at *server-name-2* and had referenced or updated *object-name*.

object-name
The name of the object.

object-type
The type of object.

server-name-1
The name of the server that attempted to access the object. Up to 16 characters of the server name are displayed.

server-name-2
The name of the server from which the definition of the object was used to create an instance of the object on *server-name-1*. Up to 16 characters of the location name are displayed.

System action
The statement cannot be processed.

Programmer response
Correct the definition of *object-name* at either *server-name-1* or *server-name-2* so that the definitions at both servers are identical. Then rebuild and rerun the application.

SQLSTATE
428I5

-30047	STATEMENT FAILED BECAUSE OBJECT OF TYPE <i>resource-type-code</i> CANNOT BE ACCESSED USING DIFFERENT DISTRIBUTED PROTOCOLS ON A CONNECTION FROM <i>server-name-1</i> TO <i>server-name-2</i>
---------------	---

Explanation
SQL statements that reference objects with resource type *resource-type-code* cannot be processed in the following cases:

- The same connection between *server-name-1* and *server-name-2* uses both application-directed access and system-directed access.
- Use of application-directed access and system-directed access are mixed in the application.

resource-type-code
The type code for the resource that could not be accessed. See [Appendix F, “Resource types for messages and codes in Db2 for z/OS,” on page 1393](#) for the type of resource that is associated with each type code.

server-name-1
The name of the server that attempted to access the object. Up to 16 characters of the server name are displayed.

server-name-2
The name of the server from which the definition of the object was used to create an instance of the object on *server-name-1*. Up to 16 characters of the location name are displayed.

System action
The statement cannot be processed.

Programmer response
If the application is controlled by a plan bound at a Db2 for z/OS requester, and the application performs commits or rollbacks before any change in the distributed protocol used by the application, the plan should be rebound with the DISCONNECT bind option set to AUTOMATIC or CONDITIONAL. This will permit the requester to automatically terminate any remote server connection during commit or rollback processing.

If the application is not controlled by a plan, SQL RELEASE statements should be executed before a commit or rollback statement so that remote server connections can be terminated before the application changes distributed protocols. Because the introduction of extra commit or rollback statements into an application can jeopardize the data integrity of the application, the application and any stored procedures it invokes should be changed to use the same distributed protocol for remote SQL statement processing.

[Resource types for messages and codes in Db2 for z/OS](#)

Various messages, reason codes, and SQL codes in Db2 for z/OS include type codes that identify particular types of resources. In some cases, specific resource names are also identified.

-30050	<i>command-or-SQL-statement-type</i> COMMAND OR SQL STATEMENT INVALID WHILE BIND PROCESS IN PROGRESS
---------------	---

Explanation

A remote command or remote SQL execution was attempted while a remote bind was in progress. The only commands allowed during bind are, BIND STATEMENT, END BIND, ROLLBACK, or COMMIT.

System action

The request is rejected. The local Db2 is disconnected from remote server.

Programmer response

Ensure the remote bind has completed before attempting to execute an SQL statement or process a remote command. COMMIT and ROLLBACK will terminate the bind processing.

SQLSTATE

58011

-30051	BIND PROCESS WITH SPECIFIED PACKAGE NAME AND CONSISTENCY TOKEN NOT ACTIVE
---------------	--

Explanation

Binding of a statement or end bind was attempted while the package was not undergoing bind processing.

System action

The bind statement request or end bind request is rejected. The local Db2 is disconnected from the remote server.

Programmer response

Ensure that the server processing the bind request was not abending when this request was being processed, or that the package name hasn't changed before terminating the remote bind package request.

SQLSTATE

58012

-30052	PROGRAM PREPARATION ASSUMPTIONS ARE INCORRECT
---------------	--

Explanation

The program preparation assumptions in effect for binding a statement (i.e. BINDSQLSTT command) are incorrect.

System action

The statement is rejected.

Programmer response

The creation of the package following this error is dependent on the package creation options specified at begin bind time.

SQLSTATE

42932

-30053	OWNER AUTHORIZATION FAILURE
---------------	------------------------------------

Explanation

An authorization error associated with the package owner is detected. The AS, for example, has determined that the binder has specified a package owner that the binder has no authorization to specify.

System action

The begin bind request is rejected.

Programmer response

Correct the authorization problem and reissue the request.

SQLSTATE

42506

-30060	RDB AUTHORIZATION FAILURE
---------------	----------------------------------

Explanation

The user is not authorized to access an RDB.

System action

The request is rejected.

Programmer response

Correct the authorization problem and resubmit the job.

SQLSTATE

08004

-30061 RDB NOT FOUND

Explanation

An attempt was made to access an RDB which cannot be found. This usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester's specification of the server location name is incorrect. Requester or server changes are needed to make the location names consistent. Location names for Db2 systems are defined in the BSDS DDF record and are also in the DSNL004I console message when DDF is started.

System action

The request is not processed.

Programmer response

Ensure the RDB name was correctly specified and resubmit the job.

-30070

command COMMAND NOT SUPPORTED ERROR

Explanation

The target does not support a particular command. The error causes termination of the connection between the local Db2 and the remote server.

Values for *command*

- Two byte hexadecimal DDM code point.

System action

The command is rejected. The local Db2 is disconnected from the remote server.

Programmer response

Ensure the proper command was issued.

SQLSTATE

58014

-30071

object-type OBJECT NOT SUPPORTED ERROR

Explanation

The target does not support a particular object. The error causes the termination of the connection between the local Db2 and the remote server.

Values for *object-type*

- Two byte hexadecimal DDM code point.

System action

The command/SQL statement is rejected. The local Db2 is disconnected from the remote server.

Programmer response

Ensure the object has been correctly specified and resubmit the job or reissue the command.

SQLSTATE

58015

-30072	<i>parameter subcode</i> PARAMETER NOT SUPPORTED ERROR
---------------	---

Explanation

A particular parameter is not supported by either the application requester or the remote server.

Values for *parameter*

- Two byte hexadecimal DDM code point.

Values for *subcode*

- Two byte hexadecimal number defined as follows:
This subcode is composed of two distinct parts, but may optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. This is X'01' if the error was detected by the local Db2; it is X'02' if the error was detected by the remote server. The low order byte is always zero.

Common parameters that are not supported include:

X'2450'

Usually this means that the server does not support the attribute clause on prepare.

System action

The command/SQL statement is rejected. A disconnect has occurred.

Programmer response

The connection to the server has been broken, and the server has therefore rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the

requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

SQLSTATE

58016

-30073	<i>parameter subcode</i> PARAMETER VALUE NOT SUPPORTED ERROR
---------------	---

Explanation

The specified parameter value is not supported by either the local Db2 or the remote server.

The *parameter*, is a 2-byte hexadecimal DDM code point. See DRDA Volume 3 "Distributed Data Management Architecture" (Open Group Library - Data Management Standards) for a definition of the valid code points. Common values for *parameter* include:

X'0035'

Usually means that a Db2 server does not support the single-byte coded character set identifier (CCSID) sent by the requester, or a Db2 requester does not support the single-byte CCSID received from a server. See X'119C' for more information.

X'1144'

DRDA servers return this code point when a Db2 client specifies a version for a package and the DRDA server does not support versions.

X'119C'

If the subcode information contains X'01', the requester does not support the single-byte CCSID that the server wants to use. If the subcode information contains X'02', the server does not support the single-byte CCSID that the requester wants to use.

Determine the single-byte CCSIDs for the requester and server systems. The single-byte CCSID for Db2 subsystems is defined in the DSNHDECP module or in a user-supplied application defaults module. One or both partners might be using an incorrect CCSID, or support might need to be added.

X'147A'

Db2 servers can return this code point when a numeric input host variable is not within the range that Db2 supports. See the explanation of SQLCODE -406 for more information.

X'14AC'

Db2 servers return this code point when a DRDA client requests an authentication mechanism that is not supported by the Db2 server. See the explanation of Db2 reason code 00D3010E for more information.

X'2110'.

Usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester's specification of the server location name is incorrect, and the length of the location name is longer than that supported by the server. Requester or server changes are needed so the location names are consistent. Location names for Db2 systems are defined in the BSDS DDF record and can also be seen in the DSNL004I console message when DDF is started.

X'2120'

Usually means that the server does not support the use of double quote string delimiters in SQL statements. Db2 COBOL applications can use double quote string delimiters in SQL statements. This requires that the program be precompiled with the SQLDELIM(QUOTESQL) option. If the server product does not support double quote SQL statement string delimiters, then the program must be modified to use single quote SQL string delimiters and be precompiled with the SQLDELIM(APOSTSQL) option.

X'2121'

Usually means that there is a semantic error with the string that specifies the character used as a decimal delimiter in SQL statements.

X'213F'

Means that the server was processing a bind or rebind command that specified an unsupported value for the DYNAMICRULES bind parameter. If the server is a Db2 Version 3 system, specify DYNAMICRULES(RUN) or omit the DYNAMICRULES parameter.

The 'subcode', which is a 2-byte hexadecimal number, consists of two distinct parts and can optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. If the error was detected by the local Db2, it is X'01'. If the error was detected by the remote server, it is X'02'. The low-order byte is always zero.

System action

The command or SQL statement is rejected. A disconnect occurred.

Programmer response

The connection to the server was broken, and the server rolled back the unit of work. The only SQL statement that can be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

-30074

REPLY MESSAGE WITH *codepoint* (svrcod) NOT SUPPORTED ERROR

Explanation

A reply message *codepoint* is not recognized or the reply message *SVRCOD* is not recognized. The error does not affect the processing of subsequent DRDA commands and SQL statements issued by the application program.

Values for *codepoint*

- The *codepoint* is a two-byte hexadecimal value that represents a DDM reply message. [DRDA Volume 3 "Distributed Data Management Architecture" \(Open Group Library - Data Management Standards\)](#) defines the valid code points for reply messages.

Values for *SVRCOD*

- The *SVRCOD* is a one-byte hexadecimal value which represents the reply messages severity code. [DRDA Volume 3 "Distributed Data Management Architecture" \(Open Group Library - Data Management Standards\)](#) defines the valid *SVRCOD* for reply messages.

System action

Processing continues.

Programmer response

The cause of this error could be a mismatch in source and target manager levels or might be an internal error.

SQLSTATE

58018

-30080 **COMMUNICATION ERROR code**
(subcode)

Explanation

A SNA communications error was detected. [SNA Programmer's LU 6.2 Reference](#) contains the valid *code* and *subcode* values that can appear in this message.

- *code* is VTAM's primary LU6.2 return code (RCPRI).
- *subcode* takes one of the following forms:
 - rcsec-sense
 - rcsec

The *rcsec* portion of *subcode* is VTAM's secondary LU6.2 return code (RCSEC).

The *sense* portion of *subcode* is VTAM's sense code. See for descriptions of sense codes that are often associated with SNA network definition errors.

System action

The statement is not executed. The application was disconnected from the server because of a communication failure. A DSNL500I message containing additional diagnostic information might be issued to the MVS console.

Programmer response

Review the diagnostic information described in [SNA Programmer's LU 6.2 Reference](#) for the particular LU6.2 return codes. Consult with a communications expert to determine the cause of the communication failure.

SQLSTATE

08001

-30081 **prot COMMUNICATIONS**
ERROR DETECTED. API=api,
LOCATION=loc, FUNCTION=func,
ERROR CODES=rc1 rc2 rc3

Explanation

A communications error was detected while communicating with a remote client or server.

prot
Identifies the communication protocol that encountered the error. Currently, 'TCP/IP' is the only possible value.

api

Identifies the communication application programming interface (API) used by Db2. Currently, 'SOCKETS' is the only possible value.

loc

The network location of the partner system.

For TCP/IP partners, this field contains the IP address of the partner.

func

The communication function that failed.

For TCP/IP partners, this field identifies name of the socket call that failed.

rc1

The first return code indicator.

For TCP/IP partners, this field contains the TCP/IP *return code* in decimal format. The *return code* values are documented in [z/OS UNIX System Services: Messages and Codes](#) or [z/OS Communications Server: IP and SNA Codes](#).

rc2

The second return code indicator.

For TCP/IP partners, this field contains the TCP/IP *reason code* in hexadecimal format. The *reason code* values are documented in [z/OS UNIX System Services: Messages and Codes](#) or [z/OS Communications Server: IP and SNA Codes](#).

rc3

The third return code indicator.

For TCP/IP partners, this field contains zero.

System action

The statement is not executed. The application is disconnected from the server.

Programmer response

Consult with a communications expert to determine the cause of the communication failure.

SQLSTATE

08001

-30082 **CONNECTION FAILED FOR**
SECURITY REASON reason-code
(reason-string)

Explanation

The attempt to connect to a remote database server was rejected due to invalid or incorrect security information. The cause of the security error

is described by the *reason-code* and *reason-string* values.

The possible values for *reason-code* and *reason-string* appear below:

- 1 (PASSWORD EXPIRED) -- the password used to connect to the remote server has expired.
- 2 (PASSWORD INVALID) -- the password used to connect to the remote server does not match the password stored at the remote server.
- 3 (PASSWORD MISSING) -- the remote server rejected the connection request because the request did not include a password.
- 4 (PROTOCOL VIOLATION) -- the remote server rejected the connection request because the request did not contain the proper security information. Error messages or trace records should be produced by the server system to explain the nature of the security violation.
- 5 (USER-ID MISSING) -- the remote server rejected the connection request because the request did not specify a user-id.
- 6 (USER-ID INVALID) -- the user-id specified in the connection request is not defined at the remote server system.
- 7 (USER-ID REVOKED) -- the user-id specified in the connection request has been revoked.
- 15 (SECURITY FAILURE:*secchkcd:svcerrno*)— Authentication failed at the remote server system. Refer to [DRDA Volume 3 "Distributed Data Management Architecture"](#) (Open Group Library - Data Management Standards) for a detailed discussion of the semantics of the DDM terms SECCHKCD and SVCERRNO.
- 16 (NEW PASSWORD INVALID) -- the password specified on a change password request did not meet the server's requirements.
- 17 (UNSUPPORTED FUNCTION) -- the security mechanism specified by the client is invalid for this server. Some typical examples:
 - The client is configured to send an Already Verified userid but the server does not support Already Verified userids. Client or server changes must be made to correct the inconsistency.
 - Db2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
 - Db2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES table.
- The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
 - Encrypted userid and encrypted security-sensitive data.
 - Encrypted userid, encrypted password, and encrypted security-sensitive data.Client changes must be made to correct the inconsistency.
 - Db2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
 - Db2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES table.
- The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
 - Encrypted userid and encrypted security-sensitive data.
 - Encrypted userid, encrypted password, and encrypted security-sensitive data.Client changes must be made to correct the inconsistency.
 - Db2 for z/OS client usage of encryption security mechanism is controlled by the SECURITY_OUT column of the SYSIBM.IPNAMES table.
- The client sent a new password value to a server that does not support the DRDA change password function.
- The client sent DCE authentication information to a server that does not support DCE.
- The client is configured to send an Already Verified userid but the server does not support Already Verified userids. Client or server changes must be made to correct the inconsistency.
 - Db2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
 - Db2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES tables.
- 26 (SWITCH USER INVALID) - The client is configured to request a trusted connection and switch user in the trusted connection. A trusted

connection was not established and so the switch user request is invalid.

System action

The attempt to connect to the remote database server fails. If the server system is a Db2 for z/OS server, a DSNL030I message at the server system describes the cause.

Programmer response

Db2 uses the communications database (CDB) to control network security functions. Make the appropriate changes to the CDB to correct the security failure.

SQLSTATE

08001

-30090

**REMOTE OPERATION INVALID
FOR APPLICATION EXECUTION
ENVIRONMENT**

Explanation

An update operation or a dynamic commit or rollback was attempted at a server that was supporting an application that was in a read-only execution environment (IMS, CICS, or RRSAF.)

When SQLERRD=-199, the error is related to a package bound with DBPROTOCOL(DRDACBF) for one of the following reasons:

- The cursor referenced in the failing statement is not open at the remote server.
- Running packages bound with and without DBPROTOCOL(DRDACBF) is not allowed to the same remote server.
- The statement is ineligible for continuous block fetch processing.

System action

The request is rejected.

Programmer response

Do not attempt to update data or issue dynamic commits or rollbacks from IMS, CICS, or RRSAF applications that are accessing remote data.

SQLSTATE

25000

-30104

ERROR IN BIND OPTION *option-name* AND BIND VALUE *option-value*.

Explanation

Bind parameters were passed from the requester site, but could not be processed.

option-name

The name of the bind option.

option-value

The value of the named option.

Possible causes for this error include:

- Either the bind option or the corresponding value is not acceptable to the server database.
- The specific bind option and value combination is not supported by the server database.
- The GENERIC option was specified on the BIND PACKAGE or REBIND PACKAGE command, and at least one of the following conditions is true:
 - The string contains more than 4096 characters.
 - The string contains an uneven number of tokens, resulting in an option name without a corresponding value.
 - A bind option name in the string contains more than 255 characters.
 - A bind option value in the string contains more than 255 characters.

System action

The BIND or REBIND command failed.

Programmer response

Examine the command options and values, determine the error, and resubmit the command.

SQLSTATE

56095

Related reference

[BIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#)

[REBIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#)

-30105

**BIND OPTION *option1* IS NOT
ALLOWED WITH BIND OPTION
*option2***

Explanation

While processing the bind parameters that were passed from the requester site, it was found that there is a conflict in bind options that are mutually exclusive.

Programmer response

The BIND or REBIND command failed. Examine the command options, determine the cause of the conflict, and resubmit the command.

SQLSTATE

56096

-30106	INVALID INPUT DATA DETECTED FOR A MULTIPLE ROW INSERT OPERATION. INSERT PROCESSING IS TERMINATED
---------------	---

Explanation

An error was detected with the input data for one row of a FOR *n* ROWS form of multiple row insert operation. No further rows will be inserted. For an

atomic operation, all inserted rows are rolled back. For a non-atomic operation, rows inserted successfully before the row containing the invalid input data was encountered are not rolled back.

System action

The statement cannot be processed.

Programmer response

Correct the row containing the invalid input data and submit the INSERT statement again for the rows that did not get inserted.

SQLSTATE

22527

[Inserting multiple rows of data from host-variable arrays \(Db2 Application programming and SQL\)](#)

Related reference

[INSERT statement \(Db2 SQL\)](#)

Part 2. Db2 reason codes

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

Chapter 3. X'C1.....' codes

Reason code identifiers that begin with 00C1 communicate normal and error situations with the call attachment facility (CAF).

00C10002

Explanation

The Db2 call attachment facility control block (the CAB) indicated that a thread was present when it should not have been present.

System programmer response

Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

User response

Notify your system programmer.

Problem determination

This is probably a call attachment facility error.

00C10003

Explanation

The Db2 call attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

User response

Modify or repair your application so that DSNACA00, the main call attachment facility code will receive control only through the language interface.

Problem determination

This is probably a user error.

00C10004

Explanation

The call attachment facility encountered an error retrieving a trace message during processing of a call attachment facility request.

System programmer response

Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

User response

Notify your system programmer.

Problem determination

This is probably a call attachment facility error.

00C10005

Explanation

The application program passed an ECB address of 0 to the call attachment facility on a CONNECT call. The trace message preceding the abend indicates whether the ECB was a start-up or termination ECB.

User response

Correct the application program that makes the CONNECT call to DSNALI. Ensure that the CONNECT call uses a valid ECB address.

Problem determination

See the Explanation above.

00C10201

Explanation

The application program passed two CONNECT calls to the call attachment facility (CAF) from the same TCB. The first CONNECT could have been either implicit or explicit.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10202

Explanation

The application program passed two OPEN commands to the call attachment facility (CAF) from the same TCB. The first OPEN could have been either implicit or explicit.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10203

Explanation

A CLOSE command was issued when there was no active OPEN.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10204

Explanation

A DISCONNECT command was issued when there was no active CONNECT.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10205

Explanation

A TRANSLATE command was issued when the Db2 subsystem was not connected to the call attachment facility (CAF).

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10206

Explanation

One of the following conditions exists:

- The wrong number of parameters were issued.

- The end-of-list bit was off.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10207

Explanation

The application program passed an unrecognized function parameter to the call attachment facility (CAF).

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10208

Explanation

The call attachment facility (CAF) received requests from the same TCB to CONNECT to the Db2 subsystem and to another subsystem.

User response

You can continue processing with a corrected request.

Problem determination

See the Explanation above.

00C10209

Explanation

The call attachment facility (CAF) received an explicit call to DSNALI from a Db2 stored procedure. This is not allowed.

User response

You can continue processing with a corrected request.

00C10210

Explanation

The DSN ASUSER *userid* is not defined in this trusted context *context name*.

System action

The DSN ASUSER processing failed.

User response

Contact the system administrator to arrange for the required Trusted Context authorization.

00C10211

Explanation

The call attachment facility (CAF) failed because the requester's authorization ID has exceeded the maximum number of concurrent sessions allowed.

System action

The connection request is not processed.

System programmer response

Determine the value of the USER.CSDATA.DSNMUCTL defined for the primary authorization ID in RACF and determine if that value needs to be updated.

Programmer response

Close or end some of the existing connections, and try the request again.

Problem determination

Db2 13 for z/OS in a Common Criteria environment (DSN6SPRM COMCRIT= YES) restricts the number of concurrent threads for a primary authorization ID based upon the custom field USER.CSDATA.DSNMUCTL.

00C10824

Explanation

The previous Db2 connection was reset, and cleanup processing was performed. The call attachment facility is ready to process new connection requests.

User response

Processing continues.

Problem determination

See the explanation for message DSN824I in [Call attachment facility trace messages \(Diagnosing Db2 problems\)](#).

00C10831

Explanation

The call attachment facility (CAF) has detected a release level incompatibility between itself and Db2. Either the current CAF or Db2 release levels do not support coexistence, or the SPE level of the lower level release does not meet the compatibility requirements for coexistence between the two releases.

System action

The connection is not successful.

User response

If you used JCL or a TSO logon procedure to invoke CAF, check to ensure that the correct Db2 libraries are defined in your JOBLIB and STEPLIB allocations. See your system programmer if you invoke CAF using procedures that are supplied by your system programmer.

Problem determination

If CAF trace (DSNTRACE) is active, message DSN831E will indicate the release levels of CAF and the Db2 subsystem.

00C12001

Explanation

The Db2 RRSF attachment facility function AUTH SIGNON was invoked by a program that was not APF authorized. This condition can indicate a security violation.

System action

The application is abended.

User response

The AUTH SIGNON function can only be invoked from an APF authorized program. Either modify your program to use the RRSF attachment facility function SIGNON which may be invoked from a non-authorized program, or contact your security administrator to make the changes required to make your program an APF authorized program.

Problem determination

This is a user error.

00C12002

Explanation

An abend has occurred during an attempt to access the caller-provided subsystem name parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12003

Explanation

An abend has occurred during an attempt to access the caller-provided *ribptr* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12004

Explanation

An abend has occurred during an attempt to access the caller-provided *eibptr* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12005

Explanation

The Db2 RRSF attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

System action

The application is abended.

User response

Modify or repair your application so that DSNACA00, the main call attachment facility code, will receive control only through the language interface.

Problem determination

This is probably a user error.

00C12006

Explanation

An abend has occurred during an attempt to access the caller-provided termination ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12007

Explanation

An abend has occurred during an attempt to access the caller-provided startup ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12008

Explanation

An abend has occurred during an attempt to access the caller-provided correlation parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12009

Explanation

An abend has occurred during an attempt to access the caller-provided accounting token parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

.

00C12010

Explanation

An abend has occurred during an attempt to access the caller-provided accounting interval parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

.

00C12011

Explanation

An abend has occurred during an attempt to access the caller-provided authid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12012

Explanation

An abend has occurred during an attempt to access the caller-provided secondary authid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12013

Explanation

An abend has occurred during an attempt to access the caller-provided ACEE parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12014

Explanation

An abend has occurred during an attempt to access the caller-provided plan name parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12015

Explanation

An abend has occurred during an attempt to access the caller-provided collection parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12016

Explanation

An abend has occurred during an attempt to access the caller-provided reuse parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12018

Explanation

An abend has occurred during an attempt to access the caller-provided user-id parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

00C12019

Explanation

An abend has occurred during an attempt to access the caller-provided applname parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

00C12020

Explanation

An abend has occurred during an attempt to access the caller-provided ws parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

00C12021

Explanation

An abnormal termination has occurred during an attempt to access the caller-provided xid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abnormally terminated.

User response

Correct the problem and submit your job again.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs.

00C12022

Explanation

An abend has occurred during an attempt to access the caller-provided package list parameter while executing in the PSW key of the caller. This error has probably occurred as a result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12023

Explanation

An abend has occurred during an attempt to access the caller-provided thread token parameter while executing in the PSW key of the caller. This reason code is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00C12024

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the accounting-string parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to information that was provided by the caller. When any abend occurs, this register indicates which parameter caused the error.

00C12025

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted user parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abended.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to information that was provided by the caller. When any abend occurs, this register indicates which parameter caused the error.

00C12026

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted password parameter that was provided by the caller. This problem is probably the result of a logic error in the requesting program.

System action

The application abends.

User response

Review the dump to determine the reason for the problem.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00C12027

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted location name parameter that was provided by the caller. This problem is probably the result of a logic error in the requesting program.

System action

The application abends.

User response

Review the dump to determine the reason for the problem.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00C12028

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted registry parameter that was provided by the caller. This problem is probably the result of a logic error in the requesting program.

System action

The application abends.

User response

Review the dump to determine the reason for the problem.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00C12029

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted original authorization ID parameter that was provided by the caller. This problem is probably the result of a logic error in the requesting program.

System action

The application abends.

User response

Review the dump to determine the reason for the problem.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00C12030

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted security token parameter that was provided by the caller. This problem is probably the result of a logic error in the requesting program.

System action

The application abends.

User response

Review the dump to determine the reason for the problem.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00C12031

Explanation

An abnormal termination has occurred during an attempt to access the caller-provided *ssnma* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abnormally terminated.

User response

Correct the problem and submit your job again.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs. information.

00C12032

Explanation

An abnormal termination occurred during an attempt to access the caller-provided *activea* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abnormally terminated.

User response

Correct the problem and resubmit your job.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs.

00C12033

Explanation

An abnormal termination has occurred during an attempt to access the caller-provided *arraysz* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abnormally terminated.

User response

Correct the problem and resubmit your job.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs.

00C12034

Explanation

An abnormal termination has occurred during an attempt to access the caller-provided *decpptr* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The application is abnormally terminated.

User response

Correct the problem and resubmit your job.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs.

00C12035

Explanation

The Db2 RRSF attachment facility function SET_REPLICATION was invoked by a program that was not APF authorized. This condition can indicate a security violation.

System action

The application is abended.

User response

The SET_REPLICATION function can only be invoked from an APF authorized or supervisor state program. Either modify your program to use the RRSF attachment facility function SIGNON which may be invoked from a non-authorized program, or contact your security administrator to make the changes required to make your program an APF authorized program or to have your program run in supervisor state.

Related reference

[SIGNON function for RRSF \(Db2 Application programming and SQL\)](#)

00C12201

Explanation

The application program invoked IDENTIFY while it was already connected to Db2.

User response

You can continue processing with a corrected request.

Problem determination:

00C12202

Explanation

The application program invoked the CREATE THREAD function request while there was already a thread created.

User response

You can continue processing with a corrected request.

Problem determination:

00C12203

Explanation

A TERMINATE THREAD command was issued when there was no active thread.

User response

You can continue processing with a corrected request.

Problem determination:

00C12204

Explanation

The application issued a function request other than IDENTIFY when no connection with Db2 existed. Only IDENTIFY may be issued when a connection does not exist.

User response

You can continue processing with a corrected request.

Problem determination:

00C12205

Explanation

The task that invoked the Db2 RRSF attachment facility function SWITCH TO has not yet identified to the Db2 subsystem specified in the request.

System action

The SWITCH TO function is performed.

User response

Use IDENTIFY to connect to a Db2 subsystem before attempting to invoke any other function at the specified subsystem.

Problem determination:

00C12206

Explanation

One of the following conditions exists:

- The wrong number of parameters were issued.
- The end-of-list bit was off.

User response

You can continue processing with a corrected request.

Problem determination:

00C12207

Explanation

The application program either omitted the function name parameter or passed an unrecognized function parameter to the RRSAF.

User response

Modify or repair your application to pass a valid function request to RRSAF.

00C12208

Explanation

The application program issued an IDENTIFY function request but omitted the *ribptr* parameter from the parameter list. An *ribptr* parameter is a required parameter on an IDENTIFY request.

System action

The IDENTIFY request is rejected.

User response

You can continue processing with a corrected request.

Problem determination:

00C12209

Explanation

The application program issued an IDENTIFY function request but omitted the *eibptr* parameter from the parameter list. An *eibptr* parameter is a required parameter on an IDENTIFY request.

System action

The IDENTIFY request is rejected.

User response

You can continue processing with a corrected request.

Problem determination:

00C12211

Explanation

The application program issued a CREATE THREAD function request and specified an invalid package list entry.

User response

You can continue processing with a corrected request.

00C12212

Explanation

The application program issued a CREATE THREAD function request and did not specify a plan name and also did not specify a collection name. If a plan name is not provided, then a collection name must be supplied.

User response

You can continue processing with a corrected request.

Problem determination:

00C12214

Explanation

The application program issued a TRANSLATE function request but omitted the *sqlca* parameter from the parameter list. An *sqlca* parameter is a required parameter on a TRANSLATE request.

User response

You can continue processing with a corrected request.

Problem determination:

00C12217

Explanation

The application program issued a CREATE THREAD function request without having completed SIGNON processing. At least one successful SIGNON must be completed before a CREATE THREAD request can be issued.

User response

You can continue processing with a corrected request.

Problem determination:

00C12219

Explanation

The application program issued an SQL or IFI function request without completing CREATE THREAD processing. SQL or IFI requests cannot be issued until CREATE THREAD processing is complete.

User response

You can continue processing with a corrected request.

Problem determination:

00C12220

Explanation

The application program issued a CALL DSNRLI with function SET_ID without completing CREATE THREAD processing. SET_ID requests cannot be issued until CREATE THREAD processing is complete.

User response

You can continue processing with a corrected request.

00C12221

Explanation

The application program issued a CALL DSNRLI with function SET_CLIENT_ID without completing CREATE THREAD processing. SET_CLIENT_ID requests cannot be issued until CREATE THREAD processing is complete. SET_CLIENT_ID request are permitted only after a plan is allocated.

User response

You can continue processing with a corrected request.

00C12222

Explanation

The application program issued a CALL DSNRLI statement with the SET_TRUSTED function, but did not complete processing of the CREATE THREAD function. SET_TRUSTED requests cannot be issued until CREATE THREAD processing is complete.

System action

The SET_TRUSTED request is not processed.

User response

Correct the request.

00C12223

Explanation

The application program issued a CALL DSNRLI statement with the SWITCH_USER function, but did not complete processing of the CREATE THREAD function. SWITCH_USER requests are permitted only after a plan is allocated.

System action

The SET_TRUSTED request is not processed.

User response

Correct the request.

00C12230

Explanation

The Db2 RRSF attachment facility function FIND_DB2_SYSTEMS was invoked with a *ssnma* and *activea* array size that is not large enough to contain the information on all the defined Db2 systems on this LPAR.

System action

The request for information failed with Return Code 4.

User response

Increase the size of the storage allocated for the *ssnma* and *activea* arrays, and change the *arraysz* parameter to indicate the new size.

00C12231

Explanation

The Db2 RRSF attachment facility failed because the requester's authorization ID has exceeded the maximum number of concurrent sessions allowed.

System action

The connection request is not processed.

System programmer response

Determine the value of the USER.CSDATA.DSNMUCTL defined for the primary authorization ID in RACF and determine if that value needs to be updated.

Programmer response

Close or end some of the existing connections, and try the request again.

Problem determination

Db2 13 for z/OS in a Common Criteria environment (DSN6SPRM COMCRIT= YES) restricts the number of concurrent threads for a primary authorization ID based upon the custom field USER.CSDATA.DSNMUCTL.

00C12822

Explanation

The RRSF received an explicit call to DSNRLI from a Db2 stored procedure. This is not allowed.

User response

You can continue processing with a corrected request.

Problem determination:

00C12823

Explanation

An attempt was made to initiate a stored procedure for a task, but one already exists. This is not allowed.

User response

You can continue processing with a corrected request.

Problem determination:

00C12824

Explanation

The previous connection to Db2 has been terminated. Cleanup processing was performed and the RRSF is now ready to process additional IDENTIFY requests.

User response

You can continue processing, and issue an IDENTIFY request.

Problem determination:

00C12825

Explanation

An attempt was made to terminate a stored procedure for a task, but no stored procedure exists. This is not allowed.

User response

You can continue processing with a corrected request.

Problem determination:

00C12831

Explanation

The release of the RRSF code is not compatible with the earlier release of the Db2 program.

System action

The connection is not made.

User response

Ensure that the release of the RRSF library is not later than the release of Db2 to which you are attempting to connect.

Problem determination

This problem can be caused by improper Db2 data set allocation in a LOGON procedure or CLIST.

00C12832

Explanation

The RRSF SIGNON processing is performed in a trusted context. The USER *authorization ID* is not defined in this trusted context *context name*.

System action

The RRSF SIGNON request is not processed.

User response

Contact the system administrator to add the user to the trusted context.

00C12850

Explanation

Db2 stored procedure DSNACICS issues this abend code when the JCL startup procedure for the stored procedure address space in which DSNACICS runs contains a DSNDUMP DD statement. DSNACICS takes an SVC dump when it generates an error message. At the time of the dump:

- Register 2 contains the address of the message that was being generated.
- Register 3 contains the address of the first parameter that was passed to DSNACICS.
- Register 4 contains the address of the XPL parameter area that was passed to DSNACICX.

System action

The stored procedure requests an SVC dump and terminates.

System programmer response

If the dump was requested to diagnose a problem in user exit DSNACICX, use IPCS to examine the contents of the dump. If the dump was requested because of a possible error in the Db2 stored procedure, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

[The DSNACICX user exit routine \(Db2 Administration Guide\)](#)

Chapter 4. X'C2.....' codes

Reason code identifiers that begin with 00C2 communicate normal and error situations with the buffer manager.

00C20021

Explanation

A member of a Db2 data sharing group was unable to perform a global drain because a physical close failure occurred in a peer Db2 due to an exceptional state or CASTOUT process failure. DSNT501I is sent to the console to report the condition.

System action

A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

00C20031

Explanation

An attempt to acquire a page latch in either shared mode or exclusive mode was rejected due to a timeout on the agent's wait time.

System action

A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

System programmer response

A diagnostic dump with reason code 00C2010F should follow 00C20031.

00C20069

Explanation

Db2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because a Db2 member in the data sharing group was in the process of restarting.

System action

If the problem was encountered by Db2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then Db2 issues message DSNB350I or DSNB351I to the console with this

reason code indicating that the object cannot be automatically recovered.

Otherwise, a 'resource not available' return code, reason code and object name are sent back to the requesting function. DSNT501I is sent to the console to report the condition.

System programmer response

If DSNB350I or DSNB351I messages were issued, wait for the failed Db2 member to complete its restart processing and then recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C2006A

Explanation

Db2 was unable to perform the drain function on an object (table space, index space, or partition) because the object was held by one or more indoubt threads.

System action

If the problem was encountered by Db2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then Db2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

System programmer response

Use the Db2 DISPLAY DB CLAIMERS command to find the indoubt threads. If the threads have been left indoubt because Db2 or a transaction manager was unable to automatically resolve the indoubts, you can use the Db2 RECOVER INDOUBT command to resolve the indoubt thread and remove the indoubt claimer on the object (the Db2 RECOVER INDOUBT command should only be used when automatic resolution does not work).

If DSNB350I or DSNB351I messages were issued, then after you resolve the indoubt threads, recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C200A1

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to release a page latch that is not currently held.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200A2

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to get a page latch that is currently held on the requesting page.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200A3

Explanation

This is a Db2/MVS internal error. The execution unit driving a buffer manager (BM) asynchronous function, which would normally run indefinitely, has been canceled. However, work being done by the execution unit is allowed to complete before the execution unit terminates.

System action

The affected asynchronous function is terminated. If the affected function is the deferred write processor (DSNB1CMS), Db2 is abended with the abend code '00C200D3'.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Start Db2 if it is abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200A4

Explanation

This code usually indicates a problem internal to Db2; however, the problem can result from errors in other products. An unexpected reason code was returned by the media manager function when it was invoked to process a database I/O request.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

User response

Notify the system programmer and rerun the application.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The unexpected media manager reason code is saved in register 8.

Check the MVS console log for an IOS (I/O subsystem) error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200A5

Explanation

Typically, this indicates a problem internal to Db2; however, the problem can result from errors in other products. Db2 was unable to drain a pageset in

preparation for page set cleanup processing. This might be caused by one of the following events:

- An IRLM out-of-storage condition
- An internal error in the lock acquisition function

System action

The execution unit driving this function proceeds normally. The abend status is recorded in SYS1.LOGREC.

Operator response

Notify the system programmer and print the SYS1.LOGREC.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Restart Db2.

Problem determination

The unexpected reason code returned by the drain function in register 8 might help determine the cause of the problem. If the problem is caused by an unavailable Db2 resource, message DSNT500I might also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200A6

Explanation

This is a Db2/MVS internal error. The execution unit scheduled by the buffer manager (BM) subcomponent of Db2 to drive the page set cleanup function has been canceled.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Refer to similar reason code '00E50013'.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200A8

Explanation

An error code other than timeout, insufficient storage, or an MVS system error was returned by the IRLM LOCK request invoked by Db2 to acquire any of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool-dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

This is a Db2 or IRLM internal error.

System action

The requesting execution unit abends.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

User response

Notify the system programmer and rerun the application.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C200A9

Explanation

A return code greater than 4 was returned by the IRLM UNLOCK request invoked by Db2 to release any of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock.

This is a Db2 or IRLM error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

User response

Notify the system programmer and rerun the application.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The unexpected IRLM reason code is saved in register 8. It might help determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200AA

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to change a page latch type, but the requesting agent already holds this latch type on this page.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200AB

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to get another page latch, which would cause the total number of page latches held by the caller to exceed the maximum allowable number of 2.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200AD

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to get a page latch for a page that belongs to one type of page set (index or data). However, the caller already holds a page latch on another page that belongs to a different type of page set.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00C200AE

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is trying to get a page latch on a page for which there are latch waiters, but no latch holders.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200AF

Explanation

This is a Db2 internal error. The caller of the buffer manager(BM) is attempting to update a page under the critical mode without holding an exclusive latch on the page.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B0

Explanation

Typically, this indicates a problem internal to Db2, however the problem can result from errors in other products. The buffer address passed by the buffer manager (BM) invokers does not contain the requested page. The buffer manager detected this error by comparing the information stored in the buffer control block (BB) with the information passed with the buffer manager by its invokers. The information that is compared is the page set piece block, the page number, and the buffer address.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

7

Address of the page buffer

8

Address of the page set block (PB)

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200B1

Explanation

This is a Db2 internal error. Either the buffer manager (BM) subcomponent of Db2 is unable to locate the requesting page in the buffer pool or the invoker of the buffer manager is attempting to decrease the buffer use count which is already 0.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B2

Explanation

This is a Db2 internal error. The buffer's write intent count is already 0 and the buffer manager (BM) invoker is attempting to decrease it.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B3

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 is unable to open a page set required by the requesting function. The page size or the page set piece size passed by the buffer manager invoker is invalid. The page set piece size is expressed by n, where 2 to the power of n is the total number of pages that can be contained within a page set piece. This error was detected during open page set processing.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B4

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 is unable to open a page set required by the requesting function. The highest page set piece number passed by the buffer manager invoker exceeds the maximum value allowed. The maximum number of data sets that can be defined for a given page set is dependent on the page set piece size. This error was detected during open page set processing.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B5

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 is unable to open a page set required by the requesting function. During the open page set processing, the page set options passed by

the buffer manager invoker were in conflict with the same page set that was opened earlier. The page set options are the writing protocol (SYSTEM or UW), the recovery option (recoverable or unrecoverable), and the page size.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200B6

Explanation

Typically, this indicates a problem internal to Db2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of Db2 is unable to reallocate a data set that is required after extending a data set to a new volume. The data set reallocation was requested and the corresponding data set was not opened. This error was detected during open page set piece processing.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200B7

Explanation

Typically, this indicates a problem internal to Db2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of Db2 is unable to open a page set required by the requesting function. The linear page set was not formatted contiguously. This error was detected during open page set processing.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200B8

Explanation

This is a Db2 internal error. Db2 is unable to update the SYSLGRNG or SYSLGRNXpage set. The utility returned an unexpected reason code.

System action

A 'resource not available' code is returned. This reason code and the table space name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200BA

Explanation

This reason code is a Db2 internal error. Db2 has encountered an unexpected error while attempting to access a system page of a page set.

System action

The requesting execution unit is abended. The SVC dump and the SYS1.LOGREC recording are requested.

Operator response

Notify the system programmer, print the SYS1.LOGREC and the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200BB

Explanation

This is a Db2 internal error to indicate that an invalid buffer pool ID is specified.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200BC

Explanation

This is a Db2 internal error. The Buffer Manager (BM) subcomponent of Db2 has discovered that the BM invoker is attempting to release the page which does not belong to the work file database.

System action

The requesting execution unit is abnormally terminated.

Operator response

Notify the system programmer, and print the SYS1.LOGREC and the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200BD

Explanation

This is a Db2 internal error. The caller of the buffer manager (BM) is still holding a page latch on the page which is currently being released by the application.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200BE

Explanation

This is a Db2 internal error. The buffer manager (BM) is trying to dequeue a page latch waiter from the wait queue, but there are no waiters.

System action

The requesting application process is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00C200C0

Explanation

Db2 is unable to perform I/O processing for the requesting function. An error code (other than a

permanent I/O error) was returned by the media manager during the I/O backend processing.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The unexpected media manager reason code is saved in register 8. It might help determine the cause of the failure.

Check the MVS console log for an IOS (I/O subsystem) error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200C1

Explanation

The page version number in the database page header is outside the valid range of values. This can be caused by one of the following errors:

- Copying data sets improperly from another Db2 subsystem.
- In a CREATE TABLESPACE statement, specifying a VCAT catalog name that is the same as the name of an object in another Db2 subsystem on the same processor.

- Conditionally starting Db2 to a prior time with an invalid RBA range.
- Incorrect use of the REPAIR utility (modifying the page RBA).
- The page was damaged by a Db2 system error.
- TOD clock values are out of synch between systems in a Parallel Sysplex®.

System action

The requesting execution unit is abended. If DSNB1SWS issues the ABEND, then it is preceded by a DSNT500I message indicating which page is in error and a DSNIO04I message indicating the page set is put in STOPE mode.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

User response

One of the following actions:

- If the data set was copied from another Db2 subsystem, run DSN1COPY with the RESET option to set the log RBAs in each page to 0.
- If a table space was created with the wrong VCAT catalog name, drop the object and create it again.
- If Db2 was conditionally started with an invalid RBA range, correct the RBA range and restart Db2 with conditions again.
- If the page was damaged by the REPAIR utility, restore it with the RECOVER utility using the PAGE option.
- If you are running data sharing, check the connectivity of the systems to the sysplex timers. The TOD clock values of all systems in the sysplex should all be within one microsecond. TOD clock values will not drift more than one microsecond apart unless a sysplex timer is malfunctioning.
- Otherwise, inform your system programmer that you suspect an error.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

7

Address of the page buffer

8

Address of the page set block (PB)

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Dump of the index or table space that failed.
- Db2 log output, including any Db2 recovery log archive tapes.

00C200C2

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 has discovered that the BM invoker is attempting to decrease the page's write intent count (WIC), but the invoker has no write intent request outstanding.

System action

The BM does not decrease the page's WIC as requested, and the execution unit driving this function is abended. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Dump of the index or table space that failed.
- Output of the GTF trace (if requested by IBM).
- Db2 log output, including any Db2 recovery log archive tapes.

00C200C3

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 discovered that the BM invoker is attempting to set the page's write intent count (WIC), but the invoker has no read intent request outstanding.

System action

The BM does not increase the page's WIC as requested, and the execution unit driving this function is abended. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Output of the GTF trace (if requested by IBM).
- Db2 log output, including any Db2 recovery log archive tapes.

00C200C5

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 discovered that its invoker

was attempting to decrease the write dependency count (WDC) for a buffer. However, the buffer contains database updates that have not yet been written back to DASD. The buffer manager makes the buffer available for reassignment.

System action

The buffer manager does not decrease the WDC as requested, and the execution unit driving this function proceeds normally. An SVC dump is requested and the abend status is recorded in SYS1.LOGREC.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Dump of the index or table space that failed.
- Output of the GTF trace (if requested by IBM).
- Db2 log output, including any Db2 recovery log archive tapes.

00C200C6

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 has discovered that the BM invoker is attempting to release a page that was not held by the invoker or the page has an unbalanced write intent (for example, reset write intent has not yet been issued prior to releasing the page).

System action

The BM does not release the page as requested, and the execution unit driving this function terminates

abnormally. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Dump of the index or table space that failed.
- Output of the GTF trace (if requested by IBM).
- Db2 log output, including any Db2 recovery log archive tapes.

00C200C7

Explanation

An error code, other than timeout, insufficient storage, or MVS system error, was returned by the IRLM LOCK request. The IRLM LOCK request was invoked to acquire an open lock to perform a physical open or close.

System action

The requesting execution unit is abended.

Operator response

Print the SYS1.LOGREC and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Rerun the application.

Problem determination

The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200C8

Explanation

A return code greater than 4 was returned by the IRLM UNLOCK request invoked to release a open lock after completing a physical open or close.

System action

The requesting execution unit is abended.

Operator response

Print the SYS1.LOGREC and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Rerun the application.

Problem determination

The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200C9

Explanation

The buffer manager (BM) subcomponent of Db2 discovered a damaged PBG control block while attempting to write a check point log record.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Db2 log output, including any Db2 recovery log archive tapes.

00C200CB

Explanation

The buffer manager (BM) subcomponent of Db2 discovered a damaged ABG or AB control block while attempting to write a checkpoint.

System action

Db2 is abnormally terminated; if processing were to continue, an invalid checkpoint would be created which would damage data on a subsequent Db2 restart.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200CC

Explanation

The buffer manager (BM) subcomponent of Db2 discovered a close task has been waiting for prefetch to complete for two checkpoints.

System action

An SVC dump is produced and checkpointing continues.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200CF**Explanation**

Db2 could not acquire enough virtual storage for allocating private buffers for an internal castout process. The castout operation is queued until an existing castout process becomes available.

System action

The requesting execution unit is abended. No dump is produced.

Problem determination:

00C200D0**Explanation**

The buffer manager (BM) subcomponent of Db2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager (BM) I/O termination exit routine. Retry of the prior abend is not allowed by MVS.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D1**Explanation**

The buffer manager (BM) subcomponent of Db2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O termination exit routine. An attempt to retry and to continue main line processing (after completion of processing of this prior abend) resulted in recursion to the I/O termination exit routine's functional recovery routine (FRR).

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

Problem determination

The FRR parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D2

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O error exit routine during processing of a database I/O error.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D3

Explanation

A prior abend occurred in a 'must complete' processing window of a buffer manager (BM) function.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See the Problem Determination section of the original abend code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D4

Explanation

A prior abend occurred in an I/O processing window of a buffer manager (BM) function. I/O functional recovery cannot be reliably performed because the tracking data required to do so is incomplete. The required data is probably missing because the functional recovery routine (FRR) that is protecting the abending I/O processing function was bypassed by MVS.

System action

Db2 is abended.

Operator response

Notify the system programmer, and print the SYS1.LOGREC and the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See the Problem Determination section of the original abend code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D5

Explanation

An abend occurred in the I/O termination exit routine while resuming the suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D6

Explanation

An abend occurred in the I/O termination exit routine while resuming the suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The functional recovery routine (FRR) parameter list is recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D7

Explanation

A prior abend occurred while resuming a suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See the Problem Determination section of the original abend code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200D8

Explanation

This is a Db2 internal error. The buffer manager (BM) subcomponent of Db2 discovered that some buffer manager resources are inconsistent.

System action

Db2 is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C200E0

Explanation

A table space or index space cannot be accessed because Db2 is unable to create the referenced buffer pool. The referenced buffer pool size was zero, which indicates to Db2 that this buffer pool should not be activated. Db2 message DSNB602I was issued to inform the operator of the error. This reason code and the table space or index space name are recorded in the cursor table (CT) and made available to the user in the SQLCA.

System action

An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

System programmer response

Analyze the virtual storage content of the database services address space (*ssnmDBM1*) to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table space or index to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.

00C200E1

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to open a data set that is required to be accessed by the requesting function. An error was returned by the media manager CONNECT function, which was invoked to open a VSAM data set. Db2 message DSNB204I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

Operator response

Notify the system programmer.

System programmer response

Refer to system message IEC161I and Db2 message DSNB204I for assistance in determining the cause of the error. Correct the situation, and notify the user to invoke the application again.

Problem determination

The unexpected media manager return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200E2

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to open a data set that is required by the requesting function. An error was returned by the dynamic allocation function that was invoked to allocate a VSAM data set. Db2 message DSNB207I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

System programmer response

The error code returned from the dynamic allocation function was externalized in the DSNB207I message. Refer to the appropriate MVS publication for an

explanation of this error code. Correct the situation, and notify the user to invoke the application again.

User response

Notify the system programmer. Invoke the application again after the system programmer has corrected the error.

Problem determination

The unexpected dynamic allocation return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200E5

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to perform the I/O operation on a data set that is required by the requesting function. A logical I/O error was detected by the buffer manager I/O functions. The logical I/O error indicates that a requested page (read operation) resides within the error page range of the data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user.

Operator response

Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

System programmer response

The error page range can be located from the console sheet or through the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an

error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. Invoke the application after the system programmer has corrected the error.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200E6

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to perform the I/O operation on a data set that is required by the requesting function. A permanent I/O error was detected by the media manager during preformat processing. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user.

System programmer response

Recover the entire data set with the recovery utility, and notify the user to invoke the application again. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. Invoke the application after the system programmer has corrected the error.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

Check the MVS console log for an IOS (I/O subsystem) error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

00C200E8

Explanation

The buffer pool (indicated in the SQLCA) cannot be created because of insufficient virtual storage. Message DSNB603I or DSNB605I was issued to inform the operator of the error. This reason code and the buffer pool ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator response

Notify the system programmer.

System programmer response

Analyze the virtual storage content of the database services address space (ssnmDBM1) to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to indicate use of a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance virtual storage usage for all buffer pools.

00C200E9

Explanation

A buffer could not be assigned in the buffer pool (indicated in the SQLCA) because all buffers in the buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

Message DSNB601I was issued to inform the operator of the error. This reason code and the buffer pool

ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator response

Notify the system programmer.

System programmer response

Reduce concurrent activity by reducing the number of Db2 threads, or, if necessary, increase the size of the failing buffer pool by using the ALTER BUFFERPOOL command.

00C200EA

Explanation

Db2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because the object was held by other claimers and the drain request timed out waiting for the claim count to reach zero.

System action

If the problem was encountered by Db2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then Db2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

Otherwise, a 'resource not available' return and reason code are sent back to the requesting function. Db2 message DSNT500I may be sent to the console. The reason code and the object name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in the message.

System programmer response

Take one of these actions:

- Reevaluate the utility timeout factor on installation panel DSNTIPI and increase it, if necessary.
- Find the threads holding the object through the -DISPLAY DB CLAIMERS command on the object. Either terminate those threads or wait until no one holds the object. Then invoke the application again.

If DSNB350I or DSNB351I messages were issued, then after you take one of the actions above, recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C200EB

Explanation

A data sharing group member is not able to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer members in the group hold retained locks on the object. Message DSNT501I is sent to the console to report the condition.

System action

A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

System programmer response

Use the DISPLAY DATABASE command with the LOCKS option to display the member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition.

Problem determination:

00C200EC

Explanation

A member of a Db2 data sharing group was unable to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer DB2s in the group failed to drain the object because some error occurred. Both the Db2 running the request and the peer Db2 send Db2 message DSNT500I to the console to report the problem.

System action

A 'resource not available' return code, reason code and object name are sent back to the requesting function.

Operator response

Notify the system programmer.

System programmer response

Retrieve the DSNT501I messages from the console and analyze the corresponding reason and error codes.

Problem determination:

00C200ED

Explanation

Db2, in a data sharing environment, detected that the requested use of a type 1 index with a SUBPAGES value greater than 1 would have caused the index to become group buffer pool dependent. Db2 does not allow type 1 indexes with a SUBPAGES value greater than 1 to become group buffer pool dependent.

System action

The use of the index is not allowed.

User response

If the index is to be used in group buffer pool dependent mode, then either the index should be converted to a type 2 index or it should be converted to a type 1 index with SUBPAGES 1.

00C200EF

Explanation

Db2 was unable to open a required data set because the data set does not have the extended addressability attribute.

System action

A "resource not available" code is returned. This reason code and the data set name are recorded in the SQLCA and in message DSNT500I.

System programmer response

Associate the data set with an extended addressability data class.

Related information

[DSNT500I \(Db2 Messages\)](#)

00C200F0

Explanation

Db2 encountered an error on an IXLCACHE request while trying to write a page to the group buffer pool during physical lock (P-lock) negotiation.

System action

The requesting execution unit abends. The error is recorded to SYS1.LOGREC, but the dump is suppressed and the abend is retried in the functional recovery. Another group member, requesting the P-lock that caused the negotiation on this member, receives a resource not available code of 00C20252, and its P-lock request is denied.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C200F1

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to unallocate a Db2 data set. An error was returned by the dynamic unallocation function that was invoked to unallocate a data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The unexpected dynamic unallocation reason code is saved in register 8. It may help determine the cause of the failure. Refer to the appropriate MVS publication for an explanation of the error code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200F2

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to close a Db2 data set. An error was returned by the media manager DISCONNECT function that was invoked to close a data set. This reason code and the data set name are recorded in the cursor table (CT) and in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The unexpected media manager disconnect reason code is saved in register 8 and may help determine the cause of the failure. Locate the corresponding IEC161I message in the operator console sheet, and refer to the appropriate MVS publication for assistance in determining the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200F3

Explanation

Db2 is unable to obtain one of the following locks:

- SYSLGRNG or SYSLGRNXrecording lock on a table space

- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected a timeout error.

System action

A 'resource not available' code is returned to the user. This reason code and the data set name are recorded in the cursor table (CT) and are available to the user in the SQLCA or in messages.

User response

Resubmit the failing application.

Problem determination:

00C200F4

Explanation

Db2 is unable to obtain one of the following locks:

- SYSLGRNG or SYSLGRNXrecording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected an out-of-storage condition.

System action

A 'resource not available' code is returned to the user. This reason code is recorded in the cursor table (CT) and is available to the user in the SQLCA or in messages.

User response

Resubmit the failing application.

Problem determination:

00C200F6

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to open a data set that is required to be accessed by the requesting function. The data set has been migrated by DFHSM and the data set must be recalled before being accessed. Since the RECALL(yes) option was selected by the installation, a recall for the migrated data set has been initiated. A recall was

not complete after the amount of time specified in the RECALL option had elapsed.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set requested. Other migrated data sets within the table space may exist. For each one that exists, a DSNT500I message containing the data set name and reason code has been sent to the console.

System action

A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

User response

After the data set has been restored, rerun the application program, transaction, or query. If necessary, contact the operator to find out the status of the migrated data set.

00C200F7

Explanation

The page found in the buffer is not the page requested by the buffer manager. The buffer manager detected the error by comparing the page number of the page returned with the requested page number. This error may be caused by one of the problems:

- Either the VTOC or VVDS is damaged, causing multiple data sets to occupy the same extents on DASD.
- The page was altered incorrectly by a non-Db2 facility or a Db2 service aid.
- An internal Db2 error damaged the page. The recovery log will be required for problem determination.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

7

Address of the page buffer

8

Address of the page set block (PB)

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- VVDS dump of the volumes that contain the data set.
- Db2 REPAIR dump of the requested page.
- DSN1LOGP detail report that contains log records associated with the damaged page.

00C200F8

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to perform the I/O operation on a data set. A physical I/O error was detected by the buffer manager I/O functions.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. A DSNB224I message is issued, unless it has already been issued 10 times for the data set.

If the I/O is a write operation, or if the I/O is a read operation performed during restart or rollback, then the error page range of the data set is updated. A DSNU086E message is issued indicating the data set name and its corresponding I/O error page range, unless it has already been issued 10 times for the data set.

Operator response

Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

System programmer response

The error page range can be located from the console sheet or with the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. Invoke the application after the system programmer has corrected the error.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

Check the MVS console log for an IOS (I/O subsystem) error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

00C200F9

Explanation

Db2 is unable to open a data set that the requesting function must access. The data set was migrated by HSM and must be recalled before being accessed. Db2 attempted to initiate a recall of the migrated data set but was unsuccessful.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last requested migrated data set. Other migrated data sets might exist. For each existing data set, message DSNT500I containing the data set name and reason code was sent to the console.

System action

A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

User response

Issue the HSM command (HRECALL) to restore the migrated data set. Rerun your application program, transaction, or query after the data set is restored.

Problem determination:

00C200FA

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to obtain an open lock to perform a physical open or close of a page set. A timeout error was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

A common reason for this failure is when IRLMRWT is less than RECALLD, and an HSM recall for the migrated data set exceeds IRLMRWT.

System action

A 'resource not available' code is returned to the user.

User response

Resubmit the failing application.

00C200FB

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to obtain an open lock to perform a physical open or close of a page set. An out-of-storage condition was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user.

User response

Resubmit the failing application.

00C200FC

Explanation

The buffer manager (BM) subcomponent of Db2 is unable to obtain an open lock to perform a physical open or close of a page set. A system error was detected by the IRLM LOCK request. The reason code

and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user.

User response

Resubmit the failing application.

00C200FD

Explanation

The buffer manager is unable to perform the I/O operation on a data set due to an error on page's parity flag detected by the buffer manager's I/O function.

System action

A 'resource not available' return code is returned to the user. The related reason code 00C200FD, the page number, the page set name, and the database name in question are recorded in the cursor table (CT) and made available to the user in the SQLCA.

Operator response

Notify the system programmer.

System programmer response

The error page can be found via SQLCA. Correct the error pages with the recovery utility, and notify the user to invoke the application again.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.

00C200FE

Explanation

Db2 is unable to open a data set that the requesting function must access. The data set was migrated by DFHSM and must be recalled before being accessed. Since the RECALL(no) option was selected by the installation, recall for the migrated data set was not initiated.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set requested. Other migrated data sets within the table space might exist. For each existing data set, message DSNT500I containing the data set name and reason code has been sent to the console.

System action

A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

System programmer response

Issue the DFHSM command (HRECALL) to restore the migrated data set.

User response

Notify the system programmer. After the data set is restored, rerun the application program, transaction, or query.

00C200FF

Explanation

An attempted open of a page set failed because Db2 has reached the MVS limit on concurrent open data sets.

System action

A 'resource not available' (SQLCODE -904) is returned to the user and the requested open is not performed. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA. A DSNB207I message is displayed on the operator console. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator response

Notify the system programmer.

System programmer response

Reduce the number of page sets that must be kept open by Db2 by limiting the amount of concurrent activity.

Problem determination

Collect the following diagnostic item:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20101

Explanation

The sharing attribute is inconsistent between the header page of a data set and the DBD. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

First determine whether the database is shared, and whether it is owned by this system. This can be achieved by issuing a SELECT on the SYSIBM.SYSDATABASE catalog table, where the database name is the database you are checking, and by examining the ROSHARE column.

If the Db2 catalog indicates that it is a ROSHARE OWNER database, the problem can be corrected by the REPAIR utility or the -STOP DATABASE command. The -STOP DATABASE command will reformat the header page and make it consistent with the DBD.

If the database is ROSHARE READ on this system, then check the definition of the database on the owning system. If, on the owning system, the database is no longer defined as ROSHARE OWNER, then the table space or index should be dropped on the system on which the error was detected, since the database has been altered to nonshared by the owning system. However, if the database is defined as ROSHARE OWNER on the owning system, then issue a -STOP DATABASE with the SPACENAM parameter from the owning system, which will make the header page consistent with the owner's DBD, and force this change to DASD, making it available to other systems.

If it is a nonshared database, then the sharing attribute can only be corrected via the REPAIR utility.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20102

Explanation

A read-only system attempted to access an inconsistent data set. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to ensure there is no exceptional state for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20103

Explanation

Db2 is unable to access a data set because its system page is inaccessible. This reason code and the data set name are available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

Determine why the system page is inaccessible by examining any error messages that appeared on the console at the time of the error, or by issuing a -DISPLAY DATABASE command. Take the appropriate action to correct the situation.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20104

Explanation

Db2 is unable to access a shared data set because it was down leveled by a DSN1COPY job, or a REPAIR utility with REPLACE RESET specified. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to ensure there is no exceptional state for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20105

Explanation

The page set creation timestamp is inconsistent between the header page and the DBD. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

First determine whether the database is shared, and whether it is owned by this system. This can be achieved by issuing a SELECT on the SYSIBM.SYSDATABASE catalog table, where the database name is the database you are checking, and examining the ROSHARE column.

For a data set in a ROSHARE OWNER database, if the failure occurs on a CREATE TABLESPACE or CREATE INDEX, the timestamp mismatch indicates that the table space or index was previously dropped, but Db2 was unable to delete the data set. In this case, the data set must be deleted using AMS DELETE CLUSTER before the CREATE can take place.

For a data set in a ROSHARE OWNER database at any time other than CREATE TABLESPACE or CREATE INDEX, the inconsistent timestamp can be corrected by first stopping the table space or index via the -STOP DATABASE command with the SPACENAM parameter, and then issuing the -START DATABASE command to start it. The -STOP DATABASE command will reformat the header page using the information retrieved from the DBD.

For a data set in a ROSHARE READ database, a timestamp mismatch indicates that the table space or index has been dropped and re-created on the owning system, and must also be dropped and re-created on this system.

For a data set in a nonshared database, the timestamp value in the header page can only be corrected via the REPAIR utility.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20106

Explanation

An update was attempted on a database defined as ROSHARE READ. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

User response

An update operation is not allowed in this database. Check to ensure that the target of the update was correct and that the database is defined as ROSHARE READ. If the update should occur, issue the update on the system in which the database was defined as ROSHARE OWNER.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

,

00C20107

Explanation

An update was attempted in a ROSHARE OWNER database, but the data set was opened in RO mode. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

Issue the -STOP DATABASE command with the SPACENAM parameter to explicitly stop this table space/index space and then issue the -START DATABASE ACCESS(RW) command.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20108

Explanation

An object in a ROSHARE OWNER database cannot be accessed. At least one system with the database defined as ROSHARE READ is still accessing it. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

Ensure that there are no systems on which the database is defined as ROSHARE READ that are still accessing the database. Issue the -STOP DATABASE command with the SPACENAM parameter on the ROSHARE READ systems that are accessing the database.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20109

Explanation

An object in a ROSHARE READ database cannot be accessed. The system with the database defined as ROSHARE OWNER still has RW access. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System action

A "resource not available" code is returned to the user.

System programmer response

On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to ensure there are no exceptional states for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C2010A

Explanation

Db2 is attempting to open a shared data set in a ROSHARE READ database, but the system cannot locate the data set. The table space or index might already be dropped from the owning system.

System action

A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System programmer response

Run IDCAMS LISTCAT to verify the existence of this data set. Verify whether the associated table space or index exists in the database defined as ROSHARE OWNER. If not, issue DROP TABLESPACE or INDEX on all systems in which the database is defined as ROSHARE READ.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C2010B

Explanation

Db2 is attempting to open a shared data set in a database defined for ROSHARE, but the data set cannot be accessed because it is not defined with SHAREOPTIONS(1,3).

System action

A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

System programmer response

Ensure that this data set belongs to a shared database, and check the SHAREOPTIONS using IDCAMS LISTCAT. If so, use AMS ALTER SHAREOPTIONS to alter the data set to SHAREOPTIONS(1,3), and resubmit the failing application.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C2010C

Explanation

Db2 was unable to update the high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set. VVDS must be updated to reflect data loaded by a RECOVER, LOAD, or REORG utility job. Message DSNB200I is issued to the console with the VSAM media manager return codes.

This reason code and the data set name are recorded in the cursor table (CT) and made available in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. A DSNB200I message is issued to the console. Db2 continues to close the data set.

System programmer response

Refer to system messages IEC161I and Db2 message DSNB200A for assistance in determining the cause of the error. Correct the condition, and notify the user to reinvoke the application.

User response

Contact the system programmer. Restart or rerun the RECOVER, LOAD, or REORG job after the system programmer corrects the error.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- IDCAMS LISTCAT output that shows the attributes of all active log data sets for the Db2 member that failed.

00C2010D

Explanation

Db2 was unable to open a required data set because an unexpected level ID was encountered.

The reason code and the data set name are made available in the SQLCA or in messages.

System action

A 'resource unavailable' code is returned to the user. Message DSNB232I is issued to the console if it was not already issued for the data set. Db2 failed to open the data set.

Operator response

Notify the system programmer.

System programmer response

Refer to message DSNB232I for help in determining the cause of the error. Run the utility REPAIR LEVELID or recover the table space or index, and then tell the user to rerun the application.

Problem determination:

00C2010E

Explanation

This is a Db2 internal error. Db2 encountered a problem while trying to add a page to the logical page list (LPL).

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C2010F

Explanation

This dump provides assistance for diagnosing the page latch timeout problem after 00C20031 is returned as the reason code for 'resource not available'.

System action

The requesting execution unit is abended to take a diagnostic dump then recovered to return an SQLCODE -904 (resource not available) to the user with the 00C20031 reason code. The resource name is also provided.

User response

Contact the system programmer to determine why the resource is unavailable. Print the SYS1.LOGREC and the SVC dump.

00C20110

Explanation

Db2 cannot access a table space, index, or partition because the highest formatted page (as recorded by Db2 in the header page) is higher than that derived from the VSAM high-used RBA.

The reason code and the data set name for this error are available in the SQLCA or in messages.

System action

Db2 returns a 'resource unavailable' code to the user.

System programmer response

To enable access to the object, take one of the following actions:

- Restore the object to a consistent state with the RECOVER or REBUILD utility, DSN1COPY, or some other means.
- Replace the data using the LOAD REPLACE utility.
- Allow access to the data in its current state. Use the REPAIR LEVELID utility to reset the high-used page number in the header page to be consistent with the VSAM high-used RBA. This may result in inconsistent data.

Problem determination

Determine the high-formatted page number in the header page by running DSN1PRNT with the FORMAT option, and checking the value of HPGHPREF.

You can also determine the VSAM high-used RBA by running an IDCAMS LISTCAT on the data set.

00C20111

Explanation

Db2 attempted to access a striped data set with a page size of 8 KB, 16 KB, or 32 KB. The data set is defined with a 4 KB control interval (CI) size. Db2 does not allow this because partial writes cannot always be detected.

System action

SQLCODE -904 is returned. The SQLCA contains a resource-not-available reason code and the data set name.

System programmer response

Ensure that the data set is defined with a control interval size that matches its page size.

User response

Convert the control interval size of the associated table space from 4 KB to a control interval size that matches the page size. The REORG TABLESPACE, LOAD REPLACE, or RECOVER utility can be used to convert the control interval size for the table space.

Problem determination

Run access method services LISTCAT to determine the data set attributes.

00C20112

Explanation

An attempt was made to access a Db2 data set which was defined with incompatible Control Interval (CI) size. A compatible CI size is either 4K or the page size.

System action

A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA.

System programmer response

Ensure that the data set is defined with the compatible CI size.

User response

Convert the data set attribute 'control interval size' of the associated table space from 4K CI into the one matching the page size. Db2 Utilities REORG table space, LOAD with REPLACE, and RECOVER can be used to convert the table space.

Problem determination

Obtain an access method services LISTCAT for the named data set's attributes.

00C20113

Explanation

Db2 reached the limit for concurrent open data sets. The OPEN statement fails with this reason code when the number of concurrent open data sets reaches the greater of 32,768 or the value of the DSMAX subsystem parameter.

System action

SQLCODE -904 is issued and the requested open is not performed. Reason code 00C20113 and the data set name are recorded in the SQLCA. SVC dump and SYS1.LOGREC recording are not requested.

Operator response

Notify the system programmer.

System programmer response

Take one of the following actions:

- Reduce the number of data sets that must be kept open by Db2 by limiting the amount of concurrent activity.

- Increase the value of the DSMAX parameter

Related tasks

[Managing the opening and closing of data sets \(Db2 Performance\)](#)

Related reference

[DSMAX field \(DSMAX subsystem parameter\) \(Db2 Installation and Migration\)](#)

[OPEN statement \(Db2 SQL\)](#)

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C20120

Explanation

This abend reason code is issued because of an unexpected return code from IWM4MREG, IWM4MDRG, or IWM4MCHS.

System action

A dump is requested, then Db2 retries the abend and processing continues.

00C20200

Explanation

Db2 was unable to open a required index data set because the index was formatted incorrectly. For example, it may have been formatted as a Type 1 index when the Db2 catalog indicates that it should be Type 2.

The reason code and index data set name are made available in the SQL communication area or in related messages.

System action

A 'resource unavailable' code is returned to the user.

Operator response

Notify the system programmer.

System programmer response

Use the RECOVER utility to restore the index to a consistent state.

Problem determination:

00C20202

Explanation

Db2 cannot retry automatic GRECP or LPL recovery because AUTOREC is set to NO.

System action

Processing continues.

User response

Recover the objects manually.

Related concepts

[Normal restart and recovery \(Db2 Administration Guide\)](#)

Related reference

[Data sharing status descriptions \(Db2 Data Sharing Planning and Administration\)](#)

[Group buffer pool RECOVER-pending status \(Db2 Utilities\)](#)

00C20203

Explanation

Db2 cannot connect to a group buffer pool. The group buffer pool is not usable by this release of Db2. This Db2 subsystem is a member of a data sharing group containing Db2 members of different release levels. A later release level of Db2 specified an option for this group buffer pool that is not supported by the previous Db2 releases. The presence of this option makes the group buffer pool inaccessible to the previous Db2 releases.

System action

Db2 takes the following actions:

- Unless already issued, message DSNB301E is sent to the console with this reason code to indicate that a connect failure occurred.
- SQLCODE -904 (resource not available) is returned to the user with this reason code. The resource type and resource name are also returned. For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

System programmer response

Take one of the following actions:

- Issue the -ALTER GROUPBUFFERPOOL command from a Db2 that is at the later release level to remove the new option so that previous release levels of Db2 can access the group buffer pool.

- Migrate the previous release levels to the current release.

User response

Contact the system programmer.

Problem determination:

00C20204

Explanation

Db2 is unable to connect to a group buffer pool because MVS detected a problem on the IXLCONN request.

System action

SQLCODE -904 (resource not available) and the group buffer pool name are returned to the user. Unless already issued for the IXLCONN code, message DSNB301E, which contains this reason code and the IXLCONN code, is issued to the console.

User response

Contact the system programmer.

Problem determination

The reason code returned by the IXLCONN request is given in message DSNB301E.

If the connection problem was caused by insufficient storage in a coupling facility, tell the MVS system administrator to alleviate the storage constraint problem by making additional storage available to the involved coupling facility, or by changing the active MVS CFRM administrative policy to redefine the coupling facility structure to a different coupling facility. Another alternative is to have the database administrator reassign those inter-Db2 sharing page sets to a different Db2 buffer pool.

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNB301E \(Db2 Messages\)](#)

00C20205

Explanation

Db2 is unable to access a group buffer pool because of a damage assessment pending (DAP) status against the group buffer pool.

System action

The action Db2 takes depends on the situation, as follows:

- If Db2 tries to read a page from the group buffer pool and finds that the group buffer pool is in DAP status, the following actions are taken:
 - SQLCODE -904 (resource not available) is returned to the user with this reason code. The name of the group buffer pool is also returned.
- If Db2 tries to read a page from the group buffer pool for rollback, backout, or restart and finds that the group buffer pool is in DAP status, the following actions are taken:
 - The page is added to the logical page list (LPL) for the page set.
 - Message DSNB250E is issued to the console with this reason code.
- If Db2 tries to write a page to the group buffer pool and finds that the group buffer pool is in DAP status, the following actions are taken:
 - The page is added to the logical page list (LPL) for the page set.
 - Message DSNB250E is issued to the console with this reason code.
- If Db2 detects DAP status when it tries to connect the group buffer pool, or if Db2 detects a group buffer pool version ID mismatch after a successful connection, the following actions are taken:
 - The damage assessment process is triggered for this group buffer pool.
 - SQLCODE -904 (resource not available) is returned to the user with this reason code. The name of the group buffer pool is also returned.
 - Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

System programmer response

Message DSNB304I is issued when the group buffer pool is entered into DAP state and message DSNB305I is issued when the DAP status is cleared. During the damage assessment process, Db2 must determine which page sets or partitions might have had changed pages in the failed coupling facility structure and need to be recovered. Each page set/partition fitting this

criteria is entered into 'group buffer pool REBUILD pending (GRECP)' status. A page set/partition in GRECP status remains unavailable for read or update until it is recovered.

User response

Contact the system programmer.

00C20206

Explanation

An attempt was made to access a page which is currently in the logical page list (LPL). LPL pages are unavailable until recovery on the affected page set completes.

System action

SQLCODE -904 (resource not available) is returned to the user with this reason code. The resource name is also given.

System programmer response

For those page sets in the LPL, use the RECOVER utility or the -START DATABASE command.

User response

Contact the system programmer.

Problem determination:

00C20207

Explanation

Db2 is unable to connect to a group buffer pool because of a Db2 system error during connect processing. This is an internal Db2 problem.

System action

A SYS1.LOGREC entry is produced and an SVC dump is requested for the original abend which caused this condition. After doing resource and latch recovery, Db2 retries the abend if retry is allowed. SQLCODE -904 (resource not available) is returned to the user with this reason code and the group buffer pool name. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20208

Explanation

The user attempted to access a group-buffer-pool-dependent page set or partition. However, the Db2 member was unable to connect to the group buffer pool because there was not enough hardware system area (HSA) storage in which to allocate the local cache vector (LCV).

System action

Db2 disconnects from the group buffer pool and issues message DSNB301E with this reason code, if it has not yet been issued. DSNB301E is usually preceded by a DSNB306I message.

SQLCODE -904 is returned to the user with this reason code.

System programmer response

Refer to message DSNB306I.

User response

Contact the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C20210

Explanation

An attempt was made to access a page set or partition which is currently in group buffer pool recovery pending (GRECP) status.

System action

SQLCODE -904 (resource not available) is returned with this reason code. The resource name is also given. GRECP page sets or partitions remain unavailable until recovery against the affected page set or partition is complete.

System programmer response

Use the START DATABASE command with the ACCESS RW option to recover the page set or partition and

remove the GRECP status. In extreme or unusual circumstances, you can also remove GRECP status as follows:

- RECOVER, either to currency, or to a prior point in time
- REPAIR SET with NORCVRPEND
- LOAD REPLACE
- START DATABASE with ACCESS FORCE (Not recommended. Specifying this option can result in inconsistent data.)

User response

Contact the system programmer to determine when the resource will be available for use.

00C20211

Explanation

Db2 is unable to access a group buffer pool because the group buffer pool is rebuilding, and the attempt to access the group buffer pool timed out waiting for the rebuild to complete.

System action

'Resource not available' return and reason codes are sent back to the requesting function.

System programmer response

Use the Db2 DISPLAY GROUPBUFFERPOOL command or the MVS D XCF,STR command to monitor the status of the rebuild. Also, monitor the status messages that the Db2 members issue as the rebuild progresses (refer to messages DSNB331I, DSNB332I, and DSNB338I). If the rebuild is not progressing satisfactorily, you can use the MVS command SETXCF,STOP,REBUILD to stop the rebuild.

User response

Resubmit the request.

00C20220

Explanation

While Db2 was accessing a group buffer pool, MVS detected an environmental error during an IXLCACHE request from Db2.

System action

The requesting execution unit abends.

Problem determination

The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLCACHE reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20221

Explanation

While accessing a group buffer pool, Db2 received an unexpected error from MVS, which detected an invalid parameter on an IXLCACHE request from Db2. This code usually indicates a Db2 internal problem. However, the problem can result from errors in other products.

System action

The requesting execution unit abends.

Problem determination

The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLCACHE reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20222

Explanation

While accessing a page in a buffer pool, Db2 received an unexpected error from MVS, which detected an invalid parameter on an IXLVECTR request from Db2. This code usually indicates a Db2 internal problem. However, the problem can result from errors in other products.

System action

The requesting execution unit abends.

Problem determination

See the IXLVECTR return code in register 8 to help determine the cause of the error. Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLVECTR reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20223**Explanation**

Db2 encountered an error while invoking the IXLCACHE macro.

System action

The requesting execution unit abends. Db2 terminates abnormally causing MVS to reset the castout locks.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20224**Explanation**

Db2 received an unexpected return and reason code from the MVS IXLFCOMP macro for a group buffer pool.

System action

Db2 abends the agent and requests a dump. If the group buffer pool is in duplex mode, then Db2 may stop duplexing for the group buffer pool in response to this error.

System programmer response

If the group buffer pool was duplexed and is entered back into simplex mode as a result of this error, and duplexing is not automatically reestablished, then use the MVS SETXCF command to enter the group buffer pool back into duplex mode if duplexing is needed. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then the system attempts to automatically reestablish duplexing for the structure.

Problem determination

See [z/OS MVS Sysplex Services Reference](#) for an explanation of the MVS IXLREBLD reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20225**Explanation**

While accessing a group buffer pool, Db2 received an unexpected error from z/OS MVS, which detected an invalid parameter in an IXLAXISN request from Db2. This code usually indicates that there is an internal error in Db2. However, the problem might result from an error in another product.

System action

The requesting execution unit abnormally terminates.

System programmer response:

Use the IXLAXISN reason code, which is saved in register 8, to help you to determine the cause of the error.

Problem determination

Refer to [z/OS MVS Sysplex Services Reference](#) for information about IXLAXISN reason codes.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20230**Explanation**

Db2 could not establish duplexing for a group buffer pool because a coupling facility with CFLEVEL = 5 functionality was not available in which to allocate the secondary group buffer pool.

System action

The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System programmer response

Upgrade the coupling facilities to CFLEVEL = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVEL = 5 functionality.

00C20231

Explanation

Db2 could not establish duplexing for a group buffer pool because the primary structure instance of that group buffer pool is allocated in a coupling facility that does not have CFLEVEL = 5 functionality.

System action

The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System programmer response

Upgrade the coupling facilities to CFLEVER = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVER = 5 functionality.

00C20232

Explanation

Db2 could not establish duplexing for a group buffer pool because the group buffer pool is defined with GBPCACHE(NO). Db2 does not allow GBPCACHE(NO) group buffer pools to be duplexed.

System action

The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System programmer response

If duplexing is needed for the group buffer pool, issue the Db2 ALTER GROUPBUFFERPOOL command to specify GBPCACHE(YES) before trying to initiate duplexing.

00C20233

Explanation

Db2 detected a version id mismatch for the secondary group buffer pool when connecting to a duplexing group buffer pool. The version ID mismatch indicates that the process to establish duplexing completed prematurely (for example due to a system failure), and the secondary group buffer pool is not in synch with the primary.

System action

Db2 stops duplexing for the group buffer pool. The group buffer pool is entered back into simplex mode. Message DSNB743I is issued indicating the reason code as the reason why the process to establish duplexing was stopped. If DUPLEX(AUTO) is specified for the group buffer pool in the active CFRM policy, then duplexing is automatically reinitiated.

System programmer response

If duplexing is needed for the group buffer pool and duplexing is not automatically reinitiated, then use the MVS SETXCF command to initiate duplexing for the group buffer pool.

00C20250

Explanation

A conditional pageset P-lock request failed.

User response

Contact IBM Software Support.

00C20251

Explanation

Db2 is unable to obtain a physical lock (P-lock) because of an out-of-storage condition detected by IRLM.

System action

SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Operator response

Notify the system programmer.

System programmer response

IRLM exhausted the amount of virtual storage available to it to represent locks. Refer to code 00C90092 for methods to reduce the storage needed by IRLM.

Problem determination:

00C20252

Explanation

Db2 is unable to obtain a physical lock (P-lock). Another Db2 holds the P-lock in an incompatible state, but is unable to downgrade because it does not have access to the corresponding group buffer pool.

System action

SQLCODE -904 (resource not available) is returned to the user. The other Db2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries, and/or an SVC dump. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem determination:

00C20254

Explanation

Db2 is unable to acquire or upgrade a physical lock (P-lock) because of an incompatible retained lock held by one or more other Db2 subsystems in the Db2 data sharing group. Retained locks are locks that persist across Db2 abnormal terminations.

System action

SQLCODE -904 is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System programmer response

Use the -DISPLAY DATABASE command to display the Db2 member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition. To show the status of the DBMS and IRLM subsystems, you can use the following command:

```
F irllmproc,STATUS,ALLD
```

00C20255

Explanation

Db2 is unable to obtain a physical lock (P-lock) because another member holding the lock has not responded to the P-lock request. This is a Db2 internal error.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other Db2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries and/or an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20256

Explanation

Db2 is unable to obtain a physical lock (P-lock). This is a Db2 internal error.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other Db2 produces SYS1.LOGREC entries, and, depending on the type of abend, might also produce an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20257

Explanation

Db2 is unable to obtain a physical lock (P-lock) because of an 'out of record list storage' condition that IRLM detected. The record list is that part of the coupling facility lock structure that IRLM uses to record 'modify locks' (those locks that would be retained in case of a failure).

System action

SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System programmer response

Allocate a larger coupling facility lock structure by using the MVS SETXCF, REBUILD command. Make sure that the active MVS CFRM policy specifies a larger structure size for the IRLM coupling facility lock structure before you initiate the rebuild. You can use the MVS SETXCF, STOP, POLICY and SETXCF, START, POLICY commands to change the active MVS CFRM policy. If lock size is not already at the current POLICY maximum size, you can increase lock size with the SETXCF START, ALTER, STRNAME=*lock_structure*, SIZE=*new_size* command.

00C20258

Explanation

Db2 is not able to obtain a physical lock (P-lock) until a peer member restarts. Another Db2 holds the P-lock in an incompatible state but cannot downgrade until it completes its restart.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are made available to the user in the SQLCA.

User response

Resubmit the failing application. The P-lock becomes available after the peer member completes its restart processing.

Problem determination:

00C20259

Explanation

This is a Db2 internal error. This reason code and the group buffer pool name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System action

A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C2025A

Explanation

Db2 encountered an unexpected error from IRLM while trying to acquire a global lock for MBA (multiple buffer pool) object.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested. Collect messages DSNT376I, DSNT500I, and DSNT501I for further diagnosis.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C2025B

Explanation

Db2 encountered an unexpected error while trying to read from the shared communications area (SCA) for MBA (multiple buffer pool) object.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C2025C

Explanation

Db2 encountered an unexpected error while trying to write to the shared communications area (SCA) for MBA (multiple buffer pool) object.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20260

Explanation

This is a Db2 internal error. Castout was unsuccessful because Db2 lost connectivity to the group buffer pool.

System action

A 'resource not available' code is returned to the user.

System programmer response

Connect this Db2 to the group buffer pool before allowing operations that reference this group buffer pool.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20261

Explanation

This is a Db2 internal error. Castout was unsuccessful due to a group buffer pool structure failure.

System action

A 'resource not available' code is returned to the user.

System programmer response

Connect this Db2 to the group buffer pool before allowing operations that reference this group buffer pool.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20262

Explanation

This is a Db2 internal error. Castout was unsuccessful due to errors in writing a page to DASD.

System action

A 'resource not available' code is returned to the user.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination:

00C20263

Explanation

This is a Db2 internal error. Castout was unsuccessful due to an unexpected error.

System action

A 'resource not available' code is returned to the user. An SVC dump and the SYS1.LOGREC recording were requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination:

00C20264**Explanation**

Db2 is unable to acquire or upgrade a physical lock (P-lock) because at least one other Db2 subsystem in the data sharing group is holding an incompatible retained lock. The amount of time this Db2 can wait for a locked resource was exceeded. This reason code is only issued if the RETLWAIT installation parameter in DSN6SPRM is set to 'YES'. If RETLWAIT is set to 'NO' (this is the default), then any IRLM lock that conflicts with a retained lock will not wait, but instead will be immediately rejected (see reason code 00C20254).

System action

An SQLCODE -904, -911, -913 or -923 is issued, and message DSNT501I is issued. Also, message DSNT378I is issued.

System programmer response

Refer to the 'System Programmer Response' in message DSNT378I.

Problem determination:

00C20267**Explanation**

Db2 is unable to recover GRECP status for a table space or index because one or more sharing group members could not perform a global drain request on the object.

System action

A Db2 message of DSNB350 or DSNB351 is issued.

System programmer response

Refer to the 'System Programmer Response' in message DSNB350 or DSNB351.

User response

Issue a START DB command to explicitly recover the page set from GRECP/LPL status.

00C20268**Explanation**

Db2 is unable to recover GRECP status for a table space or index because one or more sharing group members could not perform a global drain request on

the object. One or more peer DB2s in the group failed to drain the object because some error occurred.

System action

A Db2 message of DSNB350 or DSNB351 is issued.

System programmer response

Refer to the 'System Programmer Response' in message DSNB350 or DSNB351.

User response

Issue a START DB command to explicitly recover the page set from GRECP/LPL status.

00C20269**Explanation**

An application or utility is attempting to access Db2 data, but this is not allowed because Db2 was started in System Recover Pending mode. When Db2 is started in System Recover Pending mode, nothing other than the Restore System utility is allowed to access Db2 data.

System action

The application fails with a "resource unavailable" condition.

System programmer response

The application cannot be run while Db2 is in System Recover Pending mode.

00C2026A**Explanation**

Db2 is unable to obtain a physical lock (P-lock), because another member holding the lock has been in Db2 shutdown mode for an extended amount of time.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code, as well as the resource name, are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem determination

Check the other members of the data sharing group to find the one which is stalled in shutdown. If you suspect an error in Db2, you might need to report the problem. For information about identifying and

reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Resubmit the failing application after the member has come down.

00C2026B**Explanation**

Db2 is unable to obtain a physical lock (P-lock), because another member holding the lock has had logging suspended for an extended amount of time. The logging has been suspended because the active logs are full, or because there is an outstanding SET LOG SUSPEND command.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code, as well as the resource name, are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem determination

Check the other members of the data sharing group to find the one that has logging suspended. Then take the appropriate action by either issuing the SET LOG RESUME command or freeing up the active log data sets. Resubmit the failing application after the logging situation is resolved.

00C2026C**Explanation**

Db2 is unable to obtain a physical lock (P-lock), because another member holding the lock has encountered an abend in its P-lock exit.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code, as well as the resource name, are returned in the cursor table (CT) and made available to the user in the SQLCA. The other Db2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries, or an SVC dump.

Problem determination

Collect the SYS1.LOGREC and SVC dump, if available, from the other Db2. If the problem persists, it might be necessary to recycle this member to resolve the P-lock failure.

00C2026D**Explanation**

An update to a table or index was not allowed because the object is in basic format with 6-byte RBA or LRSN values, and the RBA or LRSN that is required for the update is near the end of the 6-byte range. Rollback and abort processing are still allowed. This reason code is typically associated with a -904 SQLCODE.

System action

The requested update failed. Previous uncommitted changes can be committed. No additional changes are allowed.

User response

Take the following actions:

1. Ensure that all catalog and directory page sets have been converted to extended format.
2. Convert the objects that are in basic format with 6-byte RBA or LRSN values to extended format with 10-byte RBA or LRSN values.
3. Try the update operation again.

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C202A1

Explanation

Db2 encountered an unexpected error while trying to read from or write to the shared communications area (SCA).

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A2

Explanation

MVS returned an unexpected error from an IXLDISC request to disconnect a group buffer pool.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested. The IXLDISC reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump.

System programmer response

Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLDISC reason code.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A3

Explanation

MVS returned an unexpected error from an IXLFORCE request to deallocate a group buffer pool.

System action

A SYS1.LOGREC entry is written and an SVC dump is requested. The IXLFORCE reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump.

System programmer response

Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLFORCE reason code.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A4

Explanation

MVS detected an error on an IXLCONN request from Db2.

System action

A SYS1.LOGREC entry is written and an SVC dump is requested. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console. The IXLCONN reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump. This reason code and the group buffer pool name are returned to the user in the SQLCA.

System programmer response

Refer to [z/OS MVS Sysplex Services Reference](#) for the MVS IXLCONN reason code.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A5

Explanation

The cache coupling facility structure attributes passed back by MVS on an IXLCONN request were incorrect.

System action

A SYS1.LOGREC entry is written. The newly-connected group buffer pool is disconnected.

If this is a non-rebuild connect, then message DSNB301E, which contains this reason code, is issued to the console (unless it has already been issued). In the message this reason code and the group buffer pool name are returned to the user in the SQLCA.

If this is a rebuild connect, then message DSNB330E, which contains this reason code, is issued to the console and this reason code is used to stop the rebuild.

Problem determination

Check the SYS1.LOGREC variable recording area (VRA) for which bit is set in "VRARRK30 - Error mask":

X'04'

If bit X'04' is set, the number of allocated data elements was not sufficient to hold a single data page. VRARRK31 contains the allocated number of data elements. The number of required data elements depends on the page size of the buffer pool:

Page size	Number of data elements
4KB	1
8KB	2
16KB	4
32KB	8

X'10'

If bit X'10' is set, the allocated vector was not long enough to cover the corresponding buffer pool. VRARRK31 contains the requested vector length, and VRARRK32 contains the allocated vector length.

X'20'

If bit X'20' is set, the data element size was not allocated as Db2 requested. VRARRK31 contains the requested data element size, and VRARRK32 contains the allocated data element size.

00C202A6

Explanation

This is a Db2 internal error. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

System action

A SYS1.LOGREC entry is written and an SVC dump is requested. The newly-connected group buffer pool is disconnected. This reason code and the group buffer pool name are returned to the user in the SQLCA.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A7

Explanation

While processing an ALTER GROUPBUFFERPOOL command request, Db2 encountered an unexpected return code from the MVS IXCQUERY service.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written. An SVC dump is requested if it appears to be a Db2 problem (return code 8 from IXCQUERY). Command processing is terminated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202A8

Explanation

In connection to a group buffer pool structure, Db2 determined that insufficient space is allocated to hold any data pages. For example, the group buffer pool GBP32K contains only 16 KB or four 4 KB pages, which are not large enough to support one 32 KB buffer.

System action

Db2 disconnects from the structure, issues a DSNB301E message with this reason code (if not already issued), and returns this reason code and the

GBP name to the user in the SQLCA. If this is a rebuild connect, then Db2 issues message DSNB335I, which contains this reason code, and this reason code is used to stop the rebuild.

System programmer response

Modify the z/OS coupling facility resource management (CFRM) policy to make the group buffer pool structure larger, or use the -ALTER GROUPBUFFERPOOL command to reduce the value of the RATIO option to assign more space for data.

00C202AA

Explanation

An error occurred in IRLM on a physical lock (P-lock) or change request from Db2. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. SQLCODE -904 is issued. This reason code and the resource name are returned in the SQLCA.

System programmer response

Examine SYS1.LOGREC for a previous error related to IRLM.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)

- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPL (mapped by DXRRPLPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCSTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202AB

Explanation

The IRLM UNLOCK request returned an error code when Db2 attempted to release a physical lock (P-lock). This is a Db2 internal error.

System action

The requesting execution unit abends. The SVC dump and SYS1.LOGREC recording are requested.

System programmer response

Request the SYS1.LOGREC and the SVC dump.

User response

Resubmit the failing application.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCSTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202AC

Explanation

There was an error during physical lock (P-lock) negotiation. This is a Db2 internal error.

System action

An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.

System programmer response

Request the SYS1.LOGREC and the SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCSTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202AD

Explanation

Db2 could not start even one castout process. A probable cause is that no virtual storage is available to acquire private buffers for the castout process.

System action

The requesting execution unit abends and Db2 terminates abnormally.

System programmer response

Restart Db2 after increasing the REGION parameter value on the database services address space (ssnmDBM1) startup procedure to get more virtual storage.

Problem determination:

00C202AE

Explanation

IRLM returned an invalid cached state on a physical lock (P-lock) request from Db2. This is an internal error.

System action

SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested.

System programmer response

Examine SYS1.LOGREC for a preceding error related to IRLM.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCCTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202AF

Explanation

There was an incompatible physical lock (P-lock) held. This is a Db2 internal error.

System action

An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.

System programmer response

Request the SYS1.LOGREC and the SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCCTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202B0

Explanation

This is a Db2 internal error.

System action

An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the physical lock (P-lock) requester that caused the conflict and the subsequent negotiation.

System programmer response

Request the SYS1.LOGREC and the SVC dump.

User response

Resubmit the failing application.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCCSTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202B1

Explanation

An error occurred during physical (P-lock) negotiation. This is a Db2 internal error.

System action

An SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested. This reason code and the resource name are returned in the SQLCA.

System programmer response

Examine SYS1.LOGREC for a previous error related to IRLM.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRPLPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this Db2
- RLPCCSTA (1 byte): New cached state of the P-lock for this Db2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other Db2 that is in conflict with the state held by this Db2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

00C202B2

Explanation

Db2 could not obtain a page set or partition physical lock (P-lock).

System action

A 'resource unavailable' condition is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System programmer response

This problem might be caused by having multiple Db2 release levels in the Db2 data sharing group.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202B3

Explanation

This is a Db2 internal error. The execution unit encountered an error while doing damage assessment for a group buffer pool.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202B4

Explanation

This is a Db2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202B5

Explanation

This is a Db2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202B6

Explanation

This is a Db2 internal error. The execution unit received an error return code while trying to translate the Db2 member name to a member ID.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202B7

Explanation

This is a Db2 internal error. An unexpected error occurred during recovery processing from a group buffer pool link failure.

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202C0

Explanation

Db2 timed out waiting for the use count on a group buffer pool to reach zero during rebuild quiesce processing for the group buffer pool. This is a Db2 internal problem.

System action

The Db2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202C1

Explanation

Db2 encountered a problem trying to connect to the new group buffer pool coupling facility structure while trying to rebuild the group buffer pool.

System action

Depending on the nature of the error, a dump might be generated. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

User response

Check the console log for previous error messages (for example, DSNB330I or DSNB306I) to determine why Db2 could not connect to the new group buffer pool structure.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related information

[DSNB306I \(Db2 Messages\)](#)

[DSNB330I \(Db2 Messages\)](#)

[DSNB335I \(Db2 Messages\)](#)

00C202C2

Explanation

Db2 received an unexpected return and reason code from the MVS IXLREBLD macro during rebuild processing for a group buffer pool.

System action

The Db2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I will be issued indicating that the IXLREBLD request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem determination

See [z/OS MVS Sysplex Services Reference](#) for an explanation of the MVS IXLREBLD reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202C3

Explanation

Db2 received an unexpected return and reason code from the MVS IXLEERSP macro during rebuild processing for a group buffer pool.

System action

The Db2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I is issued indicating that the IXLEERSP request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem determination

See [z/OS MVS Sysplex Services Reference](#) for an explanation of the MVS IXLEERSP reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202C4

Explanation

Db2 detected that the number of changed pages in the new structure is greater than the number of changed pages in the original structure at the time that the rebuild of the group buffer pool was about to be completed.

System action

Db2 abends and takes a dump. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202C5**Explanation**

During a cold start of a member of a data sharing group, Db2 performed a query for retained locks in order to determine whether a group buffer pool needed to be forced off, but the query failed.

System action

Db2 abends and takes a dump. The Db2 subsystem is abnormally terminated.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202D0**Explanation**

Db2 is unable to respond to an event that was reported by MVS. This is a Db2 internal error.

System action

Db2 terminates abnormally.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202D1**Explanation**

This is a Db2 internal error. Db2 encountered an unrecoverable error while trying to add a page to the logical page list (LPL).

System action

The Db2 subsystem is abnormally terminated.

Operator response

Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C202D2**Explanation**

An attempt was made to cold-start a member of a data sharing group, but another member had an active connection to a group buffer pool.

System action

The Db2 subsystem is abnormally terminated.

Operator response

Make sure that all other members of the group have been shut down, and restart the failing member.

00C20300**Explanation**

This is a Db2 internal error. The execution unit attempted to access, claim, or drain a page set or partition, but the page set was not logically opened.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20301

Explanation

This is a Db2 internal error. The execution unit attempted to access, claim, or drain a logical partition, but the page set is not a type 2 nonpartitioned page set.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20302

Explanation

This is a Db2 internal error. A page set was not logically opened by the execution unit that was attempting to do one of the following:

- Logical close a page set
- Physical close a page set or partition

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20303

Explanation

This is a Db2 internal error. A page set is not in-use, but an execution unit was attempting to do one of the following:

- Logical close a page set

- Physical close a page set or partition

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20304

Explanation

This is a Db2 internal error. During force write processing, the buffer manager detected that the write claim class count is not zero or there are pending updates on the page set or partition.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20305

Explanation

This is a Db2 internal error. The execution unit attempted to access, claim, drain, open, or close a partition or piece, but the partition or piece number is invalid.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20306

Explanation

This is a Db2 internal error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C20307

Explanation

This is a Db2 internal error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C2030B

Explanation

z/OS Global Resource Serialization (GRS) service ISGQUERY or ISGADMIN reported an error when Db2 opened or closed a data set.

System action

The requesting execution unit terminates abnormally.

Operator response

Notify the system programmer, print the SYS1.LOGREC, and request an SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C2030C

Explanation

Db2 could not open a data set because of a z/OS Global Resource Serialization (GRS) resource shortage.

System action

SQLCODE -904 is returned to the user, and the data set is not opened. This reason code and the data set name are recorded in the SQLCA. An SVC dump is not generated, and no information is recorded in SYS1.LOGREC.

System programmer response

Work with your Db2 administrator to reduce the Db2 workload, or reduce the number of open data sets.

User response

Notify the system programmer.

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Chapter 5. X'C5.....' codes

Reason code identifiers that begin with 00C5 communicate normal and error situations with the TSO attachment facility.

For these codes, the standard documentation to be collected is a SYSUDUMP and a printout of the DSNTRACE data set. The standard SPUFI documentation is a SYSUDUMP and a printout of the ISPF log for this session. A SYSUDUMP data set must be allocated in advance to collect your dump. A DSNTRACE data set must be allocated in advance to collect your DSN trace stream unless you are running in the background, in which case the SYSTSPRT data set contains the DSNTRACE output. ISPF normally runs with an active log data set. ISPF suppresses dumps unless it is invoked with the TEST parameter. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

In the TSO attachment facility, the user can control whether or not message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

The following abends can occur in the TSO Attachment Facility.

00C50001

Explanation

This is probably a Db2 subsystem error. DSNESM30 has detected an illegal value in the YTYPE portion of the SQLTYPE field of the SQLDA.

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, "X'C5.....' codes,"](#) on [page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

An illegal value was detected in the SQLTYPE field of the SQLDA. This may have been caused by this field being overlaid in error. To determine the source of the error, analyze the SQLDA in the storage dump.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50002

Explanation

This is probably a Db2 subsystem error. DSNESM32 has detected an illegal value in the YTYPE portion of

the SQLTYPE field of the SQLDA. This suggests that an illegal value was in the SQLTYPE field of the SQLDA.

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, "X'C5.....' codes,"](#) on [page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

An illegal value was detected in the YTYPE of the SQLDA. This may have been caused by this field being overlaid in error. Analyze the SQLDA in the storage dump to determine the source of the error.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50003

Explanation

This could be either a user or a system error. SPUFI was unable to obtain the required storage via GETMAIN.

System action

SPUFI task abends. User returns to ISPF main menu.

System programmer response

If the problem persists, the standard SPUFI documentation should be collected. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer. You may have to specify a larger machine size at logon time.

Problem determination

Register 2 contains the amount of storage that was requested. Message DSNE392E, in the ISPF log data set, gives the name of the module that issued this abend.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50005

Explanation

This could be either a user or a system error. The DYNALLOC SVC returned an unexpected return code when attempting to allocate a data set.

System action

The contents of the field are written to the ISPF log.

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

Message DSNE381E, in the ISPF log data set, gives the return code and reason code values returned from the dynamic allocation request. Refer to the appropriate MVS publication to determine the source of the error and analyze these values.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.

- Listing of the ISPF log for the session involved in the problem.

00C50007

Explanation

This is probably an error in the SPUFI code. The field describing the record format of the output data set is not valid.

System action

The contents of the field are written to the ISPF log.

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

Message DSNE383A, in the ISPF log data set, gives the record format of the output data set that was determined to be in error. The output data set record must be in one of the following formats: F, FB, FBA, V, VB, or VBA.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50008

Explanation

This could be either a user or a system error. The DYNALLOC SVC returned an unexpected return code when attempting to deallocate a data set.

System action

The contents of the field are written to the ISPF log

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

Message DSNE384E, in the ISPF log data set, gives the return code and reason code values returned from the dynamic allocation request. Analyze these values to determine the source of the error.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50009

Explanation

This is probably caused by an error in the SPUFI code. The SQLCODE translation service (module DSNTIAR) has returned an unexpected return code.

System action

The contents of the field have been written to the ISPF log.

System programmer response

The standard SPUFI documentation should be collected. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

Message DSNE387A, in the ISPF log data set, gives the return code value returned from DSNTIAR. The meanings of these return codes are:

- 4** More data was available than could fit into the message area provided.
- 8** The LRECL was not within the limits: $72 \geq \text{LRECL} \leq 240$
- 12** The message area was not large enough. Message length ≥ 240
- 16** Error in message routine (IKJEFF02).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the ISPF log for the session involved in the problem.

00C50100

Explanation

This is probably caused by an error in the DSN command processor code. Module DSNECP66 (in the DSN command processor) called module DSNTIAR to format an error message to explain an unexpected SQL return code received by DCLGEN. DSNTIAR failed.

System programmer response

The standard documentation should be collected, including a DSN trace stream. Refer to [Chapter 5, “X'C5.....' codes,” on page 455](#) for information about obtaining dumps and displaying message IDs.

User response

If the problem persists, notify the system programmer.

Problem determination

Message DSNE004E in the output gives the return code value returned from DSNTIAR. For an explanation of these return codes, see abend reason code '00C50009'.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50101

Explanation

The user has entered the ABEND subcommand of the DSN command processor. This causes a X'04E' abend and a dump to be requested. In order to retain the dump, you must have previously allocated a SYSUDUMP or SYSADUMP data set. The ABEND subcommand can be useful for debugging.

Important: The ABEND subcommand is used for diagnostic purposes only, and is intended to be used only under the direction of IBM Support. Use it only when diagnosing a problem with DSN or Db2.

System action

A X'04E' abend results, and a dump is requested.

System programmer response

The standard documentation may be needed. Refer to Chapter 5, “X'C5.....' codes,” on page 455 for information about obtaining dumps and displaying message IDs.

Problem determination

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

Related tasks

[ABEND subcommand of the DSN command processor \(Diagnosing Db2 problems\)](#)

Related reference

[ABEND subcommand \(DSN\) \(Db2 Commands\)](#)
[DSN command \(TSO\) \(Db2 Commands\)](#)
[Printing and analyzing dumps \(Diagnosing Db2 problems\)](#)

00C50102

Explanation

An error probably occurred in Db2 while it attempted to process an IDENTIFY request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from Db2.

System action

Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50102'.

System programmer response

See the Problem Determination section of this message.

User response

If the problem persists, notify the system programmer.

Problem determination

Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a Db2 dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50103

Explanation

An error probably occurred in Db2 while it attempted to process an ESTABLISH EXIT request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from Db2.

System action

Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50103'.

System programmer response

See the Problem Determination section of this message.

User response

If the problem persists, notify the system programmer.

Problem determination

Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a Db2 dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50104

Explanation

An error probably occurred in Db2 while it attempted to process a CREATE THREAD request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from Db2.

System action

Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50104'.

System programmer response

See the Problem Determination section of this message.

User response

If the problem persists, notify the system programmer.

Problem determination

Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a Db2 dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50108

Explanation

An error probably occurred in Db2 while it attempted to process a BIND, REBIND, or FREE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from Db2.

System action

Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50108'.

System programmer response

See the Problem Determination section of this message.

User response

If the problem persists, notify the system programmer.

Problem determination

Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a Db2 dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50109

Explanation

An error probably occurred in Db2 while it attempted to process a TERMINATE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from Db2.

System action

Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50109'.

System programmer response

See the Problem Determination section of this message.

User response

If the problem persists, notify the system programmer.

Problem determination

Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a Db2 dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00C50110

Explanation

This is a DSN command processor error. It occurs when the DSN STAX routine (DSNEBP01) is entered and the DSN control blocks cannot be located; the AEPLUSR field did not contain the CIB address.

System action

The DSN command processor abended.

User response

If you allocated a SYSUDUMP or SYSABEND dump data set, collect the dump. Otherwise, allocate SYSUDUMP and DSNTRACE data sets, turn on DSN tracing, and try to re-create the error. Save these data sets.

Severity

4

00C50111

Explanation

Your application program made an instrumentation facility component application program interface (instrumentation facility interface) call to Db2 language interface module DSNELI, but your application program was not running under the DSN command processor. You must run all application programs using DSNELI under DSN. To do this, first issue the DSN command, then start your application using the RUN subcommand of the DSN command processor, and finally, when the application completes, stop DSN with an END subcommand.

System action

Control returns to the application. Your application can continue processing. Further attempts at instrumentation facility interface (IFI) calls will continue to produce this return and reason code.

Operator response

Notify your system programmer.

System programmer response

Modify the job to invoke DSN. Initiate the application program using the RUN subcommand of the DSN command processor.

User response

Rerun your application under the DSN command processor.

Chapter 6. X'C6.....' codes

Reason code identifiers that begin with 00C6 communicate normal and error situations with the message generator.

00C60001

Explanation

Db2 received return code X'20' when issuing a WTO request to display a Db2 console message. MVS sets this return code when there are no message buffers for either Multiple Console Support (MCS) or JES3, or when there is a JES3 WTO staging area excess. The WTO request is terminated. The current Db2 console message and all subsequent Db2 informational console messages are ignored until the MVS problem is corrected.

At the time of the abend, general register zero contains the return code from WTO request.

System action

A record is written to SYS1.LOGREC. A retry is requested and execution continues. Db2 resumes issuing console messages when the condition is corrected.

Chapter 7. X'C8.....' codes

Reason code identifiers that begin with 00C8 communicate normal and error situations with the Db2 precompiler or the Db2 coprocessor.

Abends in the precompiler are not intercepted via ESTAE, so standard system abends might occur. The SYNAD exit is not used, so I/O errors cause S001 or S002 abends. S04E abends are generated for precompiler internal errors. Following is a list of reason codes.

00C89011

Explanation

An internal parser consistency check failed. The parser received a token code of 0 from a lexical scan. A lexical scan refers to a scan of words rather than syntax.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

Explanation

An internal precompiler or parser consistency check failed. An error occurred in storage suballocation request. Possible causes for this error include:

- Storage constraints when building the DBRM entry for the SQL statement
- An SQL statement exceeding the Db2 maximum statement length.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89012

Explanation

An internal precompiler or parser consistency check failed. An error occurred in storage suballocation control blocks. This error can be caused by a Db2 SQL statement exceeding limitations. For example:

- An SQL statement might be referencing, creating, or declaring more columns than the Db2 defined maximum number allowed for an SQL statement.
- Too many host variables might be referenced in an SQL statement.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89014

Explanation

An internal precompiler or parser consistency check failed. The error is in pointer structures.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89013

00C89015

Explanation

An internal precompiler or parser consistency check failed. The host variable information in the precompiler or parser dictionary or in the DBRM is not consistent with host variable information for an SQL statement. This error might occur when the precompiler misinterprets an invalid host variable declaration.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump, a copy of the application program source, and a copy of the DBRM that is being bound (IEBCOPY).

00C89016

Explanation

An internal parser consistency check failed. An unexpected value was provided for a parser option.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89017

Explanation

An internal precompiler or parser consistency check failed. The internal limit for a fully qualified name exceeds the maximum length of 255 characters.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89018

Explanation

An internal precompiler or parser consistency check failed. An internal conversion error occurred during conversion of a timestamp version ID.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89019

Explanation

An internal precompiler or parser consistency check failed. The internal stack storage is full.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C8901a

Explanation

An internal precompiler or parser consistency check failed. Language Environment required, but not available.

System action

An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

System programmer response

Obtain the SVC dump and a copy of the application program source.

00C89041

Explanation

More storage is needed, but could not be obtained during the precompiler execution. An S04E abend occurs. The error type and reason code are found in register 15 of the dump.

System programmer response

The storage required for the current statement could not be acquired or exceeds the maximum (64KB) for a single request. If the region is full, determine if the region can be expanded. If it cannot be expanded, the SQL statement is too large to be processed.

Chapter 8. X'C9.....' codes

Reason code identifiers that begin with 00C9 communicate normal and error situations with the data manager.

00C9000A

Explanation

A resource was unavailable. Some of the circumstances in which this reason code is issued are:

- The Db2 database manager attempted to read the log for a READS request for IFCID 0306.
- Information about the maximum length of LOB column data in the SPT01 directory table space was not available because the Db2 catalog and directory was undergoing point-in-time recovery. This reason code is generated as part of DISPLAY GROUP output.
- At Db2 startup, during building of the trusted context cache, the catalog was unavailable.
- At Db2 startup, during checking for available audit policies, the catalog was unavailable.

System action

SQLCODE -904 is returned to the user in the following cases:

- The Db2 database manager attempted to read the log for a READS request for IFCID 0306.
- Information about the maximum length of LOB column data in the SPT01 directory table space was not available because the Db2 catalog and directory was undergoing point-in-time recovery. This reason code is generated as part of DISPLAY GROUP output.

Message DSNX230I is issued in the following case:

- At Db2 startup, during building of the trusted context cache, the catalog was unavailable.

Message DSNX232E is issued in the following case:

- At Db2 startup, during checking for available audit policies, the catalog was unavailable.

User response

If the resource was unavailable when the database manager attempted to read the log for a READS request for IFCID 0306, reissue the request. If the problem persists, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the resource was unavailable because information about the maximum length of LOB column data in the SPT01 directory table space was not available, no action is necessary.

If the catalog was unavailable when the trusted context cache was being built during Db2 startup, no action is needed. Db2 attempts to rebuild the trusted context cache at one of the following times:

- At the next Db2 startup
- During the COMMIT operation for data definition statements that are related to the trusted context
- When a connection is being established

If the catalog was unavailable during checking for available audit policies at Db2 startup, any audit policies that are defined to be automatically started during Db2 startup are not started. To manually start those audit policies, issue the -START TRACE(AUDIT) command with the AUDTPLCY option.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNX230I \(Db2 Messages\)](#)

[DSNX232E \(Db2 Messages\)](#)

00C90015

Explanation

A problem with the active or archive log data set was detected. Problems that result in this message include:

- The active or archive log data set is not available.
- An error occurred during log allocation or log data set open.
- The data set was not cataloged.

System action:

The requested action will not be completed.

System programmer response:

Verify that the active or archive log data set is not missing by running Print Log Map (DSNJU004) Utility..

User response

Save one or more of the following items in order to determine the possible location of the problem:

- The console log
- The job output

00C90026

Explanation

This message is used internally to pass back the condition to RDS and Utilities. This message is an internal reason code. No response is necessary.

00C90060

Explanation

On a READS request, the return area supplied was not large enough to hold one log record. No log record is returned, but the position is held in the log.

System action

The requested operation (decompression) is not performed.

User response

Increase the size of the return area.

Problem determination

The system returns the size of the return area that is required in field IFCABSRQ of the IFCA return area.

00C90063

Explanation

On a READS request for IFCID 306, log records are returned, but data is not decompressed as requested.

Problem determination

See the reason code in field QW0306DG to determine why decompression was not performed. For example, if you receive 00C90064, it means that the decompression dictionary changed since the log record was written.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C90064

Explanation

The decompression dictionary changed since the log record was written. The log record is returned with compressed data.

System action

The requested operation (decompression) is not performed.

User response

Specify a valid WQALLRBA value and reissue the request.

Problem determination

The specified RBA/LRSN value might be too old.

00C90067

Explanation

An attempt was made to add or update a row in a partitioned table space, but the value of the partitioning key is higher than the highest limit for any partition.

System action

The requested action is not performed. When SQL was involved, SQLCODE -327 is returned to the user.

User response

Correct the SQL. If a REORG job with SHRLEVEL CHANGE was materializing pending limit key changes that reduced the highest limit key for the table, issue the TERM UTILITY command and resubmit the REORG job and specify SHRLEVEL REFERENCE. Alternatively, run REORG and specify SHRLEVEL CHANGE while avoiding SQL activity that exceeds the new limit key values.

00C9006D

Explanation

This code is used internally between components. Look for prior abends and messages on the console to determine the cause of the problem.

System programmer response

Locate the cause of the problem using the system dump, the LOGREC data set, the console log, or the job output. If you cannot determine the cause of the

problem using these resources, contact an IBM service representative.

User response

You need to save one or more of the following items so that you can determine the location of the problem:

- The system dump
- The LOGREC data set
- The console log
- The job output

If you cannot determine the cause of the problem by using these resources, consult the system programmer.

00C90070

Explanation

The Fast Log Apply (FLA) function detected an internal error within Db2. This error might indicate inconsistent data or an error in internal Db2 control structures or code. Possible causes of this error include:

- The fast log apply child task was interrupted by an unexpected error condition.
- An internal abend occurred in the Data Manager component.
- The job or thread was canceled.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

Locate the cause of the problem using the system dump, the LOGREC data set, the console log, Db2 logs, or the job output.

User response

Save one or more of the following items in order to determine the location of the problem:

- system dump
- LOGREC data set
- console log

- job output
- Db2 logs covering the log apply range
- DSN1PRNT of the page in question, if determined or all pages of the object being recovered

00C9007D

Explanation

The compression dictionary for the table space or partition cannot be stored in the table space or partition. Therefore, the LOAD or REORG utility cannot complete successfully.

System action

The table space or partition is implicitly stopped by Db2. Messages DSNT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL user.

Operator response

Notify the system programmer.

System programmer response

Correct the problem and resubmit the LOAD or REORG job. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C9007E

Explanation

The compression dictionary for the table space or partition was not successfully retrieved. Therefore, the data request failed.

System action

The table space or partition is implicitly stopped by Db2. Messages DSNT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL user.

Operator response

Notify the system programmer.

System programmer response

Correct the problem and inform the user to resubmit the request. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00C9007F

Explanation

The compression dictionary for the table space or partition is invalid. Therefore, the table space or partition cannot be opened.

System action

The table space or partition is implicitly stopped by Db2. Messages DSNT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL user.

Operator response

Notify the system programmer.

System programmer response

Recover and start the table space or partition and tell the user to resubmit the request.

00C90080

Explanation

An attempt was made to allocate a resource for update operations. However, the resource was already started for read-only access.

If the value of the LOAD_RO_OBJECTS subsystem parameter is YES this reason code is not issued.

System action

The allocation process is not allowed.

Operator response

If this reason code appears in message DSNT501I, determine whether the named resource should be started for read-only access.

User response

Determine when the resource is started for read/write access, and rerun the job.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT501I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90081

Explanation

An attempt was made to allocate a resource that is stopped for all access.

System action

The allocation process is not allowed.

Operator response

If this reason code appears in message DSNT500I or DSNT501I, determine whether the resource should be stopped.

If the resource should not be stopped, then use the -START DB *db-name* SPACENAM *space-name* command to start the object for R/W access.

User response

Determine when the resource is no longer stopped, and rerun the job or resubmit the command.

Problem determination

The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I or message DSNT501I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C90082

Explanation

An attempt was made to allocate a resource that is already allocated to a Db2 utility function.

System action

The allocation process is not allowed.

User response

Determine when the resource is available and rerun the job.

Problem determination

The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. The resource allocated to the Db2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. To access a resource that is reserved for a utility, use the -TERM UTILITY command.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[-923](#)

CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90083

Explanation

An attempt was made to allocate a resource for update operations. However, the resource is already allocated to a Db2 utility function that allows other users to have read-only access.

System action

Db2 determines whether there is a utility function that would prohibit allocation of the resource. If it finds an indication of a such a utility, the allocation of the resource is not allowed.

User response

Determine when the resource is no longer restricted by a utility and is started for read/write access, and rerun the job.

Problem determination

The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued.

The resource allocated to the Db2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. The -DISPLAY DATABASE command shows which restrictive states Db2 assigned to the resource in question. Utilities set a restrictive state (for example, UTRO) on the resource that they are processing, and then remove this state when the utility successfully completes. Therefore, if the -DISPLAY DATABASE command is issued after the successful completion of

the utility, the restrictive state set by the utility is not displayed. To access a resource that is reserved for a utility, use the -TERM UTILITY command.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

[DSNT501I \(Db2 Messages\)](#)

00C90084

Explanation

Db2 cannot find space for creating a temporary file or for inserting data into a temporary file because the work file database is full. Db2 cannot perform the requested actions because of one of the following reasons:

- You are running a large number of concurrent transactions requiring the use of temporary files.
- No space is available in any of the table spaces in the work file database.
- No space is available for sorting the data.

System action

The reason code appears in a DSNT501I message, and the requested operation is not performed, and SQLCODE -904 might be issued.

User response

To resolve the above situation, take one of the following actions:

- Reduce the number of concurrent transactions.
- Increase primary/secondary quantity defined for the table spaces in the temporary file database.
- Increase space allocated to temporary file database.
- Limit the amount of temporary storage in the work file database that a single thread can use by setting subsystem parameter MAXTEMPS to a non-zero value.
- Enable warnings about excessive agent-level space usage in the work file database by setting subsystem parameter WFSTGUSE_AGENT_THRESHOLD to a non-zero value.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C90085

Explanation

An internal limit for the number work file tables spaces that are being used for processing Db2 work files has been reached. The following situations are the likely reasons:

- Too many concurrent transactions requiring use of temporary files.
- Insufficient primary or secondary quantities defined for table spaces in the work file database.
- Inadequate space allocated to the work file database.

System action

The requested operation is not performed. Message DSNT501I is issued with reason code 00C90085 and is possibly followed by SQLCODE -904.

User response

To resolve the situation, take one of the following actions:

- Reduce the number of concurrent transactions.
- Increase the primary or secondary quantity defined for the table spaces in the work file database.
- Increase space allocated to the work file database.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Source listing of the failing application program.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Precompiler listing of failing application program with SOURCE(YES) and XREF(YES) specified.

condition REASON *reason-code*, TYPE *resource-*
type, NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90088

Explanation

The resource identified by NAME in message DSNT501I is involved in a deadlock condition.

System action

The requested operation is not performed.

System programmer response

If the deadlock condition becomes chronic, examine the mix of applications running to determine why the deadlock is occurring.

User response

Rerun the application.

Problem determination

The requested operation is not performed. An SQLCODE -911, -913, or -923 is issued, and/or message DSNT501I is issued.

If statistics trace class 3 is active, IFCID 172 contains diagnostic information. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- IRLM trace output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Listing of the IRLM procedure.
- Results from SELECT * from SYSIBM.SYSDATABASE.

UNSUCCESSFUL EXECUTION CAUSED BY DEADLOCK OR TIMEOUT. REASON CODE *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

-923

CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name*

00C90089

Explanation

The environmental descriptor manager (EDM) function of the data manager subcomponent did not have enough storage in its pool or data space to retrieve the object. The object can be either a database descriptor (DBD), a skeleton cursor table (SKCT), or a skeleton package table (SKPT). The object is identified by a DBD ID, SKCT plan name, or SKPT package name.

System action

The requested operation is not performed.

User response

Invoke the application again. If, after several attempts, EDM still reports that not enough space is available, take the following actions to reduce EDM storage requirements:

- Reduce the number of concurrent users that are using Db2.
- Try reducing the number of SQL statements in the plan or package and rebind.
- Try to simplify the database design. For example, reduce the number of partitions in the database.

If EDM storage shortage is a recurring problem, change the relevant subsystem parameters on installation panel DSNTIPC to increase the EDM pool size definition. Increase the number of concurrent users and the number of currently active databases. Then, restart Db2.

If a utility that uses a LISTDEF list was run and that list includes a large number of databases, the EDM DBD pool might be full. To see the size of each database DBD, use the DISPLAY DATABASE command. If the EDM DBD pool is full, decrease the size of your LISTDEF contents to eliminate this condition. If this condition occurs frequently, increase the size of your EDM DBD pool. For guidance, see [Calculating EDM pool sizes \(Db2 Installation and Migration\)](#).

Problem determination

The requested operation is not performed. One or more of the following messages are also issued:

- SQLCODE -904
- SQLCODE -923

00C9008F

Explanation

The database descriptor's size (DBD) has reached the limit of 25% of the EDM Pool size.

System action

The request to create/alter a database object is not allowed.

User response

Create the database object in a different database or drop unused database objects from the database. If you drop an object that is an index or a table space, the space becomes available in the DBD as soon as the drop is committed. If you drop an object that is a table, the space in the DBD is made available only after all of the following events:

- The DROP is committed.
- The Db2 REORG is run on the table space and there is no point in time recover after the REORG.
- MODIFY is run to delete all image copies of data that contains rows of the dropped table, that is, copies that were taken before the REORG. Note that MODIFY will reclaim space in the DBD only if there are SYSCOPY rows to delete.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

00C90090

Explanation

An attempt to lock a required resource failed.

System action

The operation is not performed.

User response

Wait for all jobs which hold a lock on the resource in an incompatible lock state to complete before reissuing the failing statement.

Problem determination

The requested operation is not performed.

If the resource type is table space, table, or index, then issue the -DISPLAY DATABASE command with the LOCKS option to get a list of jobs which currently hold locks on the required resource.

If the resource type is a package, then wait for BIND activity on that package to complete before reissuing the failing request.

For an explanation of *resource-type* and *resource-name* values, see [Resource types](#).

If the problem persists after jobs which hold incompatible locks complete, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Db2 log output, including any Db2 recovery log archive tapes.

00C90091

Explanation

The table space or index space could not be started, because there is an outstanding indoubt UR that must be resolved before the start is allowed.

System action

The START operation is not performed.

Problem determination

Message DSNI002I is issued. See the description of that message for additional information.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C90092

Explanation

Db2 received an out-of-storage indication from IRLM resulting from a lock, unlock, or lock change request.

System action

A record is written to SYS1.LOGREC only when an abend is issued. No dump is requested.

Operator response

Notify the system programmer.

System programmer response

IRLM has exhausted the amount of virtual storage available to it to represent locks. Insufficient virtual storage remains to satisfy this request. You can use the IRLM startup procedure to determine the amount of storage space available.

The current mix of transactions caused all available storage to be used. You can find the number of locks held by a particular transaction by either using the Db2 performance trace facility or by performing IRLM tracing.

Determine what transactions were running and the number of locks they held. You might want to schedule some of these transactions at a different time.

You can reduce the total number of page or row locks that applications concurrently hold by changing the locking protocol on one or more table spaces. Use one of the following statements:

- ALTER TABLESPACE...LOCKSIZE ANY
- ALTER TABLESPACE...LOCKSIZE TABLESPACE
- LOCK TABLE

If application logic permits, reduce the number of page or row locks concurrently held for SELECT statements by re-binding application plans with isolation level of cursor stability instead of repeatable read or read stability.

You can reduce the total number of LOB locks that applications concurrently hold by changing the locking protocol on one or more LOB table space. Use one of the following statements:

- ALTER TABLESPACE...LOCKSIZE TABLESPACE
- LOCK TABLE statement

Problem determination

One or more of the following messages or codes might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and

reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[-923](#)

CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90093

Explanation

An error occurred in IRLM.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Examine SYS1.LOGREC for a preceding error related to IRLM.

Problem determination

One or more of the following might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as shown for abend reason code '00C90101'. The first four bytes of CTSIWHY contain the return code from the IRLM function. The fifth byte of CTSIWHY contains the request code, as follows:

X'02'

Lock

X'03'

Unlock

X'04'

Change

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IRLM trace output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Definitions of views and tables involved in the error.
- Listing of the IRLM procedure.

00C90094

Explanation

A data set is in a different state than Db2 expects, which might occur as a result of the following situations:

- A data set was deleted and redefined, but Db2 does not recognize the redefined data set.
- A previous Db2 failure damaged the data set in some way.

System action

The requested action is not performed. If the invoker of this module abends, a record is written to SYS1.LOGREC, and the invoker might initiate a dump. If the invoker does not abend, no record is written, and no dump is requested. If this occurs, an SQL return code is issued, or message DSNT500I is issued, or both. The data set is placed in a stopped status unless the invoker of the module is a utility.

Operator response

Notify the system programmer.

System programmer response

If you do not have the current level of the data set, you must perform Db2 recovery to return the data set to its expected state. See the Problem Determination section of this message to learn how to determine the name of the data set to be corrected. Use the DISPLAY command to check the status of the data set. If the data set is stopped, use the START command before performing recovery.

User response

If the code was received while processing a user table, Db2 determined that the data set is empty. A DROP TABLESPACE statement followed by a CREATE TABLESPACE statement and a CREATE TABLE statement defines the dropped table to Db2. Use the IDCAMS LISTCAT for the failing Db2 data set. Check the HI-USED-RBA for this data set; if HI-USED-RBA = 0, the data set is empty.

Problem determination

This error is detected at a time when Db2 cannot determine the specific name of the data set involved. However, the SQL return code or message DSNT500I provides the name of the table space or index space where the data set resides. When the table or index space consists of a single data set, this is specific. Otherwise, the system programmer must find the particular data set within the table or index space.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Definitions of views and tables involved in the error.

Related tasks

Related information

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C90095

Explanation

An attempt was made during Db2 restart to access a page in order to apply a log record but Db2 was unable to access the page. This abend reason code appears as the reason code in message DSNI001I.

System action

The restart of the named table space, index space, or partition is deferred by the subsystem.

Operator response

Notify the system programmer.

System programmer response

Correct the problem, and then use either the -START DATABASE command or the RECOVER utility to make the table space, index space, or partition available.

Problem determination

Examine previous messages on the console to determine why Db2 could not access the page. One possible reason is that a back-level pack was mounted. That is, the page to which the log record applies was not yet formatted by VSAM. Db2 does not extend data sets during restart.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Dump of the index or table space that failed.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C90096

Explanation

The page or row lock on the page or subpage identified by the NAME *resource-name* value in message DSNT500I or DSNT501I caused the total number of page or row locks concurrently held to reach the installation maximum number of page or row locks (NUMLKUS) allowed for a single agent in the system.

System action

The operation that encountered this condition is not executed. If a utility job encountered this condition, the utility is stopped. Otherwise, any database updates for the statement that was executing are backed out. Any database reads for the statement that was executing are not executed. The position of the cursor is unpredictable.

Operator response

If a utility job encountered this resource unavailable condition, terminate the utility and restart it after the cause of the resource unavailable condition has been corrected.

System programmer response

If the application should be able to run with the current page or row or locking protocol and SQL statements, increase the NUMLKUS value for the installation to allow a higher limit of page or row to be concurrently held by a single application. If a utility job encountered this resource unavailable condition, the NUMLKUS value must be increased to accommodate the utility, because utilities are programmed to use the minimum number of page or row locks possible.

User response

Rerun the application after correcting the cause of this resource unavailable condition.

Programmer response

Reduce the total number of page or row locks that the application concurrently holds by changing the locking protocol on one or more of the table spaces to table space level locking. To do this, use the ALTER ... LOCKSIZE TABLESPACE or LOCK TABLE statements.

Review the application to see if a different choice of SQL statements can be used to perform the same operation with less concurrent access to multiple tables with page or row locking.

If application logic permits, reduce the number of page or row locks concurrently held for SELECT statements by rebinding the application plan with isolation level of cursor stability instead of repeatable read or read stability, or add more frequent commits.

Problem determination

An SQLCODE -904 and message DSNT500I or DSNT501I are issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C90097

Explanation

An attempt was made to allocate to a table space for update operations. However, the table space was marked as 'image copy' required, and updates are not allowed. This condition occurs as a result of any of the following operations:

- Running a REORG LOG NO or LOAD LOG NO utility on the table space without running a copy that specifies FULL YES.
- Execution of a RECOVER utility which specifies the TORBA or TOCOPY options, without following it with the required COPY utility.
- Execution of a -TERM UTILITY command on a COPY utility that failed during the copy phase or was active in the copy phase. Until the COPY utility completes, SQL updates are not allowed because the integrity of the data would be compromised.
- Execution of a MODIFY RECOVERY utility after all back up copies of the table space or data set were deleted from the SYSCOPY catalog table.
- Execution of an ALTER TABLESPACE LOGGED command after updates on a not logged tablespace.

System action

The allocation process is not allowed.

User response

Run the COPY utility. However, if the table space is to be used for read-only access, or if recoverability of the data is not required, instead of taking a full image copy you can run the REPAIR utility and request that the image copy required condition be removed.

Problem determination

The requested operation is not performed. An SQLCODE -904 and/or message DSNT501I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90098

Explanation

An attempt was made to increase read-only or write-access counts of the utility in process beyond the maximum (255) allowed.

System programmer response

Determine why active utilities are in the stopped state. Use the -TERM UTILITY command to terminate utilities and reduce the UIP (utility in process) counts. If no active utilities are indicated, then use the -DISPLAY DATABASE command to show which table spaces or partitions are in a UTRO or UTRW state.

User response

Use the -DISPLAY UTILITY command to determine how many utility jobs are currently active. If a number

of utility jobs are active but not in the stopped state, notify the system programmer. If the utility jobs are running, resubmit your job after they complete.

Problem determination

Message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

00C90099

Explanation

A utility attempted to load data into a partition that is already full. The utility specified the correct partition based on the high key value for the partition, but the requested data page number is higher than the last data page number in the partition, based on the DSSIZE.

This usually occurs in the following situations:

- A table space is being converted from partition-by-growth (PBG) to partition-by-range (PBR) and the new partitioning scheme (the number of partitions and the high key values) causes the data to exceed the current DSSIZE specified for the partition.
- A very large partition undergoes many inserts and updates, and a reorganization of the table space causes expansion of the free space (specified by PCTFREE and FREEPAGE) such that the data no longer fits in the partition.

System action

The requested action is not performed.

Operator response

Notify the system programmer.

System programmer response

Terminate the utility.

If the terminated utility results in recover pending (RECP) status for the target table space objects, complete these steps:

1. Recover the affected table space or partitions.
2. Alter the partition key.
3. Retry the reorganization.

User response

Adjust the high key values and retry the utility operation:

- If you receive this reason code when the REORG utility is materializing the pending definition change

for converting a PBG table to PBR, consider adjusting the partitioning scheme, so the resulting partitions can fit in the specified DSSIZE.

- Otherwise, query the catalog to check the PCTFREE and FREEPAGE values. You might be able to decrease the amount of free space to allow the REORG utility to complete successfully.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

If you receive this reason code when the REORG utility is materializing the pending definition change for converting a PBG table to PBR, also collect the following diagnostic item:

- All SYSIBM.SYSPENDINGDDL catalog table rows for the table space being reorganized.

Related reference

[-TERM UTILITY command \(Db2\) \(Db2 Commands\)](#)

Related information

[DSNT500I \(Db2 Messages\)](#)

00C9009A

Explanation

An attempt was made to create a system database which, according to the DBID space map, has already been created. However, the catalog shows the database was not created. This discrepancy between the catalog and the space map for DBIDs may be due to an unsuccessful migration.

System action

Database is not created.

Operator response

Notify the system programmer.

System programmer response

Drop the database, then create it again. If this fails to resolve the error, follow the problem determination steps.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Results from SELECT * from SYSIBM.SYSDATABASE.
- Print of the BSDS record with the key of X'16000001', obtained by running IDCAMS.

Related information

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

00C9009B

Explanation

An attempt was made to load data into a nonpartitioned table space, but the table space is full. A nonpartitioned table space can contain a maximum of 64 GB of data.

System action

The requested action is not performed.

User response

Use the -TERM UTILITY command to terminate the LOAD utility. Use ALTER TABLE SPACE to reduce the amount of free space within a page (PCTFREE attribute) and the number of free pages within the table space (FREEPAGE attribute). Then retry the load. If it is a resume load job, reorganize the table space before rerunning the load.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

Related concepts

Related information

[DSNT500I \(Db2 Messages\)](#)

00C9009C

Explanation

An attempt was made to place data into a partitioned table space, partition-by-growth table space, index space, or fixed hash space, but the partition is full or a system page could not be inserted.

For a table space partition, the data to be inserted is based on the high-key value that is specified in the cluster index. For an index space partition, the index

entry to be inserted is also based on the high-key value that is associated with the index.

System action

A "resource not available" code is returned and the requested action is not performed. The SVC dump and the SYS1.LOGREC recording are not requested.

System programmer response

Take one of the following actions:

- If you received this reason code with message DSNT501I, redefine the partition that is identified in that message and resubmit the job.
- If you received this reason code for a hash table, new system pages cannot fit in the fixed hash space. To correct this problem, reorganize the table space that contains the hash table to make room for system pages.
- If you received this reason code for a partition-by-growth table space, one of the following problems might have occurred:
 - The number of partitions cannot grow beyond the limit that is specified by MAXPARTITIONS. In this case, change the limit for MAXPARTITIONS.
 - Db2 was unable to obtain a partition lock on the table space. To determine whether this problem occurred, collect a statistics trace for IFCID 2.
- If you received this reason code from an insert or update transaction, a new system page cannot fit in the partition. To correct this problem, reorganize the table space that contains the affected partition or partitions to make room for system pages.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Definitions of table spaces, tables, and indexes involved in the error.
- Statistics trace for IFCID 2.

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C9009D

Explanation

An attempt was made to take one of the following actions, but the table space or index space was full:

- Insert data into a nonpartitioned table space or index space.
- Create a table or complete the definition of a table in the table space. In this case, Db2 attempted to insert a system page in the table space.

A nonpartitioned table space, index space or LOB table space can contain a maximum of 64GB of data. A LOB table space can contain as many as 254 data sets per table space.

System action

A 'resource not available' code is returned to the user and the requested action is not performed. The SVC dump and the SYS1.LOGREC recording are not requested.

System programmer response

The table space, index space, or LOB table space name is identified in the DSNT501I message. If the object is a table space or LOB table space, run the REORG TABLESPACE utility to attempt to reclaim additional free space. If the object is an index space, drop and re-create the index with a fewer number of SUBPAGES. If free space cannot be reclaimed, notify the database administrator to redistribute the data into different table spaces, LOB tables spaces, or index spaces.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer to reclaim some free space in the associated table space, index space or LOB table space and rerun the job.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Definitions of table spaces, tables, and indexes involved in the error.

Related reference

[REORG TABLESPACE \(Db2 Utilities\)](#)

[Limits in Db2 for z/OS \(Db2 SQL\)](#)

Related information

[DSNT501I \(Db2 Messages\)](#)

00C9009E

Explanation

The object depends on new facilities of the release and is therefore unavailable for processing. For data-sharing systems, the object will be available on a new release in a data-sharing group. For non-data-sharing systems, the object will be available after re-migration if release fall back has occurred.

System action

The operation is not allowed. The data manager function that detected this condition returns 'resource not available' to its invoker.

Operator response

Notify the system programmer.

System programmer response

In order to perform the operation on the object:

- For non-data sharing systems a re-migration is required.
- For data sharing systems, ensure that the operation is performed on a member at the correct level of Db2.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C900A2

Explanation

A READS call for IFCID 0306 included a request to convert returned log records to the format for the table space version in which the data was written. However, the log records could not be converted.

System action

Log records are returned, but the log records are not converted to the format for the table space version in which the data was written.

User response

Correct the problem that caused data conversion to fail. Then reissue the READS request.

Problem determination

In the output from the READS call, find field QW0306DG in the IFCID 0306 record. The value in that field contains information on why data version conversion was not performed. A common reason is 00C900B0, which means that information in a system page for a table space version could not be retrieved.

Related reference

[Qualifying log records for IFCID 0306 requests \(Db2 Administration Guide\)](#)

Related information

[00C900B0](#)

00C900A3

Explanation

An attempt was made to allocate a table space, index space, or a related index space while the table space or index space was in check pending status.

System action

The operation is not allowed.

Operator response

Notify the system programmer.

System programmer response

Resolve the check pending status and retry the operation.

If the object is a table space with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space with LOB columns, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is a LOB table space, then run the CHECK LOB utility to validate the structure of the LOB table space.

If the object is an index space, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space or table space partition.

Problem determination

The requested operation is not performed. An SQLCODE -904 or -923 is issued.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[-923](#)

CONNECTION NOT ESTABLISHED: DB2 *condition* REASON *reason-code*, TYPE *resource-type*, NAME *resource-name*

00C900A4

Explanation

An attempt was made to allocate a segment for a table in a segmented table space, but there are no free segments. A segmented table space can contain a maximum of 64GB of data. A segment will be allocated under one of the following conditions:

- When a table is ready to be created in a segmented table space with the CREATE TABLE statement.
- When a record is inserted/loaded into a segmented table and free space is not available from existing segments.

System action

A 'resource not available' code is returned to the user and the requested action is not performed.

System programmer response

An SQLCODE -904 is issued, and/or message DSNT501I is issued. The segmented table space name is identified in SQLCA and/or in the DSNT501I message. If the requested function is the CREATE TABLE statement, create the table in a different segmented table space. Otherwise, run the REORG TABLESPACE utility to attempt to reclaim additional free space. If no free space can be reclaimed, then notify the database administrator to redistribute the data into different table spaces.

User response

Notify the system programmer to reclaim some free space in the associated segmented table space and rerun the job.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Definitions of table spaces, tables, and indexes involved in the error.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900A5

Explanation

One or more temporary files are full, or the maximum number of extensions for VSAM data sets has been exceeded for all temporary files, or the volumes have no space available in which to extend.

System action

The reason code appears in a DSNT501I message, and the requested operation is not performed.

User response

If the reason code appears in a DSNT501I message, issue -DISPLAY THREAD to determine the total number of concurrent users. If there were a large number of users using temporary files, resubmit the job when concurrent users are low. IDCAMS LISTCAT may be used to determine the VSAM data sets space allocations.

- If there was no space available on a volumes, then clear space from the volume(s) or add more volumes to the STOGROUP or redefine the VSAM data set to concatenate more volumes.
- If the maximum number of extensions has been exceeded for VSAM data sets, ALTER or delete and redefine the temporary data sets with a larger size.
- If all the temporary files are full, then create or define more temporary files.

Issue the -START DATABASE command to start the temporary file.

Problem determination

The requested operation is not performed. An SQLCODE -904 or message DSNT501I is issued, and/or message DSNT501I is issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.

Collect definitions of the temporary files that are involved in the error.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation

This message is issued in the following situations:

- Access to the catalog was requested but denied because of one of the following situations:
 - The catalog was not migrated to the current release level. The object in catalog is available after the catalog is migrated.
 - Catalog updates are required for remigration after function levels were changed in the previous release.
 - The Db2 subsystem was installed or migrated to Db2 13 using Db2 load libraries from before the general availability (GA) of Db2 13, such as code provided for early testing by vendors and sponsor users.
- You ran one of the following utility operations that terminated prematurely in a previous attempt: CATMAINT UPDATE SCHEMA, CATMAINT UPDATE VCAT, or CATMAINT UPDATE OWNER.

System action

The operation is not complete. The data manager function that detected this condition returns 'resource not available' to its invoker.

Operator response

Notify the system programmer.

System programmer response

To perform the operation on the object, you must first complete the Db2 13 catalog migration process, as described in [Migration step 16: Tailor the Db2 13 catalog: DSNTIJTC \(Db2 Installation and Migration\)](#).

If the CATMAINT UPDATE SCHEMA, CATMAINT UPDATE VCAT or CATMAINT UPDATE OWNER utility terminated prematurely, run it again to complete any remaining catalog updates.

If this reason code was issued with message DSNG016I, discard the subsystem that was installed or migrated using the pre-GA code. Then use GA-level code to redo the installation or migration to Db2 13.

Problem determination

Check for related messages and codes, such as SQLCODE -904, DSNT501I, or DSNU590I.

Related tasks

[DSNG016I \(Db2 Messages\)](#)

00C900A7

Explanation

At allocation of a bound plan or a bound package, a lock inconsistency is detected. A Db2 internal bind error is probably responsible for this condition. The plan or the package cannot be allocated.

System action

The plan or the package is not allocated. A DSNT501I message is issued and an SQLCODE -923 is returned to the application.

System programmer response

Re-bind the plan or the package.

Problem determination

If the problem persists after the plan or the package is rebound, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C900A8

Explanation

The table space, index, or partition could not be started because of a failure to acquire the lock. Activity on the table space, index, or partition must quiesce before the START DB ACCESS(FORCE) command can acquire the necessary lock.

System action

The START operation is not performed.

User response

Wait for all activity on the table space, index, or partition to complete before reissuing the START command.

Problem determination

The requested operation is not performed. Message DSNI002I is issued. If the problem persists after all activity on the table space, index, or partition completes, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

Related information

[DSNI002I \(Db2 Messages\)](#)

00C900A9**Explanation**

An attempt was made to allocate a resource that is deferred.

System action

The allocation process is not allowed.

User response

Determine the reason for which the resource was deferred and take the appropriate action to correct the problem. Such actions include issuing the START DATABASE command or running the RECOVER, REBUILD INDEX, or LOAD REPLACE utility.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued. You might also receive message DSNT500I or DSNT501I. For more information, refer to the SQL return code or to the description of the DSNT500I or DSNT501I message. SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Db2 log output, including any Db2 recovery log archive tapes.

00C900AA**Explanation**

The table space or index space could not be stopped because it is indoubt.

System action

The STOP operation is not performed.

User response

Resolve the indoubt unit of recovery (UR) using the RECOVER INDOUBT command.

Problem determination

Message DSNI003I is issued. For more information, refer to the description of this message. If the problem persists after all indoubts with locks on the table space/index space are resolved, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

,

00C900AB**Explanation**

An attempt was made to access a resource that is in the restart pending state.

System action

The use of the resource is not allowed.

System programmer response

Use the DISPLAY THREAD TYPE(POSTPONED) to determine the status of the resource.

Use the RECOVER POSTPONED command if recover has not already been started.

Problem determination

The requested operation is not performed because the table space might be in an inconsistent state. An SQLCODE -904 is issued.

00C900AC

Explanation

The Db2 subsystem currently serves as a remote site tracker system. Users cannot have write access for tracker systems, and a tracker Db2 will not allow the use of any SQL statement that requires write access.

System action

Db2 cannot process the operation.

System programmer response

None.

Problem determination

A tracker Db2 does not allow the use of any SQL statement that requires write access, such as DDL, GRANT/REVOKE, INSERT, DELETE, UPDATE, or MERGE. Db2 issues SQLCODE -904 in conjunction with this message. You can also find more information in the description for message DSNT501I, which Db2 issues along with this reason code.

Additionally, a tracker Db2 does not allow the START DATABASE command to perform LPL/GRECP recovery. If you attempt a START DATABASE command on a tracker Db2, Db2 will issue message DSNI005I with this reason code.

00C900AD

Explanation

An attempt was made to access a resource that is in the REORG pending state.

System action

The use of the resource is not allowed.

System programmer response

Use one of the following methods to resolve the REORG pending state:

- Run the REORG utility with the SHRLEVEL NONE, SHRLEVEL CHANGE, or SHRLEVEL REFERENCE option.
- Run the LOAD utility with the REPLACE option.
- Issue SQL statement DROP TABLESPACE.

Problem determination

The requested operation is not performed because the table space might be in an inconsistent state. SQLCODE -904 is issued.

00C900AE

Explanation

An attempt was made to allocate or access an index that is in the rebuild pending status.

System action

The use of the object is not allowed.

Operator response

Determine whether the REBUILD utility should be run to complete recovering the object.

User response

Determine when the resource is available for use and rerun the job.

Problem determination

The requested operation is not performed because the index may be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I and/or message DSNI005I is issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related reference

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

[DSNI005I \(Db2 Messages\)](#)

00C900AF**Explanation**

An attempt was made to decompress a compressed index page when moving the page to the bufferpool. The compressed index page was in an inconsistent state.

System action

The decompression that was requested is not performed.

Operator response

Notify the system programmer.

System programmer response

Recover the index page listed in the DSNT408I message and rerun the job. If the job is still unsuccessful, then recover the entire index and rerun the job. If the job is still unsuccessful, then rebuild the index.

Problem determination

The requested operation is not performed because the index page is in an inconsistent state. An SQLCODE -904 is issued and message DSNT408I is issued. For more information, refer to the SQL return code in SQL return codes, or to the description of the DSNT408I message in Db2 Messages.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00C900B0**Explanation**

While formatting log records in response to a READS request for IFCID 0306, the Db2 database manager could not format a log record to match the row format that was current when the log record was written. This situation might occur for one of the following reasons:

- A schema-changing ALTER TABLE statement was issued, but no subsequent insert or update operation was issued. The alter operation generates a higher version number, but there is no insert or update operation to trigger an update to the system page.
- An ALTER TABLE statement performed an update operation, but the update was not correctly registered in the table's system pages.
- After the REORG utility was run on a table space, a READS request for IFCID 0306 was still processing the log records that were written before REORG was run. Running REORG had removed all system pages except the system page for the current version of the table space. However, when the Db2 database manager processed the READS request, it attempted to retrieve system pages that existed before REORG was run.

System action

When this code is returned in the output from a READS request for IFCID 0306, log records are returned, but the data in the log records does not reflect the table space format that was current when the log records were written.

If a replication product maintains the current and previous versions of the table definition, and the PTF for Db2 APAR PI93252 is applied, the replication program converts the log record's data to the version that was current at the time the log record was written.

System programmer response

If a schema change prevents replication from starting or continuing, and a replication product does not

maintain the current and previous versions of the table definition, try the following actions:

- Apply the PTF for Db2 APAR PI93252, if it is not already applied.
- Update the source table definition in the replication product.
- Remap the source table in the replication product.

Refer to the documentation for the replication product for details.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related concepts

[Restarting replication after schema changes](#)

Related information

[00C900A2](#)

00C900B2

Explanation

Access to the index is not allowed if the index is defined with the DESC attribute on a VARBINARY column or a column with a distinct type that is based on a VARBINARY data type. Drop the index or alter the column data type to a compatible data type such as CHAR FOR BIT DATA, VARCHAR FOR BIT DATA or BINARY, and then rebuild the index.

System action

The operation is not allowed.

User response

Drop the index or alter the column data type, and then rebuild the index.

00C900B3

Explanation

The partition number is not in the valid range for the table space during a system page insert.

System action

SQLCODE -904 is returned to the user with this reason code.

User response

Correct the problem and resubmit the job. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900BA

Explanation

A request for a drain lock for the resource identified by NAME in messages DSNT500I and DSNT501I could not be granted. The request waited for a period longer than the maximum specified by the installation.

Requests for claims might also receive this code because claims sometimes need to wait for drain locks.

System action

The requested action is not performed. The Data Manager function that detected this condition returns 'resource not available' to its caller.

System programmer response

See SQLCODE -913 or -911 and/or message DSNT501I, which accompany this abend reason code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Wait for all jobs that hold a drain lock on the resource in an incompatible state to complete before reissuing the failing statement. To display drain locks, issue a DISPLAY DB LOCKS command. In order to avoid a potential deadlock, the application should either commit or roll back to the previous COMMIT.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00C900BC

Explanation

The statement depleted the record identifier (RID) storage available.

System action

The requested action is not performed.

Operator response

Notify the system programmer.

System programmer response

Restructure the SQL statement so that fewer RIDs are needed. The best way to do this is to split the statement into two or more SQL statements equivalent to the original statement. Also, in some cases, increasing the virtual storage might eliminate the times when storage is depleted.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

SQL return code -904 and/or message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

00C900BE

Explanation

Db2 is unable to acquire a lock on a resource because a Db2 subsystem in the Db2 data sharing group holds an incompatible retained lock on that resource. Retained locks are locks that persist across Db2 abnormal terminations. After a successful restart of a Db2 member, retained locks can continue to exist for that member until all postponed abort threads have been processed.

System action

The requested action is not performed. SQLCODE -904 is issued. A 'resource not available' code is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

00C900BF

Explanation

Db2 is unable to obtain a lock because IRLM detected an 'out of record list' storage condition. The record list is that part of the coupling facility lock structure that contains the 'modify locks' (those locks that would be retained in case of a failure).

System action

SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. If it is active, an IFCID 0021 trace record is written and might contain additional diagnostic information.

System programmer response

If this becomes a prevalent problem, you will need to redistribute the coupling facility lock structure storage resource to make more room for the record list. You can do this in one of two ways:

- Issue a rebuild.
- Dynamically change the lock structure size.

Related concepts

[Changing the size of the lock structure \(Db2 Data Sharing Planning and Administration\)](#)

Lock structure size (Db2 Installation and Migration)

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900C0

Explanation

A request for an internal lock could not be granted. The request waited for a longer period than is allowed.

System action

The request action is not performed. A 'resource not available' reason code is returned to the caller.

System programmer response

See SQLCODE -911 or -913 and/or message DSNT500I, which accompany this reason code. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If the user is a Db2 utility, rerun or restart the utility. If it is a Db2 command, reissue the command. Db2 applications should either commit or roll back to the previous commit, then retry from the commit point.

00C900C1

Explanation

An attempt was made to allocate an index that has one or more logical partitions in a rebuild pending state.

System action

Use of the object is not allowed.

Operator response

Determine when the REBUILD utility should be run to complete recovering the object. Only the logical partitions marked as rebuild pending need to be recovered.

User response

Determine when the resource is available for use and rerun the job.

Problem determination

The requested operation is not performed because the index might be in an inconsistent state. An SQLCODE -904 or message DSNT501I is issued. For more information, refer to the SQL return code in [Part 1, "SQL codes," on page 1](#), or to the description of the DSNT501I.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

.

00C900C4

Explanation

An attempt was made to insert values into a table that has a ROWID column with the GENERATED BY DEFAULT attribute but no index exists to enforce its uniqueness.

System action

The use of the table is not allowed.

System programmer response

Create a unique single column index for the ROWID column.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued.

Related concepts

[ROWID data type \(Introduction to Db2 for z/OS\)](#)

Related tasks

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C900C5

Explanation

An attempt was made to access a table space that is in the auxiliary check pending state (ACHKP).

System action

The operation is not allowed. Db2 returns 'resource not available' to its invoker.

System programmer response

Use the CHECK DATA utility to identify the invalid LOBs. Use the SQL UPDATE statement to replace the invalid LOBs or the SQL DELETE statement to remove the rows with the invalid LOBs. After rectifying all invalid LOBs, run CHECK DATA again to clear the ACHKP state from the table space.

Problem determination

An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I might also be issued.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00C900C6

Explanation

Db2 detected an uncommitted read or write claim on an index being altered in the same commit scope. When you use the PIECESIZE or COPY clause with the ALTER INDEX statement, then you need to have the read or write claim committed BEFORE you complete the operation.

PIECESIZE does not allow an uncommitted write or read claim on the index.

COPY, set to YES or NO, does not allow an uncommitted write on the index.

Commit or rollback all changes to the index before using ALTER INDEX with one of these clauses.

System action

The ALTER INDEX statement is not allowed.

System programmer response

The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQLCODE in "Section 2. SQL Return Codes". Commit or rollback changes to the index and retry the ALTER INDEX statement.

Problem determination

The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQL return code in "Section 2. SQL Return Codes."

00C900C7

Explanation

The requested function was either:

- not supported by the current release or maintenance level of Db2, or
- deactivated by a modified the system parameters.

In the former case, the NAME field of the accompanying message indicates the required level of maintenance. In the latter case, the NAME field indicates the deactivating system parameter.

System action

The requested action is not performed.

System programmer response

To permit the use of the function, take the appropriate actions according to the situation. Apply the indicated maintenance, migrate to the indicated release of Db2, or use an alternate setting for the indicated system parameter.

User response

Inform the system administrator.

00C900C8

Explanation

Access to the index is disallowed within the same commit scope as an ALTER TABLE statement that alters the key column in the index. If the ALTER TABLE statement failed, then commit the changes to the index and retry the ALTER TABLE statement. If an INSERT, DELETE, UPDATE, MERGE or SELECT statement failed, then commit the ALTER and retry the statement.

System action

The operation is not allowed.

User response

Commit and then retry the operation.

00C900C9

Explanation

After being expanded to process triggers, a row has grown too large to fit into a 32K page of a workfile.

System action

Db2 does not perform the requested operation.

Programmer response

Drop and re-create triggers to use less LOB columns as transition variables, or eliminate the use of the ROWID column as a transition variable. For a table with LOB columns or a ROWID column whose row size is very close to 32K, it may not be possible to use transition tables with triggers.

Problem determination

Db2 does not perform the requested operation. Db2 issues SQLCODE -904, and may also issue message DSNT500I or DSNT501I.

Collect the following information:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Definitions of table spaces, tables, and indexes involved in the error.

Related information

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C900CB

Explanation

Resource is unavailable because the resource is in a refresh pending state.

System action

The use of the resource is not allowed.

Problem determination

Db2 does not perform the requested operation because the table space or index space might be in an inconsistent state. Db2 issues SQLCODE -904. For more information, refer to the SQL return code, or to the description of the DSNT501I message.

00C900CC

Explanation

Db2 does not accept the NOBACKOUT request during the rollback of a non-global transaction while the backout of catalog changes is in progress.

System action

Db2 rejects the NOBACKOUT request.

Problem determination

Db2 does not perform the requested operation because the backout in progress must be complete before the NOBACKOUT request can succeed. Wait for the backout to complete, then reissue the request.

00C900CD

Explanation

Db2 does not accept the NOBACKOUT request during the rollback of a non-global transaction. At least one of the objects of the transaction is shared by another transaction.

System action

Db2 rejects the NOBACKOUT request.

Problem determination

Db2 does not perform the requested operation because at least one object involved in the operation is also updated by other active transactions in Db2. Wait for the other transactions to finish, then reissue the request.

00C900CE

Explanation

Resource is unavailable because the resource is in a state that is incompatible with this version of Db2.

System action

Db2 does not allow the use of the resource.

Problem determination

Db2 does not perform the requested operation because the table space or index space might be in an inconsistent state. Db2 issues SQLCODE -904. For more information, refer to the SQL return code or to the description of the DSNT501I message.

00C900D0

Explanation

An attempt was made to access a value in a column with one of the LOB data types (BLOB, CLOB, DBCLOB), but the value of the column is no longer valid.

System action

The operation is not allowed. Db2 returns 'resource not available' to its invoker.

System programmer response

Use the CHECK LOB utility to identify the invalid LOBs. Use update to replace or delete the invalid LOBs.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C900D2

Explanation

The amount of space allowed for processing LOB values by a subsystem has been exceeded. The amount of space allowed for each subsystem is 50GB.

System action

The operation is not allowed. Db2 returns "resource not available" to its invoker.

System programmer response

Monitor applications for storage use by LOBs using a statistics trace that includes IFCID 0002, or an accounting trace that includes IFCID 0003. Field QXSTLOBV records the maximum amount of storage that is used for LOBs.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I might also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00C900D6

Explanation

The number of files that are opened for LOB file reference variables exceeds the maximum for the subsystem.

System action

The operation is not completed, and Db2 returns a 'resource not available' code to the invoker. The maximum number of LOB file reference variable files is controlled by the MAXOFILR subsystem parameter.

User response

If possible, increase the value of the MAXOFILR subsystem parameter.

Related concepts

[LOB file reference variables \(Db2 Application programming and SQL\)](#)

Related reference

[MAX OPEN FILE REFS field \(MAXOFILR subsystem parameter\) \(Db2 Installation and Migration\)](#)

00C900D7**Explanation**

A logical page list (LPL) or group buffer pool recovery pending (GRECP) recovery was attempted on a LOB table space which was created as LOG NO.

System action

The operation is not allowed.

Programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed. Message DSNIO05I is issued.

Related concepts

[Use of caching for group buffer pools \(Db2 Data Sharing Planning and Administration\)](#)

[REORG TABLESPACE \(Db2 Utilities\)](#)

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900DA**Explanation**

The number of concurrently held application LOB locators and held cursors exceeded the maximum limit (65535).

System action

The operation fails. Db2 generates a dump.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00C900E0**Explanation**

One of the following values on the header page of the data set does not match the information in the Db2 catalog table for the same object:

- Database ID (DBID)
- Table space ID (PSID)
- Table ID (OBID)

This problem usually occurs after copying data by using DSN1COPY.

System action

Db2 returns SQLCODE -904. You cannot access the data.

User response

Obtain the correct database ID, table space ID, or table ID from the catalog table of the target subsystem.

Find the DSN1COPY job that might have caused this error. Ensure that the SYSXLAT DD statement that is used in that DSN1COPY job contains the correct IDs for each object to be translated. Then rerun DSN1COPY.

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900E1

Explanation

The segment size (SEGSIZE) value on the header page of the data set does not match the information in the Db2 catalog table for the same object.

This problem usually occurs after copying data by using DSN1COPY.

System action

Db2 returns SQLCODE -904. You cannot access the data.

User response

Find the DSN1COPY job that might have caused this error and use it to identify the source subsystem. Ensure that the SEGSIZE value that is defined in the Db2 catalog on the source subsystem matches the value on the target subsystem. Correct any inconsistent schemas between the two subsystems and rerun DSN1COPY.

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900E3

Explanation

The table schema definition or the table version number in the system page does not match the information in the Db2 catalog table for the same object.

This problem usually occurs after DSN1COPY is used to copy data.

This code is generated if any of the following situations occur:

- The information in the catalog indicates that there are fewer columns in the table than are within the rows of the table.
- The version number is the same within the page set and the catalog, one or more columns does not have the same data type or length.
- The version of the table recorded in the catalog is higher than the version number of the row, one or more columns does not have the same data type or length as indicated in the catalog, and conversion of the column page set data rows to match the definition in the catalog is not supported.

System action

Db2 returns SQLCODE -904. You cannot access the data.

User response

Find the DSN1COPY job that might have caused this error, and use it to identify the source subsystem. Run REPAIR CATALOG TEST to obtain additional information. Additional information may be obtained for diagnosing the problem by running REPAIR CATALOG TEST. Ensure that the table schema definition that is defined in the Db2 catalog on the source subsystem matches the definition on the target subsystem. Correct any inconsistent schemas, and rerun DSN1COPY. After the data is copied to the target subsystem, run the REPAIR CATALOG utility to correct most version number inconsistencies.

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C900F6

Explanation

An attempt to INSERT data into a data partition whose logical NPSI partition is in the RBDPM state.

System action

SQLCODE -904 is returned to the user.

User response

Use the REORG INDEX SHRLEVEL CHANGE utility to reorganize the non-partitioned secondary index (NPSI) in the RBDPM state, and then resubmit the job.

Related reference

[REORG INDEX \(Db2 Utilities\)](#)

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C90101

Explanation

The data manager detected an internal error within Db2. Possible causes for this error include:

- Improper migration or fall back procedures.
- The Db2 directory and Db2 catalog have been restored to different points in time.
- A table space was restored improperly.
- An error in internal Db2 control structures or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

If this abend occurred while processing data in one or more pages, message DSNI014I is issued to identify each page involved. In general, the data in these pages is valid. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, analyze the set of pages specified.

Run the CHECK INDEX utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI014I is index.
- The page type indicated in message DSNI014I is data.
- An index is defined on a table in the indicated page set.

The LOC keyword in the dump title gives the *load-module.csect-name:qualifier* of the location where the abend occurred. The value of *qualifier* is a unique, 4-digit hexadecimal number that identifies the place within the source control module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9. The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

The *csect-name* value in the associated message can indicate possible causes or actions:

DSNGxxxx

If the *csect-name* value begins with DSNG, regardless of the xxxx portion of the name, make a copy of DSNDB01.DBD01, DSNDB01.SCT02, and DSNDB01.DSNSCT02 on tape with DSN1COPY. This might be a large copy.

DSNIDBMF:5016

An object is already in UTUT status, and a utility is trying to place UTUT status on the same object. The operation is denied with an abend. Two possible causes for this condition are:

- SYSUTILX was re-initialized and the pending states were not resolved for each object by running the appropriate utility.
- Two utilities ran against the same object with UTUT status.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSN1014I messages.
- CHECK utility output.

[CHECK INDEX \(Db2 Utilities\)](#)

Related information

[DSN1014I \(Db2 Messages\)](#)

[ABEND codes associated with DSN1COPY misuse](#)

Several of the 00C9... codes are frequently associated with improper use of the DSN1COPY utility.

00C90102

Explanation

An inconsistent page was detected. This has been caused by a Db2 internal error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

In addition, the following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

2

Address of the page set block (PB)

3

Address of the log record, if any

8

Address of the buffer block (BB)

9

Address of the page buffer

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of Db2 log output.
- Dump of the index or table space that failed.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00C90103

Explanation

Bad data was returned from either the edit or the validation exit.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as in abend reason code '00C90101'. Refer to the table accompanying that abend reason code for details.

The '00C90103' abend reason code was issued because one of the checks described in the following list failed:

- Save first and last byte of the input record. On return from exit, see if either group has been modified. If so, abend.
- Check length of edited data. If greater than maximum allowed for this row, or less than one, abend.
- Store a special character in the first byte past the end of the output area (place for edit procedure to put edited or (original unedited) row), to make sure the exit doesn't overrun this area. On return, check if it is still the same special character. If not, abend.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

00C90105

Explanation

An inconsistent page was detected. This has been caused by a Db2 internal error.

System action

A record is written to SYS1.LOGREC, an SVC dump is requested, and the page will be scheduled for automatic recovery. If automatic recovery is successful, message DSNB215I is issued. If automatic recovery fails, message DSNIO12I is issued, and an abend '04E' with reason code 00C90102 will occur.

Note: If the resource required for automatic recovery is in use, automatic recovery will be delayed until the resource is available.

System programmer response

Check whether an application issues an ALTER TABLE statement and an INSERT statement in the same commit scope. In such cases, you might resolve the situation by adding a COMMIT statement between the ALTER TABLE and INSERT statements.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9. Exceptions to the table definitions of the VRA fields are:

- VRARRK5 is the name of the module that called the check page routine that detected the error in the page.
- VRARRK6 identifies the error in the page.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

- | | |
|----------|------------------------------------|
| 2 | Address of the page set block (PB) |
| 3 | Address of the log record, if any |
| 8 | Address of the buffer block (BB) |
| 9 | Address of the page buffer |

Also, refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of Db2 log output.
- Dump of the index or table space that failed.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00C90106

Explanation

The entry is not found for a table space that is being set for deferred restart. An error in Db2 logic is probably responsible for this condition.

System action

A record is written to SYS1.LOGREC, an SVC dump is requested, and the Db2 restart is terminated.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C90107

Explanation

At commit phase 1, a nonzero write intent count was detected. An error in Db2 logic is probably responsible for this condition.

System action

A record is written to SYS1.LOGREC, an SVC dump is requested. The thread is aborted.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Db2 log output, including any Db2 recovery log archive tapes.

00C90108

Explanation

At commit phase 2, a nonzero read intent count or write intent count was detected. An error in Db2 logic is probably responsible for this condition.

System action

A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is committed and the application is allowed to continue without notification of the error.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C90109

Explanation

At deallocate, a nonzero read intent count or write intent count was detected. An error in Db2 logic is probably responsible for this condition.

System action

A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is deallocated normally.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

00C9010B

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C9010C

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7

- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C9010D

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C9010E

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C9010F

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C90110

Explanation

The data manager detected an inconsistent data condition. This may be caused by an inconsistency in either the Db2 catalog or the Db2 directory. In this case, the OBD for the requested OBID cannot be located in the database descriptor (DBD). The DBD in storage may be inconsistent. Specifically, the OBDDMAP(OBID) array element should contain an offset into the DBD where the OBD should be located. However, in this case the OBD expected was not at the indicated offset.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The DBD in use at the time of the abend is inconsistent in storage and may be inconsistent on DASD. Since the nature and extent of the damage done to the DBD is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of Db2 catalog and/or Db2 directory.
- Invalid restore of Db2 catalog and/or Db2 directory to a prior point in time.
- A conditional restart that bypassed recovery of a Db2 catalog page set or a Db2 directory page set.
- A Db2 internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Unformatted DSN1PRNT output of the DSNDB01.DBD01 page set. Locate the inconsistent DBD in the DSNDB01.DBD01 page set by using the method described in [Finding a DBD in a dump \(Diagnosing Db2 problems\)](#).
- The results of the following SQL statements, where *dbid* is the DBID of the damaged DBD:

```
SELECT * FROM SYSIBM.SYSINDEXES
  WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSINDEXES
  WHERE DBID=dbid ORDER BY ISOBID;

SELECT * FROM SYSIBM.SYSTABLES
  WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSTABLESPACE
  WHERE DBID=dbid ORDER BY OBID;
```

```
SELECT * FROM SYSIBM.SYSTABLESPACE
WHERE DBID=dbid ORDER BY PSID;
```

Use the results to compare the information in the Db2 catalog with the DBD. Determine which OBDs are inconsistent with the Db2 catalog. Analyze the DBD by using the procedure in [Analyzing a DBD \(Diagnosing Db2 problems\)](#).

- DSN1LOGP output with DBID (1) OBID (1F) covering the period of time in which the DBD inconsistency might have occurred. This period of time is approximately from the time of the abend back to the time when the Db2 catalog and DBD were believed to be consistent.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

00C90111

Explanation

The data manager detected an inconsistent data condition. In this case, the OBD for the requested OBID does not exist. This may be caused by an inconsistency in either the Db2 catalog or the Db2 directory. Specifically, the OBDDMAP(OBID) entry is zero rather than an offset to an OBD within the DBD.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Since the Db2 directory does not agree with the Db2 catalog, either of these may be inconsistent. Since the nature and extent of the inconsistency between the Db2 catalog the DBD is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of Db2 catalog and/or Db2 directory.
- Invalid restore of Db2 catalog and/or Db2 directory to a prior point in time.
- A conditional restart that bypassed recovery of a Db2 catalog page set or a Db2 directory page set.
- A Db2 internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Unformatted DSN1PRNT output of the DSNDDB01.DBD01 page set. Locate the inconsistent DBD in the DSNDDB01.DBD01 page set by using the method described in [Finding a DBD in a dump \(Diagnosing Db2 problems\)](#).
- The results of the following SQL statements, where *dbid* is the DBID of the damaged DBD:

```
SELECT * FROM SYSIBM.SYSINDEXES
WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSINDEXES
WHERE DBID=dbid ORDER BY ISOBID;

SELECT * FROM SYSIBM.SYSTABLES
WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSTABLESPACE
WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSTABLESPACE
WHERE DBID=dbid ORDER BY PSID;
```

Use the results to compare the information in the Db2 catalog with the DBD. Determine which OBDs are inconsistent with the Db2 catalog. Analyze the DBD by using the procedure in [Analyzing a DBD \(Diagnosing Db2 problems\)](#).

- DSN1LOGP output with DBID (1) OBID (1F) covering the period of time in which the DBD inconsistency might have occurred. This period of time is approximately from the time of the abend back to the time when the Db2 catalog and DBD were believed to be consistent.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

00C90112

Explanation

The data manager detected an inconsistent data condition. There may be more than one object with the same OBID in the Db2 Catalog. To prevent further damage and possible loss of data, the inconsistency

must be corrected before any further SQL access is attempted to this database.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Since the extent of this inconsistency is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of the Db2 Catalog and/or the Db2 Directory.
- Invalid restore of the Db2 Catalog and/or the Db2 Directory to a prior point in time.
- A conditional restart that bypassed recovery of a Db2 catalog page set or a Db2 directory page set.
- A Db2 internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Unformatted DSN1PRNT output of the DSNDB01.DBD01 page set. Locate the inconsistent DBD in the DSNDB01.DBD01 page set by using the method described in [Finding a DBD in a dump \(Diagnosing Db2 problems\)](#).
- The results of the following SQL statements, where *dbid* is the DBID of the damaged DBD:

```
SELECT * FROM SYSIBM.SYSINDEXES
  WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSINDEXES
  WHERE DBID=dbid ORDER BY ISOBID;

SELECT * FROM SYSIBM.SYSTABLES
  WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSTABLESPACE
```

```
WHERE DBID=dbid ORDER BY OBID;
SELECT * FROM SYSIBM.SYSTABLESPACE
  WHERE DBID=dbid ORDER BY PSID;
```

Use the results to compare the information in the Db2 catalog with the DBD. Determine which OBDs are inconsistent with the Db2 catalog. Analyze the DBD by using the procedure in [Analyzing a DBD \(Diagnosing Db2 problems\)](#).

- DSN1LOGP output with DBID (1) OBID (1F) covering the period of time in which the DBD inconsistency might have occurred. This period of time is approximately from the time of the abend back to the time when the Db2 catalog and DBD were believed to be consistent.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

00C90120

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C90121

Explanation

The data manager detected an internal error within Db2. This error might be in an internal Db2 control structure or code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic area (SDWA). Significant fields for this code are:

- VRARRK5, which contains the name of the control section that issued this code
- VRARRK6
- VRARRK7
- VRARRK8
- VRARRK9.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C90124

Explanation

An attempt was made to apply prior-version/release Db2 log records other than checkpoint records.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This abend can occur in migration/remigration when some necessary migration/remigration steps are skipped. It indicates that some Db2 activity occurred or was pending after the last complete checkpoint on the prior system. If this was the cause of the problem, it can be corrected by falling back to the prior version/release long enough to bring Db2 up, then bring it down while conforming to all migration/remigration steps. Pay specific attention to resolving all indoubts and to performing a stop mode quiesce.

Related concepts

[Migrating to Db2 13 \(Db2 Installation and Migration\)](#)

00C90125

Explanation

An attempt to open a data partition was blocked to prevent a risk of loss of data integrity for a table space that is defined as partition-by-range (PBR) with the PAGENUM RELATIVE (RPN) attribute.

Attention: If your Db2 environment contains PBR RPN table spaces, do not migrate any data sharing members to function level V13R1M100, or activate function level V13R1M500 or higher, until you apply the PTF

for PH61633 on all data sharing members and complete all ++HOLD actions. For more information, see the [21 June 2024 Red Alert](#).

System action

Db2 issues DSNT408I or DSNT501I messages with this reason code and blocks opening of the data partition for the PBR RPN table space to prevent any risk of loss of data integrity.

System programmer response

Follow all instructions in the associated Red Alert that was issued on 21 June 2024. For more information, see [Undetected data loss exposure when using PBR RPN table spaces in data sharing \(Red Alert\)](#).

User response

Notify the system programmer.

Related information

[PH66668](#)

[PH61633](#)

00C90205

Explanation

The data manager detected an inconsistent data condition. In this case, a row obtained from an index entry does not point to a valid row in a data page. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNI013I is issued to identify the index page. It identifies the database name, table space name, and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI013I is index
- The page type indicated in message DSNI013I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- CHECK utility output.

- Db2 REPAIR dump of the pages identified in DSNIO13I messages.

00C90206

Explanation

The data manager detected an inconsistent data condition. In this case, a row that should be pointed to by an index does not have an index entry. The error is probably caused by a missing index entry, but it could also be caused by a table update that was not backed out when it should have been.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the data pages. It identifies the database name, table space name, and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNIO14I is index
- The page type indicated in message DSNIO14I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where

the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- CHECK utility output.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.

00C90207

Explanation

The data manager detected an inconsistent data condition. In this case, a pointer record does not point to a valid overflow record. The pointer record, the overflow record, or the page that contains the pointer or overflow record is in error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the data pages. It also identifies the database name and the table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.

00C90210

Explanation

The data manager detected an inconsistent data condition. In this case, the subpage directory of an index leaf page indicates that a given search key does not belong to any of the subpages. Either this leaf page is the index tree or the nonleaf portion of the index tree lead to this leaf page as the one that should contain the given key.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the index page. It also identifies the database name and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Refer to [Appendix H, "ABEND codes associated with DSN1COPY misuse," on page 1403](#) for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code

are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- DSN1COPY-generated copy of the index space or table space identified in the DSNIO13I messages on tape.

00C90211

Explanation

The data manager detected an inconsistent data condition. In this case, a row is missing a column that is not nullable and does not allow default values.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at

least one page is involved in the inconsistency. The other pages were present at the time of the abend.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.
- DSN1COPY-generated copy, on tape, of the page set that contains the Db2 directory. Alternatively, request a dump (produced by the REPAIR utility, DSN1COPY, or DSN1PRNT) of the DBD for each database identified in the DSNIO13I messages.

00C90212

Explanation

The data manager detected an inconsistent data condition. In this case, there is an empty index leaf page other than the root. (Db2 removes empty pages from the index tree.)

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the index leaf page. It also identifies the database name and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNIO14I is index.
- The page type indicated in message DSNIO14I is data.
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer to [Appendix H, "ABEND codes associated with DSN1COPY misuse,"](#) on page 1403 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- CHECK utility output.
- DSN1COPY-generated copy of the index space or table space identified in the DSNIO13I messages on tape.

00C90213

Explanation

The data manager detected an inconsistent data condition. In this case, a row has an unexpected OBID stored in its prefix. A possible cause is that the table space was restored (via DSN1COPY or similar tool) improperly. For example, the wrong data set was copied for the given table space.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer to [Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403](#) for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.
- DSN1COPY-generated copy, on tape, of the page set that contains the Db2 directory. Alternatively, request a dump (produced by the REPAIR utility, DSN1COPY, or DSN1PRNT) of the DBD for each database identified in the DSNIO13I messages.

00C90214

Explanation

The data manager detected a condition of inconsistent data. The description of the index in the index OBD does not match the attributes of an index page. The problems consists of one of the following conditions:

- IPPNUNI does not equal OBDKNUNI,
- IPPTLTH does not equal OBDKLEN,
- IPPOLTH does not equal OBDLENO, or
- If the page is a leaf page, the segmentation flag or number of subpages conflict (IPPNLPG does not equal OBDINLPG or IPPSEGM conflicts with OBDINLPG).

The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNIO13I will be issued for each index page. It identifies the database, and the index name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer to [Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403](#) for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.
- Db2 REPAIR dump of the header page (page 0) for each index identified in the DSNIO13I messages.
- DSN1COPY-generated copy, on tape, of the page set that contains the Db2 directory. Alternatively, request a dump (produced by the REPAIR utility, DSN1COPY, or DSN1PRNT) of the DBD for each database identified in the DSNIO13I messages.

00C90215

Explanation

The data manager detected a condition of inconsistent data. The index manager subcomponent has been passed a key with a key length not equal to the key length in pages of the index. The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

A rebuild index or recover index will restore the index to a correct condition.

User response

Notify the system programmer.

Problem determination

Message DSNIO13I will be issued for each index page. It identifies the database, the index name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSNIO13I messages.
- Db2 REPAIR dump of the header page (page 0) for each index identified in the DSNIO13I messages.
- DSN1COPY-generated copy, on tape, of the page set that contains the Db2 directory. Alternatively, request a dump (produced by the REPAIR utility, DSN1COPY, or DSN1PRNT) of the DBD for each database identified in the DSNIO13I messages.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1 and ISDASDA0.
- DSN1COPY-generated copy of the table and index, taken before any recovery is performed.

00C90216

Explanation

The data manager has detected an inconsistent data condition. Either the length of a record in a table space

is longer than the maximum-defined record length as defined in the Db2 directory or a variable-length column has a longer length than the length defined in the Db2 directory.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSN1013I is issued to identify the data page that contains the record that is longer than allowed by its corresponding record definition. This could occur if the Db2 directory was recovered to a previous point, allowing new object creations (with a shorter record length) to be created having record identifiers identical to objects previously created in the table space. Also the table space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given table space.

Refer to [Appendix H, "ABEND codes associated with DSN1COPY misuse,"](#) on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Db2 REPAIR dump of the pages identified in DSN1013I messages.

- DSN1COPY-generated copy, on tape, of the page set that contains the Db2 directory. Alternatively, request a dump (produced by the REPAIR utility, DSN1COPY, or DSN1PRNT) of the DBD for each database identified in the DSN1013I messages.
- Detailed description of events prior to the abend, such as recovery or other activity affecting DSNDB01.DBD01 or the subject table spaces.
- Definitions of table spaces, tables, and indexes involved in the error. The object identifiers (OBIDs) identified with each table in the table space with the error can be obtained from SYSIBM.SYSTABLES.

00C90218

Explanation

The data manager detected an inconsistent data condition in a segmented table space. In this case, an unallocated segment was found on a segment chain.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSN1013I is issued to identify the space map page that contains the bad segment entry. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C90219

Explanation

The data manager detected an inconsistent data condition in a segmented table space. In this case, an allocated segment was found on a wrong segment chain (that is, a segment chain contains a segment that belongs to a different table).

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSN1013I is issued to identify the space map page that contains the bad segment entry. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C9021A

Explanation

The data manager detected an inconsistent data condition in a segmented table space. In this case, a data page contains a record which belongs to a table that has not been allocated for the page.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSN1013I is issued to identify the data page that contains the bad data record. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Refer to Appendix H, “ABEND codes associated with DSN1COPY misuse,” on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C9021B

Explanation

The data manager detected an inconsistent data condition in a segmented table space. In this case, the space map page indicates a data page that is not empty exists. However, the data page is either not formatted by the data manager or it is beyond the highest VSAM formatted area.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSN1013I is issued to identify the inconsistent data page and its covering space map page. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C9021C

Explanation

While running a utility, the data manager detected an inconsistent data condition. A row was encountered that is not represented by a record OBD in the database descriptor (DBD). This abend may indicate an internal Db2 error, but most likely occurs due to a user error. Possible user errors may include:

- Data from a Db2 subsystem was copied to another Db2 subsystem incorrectly. This is the most common error.
- DSNDB01.DBD01 was regressed to a time prior to a table being created.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The dump is required in the event that the problem is determined to be a Db2 internal error.

System programmer response

Determine if improper procedures were used to restore the table space or DBD that would lead to the inconsistency.

User response

Notify the system programmer.

Problem determination

Message DSNI013I will be issued.

If a Db2 internal error is indicated, collect the following diagnostic items:

- DSN1COPY of the user table space.
- DSN1COPY of DSNDB01.DBD01.

Also collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Db2 log output, including any Db2 recovery log archive tapes.
- Definitions of table spaces, tables, and indexes involved in the error.

00C9021D

Explanation

During a LOAD/REORG utility or termination of a utility, the data manager detected an inconsistent data condition. A space map page was missing from the table space. This abend may indicate an internal Db2 error (caused by the utilities subcomponent passing a bad start position to the data manager), but most likely occurs due to a user error. Possible causes are that the table space data set has been deleted and redefined without Db2 knowing, or that the table space was incorrectly restored from an improper DSN1COPY of the table space.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The dump is required in the event that the problem is determined to be a Db2 internal error.

System programmer response

Determine if the data set was improperly restored or deleted and redefined by the user. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNI013I will be issued. If the message information describes page 'xx0001'X of the table space, this indicates that the data set was deleted and redefined without Db2 knowing.

If a Db2 internal error is indicated, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Definitions of table spaces, tables, and indexes involved in the error.
- DSN1COPY-generated copy of the index space or table space identified in the DSNI013I messages on tape.

00C9021E

Explanation

The data manager detected an inconsistent data condition in a segmented table space. An invalid page was requested. The page number is outside the highest formatted RBA for the page set. Either the segment chain is broken, or the table space has been truncated. A truncated table space could be a possible user error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C9021F

Explanation

The data manager detected an inconsistent data condition in a segmented table space. A duplicate first segment block for a table is found during the rebuilding of the first segment block in a segmented table space. The segment chain may be broken.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as a result of operator initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the batch job and system messages that were issued
- Definitions of table spaces, tables, and indexes involved in the error
- Listing of the entire table space
- Listing of the DBD, obtained by executing UTILITY DIAGNOSE OBD.

00C90220

Explanation

The data manager detected an inconsistent data condition. In this case, free index page cannot be found in the index space. The problem could be caused by a problem detected by IRLM, such as out-of-storage, or some other problem.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Message DSNI013I is issued to identify the data pages. It identifies the database name, table space name, and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in

the inconsistency. The other pages were present at the time of the abend.

From the console output, determine if resource unavailable message DSNT500I/DSNT501I was given prior to the abend. If there is and the reason code given is 00C90092, 00C90093, or 00C90096, then refer to the description of the appropriate message in this book for more information. Otherwise, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

. Also collect a DSN1COPY output of the tables and indexes before any recover is performed.

00C90221

Explanation

The data manager detected an inconsistent data condition. In this case, a nonsegmented space map page was read for a table space that had been defined as segmented. This problem could be caused by incorrect use of the DSN1COPY service aid or a Db2 internal problem reading the space map page.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer to [Appendix H, “ABEND codes associated with DSN1COPY misuse,”](#) on page 1403 for further information on DSN1COPY misuse.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C90222

Explanation

While starting Db2, the data manager detected a utility in process (UTUT, UTRO or UTRW) state on an object that originated from Version 2 Release 3. This abend might indicate an internal Db2 error, but most likely occurs because of a user error. A possible user error is a result of not terminating all utilities before migrating to this release.

System action

The -START Db2 command fails. A record is written to SYS1.LOGREC and an SVC dump is requested. The dump is required if the problem is determined to be a Db2 internal error.

System programmer response

Determine if an improper procedure was used to migrate to this release. If the utilities were not terminated before migrating, fall back to Version 2 Release 3 and restart Db2. Use the -TERM UTILITY

command to terminate utilities, use the -DISPLAY UTILITY command to make sure no utility job is currently active, stop Db2, and remigrate to this release.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Detailed description of events immediately prior to and during the abend.
- Db2 log output, including any Db2 recovery log archive tapes.

00C90224

Explanation

An attempt was made to allocate a resource for update operations. However, the resource was already started for read and replication only access. The requested operation is not performed. SQLCODE -904 is issued, and/or message DSNT501I is issued.

System action

The allocation process is not allowed.

Operator response

If this reason code appears in message DSNT501I, determine whether the named resource should be started for read and replication only access.

User response

Determine when the resource is started for read/write access, and rerun the job.

DSNT501I (Db2 Messages)

00C90301

Explanation

The data manager detected an internal error with Db2 during RID LIST processing. The requested RIDMAP pointer can not be found in the specified CUB control block.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Collect the console output from the system on which the job was run from the period of time spanning the failure. Save this output for use in problem determination.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.

00C90303

Explanation

An attempt to make the database exception table (DBET) consistent failed after an agent failure.

System action

The Db2 subsystem abends, a record is written to SYS1.LOGREC, and an SVC dump is requested.

Problem determination

Restarting the member rebuilds the local DBET. Analyze SYS1.LOGREC and the dump to determine why the agent failed and why the attempt to make the DBET consistent failed.

00C90304

Explanation

START DATABASE recovery of GRECP cannot proceed because the recover base RBA value in the header page for the object is invalid. The following might have occurred:

- The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.
- DSN1COPY RESET utility command.

System action

The GRECP recovery for this object is terminated; all other objects being recovered by this START DATABASE command are not affected.

System programmer response

Use the RECOVER utility without the LOGONLY option.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00C90305

Explanation

The limit on the space usage of the work file storage by an agent was exceeded. The space usage limit is determined by the *zparm* keyword MAXTEMPS.

System action

The SQL statement was terminated with an SQLCODE -904 and this reason code.

User response

Examine the application and determine why the limit was exceeded.

Problem determination

An application used too much work file storage space. Examine the limit set for MAXTEMPS. Adjust the limit as appropriate.

00C90306

Explanation

Db2 detected that Environmental Descriptor Manager (EDM) real-time statistic (RTS) information cannot be externalized. The probable cause for this error is that the SYSTSPKG table space is in a state that does prevents updates.

System action

Statistics are discarded because they cannot be externalized.

A DSNT500I message is issued to identify the resource type and reason. For an explanation of the *resource-type* value, see [Resource types](#). Other messages might be issued, including other instances of DSNT500I. The messages indicate that the EDM RTS cannot be externalized because SYSTSPKG is in a state other than update.

User response

Make sure that the SYSTSPKG table space is in a state that does not prevent updates. If it is in a state that does not prevent updates and this condition persists, collect the information that is identified in the problem determination section.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

Related tasks

00C90603

Explanation

This code is intended for use by IBM Support personnel as they diagnose problems.

00C90611

Explanation

The Security Server was unable to process this row level, Multilevel Security (MLS) request.

System action

The requested operation is not performed.

System programmer response

Refer to the [RACROUTE REQUEST=AUTH: Return codes and reason codes \(Security Server RACROUTE Macro Reference\)](#) for an explanation of the SAF/RACF return/reason codes in the resource name, and for corrective action advice.

00C90614

Explanation

Db2 attempted to load a DBD during Db2 startup in deferred mode.

System action

Startup continues, and the DBD is not loaded.

System programmer response

After the Db2 startup, completes, the DBD can be loaded or recovered.

00C9061C

Explanation

An application tried to access a declared global temporary table that is in an inconsistent state. A declared global temporary table is marked inconsistent when both of the following statements are true:

- The table is declared with the NOT LOGGED option.

- A must-complete operation such as ROLLBACK encounters an unexpected error while processing the table. The operation marks the table inconsistent to prevent the application from further accessing the table and continues.

System action:

The requested action to access the declared global temporary table (for example, FETCH or INSERT) is not completed. The statement ends with SQLCODE -904.

User response

- Check the console log or the job output to identify the first unexpected error, such as an abend or another SQLCODE, and resolve the error.
- If the application does not handle the SQLCODE -904 appropriately, modify the application to do so.

Related information

[REORG TABLESPACE \(Db2 Utilities\)](#)

00C90630

Explanation

The CHECK DATA utility identified a record ID (RID) that represents a row that locates a different RID using hash key column values.

System action

The utility completes and issues a warning message.

User response

Reorganize the table space to correct the problem, then run CHECK DATA again.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related concepts

[DSNU messages \(Db2 Messages\)](#)

Related reference

[CHECK DATA \(Db2 Utilities\)](#)

[REORG TABLESPACE \(Db2 Utilities\)](#)

00C90635

Explanation:

An attempt was made to allocate to a table space partition for update operations. However, the table space partition is in a Persistent Read Only (PRO) restricted status, and updates are not allowed. This condition occurs as a result of using the REPAIR utility to set the PRO restricted status for the purpose of prohibiting updates.

System action:

The allocation process is not allowed.

User response:

Check with the Db2 system administrator and the database administrator. Do not remove the PRO restricted status without their consent, because updates to the data might cause data loss.

Problem determination

The requested operation is not performed. SQL error code -904 or message DSNT501I is issued.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time spanning the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and the system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00C90636**Explanation**

Db2 cannot obtain a physical lock (P-lock) because another member that holds the lock has not responded to the P-lock request.

System action

SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. Other Db2 members might produce additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries and/or an SVC dump.

System programmer response

If the problem persists, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Diagnostic dumps that are generated by the following command: `MODIFY ir1mproc,DIAG,PLOCK`

Related concepts

[Physical locks in data sharing \(Db2 Data Sharing Planning and Administration\)](#)

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C90637**Explanation**

A transaction that was waiting for consistency between data on two pages was unable to complete due to resources held by another transaction.

System action

The allocation process is not allowed. The requested operation is not performed.

User response

Determine when the resource is available and run the job again.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

00C906FF

Explanation

A specific table version record was not retrieved from the system page because the header page was not available. This situation typically happens because of lock contention in a high concurrency environment.

System action

SQLCODE -904 is issued, and processing stops.

Operator response

Notify the system programmer.

System programmer response

Lock contention usually resolves itself. Resubmit the job. If the problem persists, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related information

-904
UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00C90D01

Explanation

Db2 detected an inconsistent condition. An entry in the auxiliary index was not found. The error is probably caused by not recovering all table spaces in a table space set to the same point-in-time.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Message DSNIO13I is issued to identify the index page. Run CHECK INDEX on the auxiliary index followed by CHECK DATA on the base table space in order to identify the inconsistencies. See Db2 Utility Guide and Reference for information about CHECK INDEX and CHECK DATA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00C90D02

Explanation

The zEnterprise® data compression (zEDC) capability is not enabled for accessing the compressed LOB table space.

System action

SQLCODE -904 is returned to the user.

Operator response:

Notify the System programmer.

System programmer response

Check the availability of the zEDC card for the subsystem that returned the SQLCODE.

Related concepts

[Overview and planning of zEnterprise Data Compression \(zEDC\)](#)

[Requirements for zEnterprise Data Compression](#)

Chapter 9. X'D1.....' codes

Reason code identifiers that begin with 00D1 communicate normal and error situations with the recovery log manager.

For X'D1' codes, Db2 provides the following diagnostic information in the SYS1.LOGREC variable recording area (VRA) of the SDWA for many of the reason codes:

MODID

Name of module issuing the abend

LEVEL

Change level

COMPONENT

Subcomponent ID

REGISTERS

General purpose registers (GPRs) 0 through 15 at time of abend

00D10010

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issues this reason code. The RANGE parameter on the OPEN request specifies the address of a 12-byte area (if FORMAT=V1) or 20-byte area (if FORMAT=V2 or is not specified) containing the log RBA range to be processed by subsequent GET requests. However, the RBA specified in the second 6 bytes or 10 bytes of the RANGE parameter (which indicates the end of the log RBA) is less than or equal to the RBA specified in the first 6 bytes or 10 bytes of the RANGE parameter (which indicates the start of the log RBA).

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 8 in register 15 and a reason code of 00D10010 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user application program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Correct the RANGE RBA parameter input, and resubmit the request.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10011

Explanation

The Db2 stand-alone log services OPEN and GET processing macro (DSNJSLR) issued this reason code. During the initial processing of a FUNC=OPEN or FUNC=GET request, storage is obtained to contain the control blocks and other information required to process this request. An MVS GETMAIN failed when attempting to obtain the required storage.

System action

In response to the DSNJSLR FUNC=OPEN or FUNC=GET call, Db2 places a return code of 8 in register 15 and a reason code of 00D10011 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

In all likelihood, the REGION parameter on the EXEC statement for the user program is too small. Increase the REGION size, and resubmit the user program.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10012**Explanation**

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The Job Control Language (JCL) for the user program that uses the DSNJSLR macro must specify either the use of the bootstrap data set (BSDS) or, in the absence of the BSDS, the active or archive data set(s) that is used in the processing. The FUNC=OPEN request failed because the BSDS or a log data set is not allocated for the job.

If ACTIVE n or MxxACT n data sets are used, the supplied DD names must start with the number 1 and increment by 1. For example, you must use ACTIVE1, ACTIVE2, ACTIVE3, and so on. You cannot use ACTIVE2, ACTIVE7, and ACTIVE9.

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 8 in register 15 and a reason code of 00D10012 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Correct the JCL and resubmit the user program.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)
[DSN1LOGP \(Db2 Utilities\)](#)

00D10013**Explanation**

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS).

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10013 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM OPEN error return code is placed in SLRFRG15. The ACB error code (ACBERFLG) is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action, and resubmit the FUNC=OPEN request.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

Related information

[DFSMS Macro Instructions for Data Sets](#)

00D10014**Explanation**

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The Job Control Language (JCL) associated with the user-written application determines how access to the Db2 log data is achieved. Access can either be through the bootstrap data set (BSDS), or through the explicit inclusion of ddnames in the JCL for the active or archive log data set(s) which are to be examined. If the BSDS method is used, the user must specify a RANGE parameter on the FUNC=OPEN call. This reason code

indicates that the user used the BSDS method, but did not specify the range of RBAs to be examined.

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 8 in register 15 and a reason code of 00D10014 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Two choices are available:

1. Continue to use the BSDS method of access. If this choice is made, then the FUNC=OPEN invocation must specify a range of RBAs to be examined by use of the RANGE parameter.
2. Replace the use of the BSDS method of access. This can be done by using explicit archive data set ddnames and/or active log data set ddnames in the JCL used to invoke the user-written application program.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10015

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The VSAM OPEN of the bootstrap data set was successful but the record format of the BSDS is invalid. An invalid BSDS is the result of a failure during a prior attempt to run conversion program DSNJCNVB or DSNJCNTV.

System action

In response to DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10015 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must, therefore, anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

The procedure for running program DSNJCNVB or DSNJCNTV includes making a copy of the BSDS before conversion. Restore the BSDS to the original pre-conversion copy, and try the conversion again. When the BSDS data set is successfully converted, rerun the original application program.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10016

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, MxxARCHV and/or MxxACTn DD statements were specified for a Db2 member while MxxBSDS was also specified for the same member. However, the specification of MxxARCHV and MxxACTn DD statements is mutually exclusive with the specification of MxxBSDS DD statement for the same member.

System action

In response to DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10016 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User response

Correct the JCL and rerun the job. Specify either the DD statements for the log data sets (MxxARCHV and MxxACTN) or the DD statement for the BSDS (MxxBSDS) for a given member; do not specify both.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10017

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The job control language (JCL) associated with the user-written application indicated that the logs from more than one Db2 member were to be read in CI mode. However, CI mode is allowed only when reading the log of a single Db2 system.

System action

In response to DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10017 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User response

Either remove the CI mode from the OPEN request to read log records of more than one member or change the JCL to specify only one system's log to read its log in CI mode.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10018

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, more than one Db2 system's logs were identified. However, on the OPEN request an RBA range was specified. When reading logs from more than one Db2 system, you cannot specify an RBA range; you must specify an LRSN range.

System action

In response to DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10018 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User response

Correct the range specification on the OPEN request, and rerun the job. If range is specified when reading log records from multiple members, LRSN=YES must also be specified. Also range must be specified if GROUP DD or a MxxBSDS (BSDS) DD is specified in the JCL.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10019

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS). The error was determined to be one which could be corrected by use of an AMS VERIFY, but the VERIFY also failed.

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10019 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. take appropriate action, and resubmit the FUNC=OPEN request.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

Related information

[DFSMS Macro Instructions for Data Sets](#)

00D10020**Explanation**

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The end of data has been reached (end of the log, end of the user-specified log data set(s), or end of the log RBA range specified by the RANGE parameter).

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10020 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

This is not an error; rather, this reason code denotes a normal end of data condition. No action is necessary.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10021**Explanation**

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVE n and ARCHIVE ddnames in the user's JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10021 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

As mentioned above, this may or may not be an intentional error. Check the user's JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNJU004) utility to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure.

Related concepts

Related information

[Recovering from active log failures \(Db2 Administration Guide\)](#)

[Recovering from archive log failures \(Db2 Administration Guide\)](#)

00D10022**Explanation**

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records, and the log RBA of the next record following the gap is greater than the end RBA of the RBA range specified by the RANGE parameter.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVE and ARCHIVE ddnames in the user's JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 8 in register 15 and a reason code of 00D10022 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

As mentioned above, this may or may not be an intentional error. Check the RBA range specified on the RANGE parameter to determine if the end RBA value was in error. Check the user's JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNJU004) utility to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure.

Related information

[Recovering from active log failures \(Db2 Administration Guide\)](#)
[Recovering from archive log failures \(Db2 Administration Guide\)](#)

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered, and a conditional restart record has been found beyond a conditional restart truncation point. This condition exists when a log RBA gap was intentionally forced by the user as part of log truncation during conditional restart.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10023 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length, address, and RBA of the conditional restart record are placed in fields SLRFRCLL, SLRFFRAD and SLRFRBA, respectively.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Use the print log map (DSNJU004) utility to examine the conditional restart control records and the RBA ranges of log data sets. Note any RBA gaps which may have resulted from the truncation of the log during a conditional restart.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure.

Related information

[Recovering from active log failures \(Db2 Administration Guide\)](#)

[Recovering from archive log failures \(Db2 Administration Guide\)](#)

00D10024

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A log RBA sequence error has occurred. The RBA of the previous log record is greater than the RBA of the current log record.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 8 in register 15 and a reason code of 00D10024 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

The DD statements in the user's Job Control Language (JCL) must specify the log data sets in ascending log RBA range order. If both ARCHIVE and ACTIVE DD statements are included, the first archive data set must contain the lowest log RBA value.

Use the print log map (DSNJU004) utility to obtain a listing of the RBA ranges associated with each archive log data set and active log data set. If necessary:

- Adjust the concatenation sequence of the archive data sets in the user's JCL to ensure that the log records are read in ascending RBA sequence.
- Adjust the order of the active log data sets such that the RBA range is arranged in ascending order, starting with the ACTIVE1 ddname, and progressing through the ACTIVEn ddname.

Following the above adjustments, resubmit the user's JCL.

Related information

[DFSMS Macro Instructions for Data Sets](#)

00D10026

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing was unable to locate a log data set containing the requested RBA.

There could be several reasons for this error:

- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on all active log data sets and all archive log data sets. This will normally occur when the user has specified the bootstrap data set (BSDS) method in the JCL.
- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on the active log data sets and/or archive log data sets supplied in the user's JCL. This will occur when the user has supplied log data sets using the ACTIVE and ARCHIVE ddnames.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 8 in register 15 and a reason code of 00D10026 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA for which the GET request failed is placed in SLRFRBA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

To resolve the problem, use the print log map (DSNJU004) utility to obtain a listing of the archive and active log data sets, and their corresponding RBA ranges. Check the user's JCL and the user's RANGE parameter to ensure that they are in harmony with one another. Correct the JCL and RANGE parameters as necessary, and rerun the application.

Related information

[DFSMS Macro Instructions for Data Sets](#)

00D1002B

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log

data set. The error was determined to be one which could be corrected; however, a system error occurred while executing an MVS TESTCB macro to determine whether the active log data set which had just been opened was a VSAM ESDS data set or a VSAM LDS data set.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 12 in register 15 and a reason code of 00D1002B in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action, and resubmit the application job.

If the SLRFERCD field contains X'1001' (decimal 4097), then the error is the result of an inconsistency between the TESTCB parmlist generated in DSNJRS03 and the level of MVS under which the application program was executed. Contact IBM for assistance if SLRFERCD reflects this value.

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

Related information

[DFSMS Macro Instructions for Data Sets](#)

00D10030

Explanation

The Db2 stand-alone log services GET and CLOSE processing macro (DSNJSLR) issued this reason code. The stand-alone log services uses a request block

to establish communication between itself and the invoking application program. The address to the request block is returned to the application program on a FUNC=OPEN call, and is required for all subsequent stand-alone FUNC=GET and FUNC=CLOSE calls in the RBR parameter. This reason code is returned to the invoking application when the RBR does not address a valid stand-alone request block. Subsequently, the application program's request cannot be processed.

System action

In response to the DSNJSLR FUNC=GET or FUNC=CLOSE call, Db2 places a return code of 8 in register 15 and a reason code of 00D10030 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

On a FUNC=OPEN call, the RBR value is returned in register 1. The application program must preserve this value for all subsequent stand-alone FUNC=GET and FUNC=CLOSE calls. Due to an application program logic error in the program which invokes the stand-alone log services, the RBR value has been compromised. Repair the application program, and resubmit the application job.

Related tasks

[DFSMSdfp Advanced Services](#)

00D10040

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. An attempt is made to open the second file on the archive log tape (the first file normally contains the bootstrap data set, while the second is normally the archive log data set). If this first attempt failed because the archive log data set was not the second file on an archive tape, then the RDJFCB macro is used to change the data set sequence number from the default value of 2 to a value of 1, before the OPEN is attempted again. This

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. The attempt to open the archive log data set failed.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 12 in register 15 and a reason code of 00D10044 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback

Area (SLRF). The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). You can also view this source for additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes.

System programmer response

Determine the cause of the QSAM OPEN error, take the appropriate action to correct the error, and resubmit the application job.

00D10048

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A QSAM GET error occurred while reading an archive log data set.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 12 in register 15 and a reason code of 00D10048 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Determine the cause of the QSAM GET error, take the appropriate action to correct the error, and resubmit the application job.

Related tasks

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10050

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The bootstrap data set (BSDS) was erroneously specified as one of the ARCHIVE data sets in the user's Job Control Language (JCL). Consequently, the GET request failed.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 8 in register 15 and a reason code of 00D10050 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the requested log record control interval is placed in SLRFRBA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Examine the user's JCL, and remove the occurrence of the BSDS data set as one of the concatenated ARCHIVE data sets. Resubmit the application job.

Related tasks

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10061

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The log record control interval (CI) requested by the

application program was read successfully from an active log data set or an archive log data set. However, the physical record length returned from reading the CI is not the expected length. The GET function will complete, but will issue this reason code as a warning.

The length of a log CI in an active log data set is expected to be 4089 bytes. The length of a log CI in an archive log data set is expected to be 4096 bytes.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10061 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the CI are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the CI is placed in SLRFRBA. The 'ddname' of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

The RDF/CIDF control information in the CI has been compromised. If the SLRFRCLL field indicates a value greater than expected, then the data within the CI can still be used by the application program. If the SLRFRCLL field indicates a value less than expected, then the data within the CI in all likelihood can still be used, but with caution (additional error checking routines may be required by the user program).

[Reading log records with OPEN, GET, and CLOSE \(Db2 Administration Guide\)](#)

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)

00D10062

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The

requested record was found to be a middle spanned record segment, but a preceding first record segment does not exist. The GET function will complete, but will issue this reason code as a warning.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10062 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of Db2 did not originally construct the LRH properly.
- The log record header (LRH) for the log record segment was damaged after it was written by the Db2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected Db2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)
[DSN1LOGP \(Db2 Utilities\)](#)

00D10063

Explanation

The Db2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The requested record was found to be a last spanned record segment, but a preceding first record segment does not exist. The GET function will complete, but will issue this reason code as a warning.

System action

In response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10063 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

System programmer response

Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of Db2 did not originally construct the log record header (LRH) properly.
- The LRH for the log record segment was damaged after it was written by the Db2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).
- Striped logs are mirrored to a remote site, individual control intervals were propagated in a different order than they were originally written, and the propagated copy did not reach a point of consistency.

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected Db2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

Related reference

[Sample application that uses stand-alone log services \(Db2 Administration Guide\)](#)
[DSN1LOGP \(Db2 Utilities\)](#)

00D10064

Explanation

The Db2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. During the execution of a FUNC=OPEN request, Stand-alone Log Read encountered an invalid Stand-alone Log Read Request Block (SLRB).

System action

In response to the DSNJSLR FUNC=OPEN call, Db2 places a return code of 12 in register 15 and a reason code of 00D10064 in register 0. No abend is issued by the stand-alone services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

User response

Make necessary modifications to the user program to use the updated Stand-alone Log Request Block (SLRB) and recompile the DSNJSLR macro.

00D10101

Explanation

The ENDRBA value specified in the control statement was either greater or less than any known RBA, but cold start was not specified for the conditional restart.

System action

Db2 startup is terminated.

Operator response

Notify the system programmer.

System programmer response

Run the change log inventory (DSNJU003) utility with a CRESTART control statement that has an RBA value known to the system in the BSDS, or that has the ENDRBA and STARTRBA specifying the same RBA (cold start).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). for more information.

00D10102

Explanation

A request to disable data sharing failed.

System action

Db2 startup terminates.

Operator response

Collect an SVC memory dump, and contact the system programmer.

System programmer response

Obtain the SVC memory dump for the return code. To disable data sharing, you must run the disable data sharing job (DSNTIJGF) and then restart Db2.

Problem determination

General register 2 contains a return code. Explanation of the return code is as follows:

2

A request to disable data sharing is in the BSDS, but a conditional restart record is not present. You must use job DSNTIJGF for the correct conditional restart control record.

4

A request to disable data sharing is recorded in the BSDS, but the conditional restart record is not correct. You cannot request a normal conditional restart with a disable request. You must use job DSNTIJGF.

8

Update of the BSDS failed. Data sharing was not disabled. See code 00D10411 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart Db2.

10

A delete in the BSDS failed. Data sharing was not disabled. See code 00D10413 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart Db2.

12

Disable data sharing request was attempted on a Db2 with a BSDS that has not been converted by the DSNJCNTV BSDS conversion utility in a data sharing group that has at one point been in Db2 11 new-function mode. Data sharing was not disabled. Convert the surviving Db2 BSDS of the member, rerun job DSNTIJGF to disable data sharing, and then restart Db2.

[00D10413](#)

00D10103

Explanation

Db2 failed to open the shared communications area (SCA) structure.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10104

Explanation

Db2 failed to find the data sharing member record in the BSDS during Db2 startup.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

If this is the first startup of a new member joining the data sharing group, run the DSNTIJUZ job created to enable data sharing for this Db2 subsystem, and then restart this Db2 subsystem. Also, check whether the correct BSDS is specified in the Db2 startup procedure. See message DSN7501A for additional problem determination.

Related tasks

[Defining Db2 initialization parameters for new data sharing members \(Db2 Installation and Migration\)](#)

Related information

[DSN7501A \(Db2 Messages\)](#)

00D10105

Explanation

Db2 found a mismatch in the shared communications area (SCA) while a new member was attempting to join a data sharing group.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

This indicates that a new member is attempting to join the data sharing group. If this a migration from Db2 3.1, then catalog migration must be completed before a new member can join this data sharing group. Wait until catalog migration completes, then restart this Db2 to join the group. Otherwise, group restart is required. Wait until group restart completes, then restart this Db2 to join the group.

00D10106

Explanation

Db2 failed to update an internal control record in the BSDS for data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 code 00D10411 for problem determination.

00D10107

Explanation

Db2 failed to insert an internal control record in the BSDS for data sharing re-enable.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 code 00D10412 for problem determination.

00D10108

Explanation

Db2 failed to write an internal control record for re-enable in the shared communications area (SCA) structure.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See message DSN7501A for problem determination.

00D10109

Explanation

Db2 found a shared communications area (SCA) structure during the data sharing re-enable process. This structure should not be built at this time.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Display the existing SCA structures on this MVS system.

Problem determination

If an SCA structure already exists for this Db2 data sharing group, use the MVS command SETXCF to delete this structure, then restart Db2 to complete the re-enable process.

00D1010A

Explanation

Db2 failed to write a record for re-enable in the shared communications area (SCA) structure.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010B

Explanation

Db2 failed to update an internal control record in the BSDS to enable data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 Code 00D10411 for problem determination.

00D1010C

Explanation

Db2 failed to write an internal control record in the shared communications area (SCA) to enable data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010D

Explanation

Db2 could not find an internal control record for data sharing in the BSDS or the shared communications area (SCA).

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Check to be sure that this Db2 system is supposed to be part of a data sharing group. If this Db2 is in

a group, you can restart another Db2 subsystem that is in the same Db2 data sharing group first, and then restart. If no other Db2 subsystems exist in this group, you must recover the BSDS before restarting.

00D1010E

Explanation

Db2 failed to write an internal control record for a data sharing restart in the shared communications area (SCA) structure.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010F

Explanation

Db2 failed an attempt to change the generic LU or location name in the shared communications area (SCA) structure for the data sharing group.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis. All members in the data sharing group must first be stopped, then this Db2 subsystem can be restarted to make this change.

Problem determination

00D10110

Explanation

Db2 failed to write an internal control record for a generic LU or location name change in the shared communications area (SCA) structure.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Db2 failed in a write to the SCA structure for a data sharing restart change. Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10111

Explanation

Db2 failed to find an internal record in the shared communications area (SCA) that is needed to re-enable data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis. To re-enable data sharing, you must start the surviving Db2 member first before other members can be started. If this is meant to be a re-enable attempt, check whether the surviving member was started first. If this re-enable is already complete, check that this is the correct data sharing group.

Another possibility is that the SCA is damaged. Use the MVS command SETXCF to rebuild the SCA.

00D10112

Explanation

Db2 failed to update an internal control record in the BSDS for a generic LU or location name change.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Db2 failed in an update to the BSDS for a data sharing generic LU or location name change. See Db2 Code 00D10411 for problem determination.

00D10113

Explanation

Db2 failed to update a data sharing member's information record in the BSDS to enable data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 Code 00D10411 for problem determination.

00D10114

Explanation

Db2 failed to write a data sharing member information record in the shared communications area (SCA) for a restart of data sharing.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10115

Explanation

Db2 failed to update the data sharing record in the BSDS to reset the enable flag.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 code 00D10411 for problem determination.

00D10116

Explanation

Db2 failed to update an internal control record in the BSDS for non-data sharing migration or fallback with Db2.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

See Db2 Code 00D10411 for problem determination.

00D10117

Explanation

Db2 failed to truncate and switch to a new log for data sharing re-enable.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

Determine why Db2 failed to truncate and switch to a new log. Db2 might be using the last log. If so, determine why offload has not occurred. See Db2 messages DSNJ319I and DSNJ320I for problem determination.

00D10130

Explanation

An attempt was made to restart a deactivated member of a data sharing group.

System action

An SVC dump is generated and restart processing for the member terminates.

System programmer response

Use the print log map utility (DSNJU004) to determine the deactivation status of the member.

Problem determination

Look for other messages that might have been issued in conjunction with the error. Use the SVC dump and the LOGREC and syslog from the time of the failure to aid in problem determination.

Related reference

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D10150

Explanation

An internal logic error occurred during processing.

System action

The error is recorded in SYS1.LOGREC and an SVC dump is requested. Db2 then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the System Programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. This is likely an error in Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10210

Explanation

An unsuccessful completion of a SET WRITE CURSOR has occurred. An invalid write cursor ID was supplied.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10219

Explanation

Db2 found that the current LRSN is less than the prior LRSN after calculating a delta for the current LRSN.

System action

Db2 terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

This indicates that the system time is now less than the time recorded earlier in the Db2 log data set. Check that this Db2 subsystem is using the correct BSDS and log data sets. Also check that the correct system time is being used.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10220

Explanation

An unsuccessful completion of a LOG WRITE has occurred. An invalid write cursor ID was supplied.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10221

Explanation

An unsuccessful completion of a LOG WRITE has occurred. An invalid number of areas was specified.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10222

Explanation

An unsuccessful completion of a LOG WRITE has occurred. The record length specified was greater than 32767.

System action

An execution unit writes a record SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10223

Explanation

There was an attempt to modify a log data set while doing a conditional restart with CSRONLY specified.

System action

Db2 startup terminates.

Operator response

Notify the system programmer.

System programmer response

If a complete Db2 startup is needed, remove CSRONLY from the control statement. Restart Db2.

00D10224

Explanation

The Db2 database manager scheduled a log write request for a commit log record. A request of the same type is already active.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10230

Explanation

A CHECK LOG was issued and the log RBA specified in the macro had not been written to DASD at the time.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10231

Explanation

An unsuccessful completion of a CHECK LOG has occurred. The specified RBA is beyond the end of the log.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

.

00D10232

Explanation

A request was made to force an LRSN in non-data sharing mode.

System action

Db2 issues an SVC dump and returns an error to the requesting function.

Operator response

Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem determination

The requesting function can be determined from the SVC dump. It has requested a data sharing log manager function in non-data sharing.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10240

Explanation

An unsuccessful completion of a CLOSE LOG FOR WRITE has occurred. An invalid write cursor ID was supplied.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10250

Explanation

An unrecoverable error occurred while updating either the BSDS or the MVS catalog to reflect changes in active log data sets.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. Db2 then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Correct the error, and restart Db2.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, see abend reason code '00D10252' for a description of the information recorded in the variable recording area (VRA) of the SDWA. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Examine the console log for a DSNJxxxx message preceding this abend to determine whether the error was a BSDS error or an MVS catalog update error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10251

Explanation

An unrecoverable error occurred in the log buffer writer.

System action

The log buffer writer creates a record in SYS1.LOGREC and might request an SVC memory dump. Db2 then terminates abnormally. An SVC memory dump might not be requested if the previous messages fully describe the error.

Operator response

Collect the SYS1.LOGREC and SVC memory dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC, the SVC memory dump, and the SYSLOG from the time the error occurred. This error is typically caused by a previous error that was recorded on SYS1.LOGREC and produced an SVC

memory dump. Examine the SYS1.LOGREC entries and SVC memory dump to determine the primary error that occurred. The SYSLOG might contain messages that describe the error that was encountered.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, see abend reason code '00D10252' for a description of the information recorded in the variable recording area (VRA) of the SDWA.

The ABEND can occur when the BSDS of the subsystem is in the format that supports only 6-byte RBA and LRSN values if the RBA or LRSN reaches the limit of X'00000000FFFFFFFFFFFF' or RBA or X'00FFFFFFFFFFFF000000' for LRSN. If the LRSN limit is reached, the BSDS must be converted to the format that supports 10-byte values by using the DSNJCNTV utility. Until this conversion is complete, the subsystem cannot be restarted. If the RBA limit is reached, either the RBA reset procedure can be used or the BSDS can be converted by using DSNJCNTV.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10252

Explanation:

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, the following information is contained in the variable recording area (VRA) of the SDWA:

- Reason code '00D10252' stored with key=VRARC.
- The log buffer writer recovery tracking area is stored with key=VRARRP. These fields in the VRA are described by the system mapping macro IHAVRA.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10253

Explanation

An application program check occurred in an MVCP instruction that attempted to move a parameter list or other data from the caller's address space to the recovery log manager address space.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Examine the area from which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DA opcode and indicates the registers showing address and length to be moved.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10254

Explanation

An application program check occurred in an MVCS instruction that attempted to move data from the recovery log manager address space to the caller's address space.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Examine the area to which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DB opcode and indicates the registers showing address and length to be moved.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10255

Explanation

DSNJR008 attempted to resume the waiting execution unit, and a failure occurred leaving the state of the resume indoubt.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The Db2 subsystem then terminates to avoid leaving the execution unit in a state of indefinite suspension.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 has the address of the execution block (EB).

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10256

Explanation

Recursive abends were detected while trying to reinitialize an archive log read service task.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The Db2 subsystem then terminates to avoid leaving an execution unit in a state of indefinite suspension.

Operator response

Collect the SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC, the SVC dump, and a listing of the BSDS by running the print log map (DSNJU004) utility. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00D10261

Explanation

While scanning the records and record segments in a log control interval (CI), it was discovered that the forward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET

call, Db2 places a return code of 4 in register 15 and a reason code of 00D10261 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET feedback area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI which contains the errant log record header are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem, obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10265

Explanation

While scanning the records and record segments in a log control interval (CI), it was discovered the backward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10265 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem:

- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.
- If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10266

Explanation

While scanning a log control interval (CI), a unit of recovery ID or LINK RBA in some record was found to be inconsistent with the beginning log RBA of the CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10266 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the log record with the invalid RBA is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem, obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10267

Explanation

While scanning a log control interval (CI), a middle or last spanned record segment was not the first segment contained in the log CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.

- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem, obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10268

Explanation

While scanning a log control interval (CI), a first or middle spanned record segment was not the last segment contained in the log CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10268 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname

of the data set on which the activity occurred is placed in SLRFDDNM.

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem, obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10269

Explanation

An unrecoverable error was found in one of the buffers, while moving the current log buffer to the static write buffer ('shadow buffer') in preparation for the physical write to the active log.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The subsystem then terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D1026D

Explanation

A scan of the records and record segments in a log control interval (CI) detected that the backward record chain was broken. This condition is the result of an

incorrect record length in the log record header of some record in the log CI.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10265 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Problem determination

If the reason code is issued by an active Db2 subsystem:

- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.
- If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the reason code is issued upon return of an invocation of the Db2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D1026E

Explanation

A scan of a log control interval (CI) detected that a log RBA in the CI was too large to be a 6-byte RBA.

System action

This reason code can be issued by an active Db2 subsystem as the log buffers are scanned before they are written to the active log, or by the Db2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active Db2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked as stopped.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the Db2 subsystem is terminated.
- If the error was detected by DSNJW107 or DSNJW127, then the Db2 subsystem is terminated.

If this reason code is issued as the result of Db2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, Db2 places a return code of 4 in register 15 and a reason code of 00D10264 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The expected RBA of the beginning of the CI is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

Operator response

If the reason code is issued by an active Db2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

If the reason code is issued by an active Db2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00D10301

Explanation

An unsuccessful completion of an OPEN LOG FOR READ has occurred. An open log read cursor already exists for this execution block (EB). Only one log read cursor per EB is permitted.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Scan the read cursor pool for a cursor with the same EB, or examine through the Db2 trace for the problem. Trace IDs 040301 and 040302 identify OPEN entries while 040303 and 040304 are for CLOSE.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. All log read cursors reside in a recovery log manager storage pool

whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5. Register 6 contains the address of the EB.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10302

Explanation

An unsuccessful completion of an OPEN LOG FOR READ has occurred. A valid scope was not specified.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10303

Explanation

An unsuccessful completion of an OPEN LOG FOR READ has occurred. An invalid log RBA range was specified. HIGHRBA is less than LOWRBA.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, "X'D1.....' codes," on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

.

00D10304

Explanation

An unknown function was requested in an open of a log read cursor.

System action

Db2 issues a return code of 4 and reason code of 00D10304 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10305

Explanation

A peer log read request was made without a peer log read cursor.

System action

Db2 issues a return code of 4 and reason code of 00D10305 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10306

Explanation

A request to read merged log records failed.

System action

Db2 issues a return code of 4 and reason code of 00D10306 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

The requesting function has put this error code out. Check on this function.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10307

Explanation

A log read open in data sharing failed because the RBA values were not increasing or were overlapping.

System action

Db2 issues a return code of 4 and reason code of 00D10307 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10308

Explanation

A log read open in data sharing failed.

System action

Db2 issues a return code of 4 and reason code of 00D10308 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10309

Explanation

A peer BSDS open request failed.

System action

Db2 issues a return code of 4 and reason code of 00D10309 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D1030A

Explanation

A peer log read request was made in non-data sharing.

System action

Db2 issues a return code of 4 and reason code of 00D1030A to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10310

Explanation

An unsuccessful completion of a SET READ CURSOR RANGE has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in [Chapter 9, "X'D1.....' codes," on page 537](#). In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10311

Explanation

An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid write cursor ID was specified.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, all log write cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBWCPhB. The LMB is pointed to by register 5. Read cursors are in a similar pool at LMBRCPhB.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10312

Explanation

An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid log RBA range was specified. HIGHRBA is lower than LOWRBA.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10319

Explanation

Log rollback processing has been canceled by an operator command.

System action

The current log read request terminates and the reason code is returned to the log read requester.

Operator response

Examine the console for additional messages regarding the canceling of the log rollback process.

00D10322

Explanation

An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with a record matching the specified TYPE was not found.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10323

Explanation

An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with record matching the specified SCOPE is not found.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10324

Explanation

An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with record matching the specified CDATE is not found.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10325

Explanation

An unsuccessful completion of a LOG READ has occurred. The sum of CDATE length value and CDATE offset value is greater than 256.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10326

Explanation

An unsuccessful completion of a LOG READ has occurred. The macro invocation specified that no wait was to occur because of a busy archive log data set (ADSWAIT(NO)). The macro invocation also specified that, rather than returning with a condition code (COND(NO)), an abend should be issued by the recovery log manager (RLM) subcomponent. The RLM determined that the record requested was on an archive log data set that was in use.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10327

Explanation

An unsuccessful completion of a LOG READ has occurred because of an invalid LOGRBA value. MODE=DIRECT with requested RBA does not match the start of a log record.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

00D10328

Explanation

A LOG READ completed unsuccessfully, because a MODE request sequence was invalid. A read request specifying a sequential MODE (any MODE except DIRECT) must be preceded by an open log for read, a set read cursor range, or a read with the same MODE parameter value. It is invalid to intermix read requests with different sequential mode values.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10329

Explanation

A LOG READ completed unsuccessfully, because an I/O error occurred while reading the log data set.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). for information about recovery from log failures.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Examine SYS1.LOGREC and SVC dump information. Also, examine any prior messages with a DSNJ prefix from the log buffer reader.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D1032A

Explanation

An unsuccessful completion of a LOG READ has occurred. BSDS does not map the specified RBA into a log data set. The possible causes for this condition are:

- The BSDS is in error.
- The log data set has been deleted.
- The log data set exists but the RBA cannot be found from this log data set. This situation can happen in a disaster recovery site if the log data set was copied before BSDS was copied.
- The RBA cannot be found because it is beyond the earliest RBA recorded in the log data sets.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. Also, obtain a listing of the BSDS by running the print log map (DSNJU004) utility. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Review the recovery log manager standard diagnostic information in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

Related concepts

[Recovering from BSDS or log failures during restart \(Db2 Administration Guide\)](#)

Related information

[Recovering from BSDS failures \(Db2 Administration Guide\)](#)

00D1032B

Explanation

A LOG READ completed unsuccessfully because an error occurred while trying to allocate a log data set.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). for information about recovery from log failures.

System action

An execution unit writes a record to SYS1.LOGREC and might request an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump, if a dump was produced. Notify the system programmer.

System programmer response

Examine LOGREC and SVC dump information, if a dump was produced. Also, examine any prior messages with a DSNJ prefix from recovery log manager allocation processing.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D1032C

Explanation

A LOG READ completed unsuccessfully, because an error occurred while opening or closing a log data set.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). for information about recovery from log failures.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Examine LOGREC and SVC dump information. Also, examine prior messages from recovery log manager open/close processing. These messages have a prefix of DSNJ.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D1032D

Explanation

An unsuccessful completion of a LOG READ has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, all log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D1032E

Explanation

A LOG READ completed unsuccessfully due to an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Examine LOGREC and SVC dump information. LOG READ was passed a bad parameter list. The field which was detected to be in error (RDPLOPT1) is the third byte of the second word traced in the log manager 311 trace entry. The RET field of this trace entry along with the MEPL may be used to determine which module issued the Log Read request. Both pieces of information are useful in isolating the failure.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

Collect the following diagnostic item listed in

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D1032F

Explanation

A LOG READ completed unsuccessfully because the high range RBA provided was not the RBA of a valid log record. This is an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10330

Explanation

An unsuccessful completion of a Close Log for read has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10331

Explanation

A LOG READ completed unsuccessfully because a LINK RBA did not point to the beginning of a LOG record. This is an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10332

Explanation

A log read completed unsuccessfully because a link RBA pointed to a log record with a different URID. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC DUMP is requested. The requesting execution unit is abnormally terminated.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

While reading the log backwards using the LRHLINK RBAs, a log record was found that contained a different URID. A link read is normally done when processing a rollback or an abort. This abend is issued to prevent a rollback of the wrong transaction. If this occurs during abort processing, the subsystem is brought down. If the abend reoccurs on the subsequent restart of Db2, a conditional restart is necessary to bypass the invalid log record.

Problem determination

In addition to the standard RLM diagnostic information, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described in the DSNDLMB macro.

Related concepts

[Recovering from BSDS or log failures during restart \(Db2 Administration Guide\)](#)

00D10333

Explanation

A log read failed because an internal error was detected by the Data Manager while examining the log record during recover and deferred restart.

System action

The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and the SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537 (X'D1'). In addition, the following diagnostic information is provided in registers:

- Register 0: the Data Mgr ERQUAL that identifies the place within CSECT DSNILGRX where the error was detected
- Register 2, 3: the RBA of the log record that was being read at the time of the error
- Register 7: the address of the DSCF selection block
- Register 8: the address of the selection block for the database services address space (*ssnmDBM1*).

00D10334

Explanation

An unsuccessful completion of a LOG READ occurred because of an invalid LOGRBA value. MODE=SEQUENTIAL DIRECT with the requested RBA does not match the start of a log record.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump.

Problem determination

RLM standard diagnostic information is provided in "Recovery Log Manager Reason Codes (X'D1')".

Related tasks

[Requesting Db2 SVC dumps \(Collecting data\)](#)

Related reference

[SYS1.LOGREC \(Diagnosing Db2 problems\)](#)

00D10335

Explanation

An unsuccessful completion of a LOG READ occurred because the log was not being read in ascending order for MODE=SEQUENTIAL DIRECT.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump.

Problem determination

RLM standard diagnostic information is provided in "Recovery Log Manager Reason Codes (X'D1')".

Related tasks

[Requesting Db2 SVC dumps \(Collecting data\)](#)

Related reference

[SYS1.LOGREC \(Diagnosing Db2 problems\)](#)

00D10340**Explanation**

An unsuccessful completion of a LOG READ has occurred. This reflects a logic failure internal to the recovery log manager (RLM) subcomponent and is probably caused by a passed parameter list being lost or a previous abend processing a LOG READ request.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System programmer response

Examine LOGREC and SVC dump information for prior abends during LOG READ processing. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10341**Explanation**

A LOG READ completed unsuccessfully because an error was detected during a Forward READ of the log record. This is an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10342**Explanation**

A LOG READ completed unsuccessfully because an error was detected during a backward READ of a log record. This is an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10343**Explanation**

A LOG READ completed unsuccessfully because an error was detected during a READ of a log record due to an invalid CI offset. This is an internal error.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10345**Explanation**

A LOG READ completed unsuccessfully because an error was received from a CATALOG LOCATE request for an archive log data set. The requested archive log data set might have been uncataloged or deleted.

System action

An execution unit might write a record to SYS1.LOGREC and request an SVC dump.

Operator response

Collect the SYS1.LOGREC and SVC dump, if requested. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump, if requested. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537.

00D10347**Explanation**

An attempt to notify a peer to force write the log buffer failed.

System action

Db2 issues a return code of 4 and reason code of 00D10347 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10348**Explanation**

The maximum retry count was exceeded while attempting to read a log RBA.

System action

The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

System programmer response

Review the Db2 console for related errors.

Problem determination

This problem might occur if the user has added an archive log to the BSDS with an incorrect RBA range using Change Log Inventory (DSNJU003) or if an active log data set has been regressed such that the log data

set does not contain the RBA range that is listed in the BSDS.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10349**Explanation**

A deadlock occurred attempting to allocate an archive log tape.

System action

Db2 issues a return code of 8 and reason code of 00D10349 to the requesting function.

System programmer response

Review the Db2 console for the terminated function.

Problem determination

The requesting function was terminated. There was another function allocating the same archive log tapes. Rerun the terminated function after the present function no longer has the archive log tapes allocated.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10350**Explanation**

A lock or unlock failed in an attempt to allocate an archive log tape.

System action

An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

System programmer response

This is an internal Db2 error.

Related tasks

[Requesting Db2 SVC dumps \(Collecting data\)](#)

Related reference

[SYS1.LOGREC \(Diagnosing Db2 problems\)](#)

00D10351**Explanation**

A member of a Db2 data sharing group in a GDPS® Continuous Availability with zero data loss (GDPS Continuous Availability with zero data loss) environment issued a proxy log read request. The operation failed for one of the following reasons:

- The BSDS records for the data sharing member are not in extended format.
- Installation parameter CDDS_MODE is not set to PROXY for the data sharing member.
- The data sharing member did not start in proxy mode.

System action

Db2 issues a return code of 4 and reason code of 00D10351 to the requesting function.

System programmer response

Review the Db2 console output. In particular, check for messages that were written during Db2 startup.

Problem determination

In the console output, check for messages that indicate why the data sharing member did not start in proxy mode. One possible cause is that the compression dictionary data set (CDDS) was not available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10401

Explanation

A BSDS read was requested and the record was not found.

System action

Db2 returns a return code of 4 and reason code of 00D10401 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10402

Explanation

A BSDS read was requested and the input area was too small.

System action

Db2 returns a return code of 8 and reason code of 00D10402 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10403

Explanation

A BSDS update was requested and the record was not found.

System action

Db2 returns a return code of 4 and reason code of 00D10403 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10404

Explanation

A BSDS insert was requested and the record already exists.

System action

Db2 returns a return code of 4 and reason code of 00D10404 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10405

Explanation

A BSDS delete was requested and the record does not exist.

System action

Db2 returns a return code of 4 and reason code of 00D10405 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10406

Explanation

The bootstrap data set access service received a request with an invalid function code.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10410

Explanation

An unsuccessful completion of a READ BSDS RECORD has occurred. An error has been returned from VSAM.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Use the SYS1.LOGREC and SVC dump to determine the cause of the problem.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the

BSDS request element (BSDSRQEL) field (located at offset X'8' in the bootstrap data set block).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10411

Explanation

An unsuccessful completion of a WRITE UPDATE BSDS RECORD has occurred. An error has been returned from VSAM.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10412

Explanation

An unsuccessful completion of a WRITE INSERT BSDS RECORD has occurred. An error has been returned from VSAM.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10413

Explanation

An unsuccessful completion of a DELETE BSDS RECORD has occurred. An error has been returned from VSAM.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10414

Explanation

Db2 cannot dynamically allocate a copy of the requested bootstrap data set (BSDS).

System action

The system places the BSDS in disabled mode.

System programmer response

Restore the BSDS data set (or data sets) and restart the Db2 subsystem associated with the BSDS.

User response

Notify the system programmer.

Problem determination:

00D10415

Explanation

The bootstrap data set (BSDS) is not a valid BSDS for the data sharing group.

System action

The system places the BSDS in disabled mode.

System programmer response

Restore the BSDS data set (or data sets) and restart the Db2 subsystem associated with the BSDS.

User response

Notify the system programmer.

Problem determination:

00D10416

Explanation

A peer BSDS process was requested in non-data sharing.

System action

Db2 issues a return code of 8 and reason code of 00D10416 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

Peer BSDS requests cannot occur in non-data sharing.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10417

Explanation

A peer BSDS process was requested for a host BSDS.

System action

Db2 issues a return code of 8 and reason code of 00D10417 to the requesting function.

System programmer response

Review the Db2 console for related errors.

Problem determination

Peer BSDS requests cannot be processed for the host BSDS.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10500

Explanation

The recovery log manager's dynamic allocation function has been passed a bad function code (LRB4FUNC in control block LRB4).

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in [Chapter 9, "X'D1.....' codes," on page 537](#). In addition, trace entry 501 provides the return address to the module that passed the LRB4 with the undefined function code. It also provides the address of the LRB4. This address is also in register 7 at the time of the abend.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10501

Explanation

The recovery log manager's common access method services has been passed a bad function code (DSPLFUNC in control block DSPL).

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. The address of the DSPL is provided in register 3, and the invalid function in register 4.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10700

Explanation

An error completion code was returned by SETLOCK OBTAIN.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 0 contains the return code from SETLOCK OBTAIN.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10701

Explanation

An error completion code was returned by SETLOCK RELEASE.

System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem determination

RLM standard diagnostic information is provided in Chapter 9, “X'D1.....' codes,” on page 537. In addition, register 0 contains the return code from SETLOCK RELEASE.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10800**Explanation**

The log manager command processor (DSNJ001) was entered with an invalid Tokenized Command Segment (TCS).

System action

A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

Operator response

Collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump from the operator. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

RLM standard diagnostic information is provided under Chapter 9, "X'D1.....' codes," on page 537.

General register 1 contains the address of the TCS as passed to log manager. The character string 'TCS' should appear at the address provided in R1, plus 4. The address of the GCPC Pool Header Block (PHB) is provided in general register 2. The value X'0036' should appear at the address provided in R2. If these two items are not present, then the DSNJC001 CSECT was invoked in error by an execution unit.

00D10901**Explanation**

Db2 failed to locate a data sharing member in the SCA.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

Problem determination

Review the Db2 system console for possible DSN7xxxx messages that could relate to this problem.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10902**Explanation**

A dynamic allocation of a peer's BSDS failed.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

Problem determination

Review the Db2 system console for possible errors relating the peer's BSDS on both the host and peer Db2 system.

See the Db2 system console for messages DSNJ103I and DSNJ700I that are issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10903**Explanation**

An open of a peer BSDS failed.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

Problem determination

Review the Db2 system console for messages DSNJ100I and DSNJ700I that are issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10904

Explanation

There was a VSAM MRKBFR error for a peer BSDS.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

Problem determination

The VSAM MRKBFR error is placed in LRB1XRC.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10905

Explanation

There is a mismatch between the two BSDS timestamps of a peer.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Problem determination

There is a mismatch between the two BSDS system timestamps of a peer, the BSDS change log inventory (DSNJU003) timestamps of a peer, or both. The peer log environment might have changed. This must be resolved at the peer Db2 subsystem by determining which BSDS is in error and recovering that BSDS.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10906

Explanation

The change log inventory (DSNJU003) timestamp does not match the system timestamp in the peer BSDS.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Problem determination

A change log inventory (DSNJU003) job was executed against the peer BSDS after the last peer Db2 subsystem restart. The peer log environment might have changed. Restart the peer Db2 subsystem to reset this condition.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10907

Explanation

Db2 could not locate a peer's active log data set in the peer's BSDS.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials including SYS1.LOGREC, an SVC dump, and console output.

Problem determination

Run a print log map (DSNJU004) job against the peer's BSDS to compare BSDS active log entries with the existing peer's log data sets. There is probably a mismatch between them.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10908

Explanation

An open of a peer's active log failed.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

Problem determination

Review the Db2 system console for possible errors relating the peer's active log on both the host and peer Db2 system.

The VSAM CONNECT return code is in LRB1XRC if an SVC dump was taken.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10909

Explanation

There was no active BSDS found for the peer Db2 subsystem.

System action

If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

Problem determination

Review the Db2 system console for possible errors relating the peer's BSDSs on both the host and peer Db2 system.

See the Db2 system console for message DSNJ700I that is issued with this Db2 condition code.

The peer BSDSs have been placed in inactive mode. There might have been an error against this peer's BSDSs and a recovery is needed.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10910

Explanation

A BLDVRP/DLVRP macro failed for the BSDS buffer.

System action

An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output.

Problem determination

Review the Db2 system console for possible errors relating to the BSDS.

A BLDVRP/DLVRP macro for a VSAM shared resource pool failed for the BSDS. General register 2 will

contain a value of 1 for a BLDVRP macro or a value of 2 for a DLVRP macro. The macro return code is contained in general register 3. See the appropriate VSAM publication for advanced VSAM applications.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10916**Explanation**

Db2 received an error while attempting to read shared communications area (SCA) information from the coupling facility.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System programmer response

Correct the problem with the coupling facility, and restart Db2.

Problem determination

Review the Db2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10917**Explanation**

Db2 received an error while attempting to write shared communications area (SCA) information to the coupling facility.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System programmer response

Correct the problem with the coupling facility, and restart Db2.

Problem determination

Review the Db2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D10A00**Explanation**

A request was made to write to the compression dictionary data set (CDDS), but the CDDS is in read-only access mode.

System action

The write request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A01

Explanation

A request was made to read a record in the compression dictionary data set (CDDS), but the record was not found.

System action

The read request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A02

Explanation

A request was made to read a record in the compression dictionary data set (CDDS), but the work area was not large enough to hold the record.

System action

The read request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A05

Explanation

A request to perform an operation on the compression dictionary data set (CDDS) specified an invalid function code.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A06

Explanation

A request to perform an operation on the compression dictionary data set (CDDS) abnormally terminated.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A07

Explanation

A request to perform an operation on the compression dictionary data set (CDDS) failed because the CDDS service was not started.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A08

Explanation

A request to perform an operation on the compression dictionary data set (CDDS) failed because the CDDS service failed.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A09

Explanation

A request to perform a read operation on the compression dictionary data set (CDDS) failed because a read error occurred for the VSAM shared information area (VSI).

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A0A

Explanation

A request to perform an operation on the compression dictionary data set (CDDS) failed because fields in the VSAM shared information area (VSI) were invalid.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A0B

Explanation

A request to perform a write operation on the compression dictionary data set (CDDS) failed because data could not be written in the VSAM shared information area (VSI).

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A0C

Explanation

A request to perform a read operation on the compression dictionary data set (CDDS) system control record failed.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A0D

Explanation

A request to perform a read operation on the compression dictionary data set (CDDS) control record failed because validation of the system control record failed.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A0E

Explanation

A request to perform a write operation on the compression dictionary data set (CDDS) system control record failed.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A0F

Explanation

A request to perform a write operation on the compression dictionary data set (CDDS) system control record failed because the data set is not usable.

System action

The request fails.

System programmer response

Check whether the data set allocation attributes for the CDDS are specified correctly.

Problem determination

Run LISTCAT on the CDDS, and compare the data set attributes to those that are specified in [Modifying Db2 for the GDPS Continuous Availability with zero data loss solution \(Db2 Administration Guide\)](#).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A11

Explanation

Allocation of the compression dictionary data set (CDDS) failed.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A12

Explanation

A compression dictionary data set (CDDS) in proxy mode was not initialized.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A13

Explanation

The log record read request to a proxy data sharing group specified a member name that is not in the system control record of the compression dictionary data set (CDDS).

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A15

Explanation

The compression dictionary data set (CDDS) could not be opened.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A16

Explanation

A request was made to write to the compression dictionary data set (CDDS), but an invalid record key was specified.

System action

The write request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A17

Explanation

A request was made to insert or update a record in the compression dictionary data set (CDDS), but the specified record length was invalid.

System action

The insert or update request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A18

Explanation

An error occurred when data was copied from the address space of the caller to the compression dictionary data set (CDDS).

System action

The operation fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A19

Explanation

An error occurred while data was copied from the compression dictionary data set (CDDS) to the address space of the caller.

System action

The operation fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D10A20

Explanation

The high member ID for a proxy data sharing group in the subsystem communication block (SCOM) did not match the high member ID in the compression dictionary data set (CDDS) control record.

This situation typically occurs when a new member is added to the source data sharing group, which causes the high member ID in the CDDS to be incremented.

System action

Allocation of the BSDS for the proxy member fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- The unformatted contents of the compression dictionary data set (CDDS), or IDCAMS PRINT output of the CDDS.

00D10A21

Explanation

The compression dictionary data set (CDDS) is unavailable because it is in a STOPPED or STOPPING state.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A22

Explanation

An expansion dictionary for a table space could not be added to the compression dictionary data set (CDDS) because the exclusion list contains an entry for that expansion dictionary.

System action

The request fails.

System programmer response

Run REORG TABLESPACE with the INITCDDS option on the table space whose expansion dictionary has an entry in the exclusion list.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A23

Explanation

Insertion into the compression dictionary data set (CDDS) failed due to a VSAM PUT error.

System action

The request fails.

System programmer response

Review the Db2 console for related errors.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A24

Explanation

Insertion into the compression dictionary data set (CDDS) failed because the CDDS is full.

System action

The request fails.

System programmer response

Follow these steps to avoid data loss when you define a new and larger CDDS.

1. Issue the **STOP CDDS** command to stop the CDDS.
2. Delete the CDDS and define a larger CDDS with the same name.
3. Issue the **START CDDS** command to start the CDDS.
4. Run REORG TABLESPACE with the INITCDDS option on the following sets of table spaces:

- All table spaces that contain tables that are defined with DATA CAPTURE CHANGES.
- All table spaces that contain tables that are in replication subscription sets.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D10A25

Explanation

An operation on the compression dictionary data set (CDDS) failed because the CDDS is broken.

System action

The request fails.

System programmer response

Define a new and larger CDDS. Follow these steps to avoid data loss when you define that CDDS.

1. Issue the **STOP CDDS** command to stop the CDDS.
2. Delete the CDDS and define a larger CDDS with the same name.
3. Issue the **START CDDS** command to start the CDDS.
4. Run REORG TABLESPACE with the INITCDDS option on the following sets of table spaces:
 - All table spaces that contain tables that are defined with DATA CAPTURE CHANGES.
 - All table spaces that contain tables that are in replication subscription sets.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D1F001

Explanation

An internal error was detected during log manager processing.

System action

The request is terminated and a SVC dump is scheduled.

System programmer response

Collect the following documentation and contact the IBM Support Center:

- SVC dump
- Syslog
- SYS1.LOGREC entries from the time of the error
- Additional documentation may be required depending on the exact nature of the error.

00D1F002

Explanation

The log management block was found to be invalid during log write processing, indicating a possible storage overlay.

System action

The request is terminated and an SVC dump is scheduled. Db2 then terminates abnormally to prevent further errors.

System programmer response

Collect the following documentation:

- SVC dump
- Syslog
- SYS1.LOGREC entries from the time of the error

Contact IBM Support to determine the cause of the storage overlay. If it is suspected to be caused by other software, consider disabling or removing that software before restarting Db2 to prevent a recurrence of the problem.

Chapter 10. X'D3.....' codes

Reason code identifiers that begin with 00D3 communicate normal and error situations with the distributed data facility.

00D30000

Explanation

The operator canceled the allied agent at the requesting location and a dump was requested, or the agent abended with a reason code that indicated a possible communication problem. In either case, the database access agent at this location abended to take a dump to assist in problem determination.

System action

The agent terminates.

Operator response

Notify the system programmer.

System programmer response

The information collected as a result of this abend is related to information collected at the requesting location. Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Contact the system programmer at the requesting location (the location name can be determined from the dump header) to coordinate further action.

Problem determination

This abend was initiated in order to save diagnostic information that might be useful in problem determination.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30001

Explanation

The DPS RALE was not initialized. The DSNLSPRR was invoked with the DPSB defined as the functional

recovery routine (FRR) anchor. The DPSB is created after the DPS RALE is initialized.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30002

Explanation

The distributed data facility (DDF) standard ESTAE and FRR recovery routines detected a bad recovery element. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30003

Explanation

While establishing an ESTAE functional recovery, Db2 detected a failure.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30004

Explanation

A database access agent received an invalid message. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30005

Explanation

Db2 detected a failure while retrying Db2 recovery.

System action

Db2 abends after it writes a SYS1.LOGREC record and requests a SVC dump.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A distributed data facility (DDF) module retried recovery after an abend, but invalidly returned control to the DDF functional recovery routine (DSNLFRCV) that issued the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30008

Explanation

The distributed transaction manager (DTM) could not allocate a RALE for the distributed data facility (DDF). This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30009

Explanation

During allocation of a database access agent, simultaneous use of an APLE was attempted. An APLE can be used once during allocation of a database access agent. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3000A

Explanation

Db2 invoked the DSNLTDSC macro or a function of the distributed transaction manager (DTM). The required function could not be performed because the DPSB control block does not exist. This is a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 detects this error when the module that abnormally terminated is invoked and determines that the existence of the DDF agent local anchor block (DPSB) is not indicated by the DDF RALE or is not indicated by the ACE.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D3000B

Explanation

A function of the distributed transaction manager (DTM) was invoked and attempted to establish a functional recovery environment. The functional recovery element (FRE) that was created was not the first one on the chain of FREs anchored in the DPSB. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3000C

Explanation

The location name received in a response message from a responding site disagrees with the location name to which the request message was sent. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3000D

Explanation

A request using application-directed access starting at site 'A' referenced an object at site 'B' that is stored at site 'A'.

System action

The application statement was not processed.

User response

Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local Db2. Objects stored at the local site must be referenced using a local name.

Problem determination

If necessary, consult with the data base administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

00D3000E

Explanation

The DSNLFTMB macro was invoked to determine whether an update request was sent to a specified location, but the transaction has not yet been migrated to that location. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and

DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3000F

Explanation

A Db2 resource manager attempted to add a duplicate entry to the list of resource managers. This list contains the names of resource managers that can participate in the allocation of a database access agent at a remote site. This is a Db2 error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The module that incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30010

Explanation

A Db2 resource manager attempted to delete a resource manager that is not given in the list of resource managers that participate in the allocation of a database access agent at a remote site. This is a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This module which incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30011

Explanation

Only a certain number of resource managers can participate in the allocation of a database access agent at a remote site. The maximum has been attained and cannot be extended. This is a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30012

Explanation

More than one resource manager attempted to reserve the same RALE for use in the allocation of a database access agent at a remote site. This is a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The RALE was previously reserved by another resource manager and is not available.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30013

Explanation

The facility section (DSN6FAC) in the Db2 initialization parameter module does not exist.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem determination

Ensure that DSN6FAC was installed correctly.

00D30014

Explanation

The distributed transaction manager (DTM) detected an internal error. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30015

Explanation

The facility section (DSN6FAC) in the Db2 initialization parameter module is invalid.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility (DDF) is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem determination

Ensure that DSN6FAC was installed correctly.

00D30016

Explanation

An allied agent received an invalid response. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30018

Explanation

An agent exists at the site at which theabend occurred, but an agent that should exist at another site does not exist at that site. This is probably a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information

about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The distributed data facility (DDF) error monitor, which terminates the agent that is waiting for some action to be taken by the nonexistent agent, detects this error. The module that was waiting for the action of the nonexistent agent is the module that issued theabend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D30019

Explanation

The distributed data facility (DDF) error monitor detected an error at another site which caused the agent at this site to be canceled. This is probably a Db2 internal error.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The DDF error monitor, which terminates the agent because of an error detected at another site to which the agent is connected and for which the agent is waiting, detected this error. The module that was suspended to wait for the action to be taken at the other site is the module that issued theabend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D3001A

Explanation

A CANCEL THREAD or CANCEL DDF THREAD command naming a distributed thread caused the thread to be terminated. A dump is provided for diagnostic purposes as a result of the CANCEL command DUMP keyword.

System action

Db2 writes a SYS1.LOGREC record and requests an SVC dump. The execution unit abends. If the canceled distributed thread is an allied thread, Db2 requests the cancellation of each associated database access thread at each of the server sites (refer to the explanation for 00D30000).

Operator response

Notify the system programmer.

System programmer response

The command might have been used to terminate a thread that was in a state where no processing was occurring and the thread could not continue.

If you suspect an internal Db2 error, obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

The module that was suspended while waiting for some action to be taken is the module that issued the abend.

00D3001B

Explanation

The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row describing what Db2 authorization ID should be used for the remote primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which Db2 authorization IDs are to be used for each authorization ID received from the remote LU.

System action

The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator response

Notify the communications database administrator

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the Db2 authorization IDs to be used for each possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3001C

Explanation

The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what Db2 authorization ID to be used for the remote new user primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which Db2 authorization IDs are to be used for each remote authorization ID from the LU.

System action

The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USER NAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USER NAMES table has rows that correctly specify the Db2 authorization IDs to be used for each possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USER NAMES table for an incorrect or missing entry.

00D3001D

Explanation

The database access request from a remote site failed because the SYSIBM.USER NAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what Db2 authorization ID to be used for the remote plan owner authorization ID. When the USER NAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USER NAMES table must contain entries describing which Db2 authorization IDs are to be used for each remote authorization ID from the LU.

System action

The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USER NAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USER NAMES table has rows that correctly specify the Db2 authorization IDs to be used for each possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USER NAMES table for an incorrect or missing entry.

00D3001E

Explanation

The SYSTEM PARAMETER section (DSN6SYSP) in the Db2 installation parameter module does not exist.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. DDF is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem determination

Ensure that DSN6SYSP was installed correctly.

00D3001F

Explanation

ACCRDBRM received from the remote server indicates incompatible server.

System action

The TYPDEFNAM or TYPDEFOVR values returned from the remote server in the DDM ACCRDBRM reply require data type and/or code page translations that cannot be supported by the local Db2. The local Db2 has disconnected the conversation with the remote server. Db2 requests neither a SVC dump nor a SYS1.LOGREC record.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Notify the system programmer at the remote location that the remote server may not be usable.

User response

Notify the system programmer. Invoke the application after the problem has been corrected.

Problem determination

Determine the server being accessed by examining the SQLCODE -30041 message text. Refer also to the DDM documentation of the ACCRDB command and the ACCRDBRM reply message.

00D30020

Explanation

The processing of the CONNECT statement at a remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) EXCSAT command sent by the local Db2 to the remote server.

System action

The remote server database access agent (DBAA) sends a DRDA reply message (for example, MGRVLVLRM) to the local Db2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local Db2.

Operator response

Operator will not detect this problem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local Db2 system administrator with this information.

Problem determination

This represents a DRDA configuration mismatch between the local Db2 and the remote server. The precise mismatch is determined from the reply message sent from the remote server to the local Db2. The reply message may be determined by examining

the SQLCODE and the SQLCA tokens returned for the CONNECT statement.

The remote server and local Db2 system administrators should consult together to determine if this is a system configuration error, or if an internal error exists at either the local Db2 or remote server.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Collect the following local Db2 diagnostic items:

- Application source code and run time listing.
- Relevant error and system logs spanning the time of the failure.

00D30021

Explanation

The processing of the CONNECT statement at a Db2 remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) ACCRDB command sent by the local Db2 to the remote server.

System action

The remote server database access agent (DBAA) sends a DRDA reply message (for example, VALNSPRM) to the local Db2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local Db2.

Operator response

Operator will not detect this problem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local Db2 system administrator with this information.

Problem determination

This represents a DRDA configuration mismatch between the local Db2 and the remote server. The precise mismatch is determined from the reply message sent from the Db2 remote server to the local Db2. The reply message may be determined by examining the SQLCODE and the SQLCA tokens returned for the CONNECT statement. It could indicate any one of the following problems (but is not limited to these):

- The EXCSAT command was not successfully processed prior to receipt of the ACCRDB command.
- The TYPDEFNAM parameter (specifies local Db2 data types) in the ACCRDB command is not supported.
- The TYPDEFOVR parameter (specifies local Db2 CCSIDs) in the ACCRDB command is not supported.
- The local Db2 product is not recognized/supported by the remote server.

The system administrators for the two locations should consult together to determine if this is a system configuration error or if an internal error exists at either location.

Collect the following diagnostic items at the remote server:

- Console output from the system on which the job was run and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set obtained by executing IFCEREP1.
- The system CCSIDs.

Collect the following diagnostic items at the local Db2:

- Application source code and run time listing.
- Relevant error and system logs spanning the time of the failure.
- The system CCSIDs.

00D30022

Explanation

The processing of the CONNECT statement at the remote server has failed and the local Db2 Data Base Access Agent (DBAA) has been abended. This is because authorization checking has failed at the remote server.

System action

The conversation with the local Db2 subsystem is terminated by the remote server with an LU6.2 SNA sense code. The DBAA is abended. A DSNL030I

message is written to the MVS console at the remote server, and an alert is generated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Either the user does not have the proper authority to execute at the remote server, or there is a security configuration mismatch in the communication database between the local Db2 and the remote server. (For example, a row might be missing in the SYSIBM.USERNAMES table at the remote server.)

Examine the DSNL030I message or the alert for a more specific reason code describing the failure. Consult with the two system administrators if necessary to fix the problem. No dump is generated for this abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

[DSNL030I \(Db2 Messages\)](#)

00D3002D

Explanation

The connection to the remote server failed. The SYSIBM.USERNAMES table did not contain an outbound row and did not specify the remote authorization ID for the plan owner Db2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs that are used for each Db2 authorization ID that communicates with the LU or the TCP/IP address.

System action

A response is sent to the application to indicate that the resource is unavailable. The request is not sent to the remote site.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USER NAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified correctly for the indicated LUNAME or IPADDR. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USER NAMES table has rows that specify the remote authorization ID to be used for each possible Db2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USER NAMES table.

Problem determination

Analyze the SYSIBM.USER NAMES table for an incorrect or missing entry.

00D3002E

Explanation

No resync list entry exists during resynchronization when one is expected to exist. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

.

00D3002F

Explanation

An unrecognized function request was detected during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

.

00D30030

Explanation

This site is not considered a coordinator or participant during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

.

00D30031

Explanation

An unknown 2-phase COMMIT protocol is being used during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at

the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

.

00D30032

Explanation

This site is not considered either an initiator or recipient of resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30033**Explanation**

This site is invalidly an initiator of resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30034**Explanation**

An INDOUBT resync list entry does not have the correct associated structures during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D30035**Explanation**

A resolved unit of work still has internal structures associated with it during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

.

00D30036

Explanation

Either the coordinator or participant has an invalid status during resynchronization. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3003B

Explanation

A distributed thread was canceled because one of the following values was exceeded:

- The idle thread timeout value that is specified by Db2 subsystem parameter IDTHTOIN in macro DSN6FAC
- The ATTRIBUTE2 value in a row with KEYWORD value MONITOR IDLE THREADS in the

SYSIBM.DSN_PROFILE_ATTRIBUTES table, for a profile that monitors the thread

System action

The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

The server thread was holding Db2 resources and the requester application did not make a request to the Db2 server thread for an extended period of time. The server thread is terminated to release resources that might affect other threads.

This usually occurs for one of these reasons:

- The ACTIVE thread option was specified in the CMTSTAT subsystem parameter, which corresponds to the DDF THREADS field of the DSNTIPR installation panel. A requester application or its user did not make a request to the Db2 server for an extended period. This can happen due to a lengthy user absence. As a result, the server thread was canceled when the timeout value was exceeded.

Determine why the requester application has not made a request to the Db2 server in the specified time.

- The INACTIVE option was specified for subsystem parameter CMTSTAT. One of the following situations occurred:
 - A requester application or its user failed to issue a commit operation before an extended dormant period, such as a user absence.
 - A requester application or its user issued a commit operation before an extended dormant period, but database resources were still being held because of other conditions.

As a result, the server thread could not be moved to the inactive state, and was canceled when the timeout value was exceeded.

Determine why the server thread was not moved to the inactive state.

If the design or use of the application requires additional time, take one of the following actions:

- Increase the value of the IDTHTOIN subsystem parameter, or set it to zero to deactivate idle thread timeout.
- If the server thread is monitored by profile tables, and the SYSIBM.DSN_PROFILE_ATTRIBUTES profile table contains a row with KEYWORD value MONITOR

IDLE THREADS for a profile that monitors the server thread, increase the ATTRIBUTE2 value in the row, or set ATTRIBUTE2 to zero to deactivate monitoring.

00D3003C

Explanation:

A client program issued a cancel request that terminated processing of the SQL statement.

System action:

The SQL statement was terminated and any changes made by that statement have been undone. If an SQL cursor is associated with the interrupted SQL statement, that cursor is closed. An sqlcode of -952 is issued.

00D3003D

Explanation:

Distributed data access to an accelerator is not supported.

System action:

The connection to the accelerator server is terminated.

Programmer response:

Remove references to accelerator server location names from the application.

00D3003E

Explanation

A connection or thread that is running under KEEP_DYNAMIC refresh rules was actively in use for more than one hour. A unit-of-work was completed and only packages bound with the KEEP_DYNAMIC(YES) option are causing the thread to remain active with its connection.

This condition might normal if the client connected to Db2 indicating that it uses KEEP_DYNAMIC(YES) packages and it is enabled for either:

- Sysplex workload balancing.
- Seamless failover.

Under the support for KEEP_DYNAMIC refresh rules from the following drivers, when a client socket is closed from the server, the client attempts to reconnect back to the same server and marks that all

statements managed under the connection need to be prepared.

- IBM Data Server Driver for Java
- IBM Data Server Driver for ODBC/CLI/.NET

System action

The connection or thread is terminated.

User response

No action is required.

Related concepts

[Methods for keeping prepared statements after the point of commit or rollback \(Db2 Performance\)](#)

Related tasks

[Enabling KEEP_DYNAMIC refresh for DBATs \(Db2 Performance\)](#)

Related reference

00D30040

Explanation

An invalid or incomplete DDF communication record was found in the BSDS.

System programmer response

Use the DSNJU003 change log inventory utility to add a valid DDF communication record to the BSDS.

00D30041

Explanation

An invalid subsystem IPv4 address was found in the BSDS. The specified address does not conform to dotted decimal form.

System programmer response

Use the DSNJU003 change log inventory utility to correct or remove the BSDS DDF communication record subsystem IPv4 address. See the IPV4 and NOIPV4 keywords of the DDF statement for more information.

00D30042

Explanation

An invalid subsystem IPv6 address was found in the BSDS. The specified address does not conform to colon hexadecimal form.

System programmer response

Use the DSNJU003 change log inventory utility to correct or remove the BSDS DDF communication record subsystem IPv6 address. See the IPV6 and NOIPV6 keywords of the DDF statement for more information.

00D30043**Explanation**

An invalid group IPv4 address was found the BSDS. The specified address does not conform to dotted decimal form.

System programmer response

Use the DSNJU003 change log inventory utility to correct or remove the BSDS DDF communication record group IPv4 address. See the GRPIPV4 and NGRPIPV4 keywords of the DDF statement for more information.

00D30044**Explanation**

An invalid group IPv6 address was found the BSDS. The specified address does not conform to colon hexadecimal form.

System programmer response

Use the DSNJU003 change log inventory utility to correct or remove the BSDS DDF communication record group IPv6 address. See the GRPIPV6 and NGRPIPV6 keywords of the DDF statement for more information.

00D30045**Explanation**

An subsystem IPv4 or IPv6 address is invalid with respect to the specified group IPv4 or IPv6 address. Data sharing members require subsystem or member and group pairs. That is, if a subsystem or member IP address is specified, a corresponding group address is also required since the Db2 subsystem is a member of a data sharing group.

System programmer response

Use the DSNJU003 change log inventory utility to add a corresponding group address or to remove the subsystem or member address. See the GRPIPV4, GRPIPV6, NOIPV4, and NOIPV6 keywords of the DDF statement for more information.

00D30046**Explanation**

A value was found for the IPNAME field of the BSDS DDF record but only zero values were found for the PORT and RESPORT fields in the BSDS DDF record. If

an IPNAME value is specified, DDF will only attempt to activate its TCP/IP communications support which needs values for PORT and RESPORT in the BSDS DDF record.

System programmer response

Use the DSNJU003 change log inventory utility to add non-zero values for the PORT and RESPORT fields of the BSDS DDF record or to remove the IPNAME value if SNA/APPC communication is needed.

00D30050**Explanation**

A distributed thread was aborted because a server thread held Db2 resources, and the requesting application did not make a request to the Db2 server thread for an extended period of time. The amount of time that the distributed thread was idle exceeded the setting for the MONITOR IDLE THREADS keyword in a monitor profile. That monitor profile also specified an EXCEPTION_ROLLBACK action for one of the following filtering scopes:

- LOCATION
- PRDID
- ROLE_AUTHID
- ROLE
- AUTHID
- COLLID_PKGNAME
- COLLID
- PKGNAME
- CLIENT_APPLNAME
- CLIENT_USERID
- CLIENT_WRKSTNNAME

System action

The server thread is aborted. The connection with the remote application is maintained.

If the aborted transaction performed database updates, the application environment is placed in a must-abort state so that the application environment is made aware of the resources that have been destroyed as a result of the aborted threads.

Important: If either of the following situations are true, Db2 hides the EXCEPTION_ROLLBACK event from the remote application environment:

- The aborted transaction performed only read-only operations.

- The transaction committed or aborted, but the associated database access thread remained active before it became idle.

Because the EXCEPTION_ROLLBACK event is not visible to the remote application environment in those cases, it might appear to the remote application environment that the database resources are unexpectedly disappearing. For example, held cursors, kept dynamic statements, and declared temporary tables that were created in the transaction are destroyed.

Operator response

Notify the system programmer.

System programmer response

Review the information that is provided in the DSNL030I message. The condition usually occurs for one of the following reasons:

- The ACTIVE option was specified for subsystem parameter CMTSTAT, which corresponds to the DDF THREADS field of the DSNTIPR installation panel. A requester application or its user did not make a request to the Db2 server for an extended period. This might happen because of a lengthy user absence. As a result, the server thread was aborted when the timeout value was exceeded.

Determine why the requesting application did not make a request to the Db2 server in the specified time.

- The INACTIVE option was specified for subsystem parameter CMTSTAT. One of the following situations occurred:
 - A requester application or its user failed to issue a commit operation before an extended dormant period, such as a user absence.
 - A requester application or its user issued a commit operation before an extended dormant period, but database resources were still being held because of other conditions.

As a result, the thread could not be moved to the inactive state, and was aborted when the timeout value was exceeded.

Determine why the server thread was not moved to the inactive state.

If the design or use of the application requires additional time, follow these steps:

1. Modify the exception threshold for the MONITOR IDLE THREADS profile in the SYSIBM.DSN_PROFILE_ATTRIBUTES table.

2. Issue the START PROFILE command to refresh the exception threshold value.

Related tasks

[Monitoring remote idle threads by using profile tables \(Db2 Administration Guide\)](#)

[-START PROFILE command \(Db2\) \(Db2 Commands\)](#)

00D30051

Explanation

Authentication failed for a distributed thread. A remote client environment used a digital client certificate for authentication, but a required trusted context was not defined at the Db2 for z/OS server.

The information that is provided in the associated DSNL030I message includes the user ID and the IP address of the remote client environment. A Db2 trusted context is required for the specified user ID. The remote client environment accesses the Db2 server using digital certificates, through SSL client authentication. The user ID that is provided by the remote client is different from the user ID that is associated with the client digital certificate at the server. Therefore, additional authentication is required. Db2 uses the user ID that is obtained from the certificate to search for a trusted context. When the trusted context exists, Db2 processes the remote client user ID that is specified in the message as a trusted context switch-user request. However, the trusted context did not exist, so a switch-user request could not be performed.

System action

Authentication fails, and the connection with the remote client environment is terminated.

Operator response

Notify the system programmer.

System programmer response

Review the information that is provided in the associated DSNL030I message. Create a trusted

context for the user ID that is specified in the information for the remote client environment.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the error occurred
- Trusted context definition
- AT-TLS policy configuration, in which HandShakeRole is set to ServerWithClientAuth
- RACF RACDCERT commands that were used to add the client certificate to the keyring at the z/OS server, including any RACDCERT MAP commands if RACF certificate name filtering is used

Related concepts

User response

Verify that the correct CORS origin host was specified in the Db2 REST service request. If necessary, request Db2 subsystem CORS authorization for the origin from your Db2 security administrator.

Problem determination

During REST service request CORS authorization processing, Db2 invokes the RACROUTE service to verify the CORS origin host is authorized for this Db2 subsystem. The RACF return code indicates that the origin host is not authorized for this Db2 subsystem. The Db2 REST service request is allowed to continue processing, but it does not include CORS authorization header fields in the generated REST service response. Db2 will also have attempted to capture the host origin and related information to an IFCID 416 exception trace record. Any messages issued by RACF(ICH408I) and the content of the IFCID 416 exception trace can then be used to determine the reason for the CORS origin authorization failure.

Related tasks

[Enabling CORS support for Db2 REST services \(Db2 REST services\)](#)

Related information

[DSNL616I \(Db2 Messages\)](#)

00D30063

Explanation

Db2 received a Db2 REST services request that included cross-origin resource sharing (CORS) authorization header fields, but the origin host identified in the request is not authorized.

System action

Db2 REST services request processing is allowed to continue, but without returning any CORS origin authorization content in the response.

System programmer response

Examine the console or SYSLOG output for RACF messages (ICH408I) issued when a Db2 REST services CORS authorization request is denied. Collect and examine Db2 IFCID 416 exception trace record contents for additional information related to this failure.

00D30064

Explanation

Db2 received a Db2 REST services request that included cross-origin resource sharing (CORS) authorization, but the request did not include a value for the required origin host. This is a REST application coding error.

System action

Db2 REST services request processing is allowed to continue, but without returning any CORS origin authorization content in the response.

System programmer response

Collect and examine the IFCID 416 exception trace record contents for additional information related to this failure.

User response

Verify that a valid CORS origin host value is specified in the Db2 REST service request.

Problem determination

The Db2 REST service request is allowed to continue processing, but it does not include CORS authorization header fields in the generated REST service response. Db2 also attempts to capture the host origin and related information to an IFCID 416 exception trace record. The content of the IFCID 416 exception trace can be used to help identify the application in error.

Related tasks

[Enabling CORS support for Db2 REST services \(Db2 REST services\)](#)

00D30065

Explanation

Db2 received a Db2 REST services request that included cross-origin resource sharing (CORS) authorization using an unsupported format for the origin host value. This is a REST application coding error

System action

Db2 REST services request processing is allowed to continue, but without returning any CORS origin authorization content in the response.

System programmer response

Collect and examine Db2 IFCID 416 exception trace record contents for additional information related to this failure.

User response

Verify that a valid CORS origin host value is specified in the Db2 REST service request.

Related tasks

[Enabling CORS support for Db2 REST services \(Db2 REST services\)](#)

00D30066

Explanation

Db2 received a Db2 REST services request that included cross-origin resource sharing (CORS) authorization, but the Db2 REST services CORS support is not enabled.

System action

Db2 REST services request processing is allowed to continue, but without returning any CORS origin

authorization content in the response. Db2 attempts to issue message DSNL616I.

System programmer response

If you want to enable the Db2 REST services CORS support, activate the RACF DSNRAUTH class and define the necessary Db2 REST CORS DSNRAUTH resource profiles.

User response

If Db2 REST services CORS authorization support is required, request your Db2 security administrator to enable the Db2 subsystem CORS authorization support and permit authorization for the host origin being used.

Problem determination

Db2 attempts to issue message DSNL616I and also captures the host origin and related information to an IFCID 416 exception trace record. The content of the IFCID 416 exception trace can be used to help identify the client causing the error.

Related tasks

[Enabling CORS support for Db2 REST services \(Db2 REST services\)](#)

Related information

[DSNL616I \(Db2 Messages\)](#)

00D300F1

Explanation

The DSNLTOKS macro was invoked to extract error information from the DTMF block using the CHECK_SQLCODE keyword and the DTMF block was either uninitialized or contained an SQL return code that was not negative. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The execution unit is abnormally terminated.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and

reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This name of the module that invoked the function given as the abending module name. This is not the module in error. An earlier failing module neglected to report error information in the DTMF block.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D300F2

Explanation

EXCSATRD reply received from a remote server indicates an incompatible server.

System action

The manager levels returned from the local Db2 in the DDM EXCSATRD reply were too low for the local Db2 to support. The local Db2 has disconnected the conversation with the remote server. Db2 requests neither an SVC dump nor a SYS1.LOGREC record written.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Notify the system programmer at the remote location that the remote server is not usable.

User response

Notify the system programmer. Invoke the application after the problem has been corrected.

Problem determination

Determine the server being accessed by inspecting the SQLCODE -30041 message text. Refer to the DDM documentation of the EXCSAT command.

00D300F3

Explanation

The connection to the remote server failed. The SYSIBM.USERNAMES table did not contain an outbound row and did not specify the remote authorization ID for the new user primary Db2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs that are used for each Db2 authorization ID that communicates with the LU or the TCP/IP address.

System action

A response is sent to the application to indicate that the resource is unavailable. The request is not sent to the remote site.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified correctly for the indicated LUNAME or IPADDR. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that specify the remote authorization ID to be used for each possible Db2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D300F4

Explanation

A DRDA protocol error occurred. Either a reply chain is broken but there is no DDM reply with a high enough severity to break the chain, or a message chain is unbroken in spite of a high severity code, or a conversation expected to be available has been terminated. The problem, though detected by Db2, is believed to have originated at the remote server. The server might not be a Db2 subsystem.

System action

This reason code is returned to the application. A request message has likely been sent to the remote site but the outcome is uncertain. A DSNL031I

message may have been written to the console. Refer to the description of this message for more information. If this reason code is returned for an SQL 'COMMIT' statement, determine if manual recovery of the unit of work is necessary.

Operator response

Notify the operator or systems programmer for the remote server.

System programmer response

Determine the product type of the server. The DISPLAY THREAD command may be used. Refer to the server products' diagnostic recommendations. If the server DBMS is Db2, contact your IBM representative to report the problem and open an APAR.

Problem determination

The problem originated with the remote server. Follow the diagnostic recommendations published for the server DBMS product, which might not be Db2.

00D300F5

Explanation

DDM command chaining is in use.

System action

The DTM module returns to its invoker with a return code = 4.

00D300F6

Explanation

A valid but unexpected DDM reply was received from a remote server during a connect, commit, or abort operation. For a connect, the expected DDM reply is EXCSATRD (for EXCSAT command) or ACCRDBRM (for ACCRDB command). For a commit or abort, the expected DDM reply is ENDUOWRM. (The DDM command for a commit is RDBCMM. For a rollback, it is RDBRLBCK).

System action

The local Db2 tried to access a remote server and the server replied with an unexpected DDM answer. The remote server may have suffered permanent damage. The local Db2 may or may not subsequently disconnect the conversation to the server. This is an internal-only DDF reason code. The local Db2 requests neither a SVC dump nor a SYS1.LOGREC record.

System programmer response

If the SQLCA is available, examine all fields in the SQLCA. Using this information, try to determine what DDM reply was received. Contact the system programmer at the server site with this information. This is probably a programming error at the server database system, although it may be a Db2 error. The server database system may have recorded diagnostic information for the problem. If this is a Db2 error, write an APAR.

User response

Contact the system programmer

Problem determination

Examine the SQL return code in the SQLCA. It should give further indication of the real cause.

00D300F7

Explanation

A DDM reply message was too big to fit in the DTM reply buffer.

System action

The requesting allied agent is terminated. A SYS1.LOGREC record is written and an SVC dump is requested at the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This error should never occur. Write an APAR.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D300F8**Explanation**

An attempt was made to access data at a remote location that has been started in restricted access mode. When a Db2 system is started in restricted access mode, no remote inbound or outbound access is allowed.

System action

Remote access is not allowed.

Operator response

Notify the system programmer.

System programmer response

Determine the remote location where the remote data access was attempted. Retry the request when the remote location and/or the local Db2 has been restarted in full access mode.

00D300F9**Explanation**

The Db2 server was unable to allocate a database access agent since the maximum number allowed was zero (ZPARM MAXDBAT value was zero).

System action

The Db2 server terminates the conversation with a 084B6031 SNA sense code for application-directed access and a 00D300F9 Db2 code for system-directed access. A DSNL030I message containing this reason code is written to the MVS operator console at the Db2 server site.

System programmer response

At the server, currently no data base access agents are allowed because the MAXDBAT value in the ZPARM is zero. If access to this site from a remote site is desirable, change the MAXDBAT parameter in ZPARM to the maximum number of database access agents needed. Restart Db2 at the server. Notify the user to rerun the application.

00D300FA**Explanation**

You attempted a COMMIT statement for a plan that specified ISOLATION (RR) and update operations were performed either at the local site or at a remote

site. The COMMIT operation could not be performed because the COMMIT request could not be transmitted to a remote site where Repeatable Read operations had been performed.

System action

All update operations were backed out.

System programmer response

Determine why the COMMIT failed and retry the application.

00D300FB**Explanation**

A resource was not available during database access agent allocation at a remote site.

System action

The allocation of the database access agent was unsuccessful. A 'resource not available' code is returned to the user. Db2 requests neither a SVC dump nor a SYS1.LOGREC record.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. Invoke the application after the problem has been corrected.

Problem determination

Determine the name of the resource being allocated and correct the problem.

00D300FC**Explanation**

You attempted to allocate a resource at a remote site using an invalid name.

System action

The allocation of the database access agent was unsuccessful. A 'resource not available' code is returned to the user. Db2 requests neither a SVC dump nor a SYS1.LOGREC record. This reason code is returned only for system-directed access (DSNLTMRA).

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. Invoke the application after the problem has been corrected.

Problem determination

Determine the resource being allocated and correct the problem.

00D300FD

Explanation

An attempt was made to disconnect a connection with a specified location, but the transaction has not yet been connected to that location. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The execution unit is abnormally terminated.

Problem determination

Obtain a copy of SYS1.LOGREC and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The name of the module that invoked the function incorrectly is given as the abending module name.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D300FE

Explanation

You executed a COMMIT statement and update operations were performed at a remote site. The

success of the COMMIT operation could not be determined because a failure occurred at the remote site or in the communication link with the remote site after the request to commit the operation had been transmitted.

System action

The remote updates have been committed or backed out, depending on when the error occurred.

User response

After communication has been reestablished with the remote site, use SQL to query the updated data to determine whether the updates were committed. If the updates were not committed, rerun the application and perform the updates again.

00D300FF

Explanation

You attempted a COMMIT statement and update operations were performed at a remote site. The attempt failed.

System action

The updates at the remote site have been backed out.

User response

Rerun the application.

Problem determination

Determine why the COMMIT failed and retry the application.

00D30100

Explanation

A COMMIT statement was chained to a set of commands sent to an remote server. The remote server stopped processing the chained commands before it reached the COMMIT. COMMIT was NOT performed.

System action

Any updates performed within the current unit of Work have been backed out.

Operator response

Operator will not detect this problem.

System programmer response

See Problem Determination.

User response

Notify the system programmer of the failure.

After the problem causing the chain to be broken at the remote server is fixed, rerun the application and perform the updates again.

Problem determination

Collect the following diagnostic items from the local Db2 system.

- Listing of application program and output from application program.
- Console output and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.

Consult with the remote server system programmer to determine the cause of the error.

The remote server system programmer may need to collect the following remote server diagnostic items:

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server dumps.

00D30101

Explanation

A COMMIT was attempted but failed due to a prior error. Communications to a remote site have been lost. The COMMIT operation cannot be performed because the COMMIT request could not be transmitted to a remote site. If the program has performed updates, the updates have been backed out to the prior COMMIT point.

System action

All update operations were backed out.

Operator response

Notify the system programmer.

System programmer response

Restart DDF at the affected sites and rerun the application.

00D30103

Explanation

This reason code may be returned for a failed distributed commit using DRDA protocols. It indicates that commit has failed because an ABNUOWRM reply message was received from the server for a prior SQL statement, but an abort had not been driven at the Db2 requester prior to this commit and after the receipt of the ABNUOWRM.

An ABNUOWRM reply message is sent by the server when it has rolled back its unit-of-work in response to an unusual situation at the server (for example, deadlock or operator intervention). When an ABNUOWRM reply message is received by the requester, an abort must be driven at the requester to synchronize the distributed systems. Until an abort is driven, all subsequent SQL statements will receive an SQLCODE -906. After an abort is driven, further SQL statements will be accepted.

System action

The commit at the Db2 requester fails.

Operator response

The operator will not detect this problem.

System programmer response

Determine the cause of the problem represented by the SQLCODE returned with the ABNUOWRM and if necessary, work with the system programmer at the server to resolve it. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Scan backwards in your application for the first non -906 SQLCODE prior to the commit. This SQLCODE was returned with the ABNUOWRM from the server system. Use the server product reference manuals to determine and correct whatever problem this SQLCODE represents on the server and rerun your application. This may involve contacting your system programmer if the situation at the Server cannot be corrected or improved by changes to the application program.

Problem determination

Collect the following diagnostic items:

- User's application output, including SQLCAs returned for each SQL statement.

00D30104**Explanation**

The unit-of-work disposition (commit or rollback) received from a DRDA server is inconsistent with the command sent (commit or rollback), and the SQLCODE returned from the server. For example, if a commit is sent to the server, and the reply message indicates the unit of work (UOW) was committed, but the SQLCODE returned is negative, then this reason code will be contained in the alert sent to NetView.

System action

An alert is generated and sent to NetView. Two trace records, IFCID 0191 and IFCID 0193, may be written to the Statistics Class 4 trace, and two DSNL031I messages may be written to the console. The trace records and messages will not be written if this error was previously detected within the last 5 minutes. The Statistics Class 4 trace must be active for the trace records to be written.

An SQLCODE +30100, -30020, or -30030 is returned to the application. An SQLCODE -30020 indicates a rollback was sent to the DRDA server, but a commit unit-of-work disposition was received. An SQLCODE +30100 or -30030 conveys the unit-of-work disposition reported by the server, and replaces the original SQL return code sent by the server, which was not consistent with the UOW disposition. The original SQL return code and SQLSTATE returned by the server are saved as tokens in the SQLCA.

Operator response

Notify the system programmer.

System programmer response

This is a DRDA distributed protocol problem. Once the nature of the inconsistency is known, the server system programmer may have to be contacted to help resolve the problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Listing of the user's application program output, including printouts of the SQLCAs received for all SQL statements.

- Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of the Statistics Class 4 trace records for the LUWID associated with the failing request.

If no DSNL031I messages were written at the same time as the alert, then scan the log backwards for previous DSNL031I messages. A Db2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the two DSNL031I messages, locate the IFCID 0191 and 0193 trace records written for the problem by using the IFCID sequence numbers from the DSNL031I messages.

The IFCID 0193 trace record will document the nature of the inconsistency (command sent, UOW disposition received, SQL return code received).

The IFCID 0191 trace record will document the exact data stream returned from the Server. Use this information to determine if the reply message from the server was correctly converted into the UOW disposition and the SQL return code reported in the IFCID 0193 record. If the data stream was correctly converted, then the problem lies at the server and you should contact the system programmer at the server and have him or her analyze the data stream produced by the server.

EXECUTION FAILED DUE TO A DISTRIBUTION
PROTOCOL ERROR THAT CAUSED
DEALLOCATION OF THE CONVERSATION:
REASON *reason-code (sub-code)*

-30030

COMMIT REQUEST WAS UNSUCCESSFUL,
A DISTRIBUTION PROTOCOL VIOLATION
HAS BEEN DETECTED, THE CONVERSATION
HAS BEEN DEALLOCATED. ORIGINAL
SQLCODE=*original-sqlcode* AND ORIGINAL
SQLSTATE=*original-sqlstate*

00D30105

Explanation

A distributed commit has failed because the allied agent was canceled as a result of a STOP DDF MODE(FORCE) command during a previous execution of DDF which has terminated. When an allied agent does not issue database requests for more than 2 minutes after a STOP DDF MODE(FORCE) command is issued, DDF will come down without terminating the allied agent. The agent is canceled when it makes its next request to Db2.

System action

The commit operation is failed and the agent is canceled. The last unit of work was rolled back at all server systems when the STOP DDF MODE(FORCE) command was processed.

Operator response

Re-start DDF.

User response

Contact the operator to re-start DDF. After DDF is re-started, continue your application's work starting with the last unit of work that was rolled back.

00D30106

Explanation

The result of a DRDA distributed commit could not be determined because the reply message from the server either was invalid or could not be deciphered.

System action

An alert is generated and sent to NetView. An IFCID 0191 trace record may be written to the statistics class 4 trace, and a DSNL031I message may be written to the console. The trace record and message will not be written if this error was previously detected within the last 5 minutes. The statistics class 4 trace must be active for the trace records to be written.

The requester disconnects from the server system. The state of the unit of work at the server is unknown. It may have been committed, or it may have been rolled back. An SQLCA indicating the nature of the DRDA reply message distortion is given to the application.

Operator response

Notify the system programmer whenever a DSNL031I message is written to the MVS console.

System programmer response

This is a DRDA distributed protocol problem. Once the nature of the problem is known, the server system programmer may have to be contacted to help resolve the problem.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. After the problem has been resolved, re-connect to the server site to determine whether the last unit of work was committed or rolled back. Continue your application after correcting the server database (if necessary).

Problem determination

Collect the following diagnostic items:

- Listing of the user's application program output, including printouts of the SQLCAs received for all SQL statements.
- Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of the statistics class 4 trace records.

If no DSNL031I message was written at the same time as the alert, then scan the log backwards for a previous DSNL031I message. A Db2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the DSNL031I message, locate the IFCID 0191 trace record written for the problem by using the IFCID sequence number from the DSNL031I message.

The IFCID 0191 trace record will document the exact data stream returned from the server. Use this information to determine if the reply message from the Server was correct, and if so, the error resides with the Db2 AR.

If the data stream is incorrect, then the problem lies at the server and you should contact the system programmer at the server and have he or she analyze the data stream produced by the server.

00D30109

Explanation

Phase 1 of a distributed commit failed. One or more remote servers did one of the following actions:

- Voted NO
- Voted heuristic mixed
- Experienced a communications error
- Made an error in their use of commit protocol

System action

The commit fails. The unit of work is backed out.

For communication errors, message DSNL406I is written to the system console, alert A006 is generated, and trace record IFCID 0209 is produced to record the server affected (LUWID of the unit of work, and other information).

For protocol errors, message DSNL413I is written to the system console, alert A005 is generated, and trace record IFCID 0208 is produced to describe the nature of each server's protocol violation.

System programmer response

For protocol errors, contact the system programmer for the remote site. The invalid sync point message is recorded in the IFCID 0208 trace record. The system logic error that causes the invalid sync point message must be corrected at the remote site.

User response

Contact the Db2 systems programmer. If the commit failed for other than a commit protocol violation by a remote server, resubmit your application. Otherwise, wait for resolution of the protocol error.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3010A

Explanation

This might occur when a version of IMS that does not support the COMMIT VERIFY exit is running an IMS MODE=MULTI application with one or more non-Db2 servers. This is probably a user error, since this scenario is not supported by Db2 and IMS unless the IMS version is 4 or later.

IMS requested a new user SIGNON without an immediately preceding commit or abort, and your application was connected to one or more remote non-Db2 servers. In order to preserve the consistency of database updates made at several different servers, when at least one server is a non-Db2 server, a commit or abort must precede any new user SIGNON.

System action

The execution unit writes a record to SYS1.LOGREC. No dump is requested. The IMS application terminates as a result of theabend.

Operator response

Collect the SYS1.LOGREC. Notify the system programmer.

System programmer response

Determine if the IMS version and release being used invokes the Db2 COMMIT VERIFY exit, which is available in Version 3 and later. Obtain the SYS1.LOGREC.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3010B

Explanation

Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the conversation SYNC_LEVEL supported by the partner changed from a cached value of SYNC to the current of value NONE.

SYNC_LEVEL NONE servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back (abort).

This reason code is returned as a token in the SQLCODE -904.

System action

The connection to the server is deallocated. The server's portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

User response

If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different SYNC_LEVEL.

Rerun your application starting with the unit of work containing the SQL statement that received an SQLCODE -904.

00D3010C

Explanation

Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the partner was started with a program that does not support two-phase commit.

Such servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back.

This reason code is returned as a token in the SQLCODE -904.

System action

The connection to the server is deallocated. The server's portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

User response

If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different level.

Rerun your application starting with the unit of work containing the SQL statement that received the SQLCODE -904.

00D3010D

Explanation

Db2 requested updates at multiple servers, but at least one server does not support distributed two-phase commit.

System action

If the application is using TSO or BATCH attach, then Db2 rolls back the UOW. If the application is using CICS or IMS attach, then CICS or IMS rolls back the UOW after receiving the NO commit vote from Db2.

User response

Change the application so that updates to multiple servers (including the local server) are not performed within a single UOW unless all the update servers in the UOW support distributed two-phase commit.

Problem determination

In the UOW that was not committed, the first SQL statement that performed an update that was not allowed received an SQLCODE -919. All subsequent SQL statements also received an SQLCODE -919 until a ROLLBACK or a static ROLLBACK SQL statement was executed (if either occurred).

00D3010E

Explanation

The DRDA server system does not support the authentication mechanism specified in the communications database. For example, the communications database specified that RACF passtickets were supposed to be used, but the server does not support it.

System action

The attempt to access the remote server fails. An SQLCODE -30073 is returned to the application.

System programmer response

Modify the row in SYSIBM.LUNAMES or SYSIBM.IPNAMES to specify a security mechanism in the SECURITY_OUT column that the remote server supports.

User response

Notify the system programmer.

00D3010F

Explanation

Db2 was unable to authenticate the DRDA user, due to an error detected by RACF or DCE.

System action

The user's attempt to connect is rejected. An SQLCODE -30082 is returned to the application.

System programmer response

Correct the error detected by DCE or RACF. Both products write messages to the MVS console describing the error.

User response

Notify the system programmer.

00D30110

Explanation

A DRDA error occurred. The Db2 crypto security component detected an error and could not process the encryption security tokens used to authenticate the user.

System action

The attempt to connect to Db2 fails, the failure is reported to the SQL application with an SQLCODE of -30082, and the connection is terminated.

System programmer response

Determine the reason for the failure by verifying the DRDA data stream and by reviewing the server diagnostic work area returned in the DRDA security check reply message.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D30111

Explanation

Db2 SAF Identity Mapping service encountered an error when a request was made to process a user registry name.

System action

The Db2 SAF Identity Mapping service request is not processed. Normal connection authentication continues.

00D30112

Explanation

Integrated Cryptographic Service Facility (ICSF) detected an error and could not process the DRDA request.

System action

A DSNL045I or DSNL046I message might have been written to the console. Refer to the description of the message for more information.

If ICSF fails during connection processing at the Db2 requester, the connection attempt fails, and the failure is reported to the application with SQLCODE -904. The connection is terminated.

If ICSF fails during connection processing at a remote Db2 server, the connection attempt fails, and the failure is reported to the application with SQLCODE -30082. The connection is terminated.

If ICSF fails at a remote Db2 server during one of the following actions:

- Processing of an encrypted DRDA request
- Generation of an encrypted DRDA reply

the attempt to access the Db2 server fails, and the failure is reported to the local Db2 server. A DSNL032I message might have been written to the console. Refer to the description of the message for more information.

If ICSF fails at the Db2 requester during one of the following actions:

- Processing of an encrypted DRDA reply
- Generation of an encrypted DRDA request

the attempt to access the distributed resource fails, and the failure is reported to the local Db2 server. A DSNL031I message might have been written to the console. Refer to the description of the message for more information.

System programmer response

Check the console message and the reason code in the message for further analysis. Determine the reason for failure by verifying the DRDA data stream. If the server diagnostic work area is returned in the DRDA reply message, check the contents of the server diagnostic work area.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D30113

Explanation

Authentication of a remote user was rejected by Db2 because the user ID that was provided by the remote system or user exceeds eight characters.

The Db2 operating environment is restricted to no more than eight characters for user IDs. Remote client environments must be changed to comply with this restriction.

System action

The attempt to access Db2 is rejected, and the connection is terminated.

System programmer response

Modify the user ID that was provided by the remote system or user to contain no more than eight characters, and try the remote request again.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

[DSNL030I \(Db2 Messages\)](#)

00D30114

Explanation

Authentication of a remote user was rejected by Db2 because change of password security mechanism is not allowed when Db2 extended security support has been disabled.

Db2 extended security support is determined by the EXTSEC subsystem parameter, and the value of the parameter has been changed online to disable the support.

The change of password security mechanism will remain restricted until Db2 extended security support is enabled.

System action

The attempt to access Db2 is rejected, and the connection is terminated.

System programmer response

Enable Db2 extended security support, and try the remote request again.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related reference

[EXTENDED SECURITY field \(EXTSEC subsystem parameter\) \(Db2 Installation and Migration\)](#)

Related information

[DSNL030I \(Db2 Messages\)](#)

00D30115

Explanation

Authentication of a remote user was rejected by Db2. The TCPALVER (TCP/IP Already Verified) subsystem parameter has been changed, and the security mechanism that was provided is no longer allowed.

Possible causes for this error include:

- A user ID only (no password required) security mechanism is not allowed because the TCPALVER value has been changed to a value that requires a password.
- A user ID and password security mechanism is not allowed because the TCPALVER value has been changed to a value that requires security credentials to be properly encrypted.
- A change of password security mechanism is not allowed because the TCPALVER value has been changed to a value that requires security credentials to be properly encrypted.
- DES-based encrypted security mechanisms are not allowed because the TCPALVER value has been changed to a value that requires a more secure form of encryption.

The security mechanism will remain restricted unless the Db2 TCP/IP already verified rules are modified to accommodate the security mechanism.

System action

The remote attempt to access Db2 is rejected, and the connection is terminated.

System programmer response

Change the TCPALVER subsystem parameter to a value that supports the security mechanism, and try the remote request again. Or, modify the security mechanism to meet the security requirement that is defined by the TCPALVER subsystem parameter setting, and try the remote request again.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related reference

[TCP/IP ALREADY VERIFIED field \(TCPALVER subsystem parameter\) \(Db2 Installation and Migration\)](#)

Related information

[DSNL030I \(Db2 Messages\)](#)

00D30116

Explanation

Authentication of a remote user was rejected by Db2. The TCPALVER (TCP/IP Already Verified) subsystem parameter has been set to SERVER_ENCRYPT and the user ID and password authentication that was provided is not allowed because the password could not be evaluated to be a RACF PassTicket.

This error is likely to result from the following causes:

- The RACF PTKTDATA class is inactive, or the resource (IRRPTAUTH.*application.target-userid*) is not defined to z/OS.
- The RACF PTKTDATA class is active and the resource IRRPTAUTH.*application.target-userid* is defined to z/OS but the user ID associated to *ssnmDIST* started task is not permitted to use it.
- The password provided is not a valid RACF PassTicket.

System action

The remote access attempt to Db2 is rejected, and the connection is terminated.

System programmer response

Ensure that the RACF PTKTDATA class is active, or the resource IRRPTAUTH.*application.target-userid* is defined and the user ID associated to *ssnmDIST* started task is permitted to access this resource, and try the remote request again.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

Severity

0 (informational)

Related reference

[TCP/IP ALREADY VERIFIED field \(TCPALVER subsystem parameter\) \(Db2 Installation and Migration\)](#)

00D31010**Explanation**

An internal logic error occurred while a DCRM functional service was being invoked.

DSNLCnnn identifies that a DCRM Conversation manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31011**Explanation**

An internal logic error occurred while invoking a VTAM functional service.

DSNLVnnn identifies that a DCRM VTAM manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31012**Explanation**

A VTAM functional service request failed because the state of the conversation was invalid for the request.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31013

Explanation

A Db2 message was received with an invalid message block header (MBH). The MBH is a header that precedes all messages exchanged between two Db2 subsystems.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

Determine which connected sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31014

Explanation

One or more invalid parameters were supplied while invoking a VTAM functional service.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31018

Explanation

A syntax error was detected in a DDM reply received from a remote distributed database remote server.

System action

The attempt to access the remote database resource fails, and the failure is reported to the application.

A DSNL031I message might have been written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D31019

Explanation

A DDM protocol error was detected in a DDM reply received from a remote distributed database remote server.

System action

The attempt to access the distributed resource fails, and the failure is reported to the local Db2.

A DSNL031I message might have been written to the console. Refer to the description of this message in this book for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D3101A

Explanation

A syntax error was detected in a DDM request received from a remote distributed database local Db2.

System action

The attempt to access the Db2 server fails, and the failure is reported to the local Db2.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D3101B

Explanation

A DDM protocol error was detected in a DDM request received from a remote distributed database local Db2.

System action

The attempt to access the Db2 server fails, and the failure is reported to the local Db2.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D3101C

Explanation

Db2 has detected an error while processing a connection request from DDCS. A DB2RA connection request was received from DDCS.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the DDCS system administrator.

System programmer response

This is probably not a Db2 problem. This error is most likely caused by an incorrect entry in the DCS directory on DDCS. Refer to IBM Distributed Database Connection Services Installation and Configuration Guide for information on configuring your DDCS system.

00D31020

Explanation

An attempt was made to use SNA/APPC communications to create an outbound DRDA protocol connection. However, this DDF, as identified by the corresponding *resource-type* of 00001000 and its Db2 subsystem ID as the corresponding *resource-name*, was started with an IPNAME value. This process caused DDF to only start its TCP/IP communications support.

System action

Notification of the failure is returned to the application. The conversation is not allocated.

System programmer response

An outbound DRDA protocol connection request was determined to require SNA/ APPC communications. This will occur when only a row in the SYSIBM.LUNAMES table of the Db2 Communications Database table has a LUNAME column value that matches to the LINKNAME column of the row in the SYSIBM.LOCATIONS table that corresponds to the location requested by the application. If DDF was intended to be started with only its TCP/IP communications support, then a row must exist in the SYSIBM.IPNAMES table with a LINKNAME column value for each row in the SYSIBM.LOCATIONS table that has a distinct value for its LINKNAME column. Otherwise, remove the IPNAME value from the BSDS DDF record by performing an update to the BSDS DDF record using the NOIPNAME parameter of the DDF statement of DSNJU003, the Change Log Inventory utility.

00D31022

Explanation

The requested VTAM function for allocating a conversation was not performed because the data manager returned an unavailable resource when attempting to read the SYSIBM.LOCATIONS table in the communication database (CDB). The LOCATION cannot be resolved to the remote Db2 subsystem LUNAME.

System action

Notification of the failure is returned to the application. The conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

For more information, refer to the explanation of message DSNL700I. Collect the following diagnostic items:

- Definitions of the communication database (CDB) table space, tables, and indexes involved in the error.

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D31023

Explanation

A request for a protected SNA conversation was rejected by a Db2 server because the SNA exchange log names (XLN) process has not yet completed with the requesting system.

System action

Message DSNL030I is displayed on the system console with reason code 00D31023. The SNA conversation is rejected with SNA sense code 08640001, indicating the SNA protocol for protected conversations was violated.

System programmer response

The requesting system should have sent a valid SNA XLN request before starting a protected conversation. Contact the system programmer for the requesting system to determine why the SNA XLN process was not completed successfully.

User response

Notify the Db2 system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D31024

Explanation

The requested VTAM function for allocating a conversation was not performed because the location name is not defined in the SYSIBM.LOCATIONS table in the communication database (CDB).

System action

Notification of the failure is returned to the application. The conversation is not allocated to the specified location.

Operator response

Notify the system programmer.

System programmer response

Add the location to the SYSIBM.LOCATIONS table.

Problem determination

Collect the following diagnostic items:

- Location used in the alias entry in SYSIBM.SYSTABLES.
- Contents of the SYSIBM.LOCATIONS table.

00D31025

Explanation

The requested VTAM function for allocating a conversation was not performed because a mode name could not be found in the SYSIBM.MODESELECT table in the communication database (CDB) for the requesting thread.

System action

Notification of the failure is returned to the application. The conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

Add the mode name to be selected in the SYSIBM.MODESELECT table for the authorization ID, PLANNAME, and LUNAME of the service request that failed.

Problem determination

Collect the following diagnostic items:

- AUTHORIZATION ID, PLANNAME, and LUNAME of the thread that is used to select the MODENAME in the SYSIBM.MODESELECT table.
- Contents of SYSIBM.LOCATIONS and SYSIBM.MODESELECT tables.

00D31026

Explanation

The requested VTAM function was not performed because VTAM returned a nonzero return code while attempting to communicate on a conversation.

System action

Notification of the failure is returned to the application. The conversation is abnormally deallocated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

For more information, refer to the explanation of message DSNL500I or message DSNL502I, depending on the type of conversation that failed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D31027

Explanation

The requested VTAM function cannot be performed because VTAM is abending or because the operator has issued a HALT NET command to terminate VTAM.

System action

Notification of DDF termination is reported to the application. No remote communications are allowed. The distributed data facility is terminated.

Operator response

Notify the system programmer.

System programmer response

Determine why VTAM was terminated.

00D31029

Explanation

The requested VTAM function to allocate a conversation failed. VTAM returned a nonzero return code while attempting to negotiate limits with a remote location for a mode.

System action

Notification of the failure is returned to the application. All communications to the remote location on the mode fail until the CNOS is successfully negotiated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

For more information, refer to the explanation of message DSNL501I.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D3102A

Explanation

A conversation was not allocated because a VTAM LU name contained in the LUNAME column of the SYSIBM.LULIST table was also present in the LUNAME column of the SYSIBM.LUNAMES table. A given VTAM LU name can appear in only one of these two tables.

System action

The conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

Make sure each remote VTAM LU is defined in the SYSIBM.LULIST table or the SYSIBM.LUNAMES table, but not in both tables.

Verify that the condition did not occur because of the unintended use of a generic LU name, which would make Db2 aware of a partner LU name (its generic LU name) that is not specified in the LUNAME column of the SYSIBM.LULIST or SYSIBM.LUNAMES tables. Look for evidence of a DSNL510I or DSNL030I message

that indicates the partner's generic LU name instead of its actual LU name. If the use of a generic LU name is indicated, use the RESET GENERICLU command to purge this generic LU affinity.

Problem determination

Collect the following diagnostic items:

- Print the contents of the SYSIBM.LUNAMES table.
- Print the contents of the SYSIBM.LULIST table.

Related reference

[-RESET GENERICLU command \(Db2\) \(Db2 Commands\)](#)

[LULIST catalog table \(Db2 SQL\)](#)

[LUNAMES catalog table \(Db2 SQL\)](#)

Related information

[DSNL030I \(Db2 Messages\)](#)

[DSNL510I \(Db2 Messages\)](#)

00D3102B

Explanation

A conversation was not allocated because the partner LU attempted to allocate a conversation using a blank mode name. Although Db2 tolerates CNOS requests with a blank mode name, Db2 does not accept conversations with a blank mode name.

System action

Message DSNL030I is displayed on the system console with reason code 00D3102B. The conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

Correct the definitions at the partner LU to prevent conversations from being allocated with a blank mode name.

00D3102D

Explanation

The requested trusted connection was not established because the SECURITY_OUT option in the SYSIBM.IPNAMES table in the communications database (CDB) is not defined correctly. If the TRUSTED column in SYSIBM.LOCATIONS table is set to 'Y', then the SECURITY_OUT column in the SYSIBM.IPNAMES table must be set to 'P', 'R', or 'E'.

System action

Notification of the failure is returned to the application. The requested trusted connection is not established.

Operator response

Notify the system programmer.

System programmer response

Set up the SYSIBM.IPNAMES table correctly.

00D3102E

Explanation

The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain a row for trusted context system authorization ID translation, the TYPE column specified as 'S' describing the system authorization ID. When the USERNAMES column in SYSIBM.IPNAMES specifies 'S' requiring system authorization ID translation, the SYSIBM.USERNAMES must contain an entry describing the system authorization ID used for establishing trusted connection.

System action

A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator response

Notify the system programmer.

System programmer response

Make sure the USERNAMES column in SYSIBM.USERNAMES has been specified correctly for the indicated LINKNAME for trusted connection.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D31030

Explanation

A remote connection cannot be established. This problem might be caused by one of the following symptoms:

- The LINKNAME column in the SYSIBM.LOCATIONS table in the communications database (CDB) is greater than 8 bytes, or is blank.

- The LUNAME column in the SYSIBM.LULIST table in the communications database is greater than 8 bytes.
- The MODENAME column in the SYSIBM.MODESELECT or SYSIBM.LUMODES table in the communications database is greater than 8 bytes.
- The TPN column in the SYSIBM.LOCATIONS table in the communications database is greater than 64 bytes.
- The PORT column in the SYSIBM.LOCATIONS table in the communications database is greater than 32 bytes or contains leading blanks.
- The Db2 authorization ID used for outbound authorization ID translation is greater than 8 bytes.
- The SYSMODENAME column in the SYSIBM.LUNAMES table in the communications database is greater than 8 bytes.

System action

Notification of the failure is returned to the application. The remote connection is unsuccessful.

System programmer response

Correct the column in error as indicated by the unavailable resource message.

For Db2 authorization ID translation failure, make sure that the remote BIND OWNER option contains an authorization ID less than or equal to 8 bytes for normal connection.

Problem determination

Collect a listing of the SQL that was used to configure the CDB table in the error.

Related reference

[LOCATIONS catalog table \(Db2 SQL\)](#)

[LULIST catalog table \(Db2 SQL\)](#)

[LUMODES catalog table \(Db2 SQL\)](#)

[MODESELECT catalog table \(Db2 SQL\)](#)

00D31031

Explanation

The local distributed data facility (DDF) is terminating.

System action

Notification of the failure is returned to the application. Db2 does not allow any new distributed threads while DDF is in termination or is terminated.

Operator response

Contact the system to determine the cause of DDF termination.

System programmer response

To determine why DDF was terminated and then start DDF.

User response

Contact your system programmer to determine why DDF was terminated.

00D31032

Explanation

One of the following situations occurred:

- The requested VTAM function failed because the distributed data facility (DDF) at the remote location was terminating.
- A remote TCP/IP client attempted to connect to a local Db2 for z/OS data server after the TCP/IP listener was up, but before DDF was up on that data server.

System action

Db2 writes a SYS1.LOGREC record. If DDF terminated, no communication on the conversation is allowed.

Operator response

Notify the system programmer.

System programmer response

Take one of the following actions, depending on the situation that occurred:

- If DDF at the remote location terminated, contact the communication administrator at that location.
- If a remote TCP/IP client attempted to connect to a local Db2 for z/OS data server after the TCP/IP listener was up, but before DDF was up on that data server, no action is needed. This situation is indicated by the following events:
 1. Message DSNL519I is issued to indicate that the TCP/IP listener is up.
 2. Message DSNL030I with reason code 00D31032 is issued to indicate that the TCP/IP client is attempting to connect to the Db2 for z/OS server.
 3. Message DSNL004I is issued to indicate that DDF is up and ready to accept connections.

Related information

[DSNL519I \(Db2 Messages\)](#)

[DSNL030I \(Db2 Messages\)](#)

[DSNL004I \(Db2 Messages\)](#)

00D31033

Explanation

The VTAM function request to allocate a conversation failed because the thread timed-out while waiting for a session.

System action

Notification of the failure is returned to the application.

Operator response

Notify the system programmer.

System programmer response

The defined session limit for the mode used by the thread might be too small. The CONVLIMIT specified for the mode might have to be negotiated with the communication administrator at the remote subsystem.

Problem determination

Refer to message DSNL510I for the limit negotiated by VTAM. Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the contents of SYSIBM.LUMODES in the communications database.

00D31034

Explanation

The maximum number of remote connections, which is set by subsystem parameter CONDBAT, was reached, and the connection was rejected. The remote requester was not allowed to connect to Db2.

System action

The requester is not connected to Db2.

Operator response

Notify the system programmer.

System programmer response

The maximum number of connections that can concurrently exist is defined by the CONDBAT subsystem parameter. When the current number of connections reaches the CONDBAT limit, additional connections to Db2 are not allowed. Use a trace of IFCID 0001 for DDF global statistics to determine if the limit should be increased.

Problem determination

Collect the following diagnostic items:

- DDF global statistics: Use field QDSTQCRT to determine the number of requests that failed because of the CONDBAT limit.

Related reference

[MAX REMOTE CONNECTED field \(CONDBAT subsystem parameter\) \(Db2 Installation and Migration\)](#)

00D31035

Explanation

The requested distributed function failed. The database access agent was aborted at the remote location. Notification of the failure is returned to the requester system application however the failure is really due to an unexpected failure at the remote server system. This error is an internal error at the remote server system. Evidence of the failure should be visible as an abend in the remote server system's SYS1.LOGREC information, or, you might find the failure recorded in a dump.

System action

Db2 writes a SYS1.LOGREC record and requests an SVC dump at the remote Db2 site. Db2 server system recovery returns this reason code back to the requester system.

Operator response

Notify the system programmer.

System programmer response

Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). A dump should be present at the server

system, or evidence of an abend should be visible in SYS1.LOGREC information around the time that this reason code was returned back to the requester system application. The internal error that caused the server system abend must be corrected.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31036

Explanation

The LINKNAME column of the SYSIBM.LOCATIONS table was invalid. Since LINKNAME is a foreign key of the SYSIBM.LUNAMES table, the LINKNAME column must specify one of the values provided in the LUNAME column of the SYSIBM.LUNAMES table. This error should not occur.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Collect the SYS1.LOGREC, and the SVC dump.

System programmer response

Obtain copies of the SYS1.LOGREC and SYSLOG data sets from the Db2 site with the inconsistently defined communications database (CDB).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31037

Explanation

The connection to the remote server failed. The SYSIBM.USERNAMES table did not contain an outbound row and did not specify the remote authorization ID for the primary Db2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs that are used for each Db2 authorization ID that communicates with the LU or the TCP/IP address.

System action

A response is sent to the application to indicate that the resource is unavailable. The request is not sent to the remote site.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified correctly for the indicated LUNAME or IPADDR. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that specify the remote authorization ID to be used for each possible Db2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D31038

Explanation

A conversation was not allocated for one of these reasons:

- The requesting LU is part of a Db2 sysplex. When one or more LU names within a Db2 sysplex appear in the SYSIBM.LULIST table at the remote site, all LU names within the sysplex must be identified in the SYSIBM.LULIST table at the remote site.

- You might have intended to list all the sysplex's LU names in the SYSIBM.LULIST table, but you did not include one or more LU names.
- You listed a subset of the LU names in SYSIBM.LULIST but none of the LU names you listed are currently available. Please note that it can take up to 3 minutes for LU availability information to be updated following START DDF at the remote site.
- The location name sent to a remote site does not match the location name recorded in the BSDS at that remote site.
- The local SYSIBM.LULIST table is incorrectly defined for the remote location.

A DSNL030I message might have been written to the console.

System action

A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

The CDB tables and Db2 BSDS parameters must correctly associate the LOCATION names with their corresponding LUNAME names.

The cause of this error is usually one of the following problems:

- The BSDS at the remote site does not have the correct LOCATION or LUNAME value, which causes the remote DBMS to respond to the wrong LOCATION name when receiving distributed database requests.
- The SYSIBM.LOCATIONS table at the local Db2 system has an incorrect value in the LINKNAME or LOCATION column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.
- The SYSIBM.LULIST table at the local Db2 system has an incorrect value in the LUNAME column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.
- Not all LU names in the requesting Db2 sysplex are defined in the SYSIBM.LULIST table at the remote site.
- Not all LU names in the requesting Db2 sysplex are defined in the SYSIBM.LULIST table at the server Db2 subsystem. The remote LU is not allowed access to the server subsystem.

In general, when the requester is a member of a sysplex, each member of the requesting sysplex should be defined in SYSIBM.LULIST of the server subsystem. However, there may be causes where an LU of a remote sysplex is not defined in SYSIBM.LULIST of the local subsystem to prevent the remote LU from being a candidate member when accessing the remote sysplex. This is known as "member specific routing". If the remote sysplex LU attempts to access the local subsystem, this reason code will be returned if the remote LU is not defined in the local SYSIBM.LULIST table and is also not defined in SYSIBM.LUNAMES. Remote requesting sysplex members can be defined in SYSIBM.LULIST, or, when member specific routing requirements to the remote sysplex member are needed, the remote sysplex LU can be defined in SYSIBM.LUNAMES for inbound purposes from the remote sysplex LU that contain the appropriate inbound security characteristics.

- The local Db2 system contains a SYSIBM.LULIST row for a remote system that is not a member of a Data Sharing group. SYSIBM.LULIST rows CANNOT be defined for remote non Data Sharing server systems. Remove the SYSIBM.LULIST row for the remote systems.

Problem determination

- Determine the LUNAME and LOCATION name of the Db2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LOCATIONS table at that site.
- Print the contents of the SYSIBM.LULIST table at both the local site and the remote site.
- Determine the LUNAME and LOCATION name of the remote DBMS involved in the failure from the BSDS at the remote site.
- Issue the -DISPLAY LOCATION command to determine which LUNAMES and LOCATIONS were active at the time of failure.

00D31039

Explanation

The allocation of a connection to the remote system failed for one of the following reasons:

- The SYSIBM.USERNAMES table at the requesting site did not contain an outbound row and did not specify the remote authorization ID to be used for this Db2 authorization ID.
- The SYSIBM.USERNAMES table at the requesting site contained an outbound row, but the specified

remote authorization ID, password, or both contained more than eight characters.

When the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs and passwords that are used for each Db2 authorization ID that communicates with the LU or the TCP/IP address.

System action

The connection to the remote system is not allocated.

Operator response

Notify the system programmer.

System programmer response

On the requesting system, make sure the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified correctly for the indicated LUNAME or IPADDR. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that specify the remote authorization ID that is to be used for each possible Db2 authorization ID. Each authorization ID must contain eight or fewer characters. If the remote connection communicates with the LU and you intend to use remote passwords, verify that the SYSIBM.USERNAMES table has rows that specify the remote password that is to be used for each possible Db2 authorization ID. Each password must contain eight or fewer characters. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Determine the LUNAME or IPADDR and find the authorization ID, password, or both for the failing remote system. Collect the following diagnostic items:

- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.

00D3103A

Explanation

Database access agent allocation failed because the RACROUTE REQUEST=EXTRACT macro failed to locate a user profile for the Db2 primary authorization ID obtained from the SYSIBM.USERNAMES table. When

the ENCRYPTPSWDS column in SYSIBM.LUNAMES specifies 'Y', the requesting Db2 system must be able to extract the encrypted password (via RACROUTE REQUEST=EXTRACT) and send this encrypted password to the responding Db2 system for validation.

System action

The reason code is returned to the application.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the new authorization ID column in SYSIBM.USERNAMES has been specified correctly for the indicated LUNAME. If you intend to use encrypted passwords, the new authorization ID must be defined to your MVS security subsystem.

Problem determination

- Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
- Verify that the names given in the NEWAUTHID column are defined to your MVS security subsystem properly.

00D3103B

Explanation

An attempt to allocate an LU6.2 conversation failed because the conversation limits for the requested partner LU and VTAM MODE have been reached.

System action

This reason code is generated internally when an attempt is made to allocate an LU6.2 conversation and conversation limits have been reached for the requested partner LU and VTAM MODE. In this situation, the requesting Db2 system will attempt to reuse one of the existing LU6.2 conversations that have already been allocated to the agent in question.

The allocate process will be retried using the existing conversation.

System programmer response

If you increase the LU6.2 conversation limits for the indicated partner LU and VTAM MODE, it will not be necessary for Db2 to reclaim conversations in order to allocate additional LU6.2 conversations. The

reclaiming process will reduce system throughput, since the reclaimed conversation will have to service multiple SQL statements.

00D3103C**Explanation**

An attempt was made to allocate an SNA (LU 6.2) conversation, but the authentication request failed because the specified remote partner LUNAME will not allow authentication based on a user ID alone. The remote partner LUNAME is configured to require authentication using a user ID and corresponding password.

A password must be provided through Db2 application logic or through Db2 Communications Database (CDB) definitions. Alternately, the partner LUNAME can be configured to allow authentication based on user ID alone. For example, specify LU 6.2 SECURITY=SAME or Already-Verified.

System action

The attempt to allocate an LU6.2 conversation fails, and the error is reported to the Db2 application that requested access to the distributed resource.

System programmer response

If the remote LUNAME configuration can be changed, change it to allow Already Verified (Security=Same) authentication, which does not require a password. If the target LUNAME is a Db2 for z/OS system, support is declared by specifying SECACPT=ALREADYV on the Db2 VTAM APPL statement.

If remote LUNAME configuration changes are not appropriate, or if a higher level of security is required, then the local Db2 for z/OS system must honor the requirements of the remote LUNAME and provide a password. It might be possible to make application changes to provide a password. If application changes are not possible, CDB changes will be required.

If the local application is DRDA related, and if it is executing an explicit SQL CONNECT statement to connect to the remote system, consider changing the application to provide a password on the SQL CONNECT statement as follows:

```
CONNECT TO server USING userid USING password
```

In the following circumstances, Db2 Communications Database tables must be changed to provide a password:

- The local application cannot be modified to provide a password on its SQL CONNECT statement.

- The application is performing an implicit SQL connection. (The application refers to a three-part name, or alias, that resolves to the remote system.)

In these cases, change the SYSIBM.LUNAMES rows, which are associated to the partner LUNAME, to specify 'P' (password) or 'R' (RACF PassTicket) for SECURITY_OUT. If you specify 'P', you must also:

- Add a SYSIBM.USERNAMES "outbound" row that specifies the user ID and its associated password.
- Specify a SYSIBM.LUNAMES USERNAMES column value of 'O' or 'B' to satisfy referential constraints on the SYSIBM.USERNAMES table.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- The VTAM APPL definition for the remote Db2 system.
- The contents of the SYSIBM.LUNAMES table.

[LUNAMES catalog table \(Db2 SQL\)](#)

00D3103D**Explanation**

An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the request did not contain the proper security information.

System action

The attempt to access the remote database resource failed and the failure is reported to the application.

System programmer response

This error is usually caused by transmitting an invalid authorization ID or password in a request to the remote site. However, this is not always the case, so it is important to review the diagnostic information at the remote site to determine the cause of the failure.

- If the remote site is a Db2 subsystem, refer to the DSNL030I message at the remote site for the cause of the security failure. Additionally, an ALERT will

be recorded in NetView (if the NetView product is available) to describe the security failure.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the security failure at the remote site.

If you suspect the authorization ID or password is not correct, the Db2 CDB on the local Db2 system should be examined to validate the following items:

- If the remote site requires both an authorization ID and a password on LU6.ALLOCATE requests (i.e., the remote site does not accept already-verified ALLOCATE requests), the USERNAMES column of the SYSIBM.LUNAMES table at the local Db2 system must specify either 'O' or 'B'.
- If the USERNAMES column of the SYSIBM.LUNAMES table at the local Db2 system specifies 'O' or 'B', the SYSIBM.USERNAMES table will be used to determine the authorization ID and password sent on the LU6.ALLOCATE request.

If you intend to translate the authorization IDs, ensure that the NEWAUTHID column of the SYSIBM.USERNAMES table contains the correct authorization ID to be used at the remote site.
- If the remote site is a Db2 system, the ENCRYPTPSWDS value in the SYSIBM.LUNAMES table must exactly match the ENCRYPTPSWDS column of the SYSIBM.LUNAMES table at the remote site.
- If the remote site is not a Db2 system, the ENCRYPTPSWDS value in the SYSIBM.LUNAMES table must be set to 'N'.
- If you are transmitting passwords to the remote site, the password transmitted by the local Db2 system must exactly match the value expected by the remote site.

1. For encrypted passwords, the password sent to the remote Db2 subsystem is obtained by extracting the RACF password of the user identified by the NEWAUTHID column in the SYSIBM.USERNAMES table. This user's RACF password must exactly match the password at the remote site.
2. If password encryption is not used, the password will be taken from the PASSWORD column of the SYSIBM.USERNAMES table. This value must exactly match the password at the remote site.

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3103E

Explanation

The requested VTAM function to allocate a conversation was not performed because the VTAM MODE specified a conversation limit of zero. The conversation limits must be set to a value greater than zero before a conversation can be allocated.

System action

The conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

If you have placed entries in the SYSIBM.LUMODES table, make sure CONVLIMIT column has a nonzero value. If you are allowing the session limits to be chosen by VTAM, make sure the DSESLIM values on the VTAM APPL and mode entries are nonzero.

Problem determination

Collect the following diagnostic items:

- Determine the LUNAME and MODE name of the Db2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LUMODES table.
- Determine the session limits defined on the VTAM APPL statement and the VTAM MODE entry.

00D3103F

Explanation

An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the server at the remote LU does not support the SNA two-phase commit process.

System action

Db2 starts a new conversation to the remote site that does not use two-phase commit. Db2 does not attempt to use two-phase commit with this remote site until DDF is restarted.

System programmer response

This reason code is produced when the LU at the remote site supports two-phase commit, but the TPN at the remote LU does not support two-phase commit. This is a normal situation, so no system programmer action is required.

00D31040

Explanation

The requested VTAM function failed before the database access agent has failed. This is an internal error.

System action

Db2 writes a SYS1.LOGREC record and requests an SVC dump at the failed Db2 site.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 failure. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31041

Explanation

The requested VTAM function to allocate a conversation was not performed because the SYSIBM.USERNAMES table at the responding site did not contain a row whose authorization ID column matches the Db2 authorization ID received from the requesting Db2 system. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', inbound name translation is in effect. The SYSIBM.USERNAMES table must contain entries describing the local Db2 authorization ID to be used for each Db2 authorization ID sent by the requesting Db2 system.

System action

A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use local authorization IDs that differ from the remote Db2 authorization ID, verify that the SYSIBM.USERNAMES table has rows that correctly specify the local authorization ID to be used for each possible remote authorization ID. These rows must specify 'I' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Determine the LUNAME and authorization ID for the failing VTAM. Collect the following diagnostic items:

- Listing of the contents of the SYSIBM.IPNames and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.

00D31042

Explanation

The requested VTAM function failed. The connection to the remote location was interrupted. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the failed Db2 site.

Operator response

Notify the system programmer.

System programmer response

Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31043

Explanation

The requested VTAM function failed. The connection from the remote location was interrupted. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the failed Db2 site.

Operator response

Notify the system programmer.

System programmer response

Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31044

Explanation

A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain any security subfields. This represents SECURITY=NONE in the LU6.2 architecture, which is not supported by Db2.

System action

The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL030I message may have been written to the console.

Operator response

Notify the system programmer.

System programmer response

Verify that the remote subsystem is configured to send valid security subfields.

If the remote subsystem is Db2, make sure the VTAM APPL definition does not specify SECACPT=NONE, which is the default for the VTAM APPL definition. SECACPT=NONE will cause VTAM to remove the security subfields from the FMH5.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.

- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.

00D31045

Explanation

A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security subfield that supplies the USERID, or the USERID was not 1 to 8 bytes in length.

System action

The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.

00D31046

Explanation

A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem indicated SECURITY=SAME (also known as Already-Verified) and the subsystem in question was not authorized to send requests with SECURITY=SAME.

System action

The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL030I message may have been written to the console.

Operator response

Notify the system programmer.

System programmer response

The request was rejected because the SECURITY_IN column of the SYSIBM.LUNAMES table contained a 'V' in the row associated with the remote system. The value 'V' indicates that the remote system must send both a USERID and a PASSWORD, which corresponds to SECURITY_PGM in the SNA LU6.2 architecture. Users should also be aware that in the absence of a SYSIBM.LUNAMES row that specifically identifies the remote LU, a "default" SYSIBM.LUNAMES row (blank LUNAME) may be used, if defined, if the inbound connection is via DRDA protocols. This "default" row may not reflect the needed inbound security characteristics in which case a SYSIBM.LUNAMES row can be defined that explicitly identifies the remote LU.

If the remote LU is a member of a remote sysplex and the local system requires access to the remote sysplex, then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table although a SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST (for example when you don't want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location).

This problem can be corrected in two ways:

1. If you would like Db2 to accept requests that are marked with SECURITY=SAME, change the SECURITY_IN value in the SYSIBM.LUNAMES

table to 'A' for the remote LU in question. Also the Db2 VTAM APPL definition should specify SECACPT=ALREADYV.

2. If you would like Db2 to continue to reject requests of this kind, the remote LU must be configured to send requests that contain both a USERID and PASSWORD (SECURITY=PGM in SNA LU6.2 terms).

If the remote LU is Db2, the SECURITY_OUT column in the SYSIBM.LUNAMES table must specify either 'R' or 'P' in the row associated with the local Db2 subsystem.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.

00D31047

Explanation

A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security subfield that supplies the PASSWORD, or the PASSWORD was not 1 to 8 bytes in length.

System action

The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D31048

Explanation

The requested VTAM function for allocating a conversation at the Db2 server was not performed because the requester's LUNAME is not defined in the SYSIBM.LUNAMES table of the communication database (CDB) at the server.

System action

Notification of the failure is returned to the application. The conversation is not allocated to the specified location.

Operator response

Notify the system programmer.

System programmer response

Add the requester's LUNAME to the SYSIBM.LUNAMES table at the server. If the remote LU is Db2, the requester's LUNAME is the label name, as

opposed to the ACBNAME keyword, on the Db2 VTAM APPL statement for the requester site. A server's SYSIBM.LUNAMES table should contain an entry for the requester's LUNAME.

In the absence of a SYSIBM.LUNAMES row that specifically identifies the remote LU, a default SYSIBM.LUNAMES row (blank LUNAME) might be used, if defined, in the case where the inbound connection is through DRDA protocols. This default row might not reflect the needed inbound security characteristics, in which case a SYSIBM.LUNAMES row can be defined that explicitly identifies the remote LU.

If the remote LU is a member of a remote sysplex and the local system requires access to the remote sysplex, then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table. A SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST, such as when you do not want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location.

Verify that the condition did not occur because of the unintended use of a generic LU name, which would make Db2 aware of a partner LU name (its generic LU name) that is not specified in the LUNAME column of the SYSIBM.LULIST or SYSIBM.LUNAMES tables. Look for evidence of a DSNL510I or DSNL030I message that indicates the partner's generic LU name instead of its actual LU name. If the use of a generic LU name is indicated, use the RESET GENERICLU command to purge this generic LU affinity.

Problem determination

Collect the following diagnostic items:

- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
