Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local Db2. Objects stored at the local site must be referenced using a local name.

Problem determination

If necessary, consult with the database administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

00D3104A

Explanation

A remote server issued an SNA BACKOUT, which was not sent as a reply to an SNA PREPARE or REQUEST_COMMIT. This indicates the server backed out the current unit of work without waiting for the SQL application to either commit or roll back.

System action

The attempt to access the remote database resource fails and the failure is reported to the application. Db2 terminates the SNA conversation to the remote server and forces the application to roll back.

System programmer response

Db2 never issues an unsolicited SNA BACKOUT. Non-Db2 servers can send an SNA BACKOUT indication when resources required to complete the unit of work are not available. For example, a deadlock might cause the non-Db2 server to send an SNA BACKOUT. Contact the system programmer for the remote system to determine why the unit of work had to be aborted.

User response

Notify the Db2 systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3104B

Explanation

An SNA conversation was rejected by a Db2 server because the SNA FMH5 specified SNA persistent verification. Db2 does not support the SNA persistent verification option.

System action

Message DSNL030I is displayed on the system console with reason code 00D3104B. The SNA conversation is rejected with SNA sense code X'080F6051 ', indicating the SNA security parameters in the FMH5 were not acceptable.

System programmer response

The SECACPT keyword on the VTAM APPL statement tells VTAM whether Db2 supports persistent verification. Because Db2 does not support persistent verification, the SECACPT=PERSISTV and SECACPT=AVPV options cannot be used on the Db2 VTAM APPL statement.

User response

Notify the Db2 system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3104C

Explanation

The SNA Exchange Log Names (XLN) process failed because of a log name mismatch between Db2 and a remote LU in the network.

System action

The attempt to allocate an SNA two-phase commit conversation fails with reason code 00D3104C. Message DSNL410 is displayed on the system console to describe the error.

System programmer response

The log name recorded in the Db2 log does not match the log name currently in use at the remote LU. There are indoubt units of work that need to be resolved at this Db2 system. The log name required to resolve the indoubt units of work is displayed in the DSNL410 message.

If a non-Db2 partner was started with the wrong log, it might be possible to restart the non-Db2 partner with the desired log name. This should cause the indoubt units of work to be resolved automatically.

If the partner cannot be restarted with the desired log name, the -RECOVER INDOUBT command can be used to resolve the indoubt units of work. Once the indoubt units of work are resolved, Db2 will accept an SNA XLN with a new partner log name.

User response

Contact the Db2 systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3104D

Explanation

The local Db2 system does not support connectivity to the Db2 release currently running at the remote Db2 site.

System action

The attempt to allocate an SNA conversation is rejected with reason code 00D3104D.

System programmer response

Db2 distributed database connections can only be established between compatible Db2 releases. For example, Version 3 can connect to Db2 2.3, but not to Db2 2.2.

In order to establish connectivity, the down-level Db2 system must be migrated to a supported release of Db2.

User response

Contact the Db2 systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3104E

Explanation

An SNA Exchange Log Names (XLN) protocol violation was detected when attempting to establish a connection to a remote site.

System action

The attempt to allocate an SNA conversation is rejected with reason code 00D3104E. Message DSNL421E is written to the system console and IFCID 0213 is produced to describe the protocol violation.

System programmer response

Contact the system programmer for the remote site. The invalid XLN message is recorded in the IFCID 0213 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

User response

Contact the Db2 systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3104F

Explanation

A connection to a remote location was lost during a previous communication operation.

System action

If the communication failure occurred during a commit or abort operation, the SQL application might not be aware that a failure occurred. Messages associated with the failure were written to the system console at the time of failure. Additionally, alerts were reported to NetView at the time of failure.

User response

Reestablish the connection to the remote site and reissue the SQL statement.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

.

00D31050

Explanation

Db2 expected to receive security information for the remote client but a valid DRDA SECCHK command was not received for a connection request from a DRDA application requester (AR). The DRDA SECCHK command is only valid with a DRDA security manager level greater than or equal to 5.

This can be the case if one of the following occurs:

- The DRDA AR requested a DRDA security manager less than level 5 for an SNA connection where the APPL command for Db2 was specified with the SECACPT=NONE option.
- The DRDA SECCHK command did not contain the required security information.
- The DRDA AR requested a DRDA security manager less than level 5 for a TCP/IP connection.

System action

The attempt to access the local database resource fails, the failure is reported to the SQL application, and the conversation is terminated.

System programmer response

For SNA connections, if SECACPT=NONE and the DRDA AR does not support DRDA security manager level 5, contact the Db2 security administrator to change the SECACPT option to ALREADYV or CONV to allow for security information in the VTAM FMH-5 in the form of userid or userid/password fields. If SECACPT=NONE is not changed, then Db2 cannot accept connection requests from this remote client.

For SNA connections, If SECACPT=ALREADYV or CONV, then even though userid or userid/password fields in the FMH-5 are received and validated, Db2 must evaluate a DRDA SECCHK command if it is sent. If the DRDA AR requests this level of security but does not provide the correct information in the form

of a SECCHK command, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

For TCP/IP connections, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D31052

Explanation

An application caused recursive access to a remote location, followed by access to another remote location, which is not permitted.

For example, an application at location LOC1 might have connected to location LOC2 and accessed a table using an alias that resolves back to LOC1. There was a subsequent remote access from LOC1 to LOCn, which caused the error.

System action

The attempt to access the remote location fails. The SQL application receives a -904 SQLCODE.

System programmer response

Correct the application program so that it does not cause recursive access to a location followed by remote access from that location. The application might have used table aliases, three-part table names, stored procedures, user-defined functions, or triggers to cause the condition.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Definitions of views and tables involved in the error.
- Location used in the alias entry in SYSIBM.SYSTABLES.
- Contents of the SYSIBM.LOCATIONS table.

00D31053

Explanation

The number of queued connection requests has reached the value of the MAXCONQN subsystem parameter. The TCP/IP socket was closed for the longest-waiting connection in the connection request queue.

System action

The client is no longer connected to Db2.

User response

This reason code might indicate that a slowdown in the processing of requests occurred or is occurring. Because the value of the MAXDBAT subsystem parameter has also been reached, you might need to increase the value of the MAXDBAT subsystem parameter or determine the cause of the slowdown of the request processing.

Related tasks

[Setting limits for the queuing of client connections waiting for database access threads \(Db2 Performance\)](#)

Related reference

[CONN QUEUE MAX DEPTH field \(MAXCONQN subsystem parameter\) \(Db2 Installation and Migration\)](#)

[MAX REMOTE ACTIVE field \(MAXDBAT subsystem parameter\) \(Db2 Installation and Migration\)](#)

00D31054

Explanation

Db2 detected a connection request that waited longer than the value of the MAXCONQW subsystem parameter. The TCP/IP socket of a long-waiting connection request was closed.

System action

The client is no longer connected to Db2.

User response

You might need to increase the value of the MAXDBAT subsystem parameter or investigate the cause of the slowdown of request processing.

Related reference

[MAX REMOTE ACTIVE field \(MAXDBAT subsystem parameter\) \(Db2 Installation and Migration\)](#)

[CONN QUEUE MAX DEPTH field \(MAXCONQN subsystem parameter\) \(Db2 Installation and Migration\)](#)

00D31055

Explanation

The remote location defined in the SYSIBM.LOCATIONS table could not be accessed because the TCP/IP interface to DDF is not available.

System action

The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

Operator response

Notify the system programmer.

System programmer response

One of the following actions should be taken:

- If the remote site is not supposed to be using TCP/IP, add a row to SYSIBM.LUNAMES defining the LUNAME used by the remote location.
- If the remote site is correctly defined in the CDB, examine the messages written to the console during -START DDF processing. Those messages describe any errors that would prevent DDF from using TCP/IP.
- Determine if Db2 is started in restricted access mode. If so, retry the request when Db2 has been started in full access mode.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D31056

Explanation

The PORT column of the SYSIBM.LOCATIONS table could not be converted to a TCP/IP port number by the getservbyname TCP/IP socket call.

System action

The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL514, DSNL517, or DSNL518 is written to the console describing the error.

Operator response

Notify the system programmer.

System programmer response

Use the information in the DSNL514, DSNL517, or DSNL518 message to resolve the error.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D31057

Explanation

Db2 was able to find the row in SYSIBM.LOCATIONS for the LOCATION specified in the SQL request. However, the LINKNAME column value specified in LOCATIONS did not match any row in SYSIBM.LUNAMES or SYSIBM.IPNAMES.

System action

The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

Operator response

Notify the system programmer.

System programmer response

Insert a row in SYSIBM.LUNAMES or SYSIBM.IPNames that matches the LINKNAME specified in SYSIBM.LOCATIONS.

User response

Notify the system programmer.

00D31058

Explanation

The IPADDR column of the SYSIBM.IPNames table could not be converted to an IP address by the gethostbyname TCP/IP socket call.

System action

The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL513, DSNL517, or DSNL518 is written to the console describing the error.

Operator response

Notify the system programmer.

System programmer response

Use the information in the DSNL513, DSNL517, or DSNL518 message to resolve the error.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

.

00D31059

Explanation

An attempt to allocate a conversation to the remote site failed because Db2 was unable to obtain a RACF PassTicket. The user specified an 'R' in the SECURITY_OUT column of the SYSIBM.IPNames or SYSIBM.LUNAMES communications database (CDB) tables for the partner site. As a result, Db2 invokes RACF to extract a PassTicket for the partner site.

However, RACF could not provide a PassTicket, and the attempt failed.

System action

The attempt to access the remote database resource failed, and the failure is reported to the application.

System programmer response

The error usually occurs due to incorrect or missing RACF definitions. To avoid this error, specify the proper RACF definitions to provide for the PassTicket. Alternatively, you may avoid the use of PassTickets by changing the SECURITY_OUT column of the SYSIBM.IPNames and/or SYSIBM.LUNAMES CDB table for the partner site.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Listing of the results produced by the SQL statements.
- Listing of the contents of the SYSIBM.IPNames and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Contents of the SYSIBM.LOCATIONS table.

Related tasks

[Enabling Db2 to send RACF PassTickets \(Managing Security\)](#)

[Managing outbound connection requests \(Managing Security\)](#)

Related reference

[IPNames catalog table \(Db2 SQL\)](#)

[LUNAMES catalog table \(Db2 SQL\)](#)

00D3105A

Explanation

An SQL CONNECT statement was issued with a user ID and password to connect to a location that requires RACF PassTicket authorization. The connection cannot be made.

The entry in SYSIBM.LUNAMES or SYSIBM.IPNames for the location that is specified on the SQL CONNECT statement indicates that a connection request must contain a user ID and RACF PassTicket.

System action

The connection request is not processed. The application is placed in the unconnected and connectable state.

User response

Change the application to eliminate its use of SQL CONNECT with a user ID and password, or remove the RACF PassTicket requirement in SYSIBM.LUNAMES or SYSIBM.IPNAMES.

00D3105B

Explanation

An SQL CONNECT statement was issued with a user ID and password to connect to a location that requires RACF encrypted password authorization. The connection cannot be made.

The entry in SYSIBM.LUNAMES for the location that is specified on the SQL CONNECT statement indicates that a connection request must contain a user ID and RACF encrypted password .

System action

The connection request is not processed. The application is placed in the unconnected and connectable state.

User response

Change the application to eliminate its use of SQL CONNECT with a user ID and password, or remove the RACF encrypted password requirement in SYSIBM.LUNAMES.

00D3105C

Explanation

During a TCP/IP synchronous read operation from a Db2 for z/OS server to a distributed client, a DRDA exception occurred because the timer for the synchronous read operation expired, and the Db2 server did not receive the remaining data from the client.

System action

The connection between the distributed client and the Db2 server fails. Db2 generates message DSNL032I with reason code 00D3105C.

System programmer response

The timer for the TCP/IP synchronous receive operation might have expired for any of the following reasons:

- Slowdowns occurred at the distributed client.
- Network resource problems occurred between the client and the Db2 server.
- Problems occurred in the system on which the Db2 server was running, or in the Db2 server.
- The timeout value for TCP/IP synchronous read operations is too low. To remedy this situation, set subsystem parameter IDTHTOIN to a higher value.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Output from a statistics class 4 trace for IFCID 0192.

Related reference

[IDLE THREAD TIMEOUT field \(IDTHTOIN subsystem parameter\) \(Db2 Installation and Migration\)](#)

Related information

[DSNL032I \(Db2 Messages\)](#)

00D3105D

Explanation

The number of unique application names has exceeded 6000 unique values.

System action

Db2 does not collect remote application statistics for any new application name until DDF is restarted.

Administrator response

Notify the application programmer. The application can be identified from the *thread-information* in the DSNL030I message.

thread-information is a colon-delimited list that contains the following segments. An asterisk (*) in any segment indicates that the information is not available.

- The primary authorization ID that is associated with the thread.

- The name of the user's workstation.
- The ID of the user.
- The name of the application.
- The statement type for the previously executed statement: dynamic or static.
- The statement identifier for the previously executed statement, if available. The statement identifier can be used to identify the particular SQL statement. For static statements, the statement identifier correlates to the STMT_ID column in the SYSIBM.SYSPACKSTMT table. For dynamic statements, the statement identifier correlates to the STMT_ID column in the DSN_STATEMENT_CACHE_TABLE table. That statement might not have contributed to the current failure.
- The name of the role that is associated with the thread.
- The correlation token that can be used to correlate work at the remote system with work performed at the Db2 subsystem. The correlation token, if available, is enclosed in '<' and '>' characters, and contains three components, separated by periods:
 - A 3 to 39 character IP address.
 - A 1 to 8 character port address.
 - A 12 character unique identifier.

Programmer response

Consider using CLIENT_CORR_TOKEN for tracking individual connections. CLIENT_CORR_TOKEN is a unique value that allows you to correlate your business processes across the enterprise. CLIENT_APPLNAME should not be used to identify individual connections.

Problem determination

For more information, refer to *thread-information* in the DSNL030I message.

Related reference

[CURRENT CLIENT_APPLNAME special register \(Db2 SQL\)](#)

[CURRENT CLIENT_CORR_TOKEN special register \(Db2 SQL\)](#)

Related information

[DSNL030I \(Db2 Messages\)](#)

Explanation

The number of unique user IDs has exceeded 6000 unique values.

System action

Db2 does not collect remote application statistics for any new user IDs until DDF is restarted.

Administrator response

Notify the application programmer. The application can be identified from the *thread-information* in the DSNL030I message.

thread-information is a colon-delimited list that contains the following segments. An asterisk (*) in any segment indicates that the information is not available.

- The primary authorization ID that is associated with the thread.
- The name of the user's workstation.
- The ID of the user.
- The name of the application.
- The statement type for the previously executed statement: dynamic or static.
- The statement identifier for the previously executed statement, if available. The statement identifier can be used to identify the particular SQL statement. For static statements, the statement identifier correlates to the STMT_ID column in the SYSIBM.SYSPACKSTMT table. For dynamic statements, the statement identifier correlates to the STMT_ID column in the DSN_STATEMENT_CACHE_TABLE table. That statement might not have contributed to the current failure.
- The name of the role that is associated with the thread.
- The correlation token that can be used to correlate work at the remote system with work performed at the Db2 subsystem. The correlation token, if available, is enclosed in '<' and '>' characters, and contains three components, separated by periods:
 - A 3 to 39 character IP address.
 - A 1 to 8 character port address.
 - A 12 character unique identifier.

Programmer response

Consider using CLIENT_CORR_TOKEN for tracking individual connections. CLIENT_CORR_TOKEN is a unique value that allows you to correlate your business

processes across the enterprise. CLIENT_USERID should not be used to identify individual connections.

Problem determination

For more information, refer to *thread-information* in the DSNL030I message.

[DSNL030I \(Db2 Messages\)](#)

00D3105F

Explanation

FL 505 Db2 attempted to connect to a remote location but failed because it was not able to obtain an authentication token from RACF. The LINKNAME column of the SYSIBM.LOCATIONS table in the Db2 communications database referenced the SECURITY_OUT column of the SYSIBM.IPNames table. With SECURITY_OUT set to 'T', Db2 attempted to extract an authentication token from RACF, but found that the required IDT support was not installed or available.

System action

A Db2 connection request to a remote location fails, and the connection error is reported to the requesting system with SQLCODE -904.

System programmer response

The connection failure occurs when the required RACF/SAF/> IDT support is not installed or running on z/OS 2.4 or z/OS 2.5.

User response

Notify your system programmer.

Problem determination

Ensure that the RACF/SAF/> IDT support is properly installed and enabled on the requesting z/OS 2.4/z/OS 2.5 system.

00D31060

Explanation

FL 505 Db2 attempted to connect to a remote location but failed because it was not able to obtain an authentication token from RACF. The LINKNAME column of the SYSIBM.LOCATIONS table in the Db2 communications database referenced the SECURITY_OUT column of the SYSIBM.IPNames table. With SECURITY_OUT set to 'T', Db2 invoked RACF to extract an authentication token based on the current authorization environment used by the Db2 requester (the running application) or the outbound translated user ID.

The attempt failed if RACF encountered an error when generating the requested token or the authorization ID used for obtaining the authentication token was invalid. Db2 issued SQLCODE -904 for the error and generated diagnostic data for resource types 00000402 and 00001004 in the following name formats:

- For resource type 00000402, the resource name is `<reqloc>.<applid>.<authid>.hh-hh-hh`, where:
 - `reqloc` is the location name of the remote Db2 server.
 - `applid` is the value of the LINKNAME column in the row of the SYSIBM.LOCATIONS table where the LOCATION option is set to `<reqloc>`.
 - `authid` is the authorization ID that is used for the outbound connection.
 - `hh-hh-hh` represents the SAF/> return code, RACF return code, or the RACF reason code in hexadecimal.
- For resource type 00001004, the resource name is `<reqloc>.<authid>.<planname>`, where:
 - `reqloc` is the location name of the remote Db2 server.
 - `authid` is the authorization ID that is used for the outbound connection.
 - `planname` is the name of the plan under which the outbound connection request is being attempted.

System action

A Db2 connection request to a remote location fails, and the connection error is reported to the requesting system with SQLCODE -904.

System programmer response

The error occurs due to one of the following reasons:

- If the resource type is 00000402, the error occurs when Db2 attempts to extract an authentication

token with invalid or missing RACF or ICSF definitions.

- If the resource type is 00001004, the Db2 authorization ID used for the token extraction is invalid or does not exist on the requesting system.

User response

Notify your system programmer.

Problem determination

- For a resource type 00000402 error, check RACF messages and [z/OS Security Server RACF Callable Services](#) to determine the possible causes and solutions of the error. If the function code of the called service is X'07' (Generate an IDT from an ACEE), see the "Return and reason codes" section of the "initACEE (IRRSIA00): Initialize ACEE" description for details. To fix the problem, make sure that an IDTDATA class profile with one of the following names exists on both the requesting and the remote Db2 systems:

- JWT.applid.authid.SAF
- JWT.applid.*.SAF

where:

- For the Db2 requester, *applid* is the value of the LINKNAME column in the row of the SYSIBM.LOCATIONS table where the SECURITY_OUT column of the related SYSIBM.IPNames table is set to 'T'.
 - For the Db2 server that is a data sharing group, *applid* is the value of the generic LUNAME or IPNAME column in the BSDS. For the Db2 server that is not a member of a data sharing group, *applid* is the value of the LUNAME or IPNAME column of the SYSIBM.IPNames table.
- For a resource type 00001004 error, make sure that a valid RACF user ID exists on the requesting system.

00D31100

Explanation

The data communications function service was invoked with a parameter list that contained one or more invalid parameters. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and STS1.LOGREC at the site of a Db2abend.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31101

Explanation

A data communications functional service was invoked with the cursor table marked invalid. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31102

Explanation

A data communications functional service encountered an inconsistency in the requesting thread control block structure. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31103

Explanation

A data communications functional service received an invalid logical-unit-of-work ID (LUWID) or no LUWID. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC as the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31104

Explanation

A data communications functional service cannot find a distributed processing block for the primary thread. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31105

Explanation

A data communications functional service detected an invalid or incorrect buffer size on a send message operation. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31106

Explanation

A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31107

Explanation

A data communications functional service was invoked incorrectly (protocol violation) to wait for a message. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31108

Explanation

A data communications functional service was invoked incorrectly (protocol violation) to receive a message. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31109

Explanation

A data communications functional service was invoked incorrectly (protocol violation) to send a message. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3110A

Explanation

A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3110B

Explanation

While a message was being sent or received by the data communications resource manager, an internal error was detected in Db2. Register 4 contains a reason code that provides additional information about this error. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31110

Explanation

Instrumentation facility component (IFC) has passed a nonzero return code to the data communications resource manager. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31111

Explanation

The instrumentation facility component (IFC) passed a nonzero return code to the data communications resource manager. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31112

Explanation

The data communications resource manager cannot find the LUWID for the remote thread in the database thread control blocks. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the Db2 failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31113

Explanation

The data communications resource manager received an invalid set of control block pointers. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31114

Explanation

A data communications resource manager(DCCM) block for a deallocated conversation which belongs to a database access thread cannot be found. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31115

Explanation

The data communications resource manager attempt to enqueue a request for a database access thread failed. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31116

Explanation

The data communications resource manager received an invalid DC message number. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected

site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31117

Explanation

The data communications resource manager received a request with an invalid response type. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31118

Explanation

A message-processing routine returned to the data communications resource manager without the requested response. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31119

Explanation

The data communications resource manager processed a request with an unassigned or disconnected message class. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3111A

Explanation

The data communications resource manager received an unexpected communications error when processing a request. This can occur for any of the following reasons:

- A VTAM session failure caused the premature termination of a Db2 conversation.
- A VTAM VARY NET, INACTIVE or HALT NET command was issued which interrupted a Db2 conversation.
- A Db2 internal logic error occurred.

System action

A record is written to SYS1.LOGREC and an SVC dump may be requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

If theabendappears to have been caused by a Db2 logic error, determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site as well as any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3111B

Explanation

The data communications resource manager cannot find the remote location for the requesting thread in the control blocks. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3111C

Explanation

An internal logic error occurred while invoking a TCP/IP functional service.

DSNLInnn identifies that a DCRM TCP/IP manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3111E

Explanation

A database access thread (DBAT) meets the requirement for becoming inactive but the limit specified by the value of the MAXTYPE1 subsystem parameter has already been reached.

Note: The MAXTYPE1 subsystem parameter is removed in Db2 13 or later, and Db2 13 always operates with the behavior of the 0 setting. For more information, see [Subsystem parameter changes in Db2 13 \(Db2 for z/OS What's New?\)](#).

System action

A record is written to SYS1.LOGREC, DSNL027I and DSNL028I messages have are written to SYSLOG, and the thread is terminated.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

The DBAT meets the requirements for becoming inactive because a nonzero value has been specified for the MAXTYPE1 subsystem parameter. However, because the number of inactive DBATs has already reached the MAXTYPE1 limit, the DBAT is terminated with this reason code. To correct the condition, increase the value of the MAXTYPE1 subsystem parameter to allow additional inactive DBATs, or set the value to zero.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3111F

Explanation

The maximum amount of buffered query data has been exceeded. Rather than return one block of query data, the DRDA server system elected to return multiple extra blocks. Instead of fetching all rows in all the extra blocks, the requesting application either executed an SQL statement that is not related to the query or executed a commit while a held cursor was still open. Db2 buffers the extra in-transit blocks, however Db2 was not able to buffer the entire set of

extra blocks and thus truncated the result set. The application then resumed fetching and attempted to fetch data beyond the point of truncation.

This SQLCODE can also be returned when the DRDA server system calculates the maximum amount of storage required for processing query data, and finds the requested storage exceeds the system limit.

System action

The SQL statement fails.

Operator response

Notify the system programmer.

System programmer response

Determine the failing application program and consider the following resolutions:

- The cursor definition may cause the server to return extra blocks. In this case, the cursor definition can be changed to reduce the number of rows, thus extra blocks, being returned by the server.

Db2 for z/OS systems return extra blocks for cursors defined with the OPTIMIZER FOR *n* rows clause and will return only enough extra blocks in order to return *n* rows. When a cursor is defined with OPTIMIZER FOR *n* rows, either in the application or in a stored procedure, this indicates an application intent to fetch all *n* rows before attempting to execute other SQL statements. The application is not abiding by its intent and is executing other SQL, or committing, prior to fetching all *n* rows. In this case, the cursor definition can be changed to reduce the value of *n*, or the application logic can be modified to fetch all *n* rows or to close the cursor before executing the statement that caused the in-transit data to be buffered.

- Examine the columns in the cursor SELECT list. The columns in the select list can impact the amount of storage required by the DRDA server for processing query data. The cursor definition can be changed to reduce the number of columns in the select list, or the columns in the select list can be changed to have a smaller declared length in the table. Both can reduce the required storage at the DRDA server to handle the query data.

For information about block fetching result sets, see [Enabling block fetch for distributed applications \(Db2 Performance\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Listing of the results produced by the SQL statements.
- Source listing of the failing application program.

00D31200

Explanation

Db2 thread inactivation processing failed to inactivate a database access thread (DBAT) because the DBAT's unit of recovery state was marked as "inflight". This processing occurs only when Db2 is configured with DDF Inactive Threads support (when the "DDF THREADS" field is set to "INACTIVE" in the DSNTIPR installation panel). This error is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D31201

Explanation

Db2 has detected an inconsistency in the TCP/IP PORT configuration parameter between the DRDA and RSYNC ports. A BIND ipaddr was specified on the DRDA PORT statement in the PROFILE.TCPIP data set but the BIND ipaddr was not specified on the RSYNC PORT statement in the PROFILE.TCPIP data

set. When using dynamic virtual IP addresses (VIPA), Db2 requires both the DRDA PORT and RSYNC PORT to be configured to use a VIPA.

System action

DDF is abnormally terminated.

System programmer response

If using dynamic VIPA to bind to a Db2 PORT number, verify that a VIPA is defined for both the DRDA PORT number and RSYNC PORT number by specifying the BIND ipaddr on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORTs for Db2. If not using dynamic VIPA to bind to Db2 PORT, remove the BIND ipaddr option on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORT numbers for Db2. After fixing the TCP/IP PORT configuration statements, start DDF.

00D31202

Explanation

Db2 has detected an inconsistent change in the TCP/IP PORT configuration parameter for the RSYNC PORT. A BIND ipaddr specified on the RSYNC PORT statement was changed in the PROFILE.TCPIP data set since DDF was started.

System action

DDF is abnormally terminated. This change can cause outages because of invalid sysplex routing information or commit resynchronization failures due to invalid IP addresses being returned to requesters.

System programmer response

Verify the BIND ipaddr specified on the RSYNC PORT number in the TCP/IP PORT statement and start DDF.

00D31203

Explanation

A conversation was not allocated for one of these reasons:

- The LINKNAME was present in the SYSIBM.IPLIST table, but not in the SYSIBM.IPNames table.
- The IP Address contained in the IPADDR column of SYSIBM.IPLIST table was also present in the IPADDR column of SYSIBM.IPNames table. A given IP Address can appear in only one of these two tables.

System action

A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator response

Notify the system programmer.

System programmer response

Make sure the LINKNAME in SYSIBM.IPLIST table is also defined in SYSIBM.IPNames table. Make sure the IP Address is specified in the IPADDR column of SYSIBM.IPLIST table and a blank value is specified in the IPADDR column of SYSIBM.IPNames table.

Problem determination

Collect the following diagnostic items:

- Print the contents of the SYSIBM.IPNames table.
- Print the contents of the SYSIBM.IPLIST table.

00D31204

Explanation

An outbound TCP/IP connection requires the use of IPv6 addressing but TCP/IP is not configured to support IPv6 addressing.

System action

Notification of the failure is returned to the application.

System programmer response

The Communications Database (CDB) registration of the remote partner indicates that an IPv6 address is to be used. That is, the location name being accessed by the application SQL refers to a SYSIBM.LOCATIONS row. The SYSIBM.LOCATIONS row contains a LINKNAME that refers to a SYSIBM.IPNames row. The SYSIBM.IPNames row contains an IPADDR value that indicates the use of IPv6 addressing, either by explicitly specifying an IPv6 address or by referring to a domain name that resolves to an IPv6 address.

You must choose of the following actions:

- Configure TCP/IP to support IPv6 addressing.
- Make configuration changes to refer to only IPv4 addresses.

To configure TCP/IP to support IPv6 addressing, you must first ensure that TCP/IP is configured to use a dual-mode IPv4 and IPv6 stack - the BPXPRMxx PARMLIB member must be modified to allow TCP/IP to behave as a dual-mode stack. Other TCP/IP

configuration changes are also required to define the IPv6 address. You can verify that IPv6 addressing is correctly defined for Db2 purposes if the Db2 Display DDF command report, issued after DDF is started, provides an IPv6 address.

If TCP/IP cannot be configured to support IPv6 addressing, you can only refer to IPv4 addresses. If the IPADDR column, of the SYSIBM.IPNAMES CDB table, specifies an IPv6 address, you must change the IPADDR column to refer to an IPv4 address. If the IPADDR column specifies a domain name that resolves to an IPv6 address by the Domain Name Server (DNS), you must modify the DNS to resolve the domain name to an IPv4 address.

Make the appropriate changes and rerun the application.

00D31205

Explanation

A secure connection could not be established using z/OS Application Transparent-Transport Layer Security (AT-TLS). The reason that this code was issued depends on whether the connection attempt was inbound or outbound:

Inbound connections

Db2 has detected an invalid use of a secure port. A non-secure TCP/IP connection is attempting to access Db2 using a secure port without an AT-TLS policy established for the connection.

Outbound connections

Db2 cannot establish a secure connection with the remote location.

System action

The system action depends on whether the connection was inbound or outbound:

Inbound connections

The attempted connection request is terminated. If no instance of message DSNL030I has been written to the system console in the preceding five minutes, message DSNL030I is written to the system console.

Outbound connections

The request to connect to the remote site fails. The SQL application receives SQLCODE -904.

System programmer response

z/OS AT-TLS transparently performs transport layer security (TLS) on behalf of Db2 by invoking the z/OS System Secure Socket Layer (SSL) in the TCP transport layer. AT-TLS uses a policy-based configuration, and

the Policy Agent application is required to define AT-TLS rules and actions to the TCP/IP stack for TCP connections.

1. Use the reports generated by the z/OS UNIX `pasearch` and `TCP/IP NETSTAT TTLS` commands to verify that an AT-TLS policy exists and has been defined for the appropriate port.

Inbound connections

The secure port that Db2 uses for accepting secure TCP/IP connections.

Outbound connections

The remote port that Db2 uses to establish a secure TCP/IP connection with the remote location.

2. Ensure that AT-TLS is enabled for this connection.

User response

Verify that the correct port number has been specified for the connection to the target server. For a secure connection, the port number should be the target Db2 SECURE PORT, in which case an AT-TLS policy is required.

If you want to access Db2 without a secure connection, specify the Db2 DRDA PORT.

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00D31206

Explanation

The MAXFILEPROC limit was exceeded and the thread was not allowed to connect to Db2.

System action

The requester is not connected to Db2.

Operator response

Notify the system programmer.

System programmer response

The maximum number of sockets that can be opened concurrently is defined by the installation option MAXFILEPROC. When the MAXFILEPROC limit is exceeded, threads are not allowed to connect to Db2. This message will be issued by DSNLILNR if Db2 is acting as the server listening on a socket and the conversation was abnormally deallocated or by DSNLIAAC when Db2 is acting as the requester initiating a connection and the connection was not allocated.

Make the appropriate changes and rerun the application.

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D31207

Explanation

FL 505 A remote connection was not established because the USERNAMES option in the SYSIBM.IPNAMES table in the communications database (CDB) is not defined correctly.

If the TRUSTED column in the SYSIBM.LOCATIONS table is set to 'N' and the SECURITY_OUT column in the SYSIBM.IPNAMES table is set to 'P' or 'E', the USERNAMES column in the SYSIBM.IPNAMES table must be set to 'O'.

When the TRUSTED column in the SYSIBM.LOCATIONS table is set to 'Y', the SECURITY_OUT column in the SYSIBM.IPNAMES table cannot be set to 'T'. If the SECURITY_OUT column is set to 'T', the USERNAMES column must be 'O', null, or blank (' ').

System action

Notification of the failure is returned to the application. The remote connection is not established.

Operator response

Notify the system programmer.

System programmer response

Set up the SYSIBM.IPNAMES table correctly.

Related reference

[IPNAMES catalog table \(Db2 SQL\)](#)

00D34401

Explanation

The relational data system (RDS) passed an invalid function code to the distributed RDS (DRDS). This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34404

Explanation

The relational data system (RDS) passed the distributed RDS (DRDS) an invalid distributed interface block (DIB). This is an internal RDS error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34405

Explanation

The data communications resource manager (DCRM) passed an invalid LMPP message number to the distributed relational data system (DRDS). This is

either an internal DCRM error or an internal DRDS error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34406

Explanation

The distributed relational data system (DRDS) detected a message of invalid length from the data communications resource manager (DCRM). The message is longer than the buffer size. This is either an internal DRDS error or an internal DCRM error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34407

Explanation

The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a SEND request. This is a DCRM internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34408

Explanation

The distributed relational data system (DRDS) received an invalid LMPP from the data communications resource manager (DCRM). This is either a DCRM internal error or a DRDS internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34409

Explanation

The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state transition occurred. This is a DRDS internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3440B

Explanation

The distributed relational data system (DRDS) detected an inconsistency. This is an internal error.

System action

Db2 writes a SYS1.LOGREC record and requests an SVC dump at the failed Db2 site.

Operator response

Notify the system programmer.

System programmer response

Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3440C

Explanation

The distributed relational data system (DRDS) requesting site control block must exist at this time but does not. This is an internal DRDS error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3440D

Explanation

The distributed statistics and accounting control block does not exist. This is an internal distributed data facility (DDF) error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3440E

Explanation

A distributed request was received, but the distributed data facility (DDF) is inactive.

System action

The request is not processed.

Operator response

Ensure that the DDF has been started.

User response

Notify the system operator.

00D3440F

Explanation

The distributed relational data system (DRDS) detected a message of invalid length from the data communications resource manager (DCRM). The

message is smaller than the buffer size, but the return code from the DCRM indicates that the message is greater than one buffer. This is either an internal DRDS error or an internal DCRM error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34410

Explanation

The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a RECEIVE request. This is an internal DCRM error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34411

Explanation

The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state is specified. This is an internal DRDS error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34412

Explanation

The distributed relational data system (DRDS) detected an internal inconsistency. An internal buffer offset variable contains an invalid value. This is an internal DRDS error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34413

Explanation

The data header on the message received from the responding site contains invalid information. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34414

Explanation

The relational data system (RDS) did not specify an area for the null indicator of the data. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you

suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34415

Explanation

The input host variable SQLDA format specified in the RDI is not valid. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34416

Explanation

An incomplete response was received on a conversation when a complete response was expected.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34417

Explanation

DRDS detected an illegal attempt to enter Continuous Block Fetch mode.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34418

Explanation

The connection to the remote server failed. The SYSIBM.USERNAMES table did not contain an outbound row and did not specify the remote authorization ID for the plan owner Db2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs that are used for each Db2 authorization ID that communicates with the LU.

System action

A response is sent to the application to indicate that the resource is unavailable. The request is not sent to the remote site.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES is specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that specify the remote authorization ID to be used for each possible Db2 authorization ID.

These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D34419

Explanation

RDS has passed an invalid DESCRIBE request to DRDS. This is an internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3441C

Explanation

Allocation of the distributed processing services block (DPSB) failed.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3441D

Explanation

The distributed relational data system (DRDS) subcomponent has determined that control structures necessary for processing do not exist. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3441E

Explanation

The distributed relational data system (DRDS) subcomponent has determined that the function to be executed is not a valid function. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3441F

Explanation

The distributed relational data system (DRDS) subcomponent is in an invalid state and cannot process the function requested. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34422

Explanation

The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Transaction Manager (DTM) subcomponent during CONNECT processing. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34423

Explanation

The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Data Interchange Service (DDIS) subcomponent on an invocation to generate a request. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34424

Explanation

The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Data Interchange Service (DDIS) subcomponent on an invocation to parse a reply. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34425

Explanation

The distributed relational data system (DRDS) subcomponent has received an unexpected return

code from the Data Communications Resource Manager (DC) subcomponent. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34426

Explanation

The distributed relational data system (DRDS) subcomponent has detected an invalid date format in the DSNHDECP module or a user-supplied application defaults module. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34427

Explanation

The distributed relational data system (DRDS) subcomponent has detected an invalid time format in the DSNHDECP module or the user-supplied application defaults manual. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34428

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DRDA command and its command data objects and has generated a DRDA exception.

An EXCSQLSTT command was received with the parameter OUTEXP set to TRUE, but the requester has not sent any parameter data. Db2 returns a SYNTAXRM to the requester, writes an IFCID 195 trace record, and generates a DSNL032I console message.

System action:

Message DSNL032I is written to the console. A DDM reply message is returned to the requester system.

Operator response:

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 DRDA server system that is generating the message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D34429

Explanation

The distributed relational data system (DRDS) subcomponent has detected that the call type in the RDI is invalid. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3442B

Explanation

The distributed relational data system (DRDS) subcomponent has received a nonzero SQL return code from an invocation of the parser. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3442E

Explanation

The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using Distributed Relational Database Architecture (DRDA) at the local Db2.

The local Db2 has received an ENDUOWRM that indicates that the remote server processed a dynamic COMMIT request successfully; however, the SQLCARD that accompanies the ENDUOWRM contains a negative SQL return code.

System action

An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE +30100 for this operation.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local Db2. Consult with the remote server system programmer to diagnose the problem.

At this local Db2, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3442F

Explanation

The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using Distributed Relational Database Architecture (DRDA) at the local Db2.

The inconsistency may manifest itself as follows:

- In the processing of an embedded SELECT SQL statement, a prior execution of this embedded SELECT SQL statement resulted in a SQLDTARD that is NOT the same as the SQLDTARD received on the current execution of this SQL statement.
- In the processing of an OPEN cursor SQL statement, a prior description of the resultant data, obtained either as a result of a PREPARE or a prior execution of this SQL statement is NOT the same as the description of the resultant data that was received on the current execution of this SQL statement.

The data length, the data type and CCSID of each column of resultant data is checked for consistency.

System action

An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE -30020 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local Db2. Consult with the remote server system programmer to diagnose the problem.

At the local Db2, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

At the remote server, collect the following items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D34432

Explanation

The Distributed Relational Data System (DRDS) subcomponent encountered a positive SQL return code during remote program BIND processing. This is a Db2 internal error.

System action

The request was successfully processed.

00D34433

Explanation

The distributed relational data system (DRDS) subcomponent encountered a negative SQL return code during remote program BIND processing. This is a Db2 internal error.

System action

The request was not successfully processed.

00D34434

Explanation

The distributed relational data system (DRDS) subcomponent was forced to deallocate the conversation. This is a Db2 internal error.

System action

The request was not processed successfully.

00D34436

Explanation

The distributed relational data system (DRDS) subcomponent detected that a remote program BIND request specified the local site. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the BB2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D34438

Explanation

The distributed relational data system (DRDS) subcomponent received an invalid SQLD value from the Relational Data System (RDS) component as a result of a DESCRIBE request. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 ABEND.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3443A

Explanation

The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the Db2 authorization ID to be used for the remote plan owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which Db2 authorization IDs are to be used for each remote authorization ID from the LU.

System action

The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator response

Notify the system programmer.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the Db2 authorization IDs to be used for every possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443B

Explanation

The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a chained request using Distributed Relational Database Architecture (DRDA) at the local Db2.

Examples of inconsistencies follow:

- The local Db2 believes that the chain is intact but the remote server believes that the chain has been severed.
- The local Db2 believes that the chain has been severed but the remote server believes that the chain is intact.

- The local Db2 has received a negative SQL return code while processing a response to BEGIN BIND yet the remote server has not severed the chain.

System action

An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During BIND, the application will receive a DSNT500I message. During execution the application will receive an SQLCODE -904 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local Db2. Consult with the remote server system programmer to diagnose the problem.

At the local Db2, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

At the remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3443C

Explanation

The distributed relational data system (DRDS) received an invalid return code from the relational data system (RDS) on a string translation request. This is a DRDS internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the Db2 abend.

Operator response

Notify the system programmer.

System programmer response

Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the Db2 failure, and any related dumps from each connected site. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

00D3443D

Explanation

The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the Db2 authorization ID to be used for the remote primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which Db2 authorization IDs are to be used for each remote authorization ID from the LU.

System action

The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the Db2 authorization IDs to be used for every possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443E

Explanation

The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the Db2 authorization ID to be used for the remote package owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which Db2 authorization IDs are to be used for each remote authorization ID from the LU.

System action

The database access agent is not allocated.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the Db2 authorization IDs to be used for every possible remote authorization ID.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443F

Explanation

The connection to the remote server failed. The SYSIBM.USERNAMES table did not contain an outbound row and did not specify the remote authorization ID for the package owner Db2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified as 'O' or 'B', outbound name translation is in use. The SYSIBM.USERNAMES table must contain entries that describe the remote authorization IDs that are used for each Db2 authorization ID that communicates with the LU or the TCP/IP address.

System action

A response is sent to the application to indicate that the resource is unavailable. The request is not sent to the remote site.

Operator response

Notify the communications database administrator.

System programmer response

Make sure the USERNAMES column in SYSIBM.LUNAMES or SYSIBM.IPNAMES is specified correctly for the indicated LUNAME or IPADDR. If you intend to use remote authorization IDs that differ from the Db2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that specify the remote authorization ID to be used for each possible Db2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem determination

Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D34440

Explanation

A timeout or deadlock was detected during remote bind processing. This can occur during BIND, REBIND, or FREE.

System action

The BIND is not successful.

System programmer response

None is required.

User response

Reissue the BIND subcommand.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D34441

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DRDA command and its command data objects and has generated a DRDA exception. One of the following error conditions might have occurred:

- An EXCSQLSTT command was received specifying a stored procedure name (PRCNAM), but the statement is not a stored procedure call. Db2 returns a CMDCHKRM to the requester.
- An EXCSQLIMM or EXCSQLSTT command was received from the requester specifying an invalid QRYINSID instance variable. Db2 returns a VALNSPRM to the requester, writes an IFCID 192 trace record, and generates a DSNL032I console message.

System action:

Message DSNL032I is written to the console. A DDM reply message is returned to the requester system.

Operator response:

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 DRDA server system that is generating the message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D34442

Explanation

The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using Distributed Relational Database Architecture (DRDA) at the local Db2.

The local Db2 has received an ENDUOWRM that indicates that the remote server processed a dynamic ROLLBACK request successfully; however, the server should not have processed the ROLLBACK for one of the following reasons:

- The server was not available to update
- The server was participating in two phase commit protocols with the current request

System action

An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution, the application will receive an SQLCODE -904 for this operation. The connection to the server will be terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the trace record associated with the LUWID of the failing request to determine the reply message and data that was received by the local Db2.

Consult with the remote server system programmer to diagnose the problem.

For the local Db2 that made the request, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

For the remote server that received the request, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D34445

Explanation

The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester.

A previous CNTQRY command specified a QRYROWSET parameter, which indicated the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester. Some rows in the requested rowset are still unfetched and are pending. The DRDA rules require that this subsequent CNTQRY command must either:

- Specify a QRYROWSET value that is equal to the number of pending rows in the rowset.
- Reset the query blocks from the pending rowset

The CNTQRY command did not specify the QRYRSTBLK parameter to reset the query blocks, so this command is assumed to complete the pending rowset. Because the requested QRYROWSET value does not equal the number of pending rows in the rowset that was requested by the previous CNTQRY, a DRDA exception occurred.

System action

Message DSNL032I is written to the console, and a DDM reply message (PRCCNVRM) is returned to the requester system.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL032I message.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

At the Db2 server system that generated the DSNL032I message, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

00D34447

Explanation

The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. If either or both the OPNQRY command and the first CNTQRY command specified QRYROWSET parameter, then all subsequent CNTQRY commands must specify the QRYROWSET parameter explicitly. The CNTQRY command did not specify a QRYROWSET parameter as required by the DRDA rules and a DRDA exception occurred.

System action

Message DSNL032I is written to the console, and a DDM reply message (PRCCNVRM) is returned to the requester system.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL032I message.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

At the Db2 server system that generated the DSNL032I message, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

Related information

- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D34449

Explanation

The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. Scrolling parameters (such as QRYSCRO RN, QRYROWNBR, QRYROWSNS, QRYBLKRST, QRYRTNDDTA) were specified on the CNTQRY command, but one of the following conditions exists:

- The cursor is not scrollable.
- The cursor is scrollable, but it is being accessed by the requester in a non-scrollable manner. (Neither the OPNQRY command nor the first CNTQRY command specified the QRYROWSET parameter.)

A DRDA exception occurred.

System action

Message DSNL032I is written to the console, and a DDM reply message (PRCCNVRM) is returned to the requester system.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL032I message.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

At the Db2 server system that generated the DSNL032I message, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D3444A

Explanation

The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. The CNTQRY is fetching data from a scrollable cursor which is being accessed in a scrollable manner by the requester. The CNTQRY command will return one or more LOB columns as LOB data, but the RTNEXTDTA parameter on the CNTQRY command (indicating how LOB values are to be returned) did not specify RTNEXTALL as required by the DRDA rules. A DRDA exception is generated.

System action

Message DSNL032I is written to the console, and a DDM reply message (PRCCNVRM) is returned to the requester system.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL032I message.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

At the Db2 server system that generated the DSNL032I message, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D3444C

Explanation

The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. A previous CNTQRY command specified a QRYROWSET parameter, indicating the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester and a number of rows in the requested rowset are still unfetched, and remain in pending state. The DRDA rules require that this subsequent CNTQRY command either reset the pending query blocks by means of the QRYRSTBLK parameter or must explicitly or implicitly specify a FETCH NEXT orientation (RELATIVE+1) to complete the pending rowset. The CNTQRY command did not reset the pending rowset and did not specify the FETCH NEXT orientation, resulting in a DRDA exception.

System action

The message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

If the requester system is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

At the Db2 server system that is generating the message, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.
- All dumps taken by the attachment facility or requesting application.

00D3444F

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object received from a DRDA requester system. The total FDOTA object length, as determined by parsing the individual data items in the FDOTA object, is smaller than the stated length of the FDOTA object itself.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information. A DDM reply message (SYNTAXRM) is returned to the requester system.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00D34450

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object received from a DRDA requester system. While parsing the FDODTA constituent of the SQLDTA object, a data item has a stated or implied length that is larger than the stated length of the FDODTA object itself.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information. A DDM reply message (SYNTAXRM) is returned to the requester system.

Programmer response

Modify the stored procedure to return result sets that include only data types that are supported by the requester. You may also upgrade the level of the code at the requester to one that supports the data types that were returned by the server.

Programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00D34451

Explanation

A remote application connected to a Db2 server and issued an SQL statement that contain a three-part name or alias that refers to an table or view at a remote location. However, the remote reference actually resolves to the local Db2 server location. This situation can occur when the SQL statement refers to a location alias but the package for the application was bound before the location alias was defined.

System action

The SQL statement is rejected.

User response

Bind the application package at the server after the location alias is defined. For a data sharing group, ensure that the location alias is defined on all members.

Problem determination

Use the DISPLAY DDF command to determine the location aliases for the server. Ensure that any location alias references in the application exist at the server when the package is bound.

Related concepts

[-DISPLAY DDF command \(Db2\) \(Db2 Commands\)](#)

00D34452

Explanation

The request failed because table SYSIBM.DSNSERVICE is unavailable.

System action

The native REST request, DSN subcommand BIND SERVICE, or DSN subcommand FREE SERVICE is terminated.

User response:

Refer to [Enabling Db2 REST services \(Db2 REST services\)](#) for information on creating the required database objects for Db2 REST services.

Related tasks

[Enabling Db2 REST services \(Db2 REST services\)](#)

Related reference

[Db2 REST services table \(SYSIBM.DSNSERVICE\) \(Db2-supplied user tables\)](#)

00D35000

Explanation

Db2 has detected a DRDA exception condition. This is a generic reason code that describes a situation not covered by any other reason codes.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at the local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35001

Explanation

Db2 calculated the maximum amount of storage that is required for sending application input or output data through DRDA, and determined that the calculated value exceeds the system limit.

For a stored procedure call in which at least one of the parameters is an array type, the maximum amount of storage that is needed to send the array, in combination with the amount of storage that is used by other parameters, is too large. The actual declared cardinality of the array parameter and the maximum declared length of the array elements are used in the calculation.

System action

Execution of the SQL statement fails during DRDA processing, which is before or after Db2 executes the SQL statement.

For a stored procedure call, the stored procedure has already executed when this reason code is issued. If the stored procedure returns any result sets, they are still open.

In some cases, if the storage limit was already reached during previous Db2 processing, Db2 takes the following actions:

- Requests an abend and an SVC dump.
- Writes a record to SYS1.LOGREC.
- Writes messages DSNL027I and DSNL028I to the console.
- Writes message DSNL500I to the console if the conversation is terminated as a result of the abend.

Programmer response

To avoid this error, take one or more of the following actions:

- Reduce the number of parameters or the sizes of the parameters that are returned by the stored procedure. Doing so might reduce the required storage.

- Reduce the amount of storage that is used by array parameters by reducing the number of elements in the array, or by reducing the declared size of the elements in the array.
- If the SQL CALL statement failed, and the called stored procedure returns result sets, modify the calling application in the following ways:
 - Include COMMIT statements to close WITHOUT HOLD result sets.
 - Include ROLLBACK statements to close WITH HOLD result sets.
- If an abend and SVC dump were generated, the problem might be a Db2 error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If the SQL CALL statement failed, collect the following diagnostic items:

- Listings of the results that were produced by all SQL statements in the calling application program and the called stored procedure.
- Source listings of the calling application program and the called stored procedure.

If an abend and SVC dump were generated, take the following actions:

1. Identify all connected systems that participated in the processing of the remote request. Those systems include:
 - The requester system to which the application is connected
 - The data server that is the target of the remote request
 - Any intermediate server systems
2. At the site of the Db2 abend, examine messages DSNL027I and DSNL028I in the console log to determine the sites to which the agent that received the abend was connected.
3. For each connected Db2 system, collect the following diagnostic items:
 - Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
 - A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
 - All dumps created by this failure.

Related information

[DSNL027I \(Db2 Messages\)](#)

00D35011**Explanation**

The distributed data interchange system (DDIS) component detected an internal error. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the abend. Messages DSNL027 and DSNL028 are written to the console. If the conversation is terminated as a result of the abend, DSNL500I is also written.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may include intermediate server systems. Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the Db2 abend.

For each connected system that is a Db2 system collect the diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

00D35030**Explanation**

Db2, acting as a DRDA server, detected an error while processing an SQL request from a remote DRDA client. Db2 was building a DDM query descriptor (QRYDSC or FDODSC) to return to the DRDA client, but could not do so because the descriptor required more late environment descriptors (LEDs) than Db2 can support.

System action

The DBAA is abended. The conversation with the remote site is terminated. At the server console, the DSNL027I message is issued, accompanied by one or more DSNL028I messages identifying all remote sites where the distributed agent also exists and where diagnostic information might also be collected.

Operator response

Notify the application programmer or user creating the SQL statement.

If the remote DRDA client is a Db2 for z/OS system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

User response

The SQL request issued by the client cannot be processed by Db2. As a circumvention, the SQL request can be simplified to reduce the number of LEDs required to describe the data using DRDA. LEDs may be required, for example, if columns being fetched are in a different code page (CCSID) than the default CCSID for the Db2 for z/OS system.

00D35101**Explanation**

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM level 6b object, other than a Reply DSS or an Object DSS, is invalid.

Db2 may be acting as a requester system for a local application or may be acting as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35102

Explanation

Db2 has detected an error in the DDM reply data object received from the remote server in response to a DDM command. The object, carried in a level 6b OBJDSS, is not defined as valid for DDM level 3.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30072 and SQLSTATE 58016.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35103

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. Multiple instances of a DDM reply data object, defined within DDM level 3 as nonrepeatable, have been returned.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35104

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The reply data object is not defined by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30071 and SQLSTATE 58015.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35105

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. While defined by DDM Level 3 as a valid reply object for this command, Db2 does not support the object.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35106

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The object must be contained within a single OBJDSS, but was received in an OBJDSS which contained other objects.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35107

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. One or more DDM reply data objects, defined by DDM Level-3 as required for the DDM command, were not received.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35108

Explanation

Db2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the FDODSC scalar, contained within the SQLDTARD, exceeds 32KB. The DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the FDODSC object, contained within the SQLDTARD collection, exceeds 32KB. The DDM extended length field required to support this is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35109

Explanation

Db2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The DDM SQLDTARD object is a collection consisting of the FDODSC and FDOTA scalars. The FDODSC scalar, describing a single row returned on SELECT, is not contained with the SQLDTARD reply data object. The DDM SQLDTARD object is a collection which contains the FDODSC and FDOTA DDM objects. The FDODSC element, describing the single row, is not contained within the SQLDTARD reply data object.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D3510A

Explanation

Db2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The DDM SQLDTARD object is a collection consisting of the FDODSC and FDODTA scalars. The FDODTA scalar, containing the single row described by the FDODSC, is not contained within the SQLDTARD reply data object. The DDM SQLDTARD object is a collection which contains the FDODSC and FDODTA DDM objects. The FDODTA element, containing the single row, is not contained within the SQLDTARD reply data object.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3510B

Explanation

Db2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the resultant row, contained with the FDODTA scalar, exceeds 32KB. The FDODTA DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the resultant row exceeds 32KB. The DDM extended length field required to support this is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3510C

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The SQL operation is a SELECT and the size of the SQLDTARD,

a DDM collection consisting of the FDODSC and FDODTA scalars, SQLDTARD is greater than the sum of the lengths of the constituent FDODSC and FDODTA scalars. The object is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3510D

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The length of the DDM object is incorrect.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3510E

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The value of the DDM object specifies a machine environment which is not supported by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3510F

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The length of one of the constituent scalars, CCSIDSBC, CCSIDMBC or CCSIDDBC is incorrect.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35110

Explanation

Db2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (SBCS CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDSBC (SBCS CCSID) code point is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35111

Explanation

Db2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (MIXED CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDMBC (MIXED CCSID) code point is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35112

Explanation

Db2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (GRAPHIC CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDDBC (GRAPHIC CCSID) code point is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35113**Explanation**

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The DDM object length is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35114**Explanation**

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The length of the DDM reply message is inconsistent with the length of its DSS carrier.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35115**Explanation**

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The sum of the lengths of the constituent DDM objects within an OBJDSS is inconsistent with the length of the DSS carrier.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35116

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM reply message is not valid for the current command.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35117

Explanation

Db2 has detected an error in the SQLDTARD reply data object received in response to an EXCSQLSTT DDM command. The FDODTA element of the SQLDTARD collection contains a null SQLDTAGRP containing no data and a null SQLCAGRP, indicating that the SQL SELECT operation was successful. This is an inconsistency.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35118

Explanation

Db2 detected an error in the DDM reply data object received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply data object (that is, the level of DDM required to support the object) exceeds the DDM level of the AS specified during CONNECT processing.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL031I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D35119

Explanation

Db2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply message (that is, the level of DDM required to support the reply message) exceeds the DDM level of the AS specified during CONNECT processing.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application received SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL031I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3511A

Explanation

Db2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary

component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. Neither the SQLCARD nor the SQLDTARD is contained in the summary component.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3511B

Explanation

Db2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object.

The SQLRSLRD object is not contained in the summary component.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3511C

Explanation

Db2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. The SQLRSLRD reply data object was not preceded by the RSLSETRM reply message.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3511D

Explanation

Db2 has detected an error in the DRDA summary component or the DRDA result set component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. The DRDA result set component should consist of at least the DDM OPNQRYRM reply message and the DDM QRYDSC reply data object. The OPNQRYRM message is not present following the SQLRSLRD object.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D3511E

Explanation

Db2 has detected an error in the DDM QRYDTA reply data object received in response to a DDM OPNQRY or CNTQRY command. The SQL operation is a FETCH and the size of the QRYDTA object, exceeds 32KB. The DDM length field required to support this is invalid.

Db2 may be acting as a requester system for a local application or may be acting as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D3511F

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a MGRLVLOVR collection signaling a remote

server change in DRDA manager levels. The DDM object length is invalid.

Db2 may be acting as a requester system for a local application or may be acting as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

Explanation

Db2 has detected an error in the DDM TYPDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPDEFOVR contains multiple occurrences of the CCSIDXML scalar (XML CCSID). This is an error. The CCSIDXML (XML CCSID) code point is invalid.

Db2 may be acting as a requester system for a local application or may be acting as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35121**Explanation**

Db2 has detected an error in the DDM reply data object that was received in response to a DDM EXSQLSTT, OPNQRY, or CNTQRY command. The SQL operation is a FETCH and the DDM object is a streamed object, but is not a QRYDTA object. Db2 might be acting as a requester system for a local application or as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

- Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL031I message. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:
 - Statistics Class 4 trace record for the LUWID that is associated with the failing request.
- Identify all connected systems that are participating in the processing of the remote request, including:
 - The requester system to which the application is connected
 - The data server that is the target of the remote request

- Any intermediate server systems

For each system that is a Db2 system, collect the following diagnostic items:

- The console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
- For non-Db2 systems, refer to the references specific to those products.
- If any dumps were generated on any Db2 system that is participating in processing the remote request, collect the following diagnostic items:
 - The listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
 - All dumps generated by this failure.

00D35122

Explanation

Db2 has detected an error in the DDM reply data object that was received in response to a DDM EXSQLSTT, OPNQRY, or CNTQRY command. The SQL operation is a FETCH and the DDM object is a streamed object, but is not the only object in the OBJDSS. Db2 might be acting as a requester system for a local application or as an intermediate DRDA system for a remote application on another DRDA requester system.

System action

An alert is generated and message DSNL031I is written to the console.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

- Analyze the statistics class 4 trace record that is identified by the IFCID sequence number that is enumerated in the DSNL031I message. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:
 - Statistics Class 4 trace record for the LUWID that is associated with the failing request.
- Identify all connected systems that are participating in the processing of the remote request, including:
 - The requester system to which the application is connected
 - The data server that is the target of the remote request
 - Any intermediate server systems

[DSNL031I \(Db2 Messages\)](#)

-30020

EXECUTION FAILED DUE TO A DISTRIBUTION
PROTOCOL ERROR THAT CAUSED
DEALLOCATION OF THE CONVERSATION:
REASON *reason-code (sub-code)*

00D351FF

Explanation

Db2 received a DDM reply message from the remote server in response to a DDM command. The reply message, while valid for the DDM command, indicates that the DDM command and hence the SQL statement was not successfully processed. The application is notified of the failure through the architected SQLCODE (-300xx) and associated SQLSTATE.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number included in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35201

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is the FDODSC element of an SQLDTARD. The size of the FDODSC is greater than 32KB and the DDM level 6b extended length field is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35202

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The SQLCADTA row (RLO) MDD is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35203

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The SQLCADTA row triplet (RLO) is either invalid or has not been included with the SQLDTARD descriptor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35204

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the first component of the SQLCADTA row is other than an SQLCAGRP (early) group or the number of elements taken from the SQLCAGRP or SQLCAGRP replication factor (or both) are incorrect. The descriptor is invalid. The DDM object is either a QRYDSC or the FDODSC element of the SQLDTARD collection. The FDOCA geometry is incorrect. The first elements of the row are other than the elements of the early SQLCAGRP. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35205

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The first component of the SQLCADTA row correctly enumerates the elements of the SQLCAGRP; however, the second component, identifying the SQLDTAGRP (late) group is incorrect. Either the SQLDTAGRP local identifier (LID) is different than the LID of the SQLDTAGRP previously specified or the number of elements taken from the SQLDTAGRP replication factor (or both) are incorrect. The descriptor is invalid. The DDM object is either a QRYDSC or the FDODSC element of the SQLDTARD collection. The FDOCA geometry is incorrect. The first elements of the row correctly enumerate the elements of the early SQLCAGRP, however, the local identifier (LID) following the SQLCAGRP LID is different than the LID of the SQLDTAGRP group previously specified. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35206

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors is included within the previously specified SQLDTAGRP late group descriptor. However, SQLDTARD row (RLO) Meta Data Definition (MDD) is either incorrect or has not been included within the SQLDTARD descriptor. The descriptor is invalid. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors have been included within the previously processed SQLDTAGRP group. However, the Meta Data Definition (MDD) of the SQLDTARD row (RLO) has not been included within the descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35207

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the SQLDTARD is specified as other than a row triplet (RLO) or the SQLDTARD RLO triplet length is invalid. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35208

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the SQLCADTA LID referenced within the SQLDTARD RLO did not match the LID defined within the SQLCADTA RLO or the number of elements or replication factor (or both) within the SQLDTARD RLO was non zero. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If this Db2 is the AR for the thread, the DDM object received is an SQLDTA or QRYDSC. The application will receive SQLCODE -30000 and SQLSTATE 58008. If this Db2 is an remote server for the thread, the DDM object received is SQLDTA. DSCINVRM will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at the local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35209

Explanation

Db2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the length is specified in the LL preceding the QRYDSC or FDODSC is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the QRYDSC or FDODSC. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3520A

Explanation

Db2 has detected an error in the SQLDTARD reply data object received in response to an EXCSQLSTT DDM command. The DDM object is the FDODSC scalar of the SQLDTARD collection and is contained within multiple DDM Level 6b OBJDSS carriers. The descriptor is invalid. The DDM object is the FDODSC scalar of the SQLDTARD collection. The SQLDTARD is contained in multiple level 6b object DSSs. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D3520B

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b DSSs. One or more of the containing level 6b DSSs is (are) other than an object (OBJ) DSS. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3520C

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b object DSSs. One or more of the DDM code points within the containing object DSSs is (are) other than QRYDSC (X'241A'). The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3520D

Explanation

Db2 has detected an error in the QRYDSC reply data object received in response to an OPNQRY DDM command. The QRYDSC contained in one or more query blocks is incomplete, i.e., the entire QRYDSC

has not been returned in response to the OPNQRY command.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3520E

Explanation

Db2 has detected an error in the DDM QRYDSC or the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The number of columns described by the QRYDSC object is inconsistent with the number of columns described by the DDM SQLCINRD object.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic item:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D35301

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message code point is not supported by DDM Level 3.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35302

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message contains one or more constituent instance variables whose code point is not supported by DDM Level 3.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35303

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message is greater than the sum of the lengths of the constituent instance variables.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35304**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. One or more instance variables, specified by DDM Level 3 as required for this reply message, is (are) not contained within the reply message.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35305**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message exceeds the sum of the lengths of all the constituent instance variables.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35306**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the RDBNAM instance variable is 18 bytes as specified by DDM Level 3, however, bytes 17 and 18 are non blank. Db2 supports only a 16 byte RDBNAM.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35307

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the DDM enumerated value instance variable, DTALCKST is other than TRUE (X'F1') or FALSE (X'F0').

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35308

Explanation

Db2 has detected an error in the MGRLVLRM reply message received from the remote server in response to the EXCSAT DDM command. The MGRLVL specified is not supported by Db2. Db2 supports the following DDM Level 3 managers: CMNAPPC, SUPERVISOR, SECMGR, AGENT, DIRECTORY, SQLADM, and RDB.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35309

Explanation

Db2 has detected an error in the ACCRDBRM reply message received from the remote server as in response to the ACCRDB command. The length of the PRDID instance variable is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3530A

Explanation

Db2 has detected an error in the ACCRDBRM reply message received from the remote server in response to ACCRDB DDM command. Db2 is currently disabled to connect to the server specified by the value of the PRDID instance variable.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D3530B**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM OPNQRY command. The value of the enumerated instance variable, QRYPRCTYP, is other than SNGROWPRC or LMTBLKPRC.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58017.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3530C**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the severity code (SVRCOD)

instance variable, as specified by DRDA, is not valid for this reply message.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3530D**Explanation**

Db2 has detected an error in the ACCRDBRM reply message received from the remote server in response to ACCRDB DDM command. The DDM TYPDEFOVR instance variable, a collection, contains a scalar instance variable other than CCSIDSBC, CCSIDMBC or CCSIDDBC.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3530E

Explanation

Db2 has detected an error in the ACCRDBRM reply message received from the remote server in response to the ACCRDB DDM command. The length of the TYPDEFOVR instance variable, a collection, is different than the sum of the lengths of the constituent scalar instance variables.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3530F

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM fixed length collection or scalar is different than that specified by DDM Level 3.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35310

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM variable length collection or scalar is different than that specified by DDM Level 3.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35311

Explanation

Db2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM EXCSQLIMM or EXCSQLSTT command. The AS DDM level specified during CONNECT is 4 and an ENDUOWRM was returned signaling that a dynamic COMMIT or ROLLBACK was performed. The correct response from an AS supporting DDM Level 4 is the CMMRQSRM reply message.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35312

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. Either Db2 was expecting to receive a SRVPRTY object and received an object other than SRVPRTY, or Db2 was expecting to receive an IPADDR object and received an object other than IPADDR.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is

the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35313

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the QRYATTUPD instance variable is not recognized for this command in DDM Level 6.

System action

Db2 generates an alert, and writes message DSNL031I to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35314**Explanation**

Db2 detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the QRYATTSNS instance variable is not recognized for this command in DDM Level 6.

System action

Db2 generates an alert, and writes message DSNL031I to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35315**Explanation**

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The received value for the DDM instance

variable QRYATTSCR is other than TRUE (X'F1') or FALSE (X'F0'). The value is not supported.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35316

Explanation

Db2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The received value for the DDM instance variable QRYATTSET is other than TRUE (X'F1') or FALSE (X'F0'). The value is not supported.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35401

Explanation

Db2 detected an error in the DDM SQLCARD reply data object received from the remote server in response to a DDM command. The object contains nonzero lengths for both the SQLERRMSG_m and SQLERRMSG_s elements as described by the SQLCAXGRP early group descriptor. This is invalid as specified by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number identified in the DSNL031I message.

00D35501

Explanation

Db2 has detected an error in the DDM SQLDARD reply data object received from the remote server in response to a DDM PRPSQLSTT command. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLDAROW occurrences within the SQLDARD array, is either negative or is inconsistent with the size of the SQLDARD array.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35502

Explanation

Db2 has detected an error in the DDM SQLDARD reply data object received from the remote server in response to a DDM PRPSQLSTT command. Within one or more SQLDAROW occurrences, either (a) the lengths of SQLNAME_m and SQLNAME_s are both non-0, or (b) the lengths of SQLLABEL_m and SQLLABEL_s are both non-0, or (c) the lengths of SQLCOMMENTS_m and SQLCOMMENTS_s are both non-0. The data is invalid with regard to the Early SQLDAGRP group descriptor as defined by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35601

Explanation

Db2 has detected an error in command data received from a local Db2, or reply data received from the remote server in response to a DDM command. The command or reply data is described by either an FDOCA early or late descriptor. Any Late descriptors have been previously validated. The data currently being retrieved from the data stream is described by a simple data Array (SDA) defining variable length data whose length is given by a 2 byte length field. The value of the length field is either negative or greater than the maximum length specified by the SDA. The data is inconsistent with the descriptor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within reply data, then the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within command data, a DDM DTAMCHRM reply message will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35602

Explanation

Db2 has detected an error in a SQLSTT, SQLSTTVRB, SQLOBJNAM or SQLDTA data object received from a local Db2. The length of the data to be retrieved from the data stream is defined by an SDA which is part of an early or late descriptor. The length exceeds the length of remainder of the OBJDSS carrier of the command data object. The data is inconsistent with the descriptor.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM DTAMCHRM reply message will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35603

Explanation

Db2 has detected an error in SQLCARD, SQLDARD, or SQLDTARD reply data object received from an remote server in response to a DDM command. The reply data is described by either the SQLCAGRP or SQLDAGRP early descriptors or the SQLDTAGRP (contained within a SQLDTARD) late descriptor. The length of the data to be retrieved is specified by the default length of a constituent SDA within the SQLCAGRP or SQLDAGRP early groups or the SDA length specification within the SQLDTAGRP late group. All OBJDSSs received in response to the DDM command have been processed but the SQLCARD, SQLDARD, or SQLDTARD is incomplete. These must be returned in their entirety. The data is inconsistent with the descriptor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35604

Explanation

Db2 has detected an error in SQLCARD, SQLDARD, or SQLDTARD reply data object received from an remote server in response to a DDM command. The reply data is described by either the SQLCAGRP or SQLDAGRP early descriptors or the SQLDTAGRP (contained within a SQLDTARD) late descriptor. The length of the data to be retrieved is specified by the default length of a constituent SDA within the SQLCAGRP or SQLDAGRP early groups or the SDA length specification within the SQLDTAGRP late group. The carrier OBJDSS has been exhausted but the complete object has not been assembled. The object must be contained in exactly one OBJDSS carrier. This is not the case and the data is inconsistent with the descriptor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35605

Explanation

Db2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which are contained in a level 6b DSS. One or more of the containing level 6b DSSs is other than a DDM level 6b object DSS. This is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35606

Explanation

Db2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which are contained in a level 6b Object DSS (OBJDSS). The code points of one or more of the DDM reply data objects is other than QRYDTA (X'241B'). This is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35607

Explanation

Db2 has detected an error in a QRYDTA reply data object received from a remote server in response to a DDM OPNQRY or CNTQRY. The cursor is being processed with single row protocols (SNGROWPRC). The QRYDTA may span multiple query blocks but must be returned in its entirety. This is not the case.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35608

Explanation

Db2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The current data to be retrieved from the QRYDTA is described by an SDA defining Null-Terminated data (DRDA types X'2C', X'2D', X'2E', X'2F', X'42' or X'43'). The null terminator cannot be located within the reply data. The data is inconsistent with the descriptor defined by the QRYDSC.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35609

Explanation

Db2 detected an error in conversion of numeric data. Possible scenarios are: floating point conversion overflow, or digits of numeric character out of range.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30073 and SQLSTATE 58017.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check your numeric data. If you are connecting to Db2 via a non-S/370 type machine, overflow can occur when the floating point value is out of the System/370 floating point range.

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

parameter subcode PARAMETER VALUE NOT SUPPORTED ERROR

00D35610

Explanation

Db2 has detected an error in command data received from a remote requester, or reply data received from the remote server in response to a DDM command.

The command or reply data is described by either an FDOCA early or late descriptor. Any late descriptors have been previously validated. The data currently being retrieved from the data stream is described by a simple data array (SDA) defining variable length data whose length is given by a 4 bytes length field. The 4 bytes length field is incomplete and split across more than one object. The length field is invalid.

System action

An alert is generated and message DSNL031I (if the error is detected by Db2 acting as a requester) or message DSNL032I (if the error is detected by Db2 acting as a server) is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I or DSNL032I message.

For the Db2 system generating the DSNL031I or DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35611

Explanation

Db2 has detected an error in command data received from a remote requester, or reply data received from the remote server in response to a DDM command. The command or reply data is described by either an FDOCA early or late descriptor. Any Late descriptors have been previously validated. The data currently being retrieved from the data stream is described by a simple data Array (SDA) defining variable length data whose length is given by a 4 bytes length field. The value of the length field is either negative or greater than the maximum length specified by the SDA. The data is inconsistent with the descriptor.

System action

An alert is generated and message DSNL031I (if the error is detected by Db2 acting as a requester) or message DSNL032I (if the error is detected by Db2 acting as a server) is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I or DSNL032I message.

For the Db2 system generating the DSNL031I or DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include

intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35701

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late descriptor includes late environmental descriptors and the SQLDTAGRP meta data definition (MDD) is either invalid or has not been included within the descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35702

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The SQLDTAGRP triplet is not defined as an FDOCA nullable group. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35703

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The local identifier (LID) of one of the SQLDTAGRP constituent triplets has not been previously defined by a late environmental descriptor and the LID is outside of the bounds of the default environmental descriptor LIDs (LID > X'49'). Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35704

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The local identifier (LID) of one of the constituent SQLDTAGRP SDAs has either not been previously defined by a late environmental descriptor, or is not a valid default LID. Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35705

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD reply data object, or the SQLDTA command data object. The FDOCA geometry is incorrect. All the OBJDSS carriers have been processed and the SQLDTAGRP has not been assembled. The SQLDTAGRP is incomplete and the descriptor is invalid.

System action

If the error occurs within the QRYDSC or SQLDTARD reply data object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic item at this local Db2:

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server:

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

STATEMENTS: REASON *reason-code (sub-code)*

00D35706

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either an SQLDTARD or SQLDTA and must be contained within a single OBJDSS. The descriptor, as defined by the length of the SQLDTARD or SQLDTA DDM objects, is incomplete and is therefore invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35707

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM Level 6b DSSs. One or more of the containing level 6b DSSs is other than an object (OBJ) DSS. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

the application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35708

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM level object 6b DSSs. The code point of one or more of the containing DDM objects is other than QRYDSC (X'241B'). The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

the application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35709

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor contained within a QRYDSC DDM object. The FDOCA geometry is incorrect. The SQLDTAGRP length specification exceeds the size of the QRYDSC level 6b DSS carrier. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D3570A

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is one of the following possibilities: QRYDSC, SQLDTARD or SQLDTA. The length override value in one of the constituent SQLDTAGRP SDAs is a placeholder length value, but an allowable placeholder length was not received. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command or message DSNL031I is written to the console if the error is detected while parsing a command reply. Refer to the description of this message for further information.

If the error occurs within a QRYDSC or SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3570B

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTA late descriptor. The DDM object is the OUTOVR object. A non-zero local identifier (LID) was received as an output override descriptor, but the LID value was not one of the values allowed for the current DRDA level (DRDA Level 4). This is invalid.

System action

An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3570C

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC or SQLDTARD reply data object. The Db2 requester has received an XMLSEE LID but the CCSIDXML in the TYPDEFOVR in effect for the object is not UTF-8. Db2 only supports UTF-8 for XMLSEE LIDs in a reply data object. The CCSIDXML value is not supported and is rejected.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is

the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D3570D

Explanation

Db2 has detected an error while processing the SQLDTAGRP late group descriptor contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC or SQLDTARD reply data object. The Db2 requester has received an XMLSIE LID in a reply data object. Db2 only supports XMLSEE LIDs in a reply data object. The XMLSIE LID is not supported and is rejected.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35801

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition does not specify a valid DRDA type. The SDA and the entire descriptor are invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35802

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD reply data object, or an SQLDTA command data object. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) either specifies a local identifier (LID) of 0 or defines a nonrelational database application class (other than X'05') or the meta data reference type is other than X'01'. The MDD and the entire descriptor are invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35803

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the descriptor following the MDD is either not an SDA or is an SDA with a length other than 12 (X'0C'). The SDA and the entire descriptor are invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35804

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the SDA immediately following the MDD is overriding a DRDA type not supported by DRDA. The SDA and the entire descriptor are invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35805

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is a QRYDSC, SQLDTARD, or an SQLDTA data object. The FDOCA geometry is incorrect. The size of the late environmental descriptors exceeds the size of the DDM level 6b DSS carrier. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If the error occurs within a QRYDSC or SQLDTARD replay data object (SQLDTARD late descriptor), the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within an SQLDTA command data object (SQLDTA late descriptor), a DSCINVRM reply message will be returned to the local Db2.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35806

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either an SQLDTARD or SQLDTA, each of which may not span DDM level 6b object (OBJ) DSSs. The containing level 6b OBJDSS contains only late environmental descriptors and neither groups or rows are defined. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35807

Explanation

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within the SQLDTARD late descriptor. The DDM object is a QRYDSC which spans multiple query blocks. One or more of the containing level 6b DSSs is (are) other than an object (OBJ) DSS. The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35808**Explanation**

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within the SQLDTARD late descriptor. The DDM object is a QRYDSC which spans multiple query blocks. One or more of the code points of the DDM objects carrying the descriptor is (are) other than QRYDSC (X'241B'). The descriptor is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35809**Explanation**

Db2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within the SQLDTARD late descriptor. This late descriptor is within a QRYDSC which spans one or more query blocks. The QRYDSC contains only late environmental descriptors and is, therefore, incomplete.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35901

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. A reply DSS (RPYDSS) has been received from the local Db2. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35902

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The first level 6b DSS received is an object DSS. The DDM command carried in a level 6b request DSS (RQSDSS) must be the first level 6b DSS received.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35903

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The first level 6b DSS received is neither a request (RQS) DSS, Object (OBJ) DSS nor Reply (RPY) DSS and is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35904

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The DDM command, specified by the code point contained within the level 6b RQSDSS, is invalid or not supported by DDM Level 3.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35905

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The first DDM command received on this conversation, while a valid DDM Level 3 command, is other than EXCSAT. The first command must be EXCSAT.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35906

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The EXCSAT command has been successfully processed but the current DDM command, while supported by DDM Level 3 and Db2, has been sent prior to ACCRDB. The only valid command prior to ACCRDB is another EXCSAT command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35907

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from an local Db2. the ACCRDB command has been successfully processed and the current command is another ACCRDB instance. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBACCRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35908

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from an local Db2. The state of the Db2 remote server is in 'BIND processing' and the current DDM command is other than BNDSQLSTT, ENDBND, RDBCMM or RDBRLBCK.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PKGBPARM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35909

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from an local Db2. The DDM command has been successfully processed, however, one or more of the level 6b DSSs are other than object (OBJ) DSSs. The only valid level 6b DSS chain is a single RQS DSS, followed by one or more OBJ DSSs.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590A

Explanation

Db2 has detected an error while parsing DDM command data received from a local Db2. The DDM command data object, as defined by the DDM code point, is either invalid or not valid for this command, as specified by DDM level 3.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (OBJNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this Db2 local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590B

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. One or more DDM command data objects, defined as required by DDM Level 3, were not received with the DDM command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590C

Explanation

Db2 has detected an error while parsing DDM command data received from a local Db2. The DDM object is a TYPDEFNAM, signaling a change in machine representation from the local Db2, however, the length, as specified by DDM level 3, is incorrect.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590D**Explanation**

Db2 has detected an error while parsing a DDM command data object received from a local Db2. The DDM object is a TYPDEFNAM, signaling a change in machine representation from the local Db2, however, the value of this DDM scalar is other than QTDSQL370, QTDSQLX86 or QTDSQL400. These are the only valid machine representations supported by DRDA.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590E**Explanation**

Db2 has detected an error while parsing a DDM command data object received from a local Db2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local Db2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The length of one of the constituent scalars is incorrect.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3590F**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The DDM object is a TYPDEFOVR, signaling a

change in CCSIDs from the local Db2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDSBC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35910

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local Db2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDMBC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35911

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local Db2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDDBC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35912

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a local Db2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local Db2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR length exceeds the sums of the lengths of the constituent scalars. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35913

Explanation

Db2 has detected an error while parsing a DDM command data object received from a local Db2. The DDM object is TYPDEFOVR, signaling a CCSID change from the local Db2. This is a collection consisting of CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains an object other than CCSIDSBC, CCSIDDBC, or CCSIDDBC. This is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35914

Explanation

Db2 detected an error while parsing a DDM command received from the application requester (AR). The minimum level attribute of the DDM command received from the AR, (that is, the level of DDM required to support the command) exceeds the DDM level specified by the AR during CONNECT processing.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35915

Explanation

Db2 detected an error while parsing a DDM command data object received from the application requester (AR). The minimum level attribute of the DDM command data object received from the AR (that is, the level of DDM required to support the object) exceeds the DDM level specified by the AR during CONNECT processing.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35917

Explanation

Db2 detected an error while parsing a DDM command data object received from a remote requester. The command data object is not supported at the DDM level negotiated during CONNECT processing. The command data object is rejected.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35918

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. The DDM command, specified by the code point contained within the level 6b RQSDSS, is invalid or not supported by DDM Level 3.

System action

A DDM reply message (CMDNSPRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35919

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is greater than or equal to 5, and the required ACCSEC and SECCHK commands were not received before the ACCRDB command.

System action

The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (MGRDEPRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3591A

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and an ACCSEC command was received.

System action

A DDM reply message (CMDNSPRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3591B

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC command was received when an ACCSEC command had already been executed successfully.

System action

The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3591C

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and a SECCHK command was received.

System action

A DDM reply message (CMDNSPRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D3591D

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A SECCHK command was received out of order, which means either an ACCSEC command has not executed successfully, or a SECCHK command has already been processed.

System action

The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3591E

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or

SECCHK command was sent after an ACCRDB was successfully processed.

System action

The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D3591f

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. The negotiated resync manager level is less than 5, but a SYNCRSY command was received. The request is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35920

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A SYNCCTL command was received but the negotiated SYNCPTMGR (Sync Point Manager) level is less than 5 and XAMGR (XA Manager) level is less than 7. The request is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35921

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. Db2 received an ACCRDB command from the resynch port. The request is invalid.

System action

The conversation is terminated.

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35922

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. Db2 received an ACCSEC command from the resynch port. This request is invalid.

System action

The conversation is terminated.

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35923

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A SECCHK

command was received from the resynch port. The request is invalid.

System action

The conversation is terminated.

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35924

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An INTRDBRQS command was received on an SNA connection. The request is invalid.

System action

The conversation is terminated.

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (MGRDEPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35925

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A SYNCCTL command was received but the negotiated XAMGR (XA Manager) level is less than 7. The request is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

- All dumps created by this failure.

00D35926

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data received from a remote requester. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the remote requester. This is a DDM collection consisting of four DDM scalars: CCSIDSBC, CCSIDMBC, CCSIDDBC and CCSIDXML. The TYPDEFOVR contains multiple instances of the CCSIDXML scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35A01

Explanation

Db2 has detected an error while parsing a DDM command data object received from a local Db2. The DDM object is either an SQLSTT, SQLOBJNAM or SQLSTTVRB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. The instantiation of both the SBCS and mixed data SDAs has been sent. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DTAMCHRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35A02

Explanation

Db2 has detected an error while parsing a DDM command data object received from a local Db2. The DDM object is either an SQLSTT, SQLOBJNAM, or SQLSTTVRB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. Further, either the SBCS or mixed (not both) must be instantiated. The data retrieved from the object instantiates neither the SBCS nor the mixed SDA. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35A03

Explanation

Db2 has detected an error while parsing a DDM command data object received from a remote requester. The DDM object is either an SQLSTT, SQLOBJNAM, or SQLSTTVRB. The DDM extended length field required to support these objects is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35A04

Explanation

Db2 has detected an error while parsing a DDM command data object received from a remote requester. The DDM object is SQLATTR. The SQLATTR object has a length exceeding 32K. The length is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35B01

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The length of the SQLDTA exceeds 32KB, however, the DDM extended length field is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B02

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA is a DDM collection consisting of the FDODSC and FDODTA scalars. The first scalar within the SQLDTA is other than the FDODSC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B03

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA is a DDM collection consisting of the FDODSC and FDODTA scalars. The length of the FDODSC scalar exceeds 32KB, however, the format of the DDM extended length is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B04

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA FDOCA descriptor, contained in the FDODSC scalar, includes late environmental descriptors, however, the SQLDTA meta data definition (MDD) is either invalid or has not been included within the SQLDTA descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35B05

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA FDOCA descriptor geometry is incorrect.

Either the SQLDTA triplet length is incorrect or the SQLDTA triplet type is other than an row layout (RLO). The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35B06

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA FDOCA descriptor geometry is incorrect. The SQLDTA RLO triplet either specifies a local identifier (LID) which is different than that defined in the previously processed SQLDTAGRP late group descriptor, or specifies a nonzero number of elements

or a replication factor other than 1. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35B07

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA FDOCA descriptor, contained within the FDODSC scalar, has been validated, however, the FDOTDA scalar, containing the host variable data, is not included within the SQLDTA DDM object. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35B08

Explanation

Db2 has detected an error while parsing an SQLDTA command data object received from a local Db2. The SQLDTA FDOCA descriptor, contained within the FDODSC scalar, has been validated. The length of the FDOTDA scalar, containing the host variable data, exceeds 32KB, however, the format of the DDM extended length field is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35B09

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The SQLDTA object, or one of its constituent members, has an object length less than 4. Its constituent members are:

- FDODSC or FDODTA, in the case of an SQLDTA in non-array format
- FDODSC, FDOEXT, FDODTA, or FDOOFF, in the case of an SQLDTA in array format.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNU032E \(Db2 Messages\)](#)

00D35B0A

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The SQLDTA object, or one of its constituent members, has an object length indicator less than 8. Its constituent members are listed below:

- FDODSC or FDODTA, in the case of an SQLDTA in non-array format
- FDODSC, FDOEXT, FDODTA, or FDOOFF, in the case of an SQLDTA in array format.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B0B

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object in array format. In this case, the SQLDTA is a DDM collection consisting of FDODSC, FDOEXT, FDOTDA, and FDOOFF scalars. The last scalar within the SQLDTA is other than the FDOOFF. This procedure is invalid.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B0C

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The SQLDTA object itself, or one of its constituent members has an object length that is greater than the actual length remaining in the enclosing object. The constituent members are listed below:

- FDODSC or FDOTDA, in the case of an SQLDTA in non-array format
- FDODSC, FDOEXT, FDOTDA, or FDOOFF, in the case of an SQLDTA in array format

For example, a FDODSC scalar as an object length that is greater than the SQLDTA object in which it is contained, or an SQLDTA object has an object length greater than the DSS in which it is contained.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B0D

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The FDOCA geometry for an SQLDTAGRP late group descriptor, contained within the DRDA SQLDTA late descriptor, is incorrect. The SQLDTAGRP triplet is not defined as an FD:OCA nullable group. The descriptor is invalid.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B0E

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The FDOCA geometry for an SQLDTAGRP late group descriptor, contained within the DRDA SQLDTA late descriptor, is incorrect. The late descriptor includes late environmental descriptors and the SQLDTAGRP meta data definition (MDD) is either invalid or has not been included within the descriptor. The descriptor is invalid.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B0F

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing in an SQLDTA object received from a DRDA requester system. The total FDODSC object length computed from the constituent SDAs in the SQLDTAGRP is smaller than the stated length of the FDODSC object.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B10

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. While parsing a constituent part of the SQLDTA object, the constituent part has a stated or implied length that is larger than the stated length of the SQLDTA object itself.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B11

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object in an array format. The number elements in the FDOEXT scalar object is not equal to the number elements of SDAs in the SQLDTAGRP in the FDODSC.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B12

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object in an array format. The number elements in the FDOEXT scalar object is not equal to the number elements in the FDOOFF scalar object.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B13

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object in an array format. An offset value in FDOOFF scalar object results is invalid and results in a data value location that is not contained within the FDOTA scalar object.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B14

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. The FDOTA scalar object is a null FD:OCA group and contains no input data values. The FDOTA scalar object must be non-null and must contain the input data values described by the FDOTSC scalar object

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B15

Explanation

Acting as a DRDA server, Db2 has detected an error in an SQLDTA object received from a DRDA requester

system. The total SQLDTA object length computed from the constituent scalar object is smaller than the stated length of the SQLDTA object itself.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B16

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. While parsing the SQLDTAGRP late group descriptor contained within the SQLDTA object, the local identifier (LID) of one of the SQLDTAGRP constituent triplets was not previously defined by a late environmental descriptor and the LID is outside of the bounds of the default environmental descriptor LIDs. Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35B17

Explanation

Acting as a DRDA server, Db2 has detected an error while parsing an SQLDTA object. While parsing the SQLDTAGRP late group descriptor contained within the SQLDTA object, the length override value in one of the constituent SQLDTAGRP SDAs contains a placeholder length value, but the placeholder length value is an allowable value. The descriptor is invalid.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

A DSCINVRM reply message is returned to the requester.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C01

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. An invalid instance has been received as a parameter on a BGNBND command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C02

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. An invalid instance has been received as a parameter on a BNDSQLSTT command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C03

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. An invalid instance has been received as a parameter on a DRPPKG command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C04

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. An invalid instance has been received as a parameter on an ENDBND command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C05

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. An invalid instance has been received as a parameter on a REBIND command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C06

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND

command received from a local Db2. One or more instance variables, defined by DDM Level 3 as required parameters for this DDM command, were not received.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C07

Explanation

Db2 has detected an error while parsing a DDM command or DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command data received from a local Db2. The DDM command contains an instance variable which is not defined within DDM level 3.0 The instance variable (parameter) is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this Db2 remote server.

- Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C08

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. Multiple occurrences of a DDM instance variable, defined by DDM Level 3 as nonrepeatable, have been processed as parameters on this DDM command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C09

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, BNDCHKEXS, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C0A

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, BNDCRTCTL, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C0B

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, BNDEXOPT, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C0C

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, BNDSTASM, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C0D

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, DECPRC, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C0E

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. Bytes 9 through 18 of the DDM scalar, DFTRDBCOL are other than blank. While DDM defines the length of DFTRDBCOL to be 18 bytes, Db2 supports only 8-byte collection identifiers.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C0F

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, PKGATHOPT, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C10

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The length of the DDM scalar PKGDFTCC is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C11

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDSBC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C12

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDDBC scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C14

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains an invalid DDM object.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C15

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, PKGDFTCST, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C16

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, PKGISOLVL, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C17

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The DDM object PKGNAM is a mapped scalar containing RDBNAM, RDBCOLID and PKGID. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, Db2 supports only a 16 byte RDBNAM.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35C18

Explanation

Db2 has detected an error while parsing a DRDA BGNBND, BNDSQLSTT, ENDBND, DRPPKG, BNDCPY, BNDDPLY, or REBIND command received from a remote DRDA requester. The DDM object PKGNAM, PKGNAMCSN, or PKGID is invalid.

PKGNAMCSN

If the DDM object is PKGNAMCSN, then either the section number is nonpositive (zero or a negative number) or the DDM scalar PKGID contains a package identifier that is greater than 128 bytes in length. Db2 supports package identifiers with a maximum length of 128 bytes.

PKGNAM or PKGID

If the DDM object is PKGNAM or PKGID, then the DDM scalar object PKGID contains a package identifier that is greater than 128 bytes in length. Db2 supports package identifiers with a maximum length of 128 bytes.

System action

An alert is generated and message DSNL032I is written to the console.

The DDM reply message VALNSPRM (parameter value not supported) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C22

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The value of the DDM enumerated scalar, STTSTRDEL, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C23

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local Db2. The value of the DDM enumerated scalar, STTIMFMT, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35C24

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The DDM TIMESTAMP scalar has been received as a command parameter from a database other than Db2. The TIMESTAMP scalar is private to Db2.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C25**Explanation**

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The length of a DDM object is less than 4, the minimum length of any DDM object. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C26**Explanation**

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35C27**Explanation**

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The length of a DDM object exceeds the length defined by DDM Level 3. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.
-

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.
-

00D35C28

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. The length of a DDM object is less than the length defined by DDM Level 3. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.
-

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.
-

00D35C29

Explanation

Db2 has detected an error while parsing a DDM command or DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local Db2. A package related identifier or collection identifier is in violation of the SAA syntax. This is either the collection identifier (DFTRDBCOL) received on a BGNBND or REBIND command or the package identifier or collection identifier within the PKGNAM, PDGNAMCT, or PKGNAMCSN mapped scalars received on a BGNBND, BNDSQLSTT, ENDBND, or DRPPKG command.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C2A

Explanation

Db2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local Db2. The value of MAXSCTNBR received on the ENDBND command is invalid. The value must be within the range 1 to 32767 inclusive.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local Db2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C2E

Explanation

Db2 detected an error in a DDM BGNBND command received from a remote requester. The value of the enumerated scalar, PRPSTTKP, is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C2F

Explanation

Db2 has detected an error while parsing a DDM BGNBND, REBIND, BNDCPY, BNDDPLY command received from a remote requester. The DDM object PKGOWNID has the length more than 128 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C30

Explanation

Db2 has detected an error while parsing a DDM DRPPKG command received from a remote requester. Db2 has received a wild card instance variable RDBCOLIDANY, but neither instance variable PKGIDANY nor instance variable PKGID is received. When RDBCOLIDANY is present, PKGIDANY or PKGID must be specified. The request is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C31

Explanation

Db2 has detected an error while parsing a DDM DRPPKG command received from a remote requester. Db2 has received a wild card PKGIDANY instance variable, but neither RDBCOLIDANY nor COLID is received. When PKGIDANY is present, RDBCOLIDANY or COLID must be specified. The request is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C32

Explanation

Db2 has detected an error while parsing a DDM BNDCPY command received from a remote requester. An invalid instance variable has been received as a parameter on an BNDCPY command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (PRMNSPRM)) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C33

Explanation

Db2 has detected an error while parsing a DDM BNDDPLY command received from a remote requester. An invalid instance variable has been received as a parameter on an BNDDPLY command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (PRMNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C34

Explanation

Db2 has detected an error while parsing a DDM DRPPKG command received from a remote requester. Db2 received both the VRSNAMANY instance variable and the VRSNAM instance variable in the DDM DRPPKG command. VRSNAMANY and VRSNAM are mutually exclusive. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35C35

Explanation

Db2 has detected an error while parsing a DRDA BGNBND, BNDSQLSTT, ENDBND, DRPPKG, BNDCPY, BNDDPLY, or REBIND command received from a remote DRDA requester. The DDM object RDBCOLID, PKGNAM, PKGMANCT, or PKGNAMCSN is invalid. The DDM scalar RDBCOLID contains a collection ID that is greater than 128 bytes in length. Db2 supports collection IDs with a maximum length of 128 bytes.

System action

An alert is generated and message DSNL032I is written to the console.

The DDM reply message VALNSPRM (parameter value not supported) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35D01

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance variable, defined as valid by DDM Level 3, but not supported by Db2, has been detected on one of the following DDM commands: CLSQRY, DSCRDBTBL, DSCSQLSTT, or EXCSQLIMM.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D02

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance variable, defined as valid by DDM Level 3, but not supported by Db2, has been detected on a DDM CNTQRY command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D03

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The value of the DDM OUTEXP enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D04

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance variable, defined as valid by DDM Level 3, but not supported by Db2, has been detected on a DDM EXCSQLSTT command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D05

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The value of DDM QRYBLKCTL instance variable, received as a parameter on OPNQRY, is other than FRCSNGROW. The local Db2 may not specify LMTBLKPRC or SNGROWPRC as values of QRYBLKCTL as an OPNQRY parameter.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D06

Explanation

Db2 has detected an error while parsing a DDM command received from a remote requester. An OPNQRY command was received containing an instance variable that is not supported at the DDM level negotiated during CONNECT processing.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D07

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The value of the DDM RTNSQLDA enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D08

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance

variable, defined as valid by DDM Level 3, but not supported by Db2, has been detected on a DDM PRPSQLSTT command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D09

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance variable, defined as valid by DDM Level 3, but not supported by Db2, has been detected on a DDM RDBCMM or RDBRLLBCK command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D0A

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The length of the DDM command is not equal to the sum of the lengths of the constituent instance variables.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D0B

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. One or more instance variables, defined by DDM Level 3 as required for this command, were not received as command parameters.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D0C

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. An instance variable, defined by DDM Level 3 as not valid for this command, has been received as a command parameter.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D0D

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. Multiple occurrences of one or more instance variables, defined by DDM level 3 as nonrepeatable, have been received as parameters of this DDM command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D0E

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM Level 3 defines the length of this scalar to be 18 bytes, Db2 supports only a 16 byte RDBNAM.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D0F

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The value of the RDBNAM instance variable is different than that received on the ACCRDB command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D10

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The mapped scalar, PKGNAMCSN, is invalid. Bytes 17 and 18 of the DDM scalar RDBNAM, contained within PKGNAMCSN, are other than blank. While DDM Level 3 defines the length of this scalar to be 18 bytes, Db2 supports only a 16 byte RDBNAM.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D11

Explanation

Db2 has detected an error while parsing a DRDA command received from a remote DRDA requester.

The DDM object PKGNAMCSN is invalid. Either the section number is nonpositive (zero or a negative number) or the DDM scalar PKGID contains a package identifier that is greater than 128 bytes in length. Db2 supports package identifiers with a maximum length of 128 bytes.

System action

An alert is generated and message DSNL032I is written to the console.

The DDM reply message VALNSPRM (parameter value not supported) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35D12

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The value of the DDM scalar, QRYBLKSZ, contained as a parameter on a DDM OPNQRY, CNTQRY, or EXCSQLSTT command, is invalid. The value of QRYBLKSZ must be between 512 and 32767, inclusive.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D13

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. a TIMESTAMP instance variable has been included as a command parameter received from a database other than Db2. This DDM scalar is private to Db2.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D14

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The length of one or more instance variables received as command parameters is less than 4. This is the minimum length to support a DDM length and code point (llcp).

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D15

Explanation

Db2 has detected an error while parsing a DDM command received from a local Db2. The length of the DDM command is less than the sum of the lengths of all constituent instance variables.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D16**Explanation**

Db2 has detected an error while parsing a DDM command received from a local Db2. The length of an instance variable received as a command parameter exceeds the length of the instance variable, as specified by DDM Level 3.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D17**Explanation**

Db2 has detected an error while parsing a DDM command received from a local Db2. The length of an instance variable received as a command parameter is less than the length of the instance variable, as specified by DDM Level 3.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D18**Explanation**

Db2 has detected an error while parsing a DDM command received from a DRDA requester. The value of the DDM scalar, MAXRSLCNT, contained as a parameter on a DDM EXCSQLSTT command, is invalid. The value of MAXRSLCNT must be greater than or equal to -1.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the DRDA requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL032I.

If the DRDA requester is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

At the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D35D19

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar TYPSQLDA is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS, at the DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35D1A

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. An instance variable, defined as valid by DDM Level 5, but not supported by Db2, has been detected on a DDM DSCSQLSTT command.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D1B

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM OPNQRY or EXCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar OUTOVROPT is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D1C

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM CNTQRY command received from a remote DRDA client. The value of the DDM enumerated scalar RTNEXTDTA is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35D1D

Explanation

Db2 detected an error while parsing a DDM command received from DRDA requester. The value of the DDM QRYSCORRN enumerated value instance variable, contained within a DDM CNTQRY command, is unrecognized.

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

.

00D35D1E

Explanation

Db2 detected an error while parsing a DDM command received from a DRDA requester. The value of the QRYROWSET instance variable on an OPNQRY or CNTQRY command is less than zero. The minimum defined value for this instance variable is zero.

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35D1F

Explanation

Db2 has detected an error while parsing a DDM CNTQRY command received from a DRDA requester. The value of the QRYROWSET instance value is zero, but the minimum defined value for this instance variable on a CNTQRY command is one.

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35D20

Explanation

Db2 has detected an error while parsing a DDM command received from a DRDA requester. The value of the QRYROWSET instance variable on an EXCSQLSTT is less than zero. The minimum defined value for this instance variable is zero.

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35D21

Explanation

Db2 detected an error while parsing a DDM command received from a DRDA requester. The value of the DDM QRYRSTBLK enumerated value instance variable, contained within a DDM CNTQRY command, is other than FALSE (X'F0') or TRUE (X'F1').

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM)) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35D22

Explanation

Db2 has detected an error while parsing a DDM command received from a DRDA requester. The value of the DDM QRYRTNDDTA enumerated value instance variable, contained within a DDM CNTQRY command, is other than FALSE (X'F0') or TRUE (X'F1').

System action

Db2 generates an alert, and writes message DSNL032I to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM)) will be returned to the DRDA requester.

Operator response

Notify the System Programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

If the DRDA requester is also a Db2 for z/OS system, then at the requester Db2 system, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- All dumps taken by the attachment facility or requesting application.

00D35D23

Explanation

Db2 has detected an error while parsing a DDM RDBCMM or RDBRLLBCK command received from a remote requester. The value of the DDM enumerated scalar RLSCONV is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating

the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D24

Explanation

Db2 has detected an error while parsing a DDM EXCSQLSTT command received from a remote requester. The value of the DDM enumerated scalar NBRROW is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D25

Explanation

Db2 has detected an error while parsing a DDM CNTQRY command received from a remote requester. The value of the DDM enumerated scalar FREPRVREF is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D27

Explanation

Db2 has detected an error while parsing a DDM GETNXTCHK command received from a remote requester. The value of the DDM enumerated scalar FREREFOPT is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. - Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D28

Explanation

Db2 has detected an error while parsing a DDM EXCSQLSTT or OPNQRY command received from a remote requester. The value of the DDM enumerated scalar DYNDTAFMT is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. - Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D29

Explanation

Db2 has detected an error while parsing a DDM GETNXTCHK command received from a remote requester. The value of the DDM enumerated scalar REFRST is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. - Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35D2A

Explanation

Db2 has detected an error while parsing a DDM OPNQRY command that was received from a remote requester. The value of the DDM enumerated scalar QRYCLSIMP is invalid.

System action

An alert is generated and message DSNL032I is written to the console.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

At the Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps created by this failure.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35D2B

Explanation

Db2 has detected an error while parsing a DDM OPNQRY or CLSQRY command that was received from a remote requester. The value of the DDM enumerated scalar QRYCLSRLS is invalid.

System action

An alert is generated and message DSNL032I is written to the console.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

At the Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps created by this failure.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35D2C

Explanation

Db2 has detected an error while parsing a DDM OPNQRY or EXCSQLSTT command that was received from a remote requester. The value of the DDM enumerated scalar OUTOVRXML is invalid.

System action

An alert is generated and message DSNL032I is written to the console.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

At the Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35D2E

Explanation

Db2 has detected an error while parsing a DRDA BGNBND, BNDSQLSTT, ENDBND, DRPPKG, BNDCPY, BNDDPLY, or REBIND command received from a remote DRDA requester. The DDM object RDBCOLID, PKGNAM, PKGMANCT, or PKGNAMCSN is invalid. The DDM scalar RDBCOLID contains a collection ID that is greater than 128 bytes in length. Db2 supports collection IDs with a maximum length of 128 bytes.

System action

An alert is generated and message DSNL032I is written to the console.

The DDM reply message VALNSPRM (parameter value not supported) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this Db2 remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35E00

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on an ACCSEC command.

System action

If the length of the RDBNAM is greater than 18, then a DDM reply message (SYNTAXRM) is returned to the DRDA client. If the data in characters 17-18 of the RDBNAME is non-blank, then a DDM reply message (VALNSPRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E01

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent without one or more of its required DDM instance variables.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E02

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent with the RQSDSS length fields set improperly.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E03

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on an ACCSEC command.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E04

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on an ACCSEC command.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E05

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMGRNM length was sent on an ACCSEC command. The SECMGRNM must be null.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E06

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMEC length was sent on an ACCSEC command. Only one SECMEC can be specified.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E07

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SECCHK command.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E08**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SECCHK command.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E09**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMGRNM length was sent on a SECCHK command. The SECMGRNM must be null.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E0A**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMEC length was sent on a SECCHK command. Only one SECMEC can be specified.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E0B

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on a SECCHK command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E0C

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid USERID length was sent on a SECCHK command. Db2 user IDs cannot exceed 8 bytes.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E0D

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid PASSWORD length was sent on a SECCHK command. Db2 passwords cannot exceed 8 bytes.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E0E

Explanation

Db2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The sum of the lengths of the constituent DDM objects within an OBJDSS is inconsistent with the length of the DSS carrier.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E0F

Explanation

Db2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The size of the object is greater than 32KB and the DDM level 6b extended length field is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E10

Explanation

Db2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte or 8-byte floating point number in IEEE format to System/370 format.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

Related concepts

[Numeric data types \(Db2 SQL\)](#)

00D35E11

Explanation

Db2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte or 8-byte floating point number in IEEE format to System/370 format.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

Related concepts

[Numeric data types \(Db2 SQL\)](#)

00D35E12

Explanation

Db2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte

floating point number in VAX format to System/370 format.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

Related concepts

[Numeric data types \(Db2 SQL\)](#)

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

00D35E1E

Explanation

Db2, acting as a DRDA client, has detected an error in a numeric character data field (nullable or non-nullable). Db2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check the numeric data.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

00D35E1F

Explanation

Db2, acting as a DRDA client, has detected an error in a variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

.

00D35E20

Explanation

Db2, acting as a DRDA client, has detected an error in a nullable variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D35E28**Explanation**

Db2, acting as a DRDA client, has detected an error in a nullable variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D35E29**Explanation**

Db2, acting as a DRDA client, has detected an error in a zoned decimal data field (nullable or non-nullable). Db2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Check the numeric data.

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the Db2 for z/OS DRDA client, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

00D35E2A**Explanation**

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains multiple instances of the BNDOPTNM scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E2B

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains multiple instances of the BNDOPTVL scalar. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E2C

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains an invalid instance.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E2D

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTNM instance variable is required for this DDM collection but was not received.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E2E

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTVL instance variable is required for this DDM collection but was not received.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E2F

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM object is less than 4, the minimum length of any DDM object. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items: Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E30

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E31

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of a DDM instance variable is less than the minimum length defined by DDM Level 3. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E32

Explanation

Db2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of a DDM instance variable is greater than the maximum length defined by DDM Level 3. This is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E33

Explanation

Db2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLRSROW occurrences within the SQLRSLRD array, is inconsistent with the number of result sets indicated in the RSLSETRM.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D35E34

Explanation

Db2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command

that generated query result sets. Within one or more SQLRSROW occurrences, the lengths of SQLRSNAME_m and SQLRSNAME_s are both non-0, but only one of these lengths should be non-0. The data is invalid with regard to the Early SQLRSGRP group descriptor as defined by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D35E35

Explanation

Db2 has detected an error in the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLCIROW occurrences within the

SQLCINRD array, is either negative or is inconsistent with the size of the SQLCINRD array.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D35E36

Explanation

Db2 has detected an error in the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. Within one or more SQLCIROW occurrences, the lengths of SQLCNAME_m and SQLCNAME_s are both non-0, but only one of these lengths should be non-0. The data is invalid with regard to the Early SQLCIGRP group descriptor as defined by DRDA.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the Db2 requester, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the DRDA server is Db2 for z/OS, then Db2 diagnostic information is available. In this case, at the Db2 server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D35E37

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid IPADDR length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E38

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SNAADDR length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E39

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E3A

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid LOGNAME length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E3B

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid LOGTSTMP length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E3C

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E3D**Explanation**

Db2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The DDM level 6b length field is invalid.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local Db2, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E3E**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E3F**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E40

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid SYNCTYPE length was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E41

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid RLSCONV length was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E42

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E43

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCRSY command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E44

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCRSY command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E45

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid RSYNCTYP length was sent on a SYNCRSY command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E46

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCRSY command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E47

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWSTATE length was sent on a SYNCRSY command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E48**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid FORGET length was sent on a SYNCCTL command.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E49**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid TCPHOST length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E4A**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid CNNTKN length was sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E4B

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. A required instance variable was not sent on a SYNCLOG object.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- All dumps taken by the attachment facility or requesting application.

00D35E4C

Explanation

Db2 has detected an error while parsing an SQLSTT object for an EXCSQLSET command received from a remote requester. Both a mixed-byte and a single-byte SQL statement string were received, or the mixed-byte SQL statement string is non-null, but has a zero length or the single-byte SQL statement string is not null, but has a zero length.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote requester. The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E4D**Explanation**

Db2 has detected an error while parsing an SQLSTT object for an EXCSQLESET command received from a remote requester. The SQLSTT has an invalid object length of less than 4.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote requester. The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E4E**Explanation**

Db2 has detected an error while parsing an SQLSTT object for an EXCSQLESET command received from a remote requester. The SQLSTT object length is larger than the containing DSS carrier object.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote requester. The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E4F

Explanation

Db2 has detected an error while parsing an SQLSTT object for an EXCSQLSET command received from a remote requester. The SQLSTT object length is too small for a SET statement.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote requester. The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include

intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E50

Explanation

Db2 has detected an error while parsing an SQLSTT object for an EXCSQLSET command received from a remote requester. The SQLSTT object length is larger than the maximum length (32K) supported by Db2 for an EXCSQLSET SQLSTT statement string.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote requester. The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E51

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from a remote client. The DDM object is the OUTOVR object. The size of the OUTOVR is greater than 32KB and the DDM level 6b extended length field is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A SYNTAXRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E52

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. The SQLCADTA row (RLO) MDD is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E53

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the first component of the SQLCADTA row triplet (RLO) is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E54

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the first component of the SQLCADTA row is other than an SQLCAGRP (early) group or the number of elements taken from the SQLCAGRP or SQLCAGRP replication factor (or both) are incorrect. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E55

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. The first component of the SQLCADA row correctly enumerates the elements of the SQLCAGRP; however, the second component, identifying the SQLDTAGRP (late) group, is incorrect. Either the SQLDTAGRP local identifier (LID) is different from the LID of the SQLDTAGRP previously specified or the number of elements taken from the SQLDTAGRP replication factor (or both) are incorrect. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E56

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. One or more late environment descriptors is included within the previously specified SQLDTAGRP late group descriptor. However, the SQLDTARD row (RLO) Meta Data Definition (MDD) is either incorrect or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E57

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the SQLCADA local identifier (LID) referenced within the SQLDTARD RLO did not match the LID defined within the SQLCADA RLO or the number of elements or replication factor (or both) within the SQLDTARD RLO was non-zero. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E58

Explanation

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the SQLCADA local identifier (LID) referenced within the SQLDTARD RLO did not match the LID defined within the SQLCADA RLO or the number of elements or replication factor (or both) within the SQLDTARD RLO was non-zero. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E59**Explanation**

Db2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the length specified in the LL preceding the OUTOVR is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the OUTOVR. The descriptor is invalid.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

You should also analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

Problem determination

If the remote DRDA client is a Db2 for z/OS system, at the Db2 DRDA client, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the Db2 DRDA server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E5A**Explanation**

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid NEWPSWD length was sent on a SECCHK command. New passwords cannot exceed 255 bytes.

System action

A DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E5B

Explanation

Db2 has detected an error while parsing the DDM ACCSEC command or its reply data. The encryption connection key passed in the SECTKN instance variable has an invalid length. The connection key must be a 32-byte security token.

System action

If at the server, a DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E5C

Explanation

Db2 has detected an error while parsing the DDM SECCHK command or its reply data. The encrypted password passed in the SECTKN instance variable has an invalid length. Db2 supports an 8-byte or a 16-byte encrypted password.

System action

If at the server, a DDM reply message (SYNTAXRM) is returned to the local Db2.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At this remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E5D

Explanation

Acting as a requester or a server, Db2 has detected an error while parsing a DRDA object. The final length computed by parsing the object using its descriptor is larger than the stated length of the object itself.

System action

An alert is generated and message DSNL031I (if the error is detected by Db2 acting as a requester) or message DSNL032I (if the error is detected by Db2 acting as a server) is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35E5E

Explanation

Acting as a requester or a server, Db2 has detected an error while parsing a DRDA early descriptor object. The descriptor for the object indicates that additional nullable group data is to be parsed, but the object length is too small to contain the group null indicator.

System action

An alert is generated and message DSNL031I (if the error is detected by Db2 acting as a requester) or message DSNL032I (if the error is detected by Db2 acting as a server) is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I or DSNL032I message.

For the Db2 system generating the DSNL031I or DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E5F

Explanation

Acting as a requester or a server, Db2 has detected an error while parsing a DRDA early descriptor object. The descriptor for the object indicates that additional group data is to be parsed, but the object length is too small to contain the additional group data.

System action

An alert is generated and message DSNL031I (if the error is detected by Db2 acting as a requester) or message DSNL032I (if the error is detected by Db2 acting as a server) is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I or DSNL032I message.

For the Db2 system generating the DSNL031I or DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E60

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid XID length was received on a SYNCCTL command sent by a remote requester.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E61

Explanation

Db2 has detected an error while parsing a DDM command or DDM command data. An invalid XSHR length was received on a SYNCCTL command sent by a remote requester.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E62

Explanation

Db2 detected an error in a DDM command or DDM command data. An invalid interrupt token was sent on an INTRDBRQS command.

System action

A DDM reply message (SYNTAXRM or INTTKNRM) is returned to the DRDA client. INTTKNRM is returned if the client is not authorized to interrupt an SQL statement or the token length is not 30 bytes. In all other cases, SYNTAXRM is returned.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At the local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At the remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E63

Explanation

Db2 detected an error in a DDM command or DDM command data. An invalid RDBNAM length was sent on an INTRDBRQS command.

System action

If the length of the RDBNAM is greater than 255 (if client supports long names) or greater than 18 (if client does not support long names), then A DDM reply message (SYNTAXRM) is returned to the DRDA client. If the data in characters 17-18 of the RDBNAME is non-blank, then a DDM reply message (VALNSPRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At the local Db2, collect the following diagnostic item:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

At the remote server, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

.

00D35E67

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an invalid instance variable code point.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems

in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E68

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an instance variable code point that has been duplicated.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E69

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an invalid RESPKTSZ instance variable - the value must be 4 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E6A

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains a RESPKTSZ instance variable value that is not supported. The value must be 32767 or less.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items listed in

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E6B

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an invalid RDBNAM instance variable. Long variable name support has been negotiated but the RDBNAM value length either exceeded the 255 byte limit or was too short.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E6C

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an invalid RDBNAM

instance variable. Long variable name support has not been negotiated and the RDBNAM value must be 18 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E6D

Explanation

Db2 has detected an error while parsing a DDM SNDPKT command received from a remote requester. The SNDPKT command contains an invalid RDBNAM instance variable value that is not supported. Db2 only accepts up to 16 characters.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.

- All dumps created by this failure.

00D35E6E

Explanation

Db2 has detected an error while parsing a DDM SYNCCTL command received from a remote requester. The SYNCCTL command contains an invalid XAFLAGS instance variable - the value must be 4 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E6F

Explanation

Db2 has detected an error while parsing a DDM SYNCCTL command received from a remote requester. The SYNCCTL command contains an invalid TIMEOUT instance variable - the value must be 16 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E70**Explanation**

Db2 has detected an error while parsing a DDM ACCSEC command received from a remote requester. The ACCSEC command contains an invalid ENCALG instance variable - the value must be 2 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E71**Explanation**

Db2 has detected an error while parsing a DDM ACCSEC command received from a remote requester. The ACCSEC command contains an invalid ENCKEYLEN instance variable - the value must be 2 bytes.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) is returned to the remote requester.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote requester system. If you suspect an error in Db2, see the information about identifying and reporting problems in [Searching for known problems and solutions for Db2 for z/OS \(Diagnosing Db2 problems\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E72

Explanation

Acting as a server, Db2 detected an error while parsing an SQLSTT object. The data portion of the object has a length that is smaller than the minimum size of 4 bytes. The first four bytes of the data portion contains the length of the SQL statement.

System action

An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message. For the Db2 system generating the DSNL032I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the documentation specific to those products for diagnostic procedures.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

Related information

[DSNL032I \(Db2 Messages\)](#)

00D35E73

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The length of the data to be parsed is inconsistent with the descriptor. The error occurs when processing data for a rowset cursor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request. This includes the requester system to which the

application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E74

Explanation

Db2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The length of the data to be parsed is inconsistent with the descriptor. The error occurs when processing data for a rowset cursor.

System action

An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed. For the Db2 system generating the DSNL031I message, collect the following diagnostic items:

- Statistics Class 4 trace record for the LUWID associated with the failing request.

In addition, identify all connected systems participating in the processing of the remote request.

This includes the requester system to which the application is connected and the data server which is the target of the remote request. This may also include intermediate server systems. For each system that is a Db2 system, collect the following diagnostic items:

- Console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.

For non-Db2 systems, refer to the references specific to those products.

If any dumps were generated on any Db2 system participating in processing the remote request, collect the following diagnostic items:

- Listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
- All dumps created by this failure.

00D35E75

Explanation

Db2 has detected an error while parsing a DDM SECCHK command received from a remote client. The SECCHK command contains an invalid USRREGNM instance variable value that is not supported. The value exceeded the 255 bytes limit.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote client system. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the local Db2, collect the diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the remote client system, collect the diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E76**Explanation**

Db2 has detected an error while parsing a DDM SECCHK command received from a remote client. The SECCHK command contains an invalid USRORGID instance variable value that is not supported. The value must be 1024 bytes or less.

System action

A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote client system. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the local Db2, collect the diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the remote client system, collect the diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E77**Explanation**

Db2 has detected an error while parsing a DDM SECCHK command received from a remote client. The SECCHK command contains an invalid USRSECTOK instance variable value that is not supported. The value must be 4096 bytes or less.

System action

Notification of the failure is returned to the application. The requested trusted connection is not established.

Operator response

Notify the system programmer.

System programmer response

This is most likely an error at the remote client system. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the local Db2, collect the diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the remote client system, collect the diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E78**Explanation**

Db2 acts as a DRDA intermediate server passing input data to another DRDA server. It has detected an error in an SQLDTA object. A NUL-terminated string was found in the FDODTA scalar where the NUL-terminator could not be located within the data field as defined by the DDM descriptor received.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E79

Explanation

Db2 acts as a DRDA intermediate server passing input data to another DRDA server. It has detected an error in an SQLDTA object received from a DRDA requester system. The SQLDTA object length value computed from parsing the DDM constituents of the SQLDTA object is larger than the stated length of the SQLDTA object.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D35E7A

Explanation

Db2 acts as a DRDA intermediate server passing input data to another DRDA server. It has detected an error in an SQLDTA object received from a DRDA requester system. The SQLDTA object length value computed from parsing the DDM constituents of the SQLDTA object is smaller than the stated length of the SQLDTA object.

System action

The system generates an alert and returns message DSNL032I. Refer to the description of this message for further information.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

You should analyze the statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message.

At the Db2 for z/OS DRDA server, collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

If the requester is a Db2 for z/OS system, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00D36800

Explanation

To satisfy an unconditional request for storage for a RESTful service execution reply message, the RESTful service execution function needs additional storage to expand the reply buffer. However, the RESTful service reply message buffer is already at the maximum allowed size.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D36801

Explanation

A Db2 internal error was detected while processing a DISPLAY, START, or STOP RESTSVC command.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2(04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.

Chapter 11. X'D4.....' codes

Reason code identifiers that begin with 00D4 communicate normal and error situations with the IMS attachment facility.

00D40001

Explanation

The IMS attachment facility detected an invalid save area chain pointer. This condition occurs only if the save area is overlaid or if the save area pointer is invalid.

System action

The task is abended.

System programmer response

If the abend occurred in an IMS dependent region, restart the region. If the abend occurred in the IMS control region, restart the connection. Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the dump. Register 13 plus four bytes is the address of the invalid save area chain pointer.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- IMS dependent region, control region dump, or both.
- IMS system log information, for the period of time spanning the failure.
- IMS console log.

00D40008

Explanation

The IMS attachment facility command module's ESTAE routine places this reason code in the variable recording area of SYS1.LOGREC. The reason code indicates that the entry is not a standard Db2 entry. The reason code is followed by the current IMS attachment facility trace entry, the first four characters of the command, the output destination, and the authorization ID.

This message records information in the variable recording area (VRA).

System action

Every attempt is made to return to RTM with the retry option. If the retry is successful, a message is sent to the originating destination to show that the command failed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Analyze the SYS1.LOGREC data. The log record contains the current IMS attachment facility trace entry, the first four characters of the command, the output destination, and the authorization ID for the failing command.

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- IMS dependent region, control region dump, or both.
- IMS system log information, for the period of time spanning the failure.
- IMS console log.

00D40061

Explanation

The IMS attachment facility could not establish a connection with Db2 because an IMS /STOP SUBSYS command was issued.

System action

The application's SQLCA is updated with an SQLCODE -924 and reason code 00D40061. Control is returned to the application.

Operator response

Issue the IMS /START SUBSYS command to establish a connection with Db2 and reenter the transaction.

System programmer response

Determine why the IMS /STOP SUBSYS command was issued.

User response

Wait for the IMS /START SUBSYS command to be issued before reentering the transaction.

Problem determination

Analyze the application's SQLCA.

00D40062

Explanation

The IMS attachment facility could not establish a connection with Db2 because IMS is shutting down.

System action

The application's SQLCA is updated with an SQLCODE -924 and reason code 00D40062. Control is returned to the application.

Operator response

Restart IMS.

System programmer response

Determine why IMS was stopped.

User response

Reenter the transaction after IMS has been restarted.

Problem determination

Analyze the application's SQLCA.

00D40063

Explanation

The Db2 IMS attachment facility received an unexpected return code from the IMS external subsystem attach facility while attempting to start the subsystem connection to Db2.

System action

The application's SQLCA is updated with an SQLCODE -924, reason code 00D40063, and the return code received from the IMS external subsystem facility. One of the following return codes may appear.

- 12 - Db2 connection unsuccessful. The external subsystem encountered an error processing the request.
- 24 - Db2 connection unsuccessful. The external subsystem responded with a 'never connect' return code from the initialization exit.
- 28 - Db2 connection unsuccessful. IMS resources were unavailable to process the request.
- 32 - Db2 connection unsuccessful. An invalid EPL was encountered.
- 36 - Db2 connection unsuccessful. Request rejected due to the external subsystem invoking the subsystem termination service exit.

Control is returned to the application.

Operator response

Notify the system programmer.

System programmer response

This is an internal error. To be certain the proper diagnostic information is available, stop the region with a dump.

Problem determination

The WAL control block in the dump contains an IMS attach trace table. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IMS dependent region, control region dump, or both.
- IMS system log information, for the period of time spanning the failure.
- IMS console log.

00D40069

Explanation

The Db2 IMS attachment facility received an unexpected return code from the IMS external subsystem attach facility while attempting to establish a connection to Db2.

System action

The application's SQLCA is updated with an SQLCODE -924, reason code 00D40069, and the return code

received from the IMS External Subsystem Attach Facility. Control is returned to the application.

Operator response

Notify the system programmer.

System programmer response

This is an internal error. To be certain the proper diagnostic information is available, stop the region with a dump.

Problem determination

The WAL control block in the dump contains an IMS attach trace table. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IMS dependent region, control region dump, or both.
- IMS system log information, for the period of time spanning the failure.
- IMS console log.

00D44011

Explanation

The Db2-DL/I batch support or IMS BMP job step cannot continue because the application program could not be loaded.

System action

The Db2-DL/I batch support or IMS BMP job step cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Be sure the DDITV02 SYSIN data (for Db2-DL/I batch support) or IMSBATCH procedure (for an IMS BMP job step) names a subsystem member (SSM) parameter that points to a resource translation table (RTT). The RTT maps the IMS application name to the Db2 plan name.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44021

Explanation

The Db2-DL/I batch support cannot continue because the length of a parameter value specified in the DDITV02 SYSIN data set is incorrect.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Correct the DDITV02 SYSIN data set parameter value in error and rerun the job. Make sure the correct data set name is specified by the DDITV02 DD statement and the DCB RECFM is F or FB for the data set.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The parameter value length limits are the following numbers:

- Db2 subsystem name: 0 < SSN < 5.
- LIT value < 5.
- Db2 initialization module name = 8.
- Db2 optional resource translation module name < 9.

- Region error option value < 2.
- The command recognition value < 2.
- The connection name < 9.
- The Db2 plan name < 9.
- The application program load module name < 9.

Register 8 indicates the delimiter following the field in error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44022

Explanation

The Db2-DL/I batch support cannot continue because the DDITV02 SYSIN data set cannot be opened or an end of file was reached before a record was read.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Correct the DDITV02 DD statement or data set in error and rerun the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See if a DDITV02 data set exists and contains a properly formatted record.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44023

Explanation

The Db2-DL/I batch support cannot continue because one or more of the DDITV02 SYSIN data set values are incorrectly specified. The end of the input record was detected before all the values were found.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Correct the DDITV02 DD value or data set in error and rerun the job. Make sure the correct data set name is specified by the DDITV02 DD statement and the DCB RECFM is F or FB for the data set.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the DDITV02 DD SYSIN values for proper format.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44024

Explanation

The Db2-DL/I batch support cannot continue because the DDITV02 SYSIN data set value for the Db2 initialization module refers to an incorrect module.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Correct the DDITV02 SYSIN DD value or data set in error by specifying DSNMIN10 as the initialization module and rerun the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the DDITV02 DD SYSIN value for the required parameter DSNMIN10.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44025

Explanation

The Db2-DL/I batch support cannot continue because the DDITV02 SYSIN data set value for the Db2 region error option is incorrect. Only R, Q, A, or null (specified as ,,) are valid.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Correct the DDITV02 SYSIN DD value for the region error option of R, Q, A, or null and rerun the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the DDITV02 DD SYSIN value for the proper value of the error option of R, Q, A, or null.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.

00D44031

Explanation

The Db2-DL/I batch support cannot continue because a connection could not be established to the Db2 subsystem named in the DDITV02 SYSIN data set. This error usually occurs for one of these reasons:

- The Db2 subsystem name specified either in the DDITV02 SYSIN data set (default) or in the member defined by the IMSID-SSM combination is incorrect.
- The Db2 system is not operational.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

It might be necessary to start the Db2 subsystem specified.

System programmer response

Either correct the DDITV02 DD SYSIN or the member pointed to by the IMSID-SSM combination for the Db2 subsystem name if it is incorrect, and rerun the job. Otherwise, have the operator start the Db2 subsystem if it is stopped.

User response

Notify the system programmer.

Problem determination

Either check the DDITV02 DD SYSIN or the member pointed to by the IMSID-SSM combination for the proper Db2 subsystem name. Make sure the correct data set name is specified by the DDITV02 DD statement and the DCB RECFM is F or FB for the data set.

The WAL control block in the dump contains information about the connection and the IMS attach trace table. Field WALSSID indicates the name of the Db2 subsystem being called.

The last entry in the trace table has an ID of ID00 and the CALL STATUS contains the 2-byte return code and 4-byte reason code of the failure. The 4-byte reason code might provide additional diagnostic information to help determine the cause of the failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the correct Db2 subsystem name was specified and was available, refer to the specific reason code explanation for details about the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

.

00D44032

Explanation

The Db2-DL/I batch support cannot continue because the Db2 create thread or signon failed.

System action

The Db2-DL/I batch support cannot continue and processing terminates abnormally.

Operator response

Notify the system programmer.

User response

Verify that all required Db2 objects are available and that the specified plan name is correct. If the problem persists, notify the system programmer.

Problem determination

Examine the WAL control block in the dump, or any X'5501FF00' IMS attachment log records in the IMS log data set (if available) for specific Db2 return and reason codes, along with the WALERN field which indicates the reason for the failure.

The WAL control block in the dump contains information about the connection and the IMS attach trace table. The last entry in the trace table will have an ID of CTHD or SIGN and the CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44033

Explanation

The Db2-DL/I batch support cannot continue because the application is deadlocked or experienced a timeout.

System action

Processing terminates and Db2 sends a message to the MVS console.

Operator response

It might be necessary to schedule the application program when lock contentions or deadlock conditions are less likely to occur.

System programmer response

To determine the reason for the deadlock or timeout condition, review the information for the message that was issued. Db2 issues message DSNT375I in the case of a plan lock deadlock or DSNT376I in the case of a plan lock timeout.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

Related information

[DSNT375I \(Db2 Messages\)](#)

[DSNT376I \(Db2 Messages\)](#)

00D44034

Explanation

The Db2-DL/I batch support cannot continue because an unrecoverable error was encountered during resolve indoubt processing between IMS and Db2. The status of the current indoubt Db2 thread remains unchanged.

System action

The Db2-DL/I batch support processing is terminated, and a Db2 04E SVC dump is requested.

Operator response

Enter the DISPLAY THREAD TYPE (INDOUBT) command to determine the current status of indoubt thread processing between IMS and Db2 at the time of the failure. Notify the system programmer.

System programmer response

This may be an internal protocol error between the IMS external subsystem attach facility and the Db2 IMS attachment facility, or an execution environment error external to both IMS and Db2. Examine both the IMS and MVS console logs for any error messages or abnormal return codes associated with the DL/I batch job.

Problem determination

Locate and examine any Db2 IMS attachment snap records (code X'5501FE') that are present in the IMS log data set, and examine WAL trace table entries included in the dump.

If a Db2 reason code is provided in either the WAL trace entry, or the WALSFER2 field of the X'5501FE' log record, follow the instructions associated with this reason code for additional information concerning the failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IMS trace output.

- IMS system log information, for the period of time spanning the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- IMS console log.
- All dumps taken by the attachment facility or requesting application.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period from the last IPL to the time of the failure.

00D44035

Explanation

The Db2-DL/I batch support cannot continue because the PSB name used as the Db2 authorization ID begins with the character string SYSADM which is not allowed.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is a site problem. A PSB name beginning with SYSADM is being used as the authorization ID.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The PSB= parameter of the job step execute statement indicates the PSB name used. Register 3 plus X'34' is the authorization ID specified.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44036

Explanation

The Db2-DL/I batch support cannot continue because the authorization ID has been changed by the application program.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is a site problem. The application program has modified the authorization ID.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The authorization ID saved by Db2 does not match the value in ASXBUSER or ASXBUSER8. Control block modification has occurred. Register 3 plus X'34' is the changed value.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44037

Explanation

The Db2-DL/I batch support cannot continue because the stack of save areas has been exhausted. The error can occur when multiple levels of recursion have been invoked.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer

System programmer response

This might be a multiple recursion problem caused by the execution of a changed data capture exit.

Problem determination

Verify that the user exit(s) are not being recursively invoked during a database update operation.

00D44038

Explanation

The Db2 IMS Attach facility attempted to notify the IMS subsystem that captured Db2 table data is ready for propagation. However, the IMS exit manager was not available for notification.

System action

Db2 propagation processing is abnormally terminated.

System programmer response

This is a site problem. The required release of IMS is not available.

User response

Notify the system programmer.

Problem determination

Verify that the IMS release that supports data propagation from Db2 to IMS is installed.

00D44039

Explanation

The Db2-DL/I batch support cannot continue because the record format (RECFM) for the DDOTV02 output data set has a format of fixed or fixed block.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

System programmer response

Change the RECFM parameter in the DCB from fixed 'F' or fixed blocked 'FB' to variable 'V' or variable blocked 'VB'. Specify LRECL=4092 and a BLKSIZE of at least LRECL+4. Then rerun the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the DDOTV02 DD for the proper DCB-RECFM value of 'V' or 'VB'.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00D44050

Explanation

The Db2-DL/I batch support cannot continue because a Db2 prepare problem was detected.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is an internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of PREP. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44051

Explanation

The Db2-DL/I batch support cannot continue because a Db2 commit continue problem was detected.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is an internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of COMC. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44052

Explanation

The Db2-DL/I batch support cannot continue because a Db2 abort problem was detected.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is an internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of ABRT. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44053

Explanation

The Db2-DL/I batch support cannot continue because a DL/1 XRST call problem was detected.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an application program error. Check the PCB status code for a nonblank value, validate the PCB used for the call, and validate the parameters passed by the call. Correct the application program and resubmit the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOV02 output data set.

00D44054

Explanation

The Db2-DL/I batch support cannot continue because an IMS XRST call problem was detected. An XRST call, if issued, must be issued before any SQL call is issued; only one XRST call should be issued.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an application program error. Correct the application program so it will issue the XRST call before any SQL statements are processed. Then resubmit the job. Also make sure only one XRST call is issued by the application program.

Check the DDOV02 data set to see if an INDOUBT unit of recovery has been erroneously aborted.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Follow normal IMS debugging techniques to gather the DL/I documentation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOV02 output data set.

00D44055

Explanation

The Db2-DL/I batch support cannot continue because an IMS CHKP call problem was detected by IMS.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an application program error. Check the PCB status code for a nonblank value, validate the

PCB used for the call, and validate the parameters passed by the call. Correct the application program and resubmit the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44056

Explanation

IMS detected a problem with the call to IMS ROLL or ROLB, which caused Db2 DL/I batch support to stop processing. One common reason for the problem is that a ROLB call was used with the BKO= parameter for procedures set to N (which is the default setting), and you used a temporary data set.

System action

The Db2 DL/I batch support processing is terminated.

Operator response

Notify the system programmer.

System programmer response

One of two errors can result in this reason code: an incorrect ROLB call or an application program error.

In most cases, the ROLB has incorrect settings and data. Complete the following actions to correct the ROLB call settings:

1. Validate that you are using an existing data set that is not temporary.

2. Validate that the BKO= parameter for procedures is set to Y.

3. Resubmit the job.

Sometimes an application program error can cause this reason code. Complete the following actions to correct the application error:

1. Check the PCB status code for a non-blank value.
2. Validate that the PCB used for the call is correct.
3. Validate that the parameters passed by the call is correct.
4. Resubmit the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

00D44057

Explanation

The Db2-DL/I batch support cannot continue because an IMS call problem was detected by the Db2-DL/I batch support. An IMS SYNC, ROLS, or SETS call is not allowed.

System action

The Db2-DL/I batch support cannot continue and processing is terminated.

Operator response

Notify the system programmer.

System programmer response

This is probably an application program error. Correct the application program to use supported IMS calls and resubmit the job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Copy of the DDITV02 SYSIN data set.
- Copy of the DDOTV02 output data set.

Chapter 12. X'D5.....' codes

Reason code identifiers that begin with 00D5 communicate normal and error situations with the XML manager.

00D50001

Explanation

The amount of space allowed for processing XML values by a user has been exceeded. The amount of space allowed per user is 2GB.

System action

The operation is not allowed. Db2 issues the message, "resource not available," to the invoker.

System programmer response

Check the SQL statements in the application for XML usage. Monitor the application using a statistics trace that includes IFCID 0002, or an accounting trace that includes IFCID 0003. Field QXSTXMLV records the maximum amount of storage that is used for XML values.

Problem determination

The requested operation is not performed. SQLCODE -904 is issued. Messages DSNT500I or DSNT501I might also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related concepts

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00D50002

Explanation

The amount of space allowed for processing XML values by a subsystem has been exceeded. The amount of space allowed for each subsystem is 50GB.

System action

The operation is not allowed. Db2 issues the message, "resource not available," to the invoker.

System programmer response

Monitor applications for storage use by XML values using a statistics trace that includes IFCID 0002, or an accounting trace that includes IFCID 0003. Field QXSTXMLV records the maximum amount of storage that is used for XML values.

Problem determination

The requested operation is not performed. SQLCODE -904 is issued. Messages DSNT500I or DSNT501I might also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related concepts

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00D50003

Explanation

An XML subcomponent internal inconsistency was detected.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

This code generates an SVC dump and SYS1.LOGREC entries. Use information from those two sources and from the Problem Determination section of this code to resolve the problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The abend code can be issued by any of the XML subcomponent modules. The module name can be found in the SQLCA. SQLERRD1 in the SQLCA contains a unique code that identifies the location within the module where the error was detected. SQLERRM might contain some meaningful information for this particular error. See the information about finding the SQLCA in [Finding the SQLCA \(Diagnosing Db2 problems\)](#).

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.

00D50004

Explanation

The SQL statement or utility could not be executed because z/OS XML System Service is not installed.

System action

The SQL statement is rejected with SQLCODE-904 and this reason code. For a utility, the utility is rejected with message DSNT500I and this reason code.

System programmer response

Install z/OS XML System Service. z/OS R1.7 or later is required. If you are installing on z/OS R1.7, install z/OS XML system service PTF.

00D50005

Explanation

The SQL statement could not be executed because z/OS XML System Services for schema validation service is not available.

System action

The SQL statement is rejected with SQLCODE -904 and this reason code.

System programmer response

Install z/OS XML System Services.

Issue the following command to load the required z/OS XML System Services module:

```
SETPROG LPA,ADD,MODNAME=(GXLIMODV),  
DSNAME=SYS1.SIEALNKE
```

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Chapter 13. X'D6.....' codes

Reason code identifiers that begin with 00D6 communicate normal and error situations with Db2.

00D60001

Explanation

Db2 detected an inconsistent condition. The index entry for a LOB does not point to a valid LOB in the auxiliary table. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been or from a point-in-time recovery.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Message DSNI013I is issued to identify the index page. Run the CHECK utility to identify the extent of index inconsistency.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D60100

Explanation

Db2 detected an inconsistent condition. The index entry for a LOB does not point to a valid LOB in the auxiliary table. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been or from a point-in-time recovery.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Message DSNI013I is issued to identify the index page. Run the CHECK utility to identify the extent of index inconsistency.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D60803

Explanation

An attempt was made to access a value in a column with one of the LOB data types (BLOB, CLOB, DBCLOB), but the value of the column is no longer valid.

System action

The operation is not allowed. Db2 returns 'resource not available' to its invoker.

System programmer response

Use the CHECK LOB utility to identify the invalid LOBs. Use update to replace or delete to remove the invalid LOBs.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT500I \(Db2 Messages\)](#)

[DSNT501I \(Db2 Messages\)](#)

00D60C02

Explanation

Auxiliary index entry not found. An attempt was made to access an auxiliary index, but the entry was missing. This could be caused by not recovering all the table spaces in the a table space set to the same point in time.

System action

The operation is not allowed.

System programmer response

Use the CHECK DATA to determine the rows of the table which are inconsistent. Use SQL UPDATE or DELETE to correct these errors.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D60C03

Explanation

Unable to access a LOB data page because it is not formatted or it belongs to another LOB.

System action

The operation is not allowed.

System programmer response

Run CHECK LOB to determine the extent of the inconsistency.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The requested operation is not performed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Chapter 14. X'D7.....' codes

Reason code identifiers that begin with 00D7 communicate normal and error situations with the data space manager.

00D70001

Explanation

Either the data space manager (DSM) subcomponent of Db2 could not access some storage group definition, or the storage group contains no volume IDs. Possible sources of the error include use of an incorrect name for the storage group and removal of all volume IDs via ALTER STOGROUP without providing new ones.

System action

A 'resource not available' code is returned to the caller.

System programmer response

Notify the database administrator if appropriate. Otherwise, check the SQLCA for the name of the storage group. Check this storage group (via an SQL SELECT on SYSIBM.SYSSTOGROUP) to ensure that it exists. Check for associated SYSIBM.SYSVOLUMES table entries to see if any volume IDs exist for this storage group.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

Problem determination

Obtain output listing from SELECT * FROM SYSIBM.SYSSTOGROUP and SELECT * FROM SYSIBM.SYSVOLUMES, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. Use this documentation to determine the cause of the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70002

Explanation

The required data sets are not available to Db2. This is probably a user error. For example, the user might have forgotten to create the needed VSAM data clusters using access method services before issuing a CREATE TABLESPACE request with the USING VCAT parameter.

System action

A 'resource not available' code is returned to the user.

System programmer response

Take one or both of these actions:

- Make the needed data set available.
- Be sure it is cataloged in the appropriate integrated catalog facility (ICF) catalog.

The data set names appear in the SQLCA, in the DSNP-prefixed message that contained this code, or in an earlier DSNP-prefixed message for the same user (same connection and correlation IDs).

If the data set name is correct, is cataloged, and appears in the VTOC, run the access method services DIAGNOSE command on the integrated catalog facility (ICF) catalog identified by the first qualifier of the data set name.

User response

If you are unable to resolve the problem, notify the system programmer or database administrator.

Problem determination

Obtain the following information to determine the cause of the problem:

- Listings of the integrated catalog facility (ICF) catalog and VTOC showing the data set
- Details of the request that led to this code
- The contents of the SQLCA
- The operator's console sheet showing any related messages

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related concepts

[DSNP messages \(Db2 Messages\)](#)

Related reference

[CREATE TABLESPACE statement \(Db2 SQL\)](#)

Related information

[DIAGNOSE command \(DFSMS Access Method Services for Catalogs\)](#)

00D70003

Explanation

Some or all of the data sets already exist. The data space manager (DSM) subcomponent of Db2 has discovered the preexistence of a data set that has the same name as one it was about to create. The name of the data set appears in the SQLCA or in

messages DSNP002I or DSNP022I. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

This may occur if a user creates a data set with VSAM access method services (intending to use it for a table space or index), then creates the table space or index via SQL CREATE statement, but forgets to specify USING VCAT.

Another possibility is that the data set remained from some prior, unsuccessfully completed DROP or DELETE or backout operation of Db2. This failure would probably occur if the data set or integrated catalog facility (ICF) catalog were unavailable at the time of the DROP or DELETE or backout. For example, packs may be offline, or other operational problems may exist. In this case, the table space would be dropped, but the data sets could remain and be brought back online at a later time.

There should have been some indication of this type of failure at the time it occurred. (for example, some DSNP-prefixed message indicating the data set was not deleted). You might check recent console sheets for such a message; however, it may have happened a long time ago.

System action

Error indication is returned to the user.

System programmer response

Notify the database administrator if appropriate. Otherwise, either use access method services to delete the data set or use a different name for the table or index you are trying to create.

If the data set name is correct, is cataloged, and appears in the VTOC, run the access method services DIAGNOSE command against the integrated catalog facility (ICF) catalog identified by the first qualifier of the data set name.

User response

If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

Problem determination

Information is needed concerning the history of the use of this data set; that is, of the table space/index name in conjunction with this database name. Listings of the console, integrated catalog facility (ICF) catalog, and VTOC may also be needed, with details of the

request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. Use this documentation to determine the cause of the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70004

Explanation

Certain data sets are pending deletion. Creation of a new data set is blocked by the presence of the name on a drop list. This is usually a user error. It usually occurs when the user has dropped an old object (table space, index, and so forth) and then attempted to redefine it without committing the drop.

System action

Error indication is returned to the user.

System programmer response

The user must commit the drop of the data set on the drop list. Collect the materials listed in the Problem Determination section of this message to determine the specific cause of the problem.

User response

You must commit the drop prior to redefining. Notify the system programmer or database administrator, if necessary.

Problem determination

Documentation is needed showing activities from the last committed action up to and including details of the request that resulted in this code. You also need to examine the contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. Use this documentation to determine the cause of the problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70005

Explanation

The specified data set was access method services user-defined. It does not have the required Db2 attributes.

System action

No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator response

Notify the system programmer.

System programmer response

Delete the named data set and define it with the correct attributes.

Problem determination

Obtain an access method services LISTCAT for the named data set's attributes.

Related tasks

[Migration step 12: Define system data sets: DSNTIJIN \(Db2 Installation and Migration\)](#)

00D70006

Explanation

The data sets are not owned by this Db2 subsystem. The data sets backing a table space or index can be deleted only by the data space manager (DSM) subcomponent of the Db2 subsystem that created them or by one having the same authorization ID at the time of installation. This is a safety feature to restrict DSM from deleting data sets that might have been created by the user but that have a name that matches the one we are trying to delete. This safety feature also prevents the deletion of data sets that might have been created by some other Db2 subsystem and that are still needed there.

System action

The data sets remain intact.

User response

If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

Problem determination

Obtain integrated catalog facility (ICF) catalog and VTOC listings, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. This documentation will assist you in determining the cause of the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70007

Explanation

The specified data set must be cataloged in an ICF catalog. It was found in a non-ICF catalog.

System action

No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator response

Notify the system programmer.

System programmer response

Delete the named data set, define it again, and use an ICF catalog

Problem determination

Obtain an access method series LISTCAT for the named data set's catalog types.

Related tasks

[Installation step 4: Define the ICF catalog and alias: DSNTIJCA \(optional\) \(Db2 Installation and Migration\)](#)

[Installation step 5: Define system data sets: DSNTIJIN \(Db2 Installation and Migration\)](#)

Related reference

[DEFINE CATALOG field \(Db2 Installation and Migration\)](#)

00D70008

Explanation

During allocation of a data set, Db2 detected that the attributes for the data set were incorrect. The data set requires the extended format and extended addressability attributes that are defined through DFSMS. If a key label is specified, the data set requires the extended format attribute that is defined through DFSMS. Either the data set was defined without the required attributes, or it was not defined through DFSMS.

System action

No data set is allocated. SQLCODE -904 is issued. Additional messages or codes might be issued.

System programmer or storage administrator response

Data sets that are larger than 4GB must belong to a DFSMS data class that is defined with the extended format and extended addressability attributes. Data sets that use key label must belong to a DFSMS data class that is defined with the extended format.

1. If the diagnostic message that issued this code includes a reference to STOGROUP 00000001, then the data set is a catalog or directory data set. Use the LISTCAT command to determine the name of the data set.
2. Update the data set class definition in DFSMS. On the DATA SET CLASS DEFINE panel, specify the following values:

Field	Value
DATA SET NAME TYPE	EXT
EXTENDED ADDRESSABILITY	Y

3. Make sure that the automatic class selection routine associates this data set with this data class.

User response

Notify the system programmer or storage administrator.

Problem determination

Obtain the data set attribute information from the corresponding SMS data class for the named data set.

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-*

code, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[LISTCAT command \(DFSMS Access Method Services for Catalogs\)](#)

00D70009

Explanation

The specified data set was access method services user-defined. It does not have the required Db2 attributes. The data set was defined with a Control Interval (CI) size that is incompatible with the page size. A compatible CI size is either 4K or the page size. For example, if the page size is 32K, the ControlIntervalSize parameter in the Define command should be specified with either 4K or 32K. Db2 recommends the use of the page size as the Control Interval size.

System action

A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA.

System programmer response

Ensure that the data set is defined with the compatible CI size, which is 4K or its page size.

User response

Delete the data set that was named and redefine it with the correct CI attributes.

Problem determination

Obtain an access method services LISTCAT for the named data set's attributes.

Related concepts

[Control interval sizing \(Db2 Administration Guide\)](#)

[Job DSNTIJIN \(Db2 Installation and Migration\)](#)

00D70010

Explanation

This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

System action

The data sharing extend is incomplete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP021I.

Problem determination

Obtain the console sheet showing the associated DSNP021I message and any related messages preceding that message.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70011

Explanation

The data space manager (DSM) subcomponent of Db2 has been requested to extend a table space or index space, but the table space or index space has already been extended to its maximum size. This situation does not mean that no more is space available in the page set for the requested insert. An additional search will be performed for space in the current table space or index space. If space cannot be found, then the data manager component will issue reason code 00C9009C for a partitioned page set or 00C9009D for a non-partitioned page set.

If this condition is encountered when trying to insert into a traditional sort work file, other table spaces in the work file database are searched for space. If none is available, the job fails with a "resource not available" code.

If this condition is encountered for a table space in a work file database when inserting into a DGTT, the job might fail with resource unavailable because other concurrent jobs are competing for storage in the work file database. If it is encountered for DGTT use when no other jobs are running, it indicates the table space is not big enough to hold all the data.

For the name of the data set from which the name of the table space, index space, and/or partition can be derived, see message DSNP001I or DSNP007I and the SQLCA.

System action

No extension is done.

System programmer response

Notify the database administrator if appropriate. Otherwise, if the table space is partitioned and there is space in other partitions, you may be able to redefine the table space with new partitioning parameters so that the data that has overloaded this partition is directed to others. If the table space is not partitioned, you probably have more than one table residing in this table space. Define another table space, unload this one, then reload the tables into the separate spaces. (Be aware that this is a very large amount of data to move. Careful planning is recommended.)

If a large DGTT cannot be contained in a single existing table space in the work file database, consider altering the MAXPARTITIONS attribute to increase the number of partitions if it is a PBG table space, or create larger table spaces. Because you do not control which table space is used, the recommendation is to create all work file table spaces with sufficient space.

User response

If this condition occurs when inserting into a DGTT or sort work file and other concurrent jobs are competing for storage space, try rerunning the job when the usage is less. If the same condition is encountered for DGTT use when no other jobs are running the table space is not big enough to hold all the data.

If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

Problem determination

If you believe the table space or index space has not yet reached maximum size, provide listings of the console, integrated catalog facility (ICF) catalog, and VTOC.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

Related concepts

[DSNP007I \(Db2 Messages\)](#)

00D70012

Explanation

A password or security error has occurred. An attempt to access a integrated catalog facility (ICF) catalog entry for a cluster (data set) failed because of some security violation. This is probably a user error. It may be caused either by the incorrect specification of a password or the changing of the password in the Db2 catalog (via SQL ALTER) but not in the integrated catalog facility (ICF) catalog (via access method services ALTER) or vice versa.

System action

A 'resource not available' code is returned to the user.

System programmer response

Notify the database administrator if appropriate. Otherwise, check the passwords and/or RACF authorizations.

User response

Ensure that the correct password is being used. If you are unable to resolve the problem yourself, notify the database administrator.

Problem determination

Obtain output from SQL SELECT * FROM SYSIBM.SYSTABLESPACE and (if storage group related) SELECT * FROM SYSIBM.SYSSTOGROUP. Also obtain integrated catalog facility (ICF) catalog listing, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. This documentation will assist you in determining the cause of the problem if it is not merely an incorrect password. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70013

Explanation

A required integrated catalog facility (ICF) catalog does not exist or is inaccessible. An attempt to access an integrated catalog facility (ICF) catalog entry for a cluster (data set) failed. This is probably a user error.

System action

A 'resource not available' code is returned to the user.

System programmer response

Take the following actions:

- Check that the proper catalog name was specified and is available to Db2.

- Check the associated DSNP012I message on the operator's console for the integrated catalog facility (ICF) return and reason codes.
- See the description of DSNP012I.
- Look for any related messages on the console sheet.
- Refer to the appropriate MVS publication for a description of message IDC3009I.

User response

If you are unable to resolve the problem, notify the system programmer or database administrator.

Problem determination

Obtain the following to help you determine the cause of the problem:

- Details of the request that resulted in this code
- Contents of the SQLCA

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70014

Explanation

An attempt to extend a data set failed, because a problem was detected in media manager services.

One possible cause of this error is that a table was created or the definition of a table was completed in a simple table space. Db2 attempted to insert a system page in the table space, but there was not enough room to insert the system page.

System action

Abort the request.

Operator response

Notify the system programmer or database administrator.

System programmer response

Notify the database administrator if appropriate. Otherwise, check the packs available to the data set. They might merely be full or the data set might have reached its maximum allowable extents. For more information, see the description of message DSNP001I.

User response

Notify the operator, system programmer, or database administrator.

Problem determination

Obtain console sheet that shows associated DSNP001I, DSNO007I, or DSNP011I messages and any related messages that precede them. This documentation can assist you in determining the cause of the problem. For more information, see the description of these messages.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

Related information

[DSNP001I \(Db2 Messages\)](#)

00D70015

Explanation

An attempt to update the high-used RBA for a data set failed in media manager services.

System action

Abort the request.

Operator response

Notify the system programmer or database administrator.

System programmer response

Notify the database administrator (DBA), if appropriate. The DBA should be made aware of the extend problem. However, this is probably a system problem.

Problem determination

Obtain console sheet showing associated DSNP001I, DSN0007I, or DSNP011I messages and any related messages preceding them. This documentation will assist you in determining the cause of the problem. For additional information, see the description of these messages.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70016

Explanation

This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

System action

The data sharing extend is incomplete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP021I.

Problem determination

Obtain the console sheet showing the associated DSNP021I message and any related messages preceding that message.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70017

Explanation

An error occurred while attempting to obtain information from an integrated catalog facility (ICF) catalog.

System action

The request is terminated.

System programmer response

Ensure that the proper packs and catalog are online and operating correctly. See message DSNP012I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70018

Explanation

This is a Db2 internal error. One of the following circumstances has occurred:

- A data set inquiry function was called for a partitioned table space or index space. Its function applies only to nonpartitioned table spaces or index spaces.
- The reset function of data space manager (DSM) was called on a table space that had been opened incorrectly.

System action

Abort the request.

Operator response

Notify the system programmer.

System programmer response

Collect the materials listed in the Problem Determination section of this message. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Request a dynamic dump. In the dump, the second parameter passed to the data set inquiry function identifies the table space or index space. The third parameter is the table space or index space object descriptor block (OBD). The OBD indicates whether or not the table space or index space is partitioned. If it is partitioned, the calling module is in error. If it is not partitioned, the test in the data set inquiry function must be at fault.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70019

Explanation

The data space manager (DSM) subcomponent of Db2 could not release the extend lock it acquired against a data set during an attempt to extend that data set.

System action

The SQL request that led to the abend is terminated, and the unit of recovery that issued the request is backed out.

Operator response

Notify the system programmer.

System programmer response

Investigate the DSM messages associated with this condition (at least message DSNP015I) for clues to the

problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This problem is probably the result of either: (1) an attempt by DSM to free a lock it did not hold or, (2) a problem in IRLM. The IRLM return and reason codes appear in the associated DSNP015I message. For additional information, see the description of this message.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70020

Explanation

This is probably an internal error. An attempt to extend a data set failed because a problem was detected in media manager services during the DSM notify process.

System action

The request is terminated.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP021I.

Problem determination

Obtain the console sheet showing the associated DSNP021I message and any related messages preceding that message.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70021

Explanation

The data space manager (DSM) subcomponent of Db2 could not write a required log record.

System action

Abort the request.

Operator response

Notify the system programmer.

System programmer response

Collect the materials listed in the Problem Determination section of this message.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.

- Definitions of views and tables involved in the error.

00D70022

Explanation

The data space manager subcomponent of Db2 is unable to acquire a needed lock. The extend request can not be completed.

System action

Abort the request.

Operator response

Notify the system programmer.

System programmer response

Obtain documentation from message DSNP014I. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See message DSNP014I.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70023

Explanation

There is an insufficient amount of space in primary allocation to format control pages.

System action

The requested table space or index space creation is backed out.

Operator response

Notify the system programmer or database administrator.

System programmer response

Notify the database administrator if appropriate. Otherwise, increase the primary allocation value in the data set that was defined directly via access method services. (This should not happen for storage group related data sets, because the Db2 interpreter ensures a sufficient setting for the primary value.)

Problem determination

Obtain integrated catalog facility (ICF) catalog and VTOC listings, details of the request that led to this code, and contents of the SQLCA. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Results of SQL SELECT * FROM SYSIBM.SYSTABLESPACE may also be useful. Also obtain the operator's console sheet showing related messages, if any.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70024

Explanation

No data sets exist for a nonpartitioned table space or index space. Because at least one existed at create time, a serious problem might have occurred for this table space or index space. The name of the data set that Db2 expected to find for the table space or index

space appears in message DSNP012I and/or in the SQLCA along with the reason code.

System action

The request is terminated.

System programmer response

Ensure that the data set and its pack are available to Db2 and that the data set has not been inadvertently deleted or migrated by any DASD operation.

If the data set name is correct, is cataloged, and appears in the VTOC, run the access method services DIAGNOSE command on the integrated catalog facility (ICF) catalog identified by the first qualifier of the data set name.

Problem determination

Obtain the following items:

- The integrated catalog facility (ICF) catalog
- The VTOC listings
- Details of the request that led to this code
- Contents of the SQLCA
- The operator's console sheet showing related messages

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related concepts

[SQL communication area \(SQLCA\) \(Db2 SQL\)](#)

Related information

[DIAGNOSE command \(DFSMS Access Method Services for Catalogs\)](#)

[DSNP012I \(Db2 Messages\)](#)

00D70025

Explanation

An access method services request failed.

System action

Abort the request.

Operator response

Notify the system programmer or database administrator.

System programmer response

Examine messages DSNP009I and DSNP010I on the operator's console for the access method services messages they encompass. Refer to the appropriate MVS publication for information about specific access method services messages received.

Problem determination

See the message DSNP009I description.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70026

Explanation

This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

System action

The data sharing extend did not complete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP022I.

Problem determination

Obtain the console sheet showing the associated DSNP022I message and any related messages preceding that message.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70027

Explanation

The secondary allocation value is 0. No physical extension is done. If this occurs in a create of a segmented table, the primary allocation of the table space is not big enough to allocate the first segment. The first segment consists of a number of pages which are defined in SEGSIZE.

System action

The request to extend the data set is terminated.

System programmer response

Notify the database administrator if appropriate. Otherwise, if you intended to allow physical extension of the data set, change its secondary value to a nonzero quantity.

Problem determination

Obtain the integrated catalog facility (ICF) catalog and VTOC listings, and (if storage group-defined) the output from `SELECT * FROM SYSIBM.SYSSTOGROUP`. Also obtain details of the request that resulted in

this code, contents of the SQLCA, and the operator's console sheet showing related messages, if any.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70028

Explanation

An HSM request for the recall of a migrated data set failed.

System action

The HSM recall is aborted by data space manager and control returns to the function that issued the recall request. The higher level function will not necessarily terminate processing since the data set may have already been recalled.

Operator response

If processing was terminated, notify the system programmer or database administrator.

System programmer response

If processing was terminated, investigate the reason for the HSM failure via messages issued to the MVS operator's console. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Refer to the problem determination section(s) of the associated Db2 and HSM messages which were issued to the MVS operator's console.

Collect the following diagnostic item listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

00D70029

Explanation

Db2 could not access a data set because the data set is on a volume that is offline.

System action

The request to access the data set is terminated.

System programmer response

Ensure that the proper volumes are online. See console message DSNP012I or DSNT500I.

Problem determination

Obtain the following logs to find the failing data set name:

- The operator's console log that contains either the related DSNP012I message with CTLGRC=00000008 CTLGRSN=xxxx0532, or, message DSNT500I with REASON 00D70029.
- The job log that contains the 00D70029 code.

Use ISPF, ISMF, or other facility to locate the volumes and device numbers where the data set resides. Vary the volume, or volumes, back online.

00D70030

Explanation

Unexpected reason code was received from some Db2 subcomponent invoked by data space manager (DSM).

Almost any DSNP module can issue this reason code.

System action

Abort the request.

Operator response

Notify the system programmer.

System programmer response

There is not much the system programmer can do here, but see register 2 in the accompanying dump for the unexpected code. Its description may provide a clue to the type of problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Obtain a listing of the SQL request that resulted in this code and a listing of the contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. There should be at least one DSNP-prefixed message containing the '00D70030' code. Messages preceding it from other subcomponents (having other prefixes beginning with DSN) may provide additional details about the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

.

00D70040

Explanation

An attempt to rename an existing data set failed, because a name does not conform to the naming convention.

System action

Error indication is returned to the user.

System programmer response

Notify the database administrator if appropriate.

User response

Notify the system programmer.

Problem determination

This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I or DSNP026I.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70041

Explanation

An attempt to rename an existing data set failed.

System action

Error indication is returned to the user.

System programmer response

Notify the database administrator if appropriate.

User response

Notify the system programmer.

Problem determination

This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.

- VTOC listing of the disk volume on which the failing operation occurred.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70042

Explanation

An attempt to rename an existing data set failed, because the old and new names are not compatible. This problem might arise in one or both of the following situations:

1. One data set name is a Db2 page set data set name and another data set name is a non-Db2 page set data set name.
2. Both are Db2 page set data set names, but there is a mismatch in the catalog alias names, the database names, or the table space/index space names.

System action

Error indication is returned to the user.

System programmer response

Notify the database administrator if appropriate.

User response

Notify the system programmer or database administrator.

Problem determination

This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.

- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D70043

Explanation

During the define cluster for a undefined data set, Db2 detected that the specified data set requested to be defined already exists.

System action

A 'resource not available' code is returned to the user.

User response

Delete the existing cluster and rerun the job.

00D70044

Explanation

An unexpected error was received in acquiring the SY_PITR lock by data space manager during DEFINE or EXTEND processing of the data set.

System action

The data set DEFINE or EXTEND did not complete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP014I.

Problem determination

Obtain the console sheet showing the associated DSNP014I message. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70045

Explanation

An unexpected error was received in acquiring the SY_PITR lock by data space manager during DEFINE or EXTEND processing of the data set.

System action

The data set DEFINE or EXTEND did not complete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP015I.

Problem determination

Obtain the console sheet showing the associated DSNP015I message. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70046

Explanation

This is an internal error. An attempt to extend a data set failed because an error is detected. The high used page number of the pageset recorded in Db2 does not match the high used control interval from the integrated catalog facility (ICF) catalog.

System action

The data sharing extend did not complete.

Operator response

Notify the system programmer or database administrator.

System programmer response

For additional information, see the description of message DSNP007I.

Problem determination

Obtain the console sheet showing the associated DSNP007I message. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D70051**Explanation**

One of the following is issued on a ROSHARE OWNER database:

- A CREATE TABLESPACE statement
- A CREATE INDEX statement, or
- The REORG utility with SHRLEVEL REFERENCE or SHRLEVEL CHANGE using user-managed data sets

However, the data sets are not defined with VSAM SHAREOPTIONS(1,3).

System action

An SQLCODE -731 is returned to the user (for CREATE TABLESPACE or INDEX) The CREATE TABLESPACE or INDEX statement or the REORG utility is not executed.

User response

Use AMS ALTER SHAREOPTIONS to alter the data set to SHAREOPTIONS(1,3) and resubmit the CREATE TABLESPACE or INDEX statement or the REORG utility.

00D70052**Explanation**

An ALTER DATABASE statement is issued to convert a database to ROSHARE OWNER. But, within this database, at least one user defined data set is not defined with VSAM SHAREOPTIONS(1,3). All user-defined data sets that are within this database must be converted to SHAREOPTIONS(1,3) before the database can be altered to ROSHARE OWNER.

System action

An SQLCODE -731 is returned to the user and the ALTER DATABASE statement is not performed.

User response

Use AMS ALTER SHAREOPTIONS to alter all user-defined data sets that are within this database to SHAREOPTIONS(1,3), and resubmit the ALTER DATABASE statement.

00D70100**Explanation**

A requested resource is not available. Either the data space manager (DSM) or some subcomponent that it invoked discovered that some resource is not available. The name and type of the resource and the

reason it is unavailable are placed in the CT control block by the subcomponent that made the discovery. This information is made available to the user in the SQLCA and/or messages. The reason code in the CT/SQLCA contains the identifier of the subcomponent that discovered the problem.

Almost any DSNP module can issue this reason code.

System action

Abort the current request.

Operator response

Notify the system programmer or database administrator.

System programmer response

Notify the database administrator if appropriate. Otherwise, determine what resource was unavailable (from SQLCA information) and, if it is something you can control, make it available. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

See the Problem Determination section in the description of the code that appears in the SQLCA or CTRURES field of the CT and/or in the description of any associated console messages. Obtain details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

00D79999

Explanation

A severe error has occurred. For example, an invalid data space manager (DSM) function is invoked.

Almost any data space manager (DSM) function can issue this reason code.

System action

Abort the request.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Obtain the console sheet, dump, details of the request that led to this code, and contents of the SQLCA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of views and tables involved in the error.

Chapter 15. X'D9.....' codes

Reason code identifiers that begin with 00D9 communicate normal and error situations with the recovery manager.

00D90000

Explanation

A recovery manager module received control from its FRR for retry and found an invalid retry point identifier. The name of the module in which the failure occurred appears in the SYS1.LOGREC entry showing this reason code in register 15.

System action

Standard Db2 diagnostic information is provided. The error is recorded in SYS1.LOGREC, an SVC dump is scheduled, and Db2 subsystem termination is requested. The subsystem termination reason code reflects the function for which retry was unsuccessfully attempted.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

This is a secondary subsystem error. Obtain a copy of SYS1.LOGREC and the SVC dump for this failure and for the original failure that resulted in the retry attempt.

Problem determination

Examine the SYS1.LOGREC information and the dumps from both the original failure and this second failure to determine if the recovery parameter area was damaged or if retry incorrectly restored registers for the mainline module.

00D90003

Explanation

A failure occurred while Db2 was attempting to open an object in the shared communications area (SCA).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Operator response

Ensure the coupling facility for the SCA is available, and restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90004

Explanation

An error occurred while Db2 was attempting to create a service task.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90010

Explanation

During the process of re-enabling data sharing, all members, other than the surviving member, are forced to cold start. In the process of setting up the cold start for this member, an active conditional restart control record was discovered in the BSDS. This record could not have been in the BSDS when data sharing was disabled, and this Db2 should have been inactive since data sharing was disabled; therefore, it is unclear what the conditional restart control record is requesting.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Use the change log inventory (DSNJU003) utility to cancel the active conditional restart control record in this member's BSDS.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D90011

Explanation

Db2 determined that the version of the shared communications area (SCA) recorded within the SCA did not match the version of the SCA returned from MVS.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90012

Explanation

An error occurred while Db2 was attempting to create a service task.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90013

Explanation

The restart parameters for TRKRSITE are invalid. If TRKRSITE is YES on DSNZPARM and this Db2 subsystem has not successfully restarted in this 'Tracker Recovery cycle', Db2 requires special conditions before it can restart.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System programmer response

Ensure that the Conditional Restart Control Record is correct, then restart Db2. You can run the Print Log Map Utility (DSNJU004) to examine the current Conditional Restart record. The following conditions are correct:

- BACKOUT = NO
- FORWARD = NO
- Either an ENDRBA value for non-data sharing or an ENDLRSN value for data sharing. In data sharing, the ENDLRSN value must be the same for all members restarting in this 'Tracker Recovery cycle'.

To avoid a cold start or log skipping in a tracker site, ensure that STARTRBA has no specified value. You can create or modify the Conditional Restart parameters with the Change Log Inventory Utility (DSNJU003).

Related reference

[DSNJU003 \(change log inventory\) \(Db2 Utilities\)](#)

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D90014

Explanation

The System Level Recovery restart was invalid. All members of the data sharing group must truncate their logs with the same LRSN value that was specified in the SYSPITR conditional restart parameter.

System action

Db2 startup terminates.

Operator response

Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System programmer response

Ensure that the conditional restart control record is correct, and then restart Db2. You can run the Print Log Map utility (DSNJU004) to examine the current conditional restart record.

00D9001F

Explanation

An invalid function code was passed to a Db2 service task.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90020

Explanation

During the process of re-enabling data sharing, the surviving member of the previous data sharing disable must be the first member started. An attempt was made to start a member other than the surviving member during the process of re-enabling data sharing.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Operator response

To initiate the data sharing re-enable process, start the surviving member of the previous data sharing disable first.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90021

Explanation

After data sharing is disabled, only the surviving member of the group can be started. An attempt was made to start a member other than the surviving member.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90022

Explanation

After reading information from the BSDS of a peer member in its data sharing group, this Db2 was not able to close the peer's BSDS.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90050

Explanation

Data sharing re-enable is canceled.

This Db2 member was canceled while waiting for other members of the data sharing group to complete their re-enable processing.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Operator response

To re-enable data sharing, start the surviving member again.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900E0

Explanation

A Db2 functional recovery routine invoked Db2 subsystem termination because an unrecoverable error was detected.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900E1

Explanation

The operator replied 'NO' to message DSNR020I. See message DSNR020I for more information.

System action

Db2 terminates.

Problem determination:

00D900EB

Explanation

This abend reason code appears at a member, other than the surviving member, when the surviving member is not able to complete the process of re-enabling data sharing. This member cannot continue because data sharing was not re-enabled successfully.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

Determine why the surviving member was not able to complete the data sharing re-enable.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900EC

Explanation

During the process of re-enabling data sharing, a member other than the surviving member was not able to complete it's portion of the re-enabling process.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F0

Explanation

Db2 received an error while attempting to access shared communications area (SCA) information from the coupling facility.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC memory dump is requested. Depending on the nature of the problem, Db2 subsystem termination might be initiated.

System programmer response

Collect the following documentation and contact IBM Support:

- SVC memory dump
- Syslog

Additional documentation might be required, depending on the exact nature of the error.

00D900F1

Explanation

Db2 received an error while attempting to read shared communications area (SCA) information from the coupling facility.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Correct the problem with the coupling facility, and restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F2

Explanation

Db2 received an error while attempting to write shared communications area (SCA) information to the coupling facility.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Correct the problem with the coupling facility, and restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F3

Explanation

Db2 received an error while attempting to read the BSDS.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Correct the problem with the BSDS, and restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F4**Explanation**

Db2 received an error while attempting to write to the BSDS.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Correct the problem with the BSDS, and restart Db2.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F5**Explanation**

Db2 received an error while attempting to read the BSDS of another member in the data sharing group.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

System programmer response

Correct the problem with the BSDS, and restart Db2.

Problem determination

Register 4 contains the member ID of the member whose BSDS was being read.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F7**Explanation**

Db2 received an error while attempting to acquire a lock.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump might be requested. Depending on the error, Db2 might initiate subsystem termination.

Problem determination

Register 4 points to the resource that Db2 was attempting to lock.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F8**Explanation**

Db2 received an error while attempting to release a lock used to serialize portions of restart or group restart.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900F9

Explanation

Db2 received an error while attempting to notify other members in the data sharing group of a restart or group restart event.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D900FA

Explanation

The starting Db2 subsystem is an incompatible release of Db2 or the code does not have the proper level of

SPE applied or was coming from a release of Db2 that was not at the required catalog and/or function level.

System action

The Db2 subsystem terminates. An SVC dump might be requested.

System programmer response

Verify that:

- The correct load libraries are being used to start up the Db2 subsystem.
- The correct level of SPE has been applied.
- The catalog and function levels are at the required level in the previous release before migration to a new Db2 release.

Related tasks

[Activate function level 510 in Db2 12 \(Db2 Installation and Migration\)](#)

[Migration step 1: Complete premigration tasks \(Db2 Installation and Migration\)](#)

00D90100

Explanation

A Db2 functional recovery routine invoked Db2 subsystem termination because an unrecoverable error was detected.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90110

Explanation

This is an internal error.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D90111

Explanation

This is an internal error.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before Db2 subsystem termination is initiated.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D91001

Explanation

A thread that was participating in a global transaction attempted to issue a Begin-UR after a decision point (commit or abort) was already reached for the global transaction. This is violation of the protocol and is not allowed.

System action

The Begin-UR request is failed and a SVC dump may be scheduled. The thread requesting the Begin-UR might be abended. No resources are released because a UR is not created for the thread and no resources may be held.

System programmer response

This is a protocol error. The application controlling the global transaction thread may not request that a new unit of recovery be created after the global transaction has reached a decision point, either commit or abort.

Problem determination

Obtain the UR-control log records (type '0020'x) for all the threads in the global transaction to determine the sequence of events that led to the protocol violation. Correct the application.

00D91044

Explanation

An unexpected return code was received from RRS when setting the type of interest in a Unit of Recovery (UR).

System action

The application is abended.

Operator response

Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer.

System programmer response

This is probably either an error in Db2 or in RRS. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). If RRS has terminated, restart RRS.

Problem determination

Examine the SVCDUMP to determine the cause of the RRS failure. Register nine contains the return code from the RRS ATRSIT request.

00D92001

Explanation

The checkpoint/restart serial controller (DSNRCRSC) FRR invoked Db2 subsystem termination, because an unrecoverable error was detected while processing a request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Subsystem termination is initiated. Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the associated abend.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error, and follow the instructions associated with it.

Problem determination

See the original error.

00D92003

Explanation

The restart request servicer (DSNRRRQS) FRR invoked Db2 subsystem termination, because an unrecoverable error was detected while processing a restart request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D92004

Explanation

The shutdown checkpoint controller (DSNRCSHT) FRR invoked Db2 subsystem termination, because an unrecoverable error was detected while processing a shutdown checkpoint request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D92011

Explanation

An invalid URE was found during checkpoint processing. An overlay of the URE may have occurred.

System action

The checkpoint process will ABEND to prevent a damaged URE from being written out to the log, and the subsystem will be terminated. This is to prevent the loss or incorrect processing of a Db2 unit of recovery (UR). Db2 Restart will use the previous

checkpoint and apply all the Db2 log records up to the point of failure. Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

Operator response

Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart Db2.

System programmer response

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the SVCDUMP and the Db2 Trace Table in the dump to determine the cause of the URE overlay.

00D92012

Explanation

An invalid RURE was found during checkpoint processing. An overlay of the RURE may have occurred.

System action

The checkpoint process will abend to prevent a damaged RURE from being written out to the log, and the subsystem will be terminated. This is to prevent the loss or incorrect processing of a Db2 unit of recovery. Db2 Restart will use the previous checkpoint and apply all the Db2 log records up to the point of failure. Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

Operator response

Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart Db2.

System programmer response

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the SVCDUMP and the Db2 Trace Table in the dump to determine the cause of the RURE overlay.

00D92013

Explanation

An invalid GXID was found during checkpoint processing. An overlay of the GXID might have occurred.

System action

The checkpoint process will abnormally terminate to prevent a damaged GXID from being written out to the log, and the subsystem will be terminated. This is to prevent the loss of or incorrect processing of a Db2 unit of recovery. Db2 restart will use the previous checkpoint and apply all the Db2 log records up to the point of failure. Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

Operator response

Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart Db2.

System programmer response

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Examine the SVCDUMP and the Db2 Trace Table in the dump to determine the cause of the GXID overlay.

00D92021

Explanation

An invalid URE was read from the log during the current status rebuild phase of restart. Restart cannot process the damaged URE.

System action

The restart processing abends, which terminates the subsystem. This is to prevent the loss or incorrect processing of a Db2 unit of recovery.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. The first 4 digits of the RBA of the invalid log record is contained in register 3 and the last 8 digits in register 4.

Operator response

Do not attempt to restart Db2 until the error is resolved. Notify the system programmer and collect the following diagnostic items listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

System programmer response

Print the BSDS using the print log map (DSNJU004) utility. Find the checkpoint queue in the output listing from DSNJU004.

Next, run the change log inventory (DSNJU003) utility to create a conditional restart record with the CHKPTRBA option specifying the Begin checkpoint RBA found in the second entry of the checkpoint queue. Restart Db2 using the conditional restart record found. If the same failure occurs, repeat the

conditional process using the next begin checkpoint RBA in the checkpoint queue.

Repeat this process, going down the checkpoint queue until Db2 restarts. This will be prior to the time when the invalid URE was written to the log. The restart process is then able to apply all the log records to the end of the log.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D92024

Explanation

During restart, the state of a logged unit of recovery and the state of the global transaction which the unit of recovery is part of are incompatible.

System action

The restart processing abnormally terminates, which terminates the subsystem. This is to prevent the loss or incorrect processing of a Db2 unit of recovery.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

Operator response

Do not attempt to restart Db2 until the error is resolved. Notify the system programmer and collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

System programmer response

Print the BSDS using the Print Log Map (DSNJU004) utility. Find the checkpoint queue in the output listing from DSNJU004.

Next, run the Change Log Inventory (DSNJU003) utility to create a conditional restart record with the CHPTRBA option specifying the begin checkpoint RBA found in the second entry of the checkpoint queue. Restart Db2 using the conditional restart record found. If the same failure occurs, repeat the conditional process using the next begin checkpoint RBA in the checkpoint queue.

Repeat this process, going down the checkpoint queue until Db2 restarts. This will be prior to the time when the invalid record was written to the log. The restart process then applies all the log records to the end of the log.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The state of the logged unit of recovery is reported in register 1 and the state of the global transaction is provided in register 2. The meanings of these values are shown below.

Unit of recovery state (in register 1):

- 1 inflight
- 2 ensure abort
- 3 commit indoubt
- 4 ensure commit

Global Transaction State (in register 2):

- 1 inflight
- 2 ensure abort
- 3 commit indoubt
- 4 ensure commit

Related reference

[DSNJU003 \(change log inventory\) \(Db2 Utilities\)](#)

00D92025

Explanation

During restart, it was determined that at least one unit of recovery (UR) was still active at the previous termination of this Db2 subsystem and that the subsystem was last started at a different release level.

During migration to a new release or fallback to an older release, all activity must be quiesced and there should be no active units of recovery. Db2 restart will fail until the situation is resolved.

System action

The restart terminates abnormally, which terminates the subsystem. This action is to prevent the loss or incorrect processing of a Db2 unit of recovery. An SVC dump is scheduled and an entry is created in SYS1.LOGREC.

Operator response

Do not attempt to restart Db2 until the error is resolved. Notify the system programmer and collect the required items for problem determination.

System programmer response

Because all work must be quiesced before either migration or fallback of a Db2 subsystem, the recommended action is to restart the Db2 subsystem at the release level that created the outstanding unit or units of recovery and let the units of recovery end normally.

You might need to use the RECOVER INDOUBT command to resolve indoubt threads.

After all units of recovery have completed processing, use the STOP DB2 command with MODE(QUIESCE) to stop Db2. Then restart Db2 at the desired release level. Using a different release level may require additional migration or fallback actions.

If it is not possible to restart Db2 at the release level that created the outstanding units of recovery, then a cold start is required.

1. Print the BSDS using the DSNJU004 (print log map) utility.
2. Find the highest written RBA using the output from DSNJU004.
3. Use the DSNJU003 (change log inventory) utility to create a conditional restart record, specifying the same value for STARTRBA and ENDRBA. The RBA value must be an even multiple of 4096

(a hexadecimal value ending in 000) and should be rounded up from the highest written RBA as indicated by the DSNJU004 output.

Additional actions might be necessary to recover from possible data inconsistencies.

Another option is to restore the Db2 logs and data to a prior consistent point in time.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D93001

Explanation

The commit/abort FRR (DSNRCAFR) invoked Db2 subsystem termination, because an unrecoverable error was detected during must-complete processing for phase 2 of a commit-UR request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D93002

Explanation

The Db2 subsystem is terminated because an unrecoverable error was detected during must-complete processing for phase 2 of a commit-UR request for an agent that is a participant in a global transaction.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2. Notify the system programmer.

System programmer response

This is probably either an error in Db2 or in the commit of the global transaction. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with Db2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D9300F

Explanation

The commit/cancel secondary FRR invoked Db2 subsystem termination. This occurs only if functional recovery itself fails while processing a failure during must-complete processing for phase 2 of a commit-UR request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error. Standard Db2 diagnostic information is also recorded in SYS1.LOGREC for the secondary error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC for both the original and the secondary error, and the SVC dump for the original error.

Problem determination

See the original error.

00D93011

Explanation

A subcomponent of Db2 invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was requested for an agent that was modifying data. Either commit-UR or abort-UR was already in process, or the recovery structure (URE) was damaged.

System action

Abnormal termination of the agent results, including backing out (abort-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area by reason code '00D9CCCC', is added to the SDWA variable recording area (VRA).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the agent were in a must-complete state (in-commit2 or in-abort), the Db2 subsystem is also terminated with reason code '00D93001'. When the subsystem is next restarted, recoverable activity for this agent (such as an ensure-abort or ensure-commit UR) is handled to complete the commit or abort process.

System programmer response

This is a Db2 subsystem error. Collect the materials mentioned in the Problem Determination section of this message.

Problem determination

Examine the SYS1.LOGREC data and the Db2 trace table in the dump to establish whether either commit-UR was invoked incorrectly or the control structure that reflects the state (ACEPROG, UREPROG) was damaged.

00D93012

Explanation

A subcomponent of Db2 invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was invoked for an agent that was only retrieving data. Either commit-UR or abort-UR was already in process, or the ACE progress state field was damaged.

System action

Abnormal termination of the agent results, including backing out (abort-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area by reason code '00D9CCCC', is added to the SDWA variable recording area.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

System programmer response

This is a Db2 subsystem error. Collect the materials mentioned in the Problem Determination section of this message.

Problem determination

Examine the SYS1.LOGREC data and the Db2 trace table in the dump to establish whether either commit-UR was invoked incorrectly or the control structure (ACEPROG) was damaged.

00D93013

Explanation

The request to commit an agent that was a participant in a global transaction failed because a mismatch between the state of the agent and the state of the global transaction. State field was damaged.

System action

Abnormal termination of the agent occurs, including backing out (abort-UR) its activity to the previous point of consistency. This releases all resource locks held by the agent.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

Operator response

Notify the system programmer.

System programmer response

This is probably either an error in Db2 or in the commit of the global transaction. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with Db2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D93100

Explanation

This reason code indicates that a Db2 allied agent does not need to participate in the Phase 2 (Continue Commit) call, because all required work has been accomplished during the Phase 1 (Prepare) call.

This reason code is generated by Recovery Manager when it is determined that a Db2 allied agent has not updated any Db2 resource since its last commit processing occurred.

System action

The "yes" vote is registered with the Commit coordinator.

00D94001

Explanation

The commit/abort FRR (DSNRCAFR) invoked Db2 subsystem termination, because an unrecoverable error was detected during must-complete processing for an abort-UR request.

This is a Db2 subsystem termination reason code.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the reason code for the original error.

00D94002

Explanation

An unrecoverable error was detected during must-complete processing for an abort-UR request for an agent that is a participant in a global transaction. A Db2 subsystem termination might occur.

This is a Db2 subsystem termination reason code.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested.

Operator response

Print SYS1.LOGREC, and restart Db2. Notify the system programmer.

System programmer response

This is probably either an error in Db2 or in the commit of the global transaction. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with Db2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

,

00D9400F

Explanation

The commit/abort FRR invoked Db2 subsystem termination. This occurs only if functional recovery itself fails while processing a failure during must-complete processing for an abort-UR request.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error. Standard Db2 diagnostic information is also recorded in SYS1.LOGREC for the secondary error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC for both the original and the secondary error, and the SVC dump for the original error.

Problem determination

See the original error.

00D94011

Explanation

A subcomponent of Db2 invoked abort at a point when the agent state is invalid for invoking the function that aborts units of recovery. Either abort-UR or commit-UR phase 2 was already in process, or the agent structure was damaged.

System action

Abnormal termination of the agent results and, because the agent is in a must-complete state, the Db2 subsystem is terminated with reason code '00D94001'. When the Db2 subsystem is restarted, recoverable activity for this agent is handled to complete the commit or abort process.

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area by reason code '00D9AAAA7', is added to the SDWA variable recording area. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

System programmer response

This is a Db2 subsystem error. Collect the materials mentioned in the Problem Determination section of this message.

Problem determination

Examine the SYS1.LOGREC data and the Db2 trace table in the dump to establish whether commit-UR was invoked incorrectly or the control structure (ACEPROG, UREPROG) was damaged.

00D94012

Explanation

During rollback, the end of the log was read before all the expected log ranges were processed. The abend is accompanied by a Db2 abnormal subsystem termination with reason code 00D94001.

System action

The agent is abnormally terminated. Because the agent is in a must-complete state, the Db2 subsystem is terminated with reason code 00D94001 and message DSNV086E. Standard Db2 diagnostic information is recorded in SYS1.LOGREC. An 04E-D94012 SVC dump is requested.

Operator response

1. Run the print log map (DSNJU004) utility to print the content of both BSDSs.
2. Print SYS1.LOGREC.
3. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

To restart Db2, you must take one of the following actions:

- Add the missing archive log data sets back to the BSDS with the change log inventory (DSNJU003) utility.
- Restart Db2 with a conditional restart specifying BACKOUT=NO to bypass the unit of recovery that is in-abort.

Problem determination

At the time of the abend, registers 3 and 4 contain the 6-byte relative byte address (RBA) of the beginning of this unit of recovery. Db2 must read the log back to this point to complete the ROLLBACK of this unit of recovery.

[DSNV086E \(Db2 Messages\)](#)

00D94014

Explanation

A savepoint request encountered an invalid request block. This is an internal error.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested.

Operator response

Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

Problem determination

At the time of the abend, general register zero contains the address of the invalid SRPL request block.

00D95001

Explanation

The recovery manager's common FRR (DSNRCRFR) invoked Db2 subsystem termination, because an unrecoverable error was detected during checkpoint (DSNRCPRC) processing.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D95011

Explanation

The recovery manager checkpoint (DSNRPBCW) FRR invoked Db2 subsystem termination, because an unrecoverable error was detected while performing its checkpoint functions.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D96001

Explanation

The recovery manager's restart FRR invoked Db2 subsystem termination, because an unrecoverable error was detected during the restart processor (DSNRRPRC) processing.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the

original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D96011

Explanation

The restart participation FRR invoked Db2 subsystem termination, because an unrecoverable error was detected while processing log records during restart.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, correct the problem, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D96021

Explanation

The Db2 subsystem was terminated during restart because a failure occurred while attempting to read the log forward MODE(DIRECT). It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a Db2 subsystem termination reason code.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. If possible, correct the cause of original error and restart Db2.

00D96022

Explanation

The restart FRR invoked abend, because, while reading the log forward during restart, the end-of-log was read before all recovery log scopes had been processed. It is followed by Db2 abnormal subsystem termination with the same reason code ('00D96022').

This is a Db2 subsystem termination reason code.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the abend before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

At the time of the abend, registers 2 and 3 (as shown in the dump or in SYS1.LOGREC) contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

Related concepts

00D96031

Explanation

The restart FRR invoked Db2 subsystem termination, because a failure occurred while attempting to read the log backward MODE(DIRECT). It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start Db2 again.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the accompanying abend reason code.

00D96032

Explanation

During restart, the end of the log was read before all the expected log ranges had been processed. The abend is accompanied by a Db2 abnormal subsystem termination with the same reason code ('00D96032').

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC. A 04E-D96032 SVC dump is requested. The Db2 subsystem is terminated with DSNV086E message.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Determine where the log went. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). before restarting.

Problem determination

At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

00D96041

Explanation

The recovery manager's restart function detected an internal error.

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the error. For more information see message DSNL429.

Operator response

Notify the system programmer.

System programmer response

See message DSNL429 for more information.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00D98001

Explanation

The recovery manager's common FRR (DSNRCRFR) invoked Db2 subsystem termination, because an unrecoverable error was detected during indoubt-UR (DSNRRIPR, DSNRRIRD, DSNRRIUN, DSNRIPMU) processing.

This is a Db2 subsystem termination reason code.
For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the original error.

00D98011

Explanation

The FRR for the resolve-indoubt-UR request servicer (DSNRIURS) invoked Db2 subsystem termination, because an unrecoverable error was detected processing a request.

This is a Db2 subsystem termination reason code.
For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

Print SYS1.LOGREC, and restart Db2.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the accompanying abend reason code.

00D98021

Explanation

The resolved indoubt FRR invoked Db2 subsystem termination because of a failure while attempting to read the log MODE(DIRECT) during forward recovery. It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a Db2 subsystem termination reason code.
For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start Db2 again.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the accompanying abend reason code.

00D98022

Explanation

Resolved indoubt invoked abend when end-of-log was reached before all ranges had been processed for forward recovery. This abend is accompanied by abnormal Db2 subsystem termination with the same reason code ('00D98022').

This is a Db2 subsystem termination reason code.
For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start Db2 again.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

00D98031

Explanation

The resolved indoubt FRR invoked Db2 subsystem termination, because a failure occurred during an attempt to read the log MODE(DIRECT) while reading the log backward. It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the begin-scope RBA of the portion that is read.

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start Db2 again.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

See the accompanying abend reason code.

00D98032

Explanation

Resolved indoubt FRR invoked abend when end-of-log was reached before all ranges had been processed for backward recovery. This abend is accompanied by abnormal Db2 subsystem termination with the same reason code ('00D98032').

This is a Db2 subsystem termination reason code. For further information, see [IRLM abend codes \(IRLM messages and codes\)](#).

System action

Standard Db2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before Db2 subsystem termination is initiated.

Operator response

1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start Db2 again.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

Problem determination

At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

00D98600

Explanation

An internal error occurred during processing of a deactivation or destruction request for a member of a data sharing group.

System action

Depending on the circumstances, some combination of the following actions occurs:

- An SVC dump is generated.
- Restart processing terminates.
- Additional messages is issued.

System programmer response

Attempt to identify and resolve the problem:

1. If other messages were issued in conjunction with the error, correct the conditions that they describe and try the request again.
2. If the problem persists, collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- The SVC dump, if one is generated
- The LOGREC and syslog from the time of the failure

00D98601

Explanation

A deactivation or destruction request for a member of a data sharing group specified an invalid member ID.

System action

The request is ignored. The invalid request record is deleted from the BSDS.

System programmer response

Correct the member ID, and resubmit the request.

Problem determination

Use the LOGREC and syslog from the time of the failure to aid in problem determination.

00D98602

Explanation

A deactivation or destruction request for a member of a data sharing group specified a member that was not quiesced.

System action

The request is ignored.

System programmer response

If the correct member was specified in the request, quiesce the member, and restart the deactivation or destruction process.

If an incorrect member was specified, use the change log inventory (DSNJ003) utility RSTMBR command to stop future attempts to process the member.

Related reference

[DSNJU003 \(change log inventory\) \(Db2 Utilities\)](#)

00D98603

Explanation

A deactivation or destruction request for a member of a data sharing group specified a member that was not properly shut down (as determined by its checkpoint queue).

System action

The request is ignored.

System programmer response

Quiesce the member before starting the deactivation or destruction process:

1. Restart the member.
2. Make sure that the member has no outstanding work.
3. Stop the member with MODE(QUIESCE).

Problem determination

Use the print log map utility (DSNJU004) to see the contents of the checkpoint queue.

Related concepts

[Starting a data sharing member \(Db2 Data Sharing Planning and Administration\)](#)

[Stopping a data sharing member \(Db2 Data Sharing Planning and Administration\)](#)

Related reference

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D98604**Explanation**

The BSDS for a data sharing member that was the target of a deactivation or destruction request encountered a read error when it attempted to access the checkpoint queue.

System action

The request is ignored. Depending on the circumstances, some combination of the following actions occurs:

- An SVC dump is generated.
- Additional messages is issued.

System programmer response

Use the print log map utility (DSNJU004) to see the contents of the checkpoint queue. If no checkpoint queue exists, verify that the member was successfully started at some time in the past. If the member has never been started, deactivate or destroy it.

Related reference

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D98605**Explanation**

The SCA did not contain a record for the target member of a deactivation or destruction request, and the record in this Db2 subsystem's BSDS is not current.

System action

The request is ignored. Additional messages might be issued.

System programmer response

Use the print log map utility (DSNJU004) to see information about each member's BSDS. Determine which member has current information for the target member, and start that member (the one with current information) before starting any target member that

has caused code 00D98605. Then resubmit the request.

Related concepts

[Starting a data sharing member \(Db2 Data Sharing Planning and Administration\)](#)

Related reference

[DSNJU004 \(print log map\) \(Db2 Utilities\)](#)

00D99001**Explanation**

An attempt to read the CHKPTRBA failed to return a valid checkpoint record. This abend is issued after the DSNR015I error message is issued.

System action

Restart is abended.

Operator response

Inform the system programmer.

System programmer response

Let the change log inventory (DSNJU003) utility select the checkpoint RBA when building the conditional restart record. If a specific checkpoint is desired, use DSN1LOGP to print out the checkpoint log records within a specified range. If manual selection of the checkpoint RBA is desired, use the print log map (DSNJU004) utility to print the checkpoint queue. Print the checkpoint queue by using the CHKPTRBA keyword.

Problem determination

- Print the checkpoint records within the desired range using DSN1LOGP.
- Print the checkpoint queue using DSNJU004.
- Verify the checkpoint queue against the DSN1LOGP report.
- If automatic checkpoint selection was used and the checkpoint was invalid, find the valid checkpoint RBA in the DSN1LOGP report. Use this checkpoint RBA in the CRCR using the CHKPTRBA keyword.
- If an explicit checkpoint was specified and the checkpoint was invalid, let DSNJU003 automatically choose the checkpoint by not specifying a CHKPTRBA keyword.

00D99002

Explanation

Validation of the STARTRBA failed because either the end of the log was reached, or a bad log record was encountered while attempting to find the first complete log record.

System action

Restart abends.

Operator response

Inform the system programmer.

System programmer response

Check the console log for DSNJ (Log Manager) messages; these may indicate failures in the Log Manager processing, or may reveal additional useful information for diagnostic purposes. Use DSN1LOGP to find a safe STARTRBA to use for restart. If a STARTRBA is specified, the Recovery Manager will use it as a starting point. From the starting point, the Recovery Manager will attempt to find the beginning of a valid log record.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00D99003

Explanation

CSRONLY was specified in the conditional restart record. Only the Db2 status phase of restart will complete.

System action

Restart abends.

System programmer response

Use the change log inventory (DSNJU003) utility to cancel the current conditional restart record or create a new conditional restart record.

00D99004

Explanation

A log read failed because an internal error was detected by the data manager while examining the log record during Db2 restart.

System action

The execution unit writes a record to SYS1.LOGREC and requests a SVC dump. Restart abends.

Operator response

Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System programmer response

Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

RM standard diagnostic information is provided in "Recovery Manager Reason Codes (X'D9')". In addition, the following diagnostic information is provided in registers:

Register 0

The data manager ERQUAL that identifies the place within the data manager filter routine where the error was detected

Register 2,3

The RBA of the log record that was being read at the time of the error

Register 8

The address of the selection block for the database services address space (*ssnmDBM1*)

Register 9

The address of the selection block for DSCF

00D99900

Explanation

The request to commit the unit of recovery failed because the agent is a participant in a global transaction and the global transaction is going to be backed out.

System action

The unit of recovery is not committed.

User response

The application must roll back to the previous COMMIT.

00D9AAAA

Explanation

This reason code identifies additional data stored in the SDWA variable recording area following a failure during abort-UR.

This reason code appears only in the SDWA variable recording area (VRA) and serves only to identify data (in addition to the standard Db2 diagnostic information that is stored in the SDWA). This reason code is the first data item of the standard information. As such, it always appears in the VRA of an SDWA for a primary error completion/reason code. If no data is added, the reason code in the SDWA VRA is the same as that associated with the completion code.

System action

Five bytes of data preceded by code VRAHEX are stored following the EBCDIC string 'RMC-COMMIT/ABORT'.

Length Data

Use this information in conjunction with the information about the error completion code. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00D9F001

Explanation

An internal error was detected during recovery manager processing.

System action

The request is terminated and an SVC memory dump is scheduled.

System programmer response

Collect the following documentation and contact IBM Support:

- SVC memory dump
- Syslog

Additional documentation might be required, depending on the exact nature of the error.

Chapter 16. X'E2.....' codes

Reason code identifiers that begin with 00E2 communicate normal and error situations with the storage manager.

00E20001

Explanation

The get variable storage function detected that input parameters passed by the invoker were invalid.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 4 contains the address of the pool header block (PHB), which contains information for the current status of the pool.
- Register 7 contains the value of the caller's saved register 14.
- Register 3 contains the input request length.
- Register 5 contains the input request owner ID.

Offset X'1EF' in the SDWA contains a VRACAN key of X'3D', followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20002

Explanation

The free variable storage function detected that input parameters (either the pool address or the pool type) passed by the invoker were invalid.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 4 contains the address of the pool header block (PHB), which contains information for the current status of the pool.
- Register 7 contains the value of the caller's saved register 14.

Offset X'1EF' in the SDWA contains a VRACAN key of X'3D', followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20003**Explanation**

In order to satisfy an unconditional request for storage, the get variable storage function needed to obtain storage from GETMAIN to expand a storage pool. However, GETMAIN indicated that sufficient storage in the private area was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14.

At offset X'221' in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the storage manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20004**Explanation**

In order to satisfy an unconditional request for storage, the get variable storage function needed to obtain additional storage (from GETMAIN) to expand a storage pool. However, the pool attributes defined at

the time the pool was created indicated that the pool was already at maximum size.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20005**Explanation**

The free variable storage function detected that the address of a block being freed was invalid. That is, it did not lie within an existing storage pool.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. Register 11 contains the address of the invalid block to be freed.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20006

Explanation

The free variable storage function detected that the block being freed was not allocated. That is, it was already free.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. Register 11 contains the address of the free block.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20007

Explanation

The allocate variable storage pool function detected that the input parameters passed by the invoker were invalid.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 2 contains the input parameter list address.
- Register 3 contains the input maximum pool size.
- Register 4 contains the input expansion segment size.

- Register 5 contains the input initial segment size.

The trace information contains the address of the invalid parameter list.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20008

Explanation

The free variable storage pool function detected that the input parameter (PHB, pool header block) did not represent an existing pool.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The trace information contains the address of the invalid PHB (pool header block).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20009

Explanation

The get fixed blocks function detected that input parameters passed by the invoker were invalid.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 4 contains the address of the pool header block (PHB).
- Register 7 contains the value of the caller's saved register 14.
- Register 5 contains the number of blocks requested.

The invalid input parameters are also contained in the trace information.

Offset X'1EF' in the SDWA contains a VRACAN key of X'3D', followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000A

Explanation

The get tracked storage function requested storage from the DSNSGETM function for a tracking element in order to track the storage to be returned to the invoker. However, storage for the tracking element was unavailable. The invoker's request was unconditional.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000B

Explanation

In order to satisfy an unconditional request, the get fixed block(s) function needed to obtain additional storage to expand a storage pool. However, GETMAIN indicated that insufficient storage existed in the private area.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. The trace information contains the number of blocks requested.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000C

Explanation

In order to satisfy an unconditional request, the get fixed block(s) function needed to obtain additional storage to expand a storage pool. However, the pool attributes defined at the time the pool was created indicated that the pool was already at maximum size.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. The trace information contains the number of blocks requested.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000D

Explanation

Db2 detected that either the address of a block being freed (the only block or a block on a chain of blocks) was invalid or the block did not lie within an existing storage pool.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

The most likely cause of the problem is a storage overlay or an invalid storage request from a Db2 component. A product other than Db2 could cause the storage overlay problem.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 7 contains

the value of the caller's saved register 14. Register 11 contains the address of the invalid block to be freed.

At offset X'1EF' in the SDWA, there is a VRACAN key of X'3D', followed by the module name of the storage manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000E

Explanation

Db2 detected that a segment of storage within the pool on which the request was directed was invalid or contained an invalid 'free chain' of free blocks in the segment.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

The most likely cause of the problem is a storage overlay or an invalid storage request from a Db2 component. A product other than Db2 could cause the storage overlay problem.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. Register 11 contains the address of the block to be freed if freeing a fixed block.

At offset X'1EF' in the SDWA, there is a VRACAN key of X'3D', followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2000F

Explanation

The free fixed block(s) function detected that the only block, or the one block on the chain of blocks, being freed did not represent an allocated block; that is, it was already free.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14. Register 11 contains the address of the free block.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20010

Explanation

The allocate fixed-block pool function detected an invalid input parameter passed by its invoker.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 2 contains the input parameter list address.
- Register 3 contains the input request block size.
- Register 4 contains the input maximum pool size.
- Register 5 contains the input expansion segment size.

The trace information also contains the address of the invalid parameter list.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20011**Explanation**

The free fixed-block pool function detected that the input parameter either was not a valid pool header block (PHB), or it did not represent an existing pool.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The trace information has the address of the pool header block (PHB).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20012**Explanation**

The get tracked storage from the GETMAIN function detected an invalid input parameter passed by its invoker.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 2 contains the input parameter list address.
- Register 3 contains the input request length.
- Register 4 contains the input storage class.

The trace information has the address of the invalid parameter list.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20013**Explanation**

The get tracked storage from GETMAIN function was unable to obtain sufficient storage in private area to satisfy an unconditional request.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be

printed. The trace information has the address of the parameter list.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20014

Explanation

The free tracked storage function detected that the area requested to be freed was not valid. Either the address did not represent storage currently allocated (via the DSNSGETM function), or the storage class passed as input to DSNSFREM did not match the class assigned to the storage by DSNSGETM.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The trace information has the address of the storage and the storage class.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20015

Explanation

The allocate stack function, which is always unconditional, requested storage from GETMAIN to obtain a stack segment. GETMAIN indicated that 8K bytes of private area storage in subpool 229 was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase maximum private storage.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. There is probably a shortage of private area storage in the address space in which the failure occurred. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20016

Explanation

The get stack storage function, in order to satisfy an unconditional request for stack storage, requested storage from GETMAIN. However, GETMAIN indicated that sufficient storage in subpool 229 was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20017

Explanation

The free stack storage function detected that the address of the area to be freed did not lie within allocated storage in the stack indicated by the requester.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20018

Explanation

The get stack storage function detected that the amount of storage requested by the invoker was invalid. For a 31-bit request the amount was less than or equal to zero. For a 64-bit request the amount was either less than or equal to zero or it exceeded the maximum allowable request size.

System action

The thread is abended.

System action:

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20019

Explanation

The purge pool function detected that input parameters passed by the invoker were invalid.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The following general registers contain the indicated diagnostic information:

- Register 4 contains the input pool address.
- Register 5 contains the input pool owner ID.

The trace information also contains the input parameters.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001A

Explanation

ESTAE recovery can not be established, because either an unexpected error occurred, or SCB is not available.

System action

The agent is abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 15 contains the return code from DSN3EST0; this is the MVS ESTAE return code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001B

Explanation

The SETLOCK OBTAIN function issued a nonzero return code.

System action

The invoker of storage manager functions is abnormally terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001C

Explanation

The purge stack function detected that one of the SKBs (stack block) is not valid and the SKB chain is possibly damaged.

System action

The SKB chain is repaired and processing continues.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The trace information contains the address of the EB for which the stack segments are to be purged.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001D

Explanation

Either GPVT (global pool anchor) or LPVT (local pool anchor) is damaged, and no storage managed by storage manager can be accessed.

System action

The Db2 subsystem is abended. In some cases, the FRR is established by the caller of the storage manager (SM) subcomponent. When this is the case, the SVC dump is requested by the caller. When this is not the case, the SM requests the SVC dump.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump is requested, but in some cases the dump request is made by the caller of storage manager, rather than by storage manager itself. Register 6 contains the address of the EB.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001E

Explanation

The get stack storage function detected that two asynchronous (unrelated) agents use the same stack storage.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the address of the stack segment (SKB). Register 6 contains the address of the EB. In the event of an ABEND, DSNTRFCV saves information in the VRA of the SDWA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2001F

Explanation

In order to satisfy an unconditional request for storage, the get variable storage function needed to obtain storage (from GETMAIN) to expand a storage pool. However, GETMAIN indicated that sufficient storage in common service area (CSA) to expand the pool was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase common service area (CSA) size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The common service area (CSA) portion of the dump should be printed. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller's saved register 14.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20020

Explanation

The get variable pool function needed to obtain storage (from GETMAIN) to create pool header block (PHB) to represent the pool, but GETMAIN indicated that sufficient storage in private area was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20021

Explanation

The get variable pool function needed to obtain storage (from GETMAIN) to create pool header block (PHB) to represent the pool, but GETMAIN indicated that sufficient storage in common service area (CSA) was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase common service area (CSA) size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The common service area (CSA) portion of the dump should be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20022

Explanation

In order to satisfy an unconditional request, the get fixed block(s) function needed to obtain additional storage to expand a storage pool. However, GETMAIN indicated that sufficient storage in common service area (CSA) was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase common service area (CSA) size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the saved caller's register 14. The common service area (CSA) portion of the dump should be printed.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20023

Explanation

The get fixed pool function needed to obtain storage (from GETMAIN) to create pool header block (PHB) to represent the pool, but GETMAIN indicated that sufficient storage in private area was not available.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20024

Explanation

To create a pool header block (PHB) that represents the pool, the get fixed pool function requested storage from GETMAIN. However, GETMAIN indicated that insufficient storage existed in the common service area (CSA) to satisfy the request.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase common service area (CSA) size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The common service area (CSA) portion of the dump should be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20025

Explanation

The get tracked storage from GETMAIN function was unable to obtain sufficient storage in common service area (CSA) to satisfy an unconditional request.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

Increase common service area (CSA) size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. The trace information has the address of the parameter list. The common service area (CSA) portion of the dump should be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20026

Explanation

Either the allocate stack storage function or the get stack storage function was unable to obtain 4KB of private area storage in subpool 229 for an all-segment table in which a record (representing a stack storage segment) was to be inserted.

System action

The invoker of the function is abended.

Operator response

Notify the system programmer.

System programmer response

Increase region size.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. There is probably a shortage of private area storage in the address space in which the failure occurred. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20027

Explanation

The free variable storage function detected that unallocated storage in the block being freed has been modified.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

4

address of the pool header block (PHB)

7

value of the caller's saved register 14

11

address of the block to be freed

The block to be freed includes two parts: a four word header of control information and the block itself. The second word in the header (offset of 4) is the length of the block.

The third word in the header (offset of 8) is the address of the storage requester. The block is made up of two parts: allocated storage and two words of unallocated storage (padding area of '03').

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

00E20028

Explanation

Either the get stack, deallocate stack or release stack storage function detected that an SKB was invalid or was not represented accurately in the all-segment table.

System action

The invoker is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 7 contains the value of the stack segment (SKB).

00E20029

Explanation

The free variable storage function detected that although the address of the block being freed was within the specified storage pool it was not the address of the beginning of a variable block.

System action

The agent is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

4

value of the pool header block (PHB)

7

address of the caller's saved register 14

11

address of the invalid block to be freed

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2002A

Explanation

The SMC Recovery Stack Management function detected that the number of allowed entries in the SMC Recovery Stack has been exceeded, or the structure has been incorrectly modified.

System action

The invoker is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 6 contains the address of the current execution block (EB). This EB has a pointer to the current head stack block (SKB) that is encountering the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2002B

Explanation

This abend code is used to force percolation in the case when an abend is encountered while in Storage Manager code and the Storage Manager has been called recursively.

Problem determination

Refer to the originating abend code.

00E2002E

Explanation

Db2 detected an internal error during the freeing of data space storage.

System action

The requested function is not performed. A Db2 dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E2002F

Explanation

Db2 detected an internal error during the freeing of data space storage.

System action

The requested function is not performed. A Db2 dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20030

Explanation

Db2 detected that the free chain in a 64-bit object might be damaged or might be unexpectedly fully allocated.

System action

The requested function is not performed. A Db2 dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20031**Explanation**

Db2 is unable to create a 64-bit object.

System action

The requested function is not performed. A Db2 dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E20032**Explanation**

Db2 detected an internal error while processing storage. This abend reason code is issued by the CSECT indicated in the dump title.

System action

The requested function is not performed. A Db2 dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

00E20033**Explanation**

The amount of combined real and auxiliary storage used by the Db2 address space has reached or exceeded the maximum amount allowed by the value specified for the REALSTORAGE_MAX subsystem parameter.

System action

The Db2 subsystem abnormally terminated with reason code 00E20033. A dump and LOGREC entry might have been issued and Db2 terminated with DSNV086E.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

The value that you specified can be found the REALSTORAGE_MAX subsystem parameter, and the amount of the combined real and auxiliary storage used is recorded in the dump.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

and IFCID225 records.

00E20040

Explanation

Either the free or discard 64-bit stack queue has been corrupted.

This code typically reflects an internal Db2 error.

System action

Db2 terminates with this reason code.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E20041

Explanation

An invalid 64-bit stack segment has been freed.

This code typically reflects an internal Db2 error.

System action

The agent detecting the problem abends, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E20042

Explanation

Additional 64-bit stack storage is needed but could not be obtained.

This code typically reflects an internal Db2 error.

System action

Db2 terminates with this reason code.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E20043

Explanation

An invalid head 64-bit stack segment was used for a get or free stack request.

This code typically reflects an internal Db2 error.

System action

The invoker abends.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Chapter 17. X'E3.....' codes

Reason code identifiers that begin with 00E3 communicate normal and error situations with the service controller.

00E30001

Explanation

A service controller internal inconsistency has been encountered. This is probably a Db2 subsystem error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abnormally terminated.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30003

Explanation

An error was returned from a data manager restore operation. This abend is issued to ensure that changes made to the catalog by a failing BIND function are backed out.

System action

The BIND function is abended. All effects of the BIND operation are rolled back. A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller code, using the data manager restore function, has detected an error while trying to undo the results of a BIND operation. The data manager return and reason code encountered can be found in the CTDMRETC and CTSIRCOD fields of the cursor table pointed to by register 7 in the SDWA.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30004

Explanation

This abend is issued by the service controller initialization module whenever an error return code is received from a database services subcomponent participating in the Db2 startup process. This abend ensures that Db2 is terminated.

System action

The database services shutdown process is initiated after an SVC dump is requested, and a record is written to the SYS1.LOGREC data set. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A list of all database services subcomponents whose initialization process has been completed may be obtained from the SVC dump requested by this abend. Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Module qualifier that identifies the area within DSNTSTRT at which the error was detected. The qualifier should be:

A (10)

Error found upon return from the SCC startup initialization process

B (11)

Error found upon return from the SCC IRLM identify process

C (12)

Error found upon return from the buffer manager initialization process

D (13)

Error found upon return from the data manager initialization process

E (14)

Error found upon return from the data space manager initialization process

F (15)

Error found upon return from the RDS initialization process or LOB Manager initialization process.

2 (2)

Error return code from the invoked subcomponent

4 (4)

Error reason code from the invoked subcomponent

8 (8)

Pointer to a structure containing a character string SSCM followed by a 32-bit map representing the following information:

Bit 0

1 if Db2 has successfully 'signed on' to IRLM

10 (16)

Error found upon return from the SCC startup initialization process

Bit 1

1 if the buffer manager subcomponent initialization process is completed

Bit 2

1 if the data manager subcomponent initialization process is completed

Bit 3

1 if the data space manager subcomponent initialization process is completed

Bit 4

Not used

Bit 5

1 if the RDS subcomponent initialization process is completed

Bit 6

Not applicable

Bit 7

1 if the SCC initialization process is completed

Bit 8

1 if the LOB Manager initialization is completed

Bits 9 to 31

Not used

C (12)

Pointer to invoked subcomponent's RMFT.

From this information the appropriate subcomponent's startup process may be identified.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related tasks

[Preserving LOGREC data \(Collecting data\)](#)

00E30005

Explanation

A service task could not be created during the database services initialization process. This is probably a Db2 error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is possibly a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Should equal X'3'

2 (2)

Return code from the service task creation function of the agent services manager (ASM) subcomponent

4 (4)

Abend reason code from the service task creation function of the agent services manager (ASM) subcomponent

8 (8)

Not used

C (12)

Not used

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30006

Explanation

A service task could not be created during the database services delete process. This is probably a Db2 error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is possibly a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Should equal X'3'

2 (2)

Return code from the service task creation function of the agent services manager (ASM) subcomponent

4 (4)

Abend reason code from the service task creation function of the agent services manager (ASM) subcomponent

8 (8)

Not used

C (12)

Not used

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30008

Explanation

DSNTSTR2 loaded an incorrect version of the system parameter CSECT DSN6SPRM while Db2 was executing. Message DSNT103I is generated before the abend occurs.

System action

Db2 is terminated.

Operator response

Notify the system programmer.

System programmer response

Restart Db2 with a -START DB2 PARM= command, where the parameter block that follows the 'PARM=' parameter specifies an MVS/XA version of the Db2 subsystem parameters.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

00E3000A

Explanation

A bad recovery element was detected by the database services standard ESTAE and FRR recovery routines. This is probably a Db2 subsystem error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This error is detected when a module invokes the macro DSNTSFRR to disconnect a functional recovery element (FRE) from a functional recovery chain to which it is not connected. The name of the module passing the invalid FRE is the module issuing the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3000B

Explanation

The database services section (DSN6SPRM) in the Db2 initialization parameter module (DSNZPARM) does not exist.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Should equal X'1'

2 (2)

Return code from the get descriptor function of the system parameter manager (SPM) subcomponent of Db2

4 (4)

Not applicable

8 (8)

Not applicable

C (12)

Not applicable

First, ensure that DSNZPARM was installed correctly. Then, using the return code from SPM, determine why the descriptor is not available.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

00E3000C**Explanation**

A database services TCB service task that cannot be reinstated has been abnormally terminated. Entries in SYS1.LOGREC that precede this entry indicate the source of the error.

System action

The executing unit is abended. A record is written to SYS1.LOGREC.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3000D**Explanation**

A failure occurred and was detected while an ESTAE functional recovery was being established.

System action

The executing unit is abended. A record is written to SYS1.LOGREC.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3000E**Explanation**

The execution unit supporting the database services checkpoint process has abended. The CSECT involved in the abend writes a record to SYS1.LOGREC and requests an SVC dump.

System action

Db2 is abended. A record is written to SYS1.LOGREC.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3000F

Explanation

The database services functional recovery load module, DSNTF, has an unrecognizable entry point.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Should equal X'4'

2 (2)

Not applicable

4 (4)

Not applicable

8 (8)

Not applicable

C (12)

Not applicable

Theabend is generated whenever the Db2 load module DSNTFEPL is not link-edited with a load module entry point name of DSNTF. To correct this, link-edit DSNTFEPL again with the correct entry point name.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30010

Explanation

The database services initialization process could not read the Db2 bootstrap data set (BSDS).

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably an installation error. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This error can usually be traced to a VSAM error occurring while reading the BSDS. Before examining the dump, examine the operator console log and SYSLOG to determine if VSAM has encountered any errors on the BSDS.

Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)

Should equal X'2'

2 (2)

Return code from a BSDS read request function of the recovery log manager (RLM) subcomponent

4 (4)

Abend reason code from a BSDS read request function of the recovery log manager (RLM) subcomponent

8 (8)

Not applicable

C (12)

Not applicable

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.

00E30013

Explanation

The value specified in the DSN6SYSP CSECT to define reserve storage is either negative or zero.

System action

Db2 is terminated.

Operator response

Notify the system programmer.

System programmer response

Reassemble DSN6SPRM and relink-edit the DSNZPARM load module. This is done by resubmitting the installation job stream, DSNTIJUZ, that built the load module named in the -START DB2 command 'PARM=' parameter.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

00E30014

Explanation

The value specified in the DSN6SYSP CSECT to define reserve storage for a 'must complete' process is either negative or 0.

System action

Db2 is terminated.

Operator response

Notify the system programmer.

System programmer response

Reassemble DSN6SPRM and relink-edit the DSNZPARM load module. This is done by resubmitting the installation job stream, DSNTIJUZ, that built the load module named in the -START DB2 command 'PARM='

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

00E30017

Explanation

While loading the Db2 database services function recovery and emergency shutdown modules, the Service Controller function abends with this reason code. This is because it detected a load module which was loaded with an invalid addressing capability. The abend is preceded by message DSNT107E.

System action

Db2 database services startup is terminated.

System programmer response

Refer to message DSNT107E.

Problem determination

Refer to message DSNT107E.

00E3001B

Explanation

A plan could not be executed because the system from which you are attempting to run is disabled or unknown. The system type might be unknown if the attach library that you are using is from a previous release of Db2 that does not support the ENABLE and DISABLE options of the bind operation.

System action

The plan is not allocated.

System programmer response

Refer to the SYSIBM.SYSPLSYSTEM table to determine the systems from which the plan can be executed, or correct the attach library.

00E3001D

Explanation

A DSNHDECP name, authorization exit name, signon exit name or access control exit name other than the default name is not supported in an environment executing early code from a prior release. If Db2 detects early code from a prior release and a DSNHDECP or exit that is not the default name Db2 start-up will be terminated with this reason code.

System action

Db2 start-up is abended with reason code 00E3001D.

System programmer response

Reassemble and link-edit a DSNHDECP or exit with the default name.

00E3001E

Explanation

A statement in the package could not be processed successfully because it would require access to a remote location and the package was last bound with DBPROTOCOL(PRIVATE).

System action

The execution of the package section fails.

User response

Rebind the plan or package with the DBPROTOCOL(DRDA) bind option.

Run the Private Protocol to DRDA Protocol Catalog Analysis tool, DSNTP2DP to obtain a set of conversion commands to convert packages in the system to use DRDA protocol.

Related tasks

[Preparing your system for DRDA access \(Db2 Installation and Migration\)](#)

00E30021

Explanation

A processing error has occurred during authorization checking.

System action

The request to allocate a plan to the authorization ID is denied.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30034

Explanation

The authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist.

System action

The request to allocate a plan to the authorization ID is denied.

User response

Verify that the correct plan name was specified. If the plan exists, then authority to execute the plan must be granted.

00E30035

Explanation

A processing error has occurred during authorization checking.

System action

The request to allocate a plan to the authorization ID is denied.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30036

Explanation

A processing error has occurred during authorization checking.

System action

The IRLM query request is denied.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30037

Explanation

An internal logic error occurred while invoking a distributed transaction manager function.

System action

Db2 writes a SYS1.LOGREC record and requests a SVC dump.

Operator response

Collect the SYS1.LOGREC listing and the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30040

Explanation

An internal logic error occurred while the catalog access function was being invoked.

System action

The START RLIMIT command fails. The governing status prior to issuing this command continues unchanged.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, the registers contain the following information:

Register

Contents

0	Address of the catalog access package parameter list
2	Catalog access return code
3	Catalog access reason code
4	Data manager return code
5	Data manager reason code
7	CT address

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30041

Explanation

An internal error occurred when trying to obtain a limit from the resource limit specification table.

System action

A record is written to SYST1.LOGREC, and an SVC dump is requested. The requested execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30063

Explanation

The BIND PACKAGE or CREATE PROCEDURE request attempted to insert more than the maximum supported number of records for a single package into the SYSIBM.SYSPACKSTMT catalog table. The number of SYSPACKSTMT records for a single package cannot exceed 2,147,483,647.

System action

The BIND PACKAGE subcommand or the CREATE PROCEDURE SQL statement fails.

User response

Break the application into smaller applications so that each package requires fewer records.

Severity

8 (error)

Related reference

[Limits in Db2 for z/OS \(Db2 SQL\)](#)

[SYSPACKSTMT catalog table \(Db2 SQL\)](#)

00E30064

Explanation:

Db2 detected that a resource was unavailable during the automatic rebind process or when stopping databases, table spaces, or index spaces.

System action

The automatic rebind or the process of stopping the specified databases, table spaces, or index spaces fails.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If the unavailable resource is detected during an automatic rebind, issue an explicit REBIND subcommand, which either resolves the problem or provides more details about the problem in the output.

Severity

8 (error)

00E30065

Explanation

The service controller's BIND processor detected an error in the user's database request module (DBRM) while building the SYSDBRM record.

System action

The BIND command fails.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

An invalid field in the DBRM was found while processing the BIND command. The DBRM might be bad. Rebuild the DBRM and reissue the BIND command.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30066

Explanation

The service controller's BIND processor has detected an invalid release dependency mark in the cursor table.

System action

The BIND command fails.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

The service controller module DSNTBBP detected an unknown value in the CTRELDEP field of the BIND CT. The BIND CT is pointed to by GPR7 at the time of the abend and is mapped by DSNDCT. The one byte CTRELDEP field should have been set by the RDS BIND processor (DSNXEPR) or one of the functions it invokes.

00E30067

Explanation

The BIND process program abended while attempting to use a BIND parameter. This usually indicates that the parameter list provided to the service controller BIND function is invalid (such as invalid addresses or incorrect key).

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The BIND subcommand is terminated.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump.
If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Register 2 contains an indication of the type of parameter as follows:

- 00000101**
Input parameter list.
- 00000102**
Communication information block (CIB).
- 00000103**
Invalid BIND subcommand name. Registers 3 and 4 contain the invalid subcommand name.

- 00000104**
Subcommand information block (SIB).
 - 00000201**
DBRM member name list.
 - 00000202**
Plan-ID list.
 - 00000203**
Message block in user storage. Other register contents are as follows:

R	R
3	4
< 4	Simple reference • R8 = zero
> > 0 4	MVCL • R8 = From address • R4 = move length To and from lengths are equal.
0 > 4	GETMAIN for user storage failed • R4 = storage length required • R8 = GETM To fix this problem, increase your region size.
< > 0 4	FREEMAIN of user storage failed • R4 = length of storage of free • R8 = address of storage to free
 - 00000204**
Message block in user storage. R8 = Message block address.

Except as indicated above, the information in the other registers is as follows:
 - R3**
Parameter address
 - R4**
Parameter length
 - R5**
Parameter storage key
 - R8**
Input parameter list address
 - 00000205**
Package-list name list.
 - 00000206**
ENABLE/DISABLE system list.
- Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.

00E30068

Explanation

A function invoked by a BIND subcommand has returned an unexpected error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The BIND subcommand is terminated.

System programmer response

This is an internal Db2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

The service controller code has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30069

Explanation

An attempt to allocate a cursor table (CT) failed.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is an internal Db2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller code has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30070

Explanation

An attempt was made to use the Internal Resource Lock Manager (IRLM) facilities, but the IRLM was not available. Either the IRLM had not been started by the operator, or the IRLM has encountered a problem causing it to terminate abnormally.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

Operator response

The IRLM should be started before the Db2 subsystem is started. If this does not resolve the problem (that is, if the IRLM actually was started before Db2 was started) notify the system programmer.

System programmer response

This is probably not a Db2 problem. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

If IRLM abended, and if you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Otherwise, ensure that the IRLM is started before the -START DB2 command is issued.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.
- IRLM trace output.

00E30071

Explanation

Either Db2 terminated without successfully signing off from IRLM, or another subsystem with the same SSNAME is still connected. This abend reason code accompanies message DSNT380I.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Determine if another Db2 subsystem is active. If another subsystem is not active, and IMS is not sharing the same IRLM, cancel IRLM prior to starting Db2. Regardless, notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If the error was caused by a previously unsuccessful QUIT from the IRLM, manually stop IRLM. If IMS is using the same IRLM, refer to the IMS documentation to determine the effect of IRLM terminating while IMS is connected.

If you are running multiple versions of Db2, ensure that the SSNAME specified by the DSN6SPRM macro during the installation of the member DSNZPARM is not the same as the SSNAME in another version of Db2.

Problem determination

A previously unsuccessful sign-off from the IRLM is documented by an abend of X'00E30075' during the previous termination of Db2.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.
- IRLM trace output.

00E30072

Explanation

An error was encountered during an IRLM lock query request.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is terminated.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, the registers contains the following information:

R2

Address of the lock request RLPL

R4

Address of the IRLM query request RLPL

R5

Address of the IRLM query RLQD

R7

CT address

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IRLM trace output.

Related concepts

[IRLM return and reason codes \(IRLM messages and codes\)](#)

00E30073

Explanation

An unrecoverable system error occurred while processing a LOCK or UNLOCK request.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The requested execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an

error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller (SC) subcomponent has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IRLM trace output.

00E30074

Explanation

A global out-of-storage condition was encountered by the Internal Resource Lock Manager (IRLM) during the processing of a LOCK or UNLOCK request.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably not a Db2 problem. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The name of the module issuing the abend is recorded in the SYS1.LOGREC entry. It is also recorded in the SVC dump as the CSECT involved in the abend. A parameter in the IRLM procedure specifies the amount of the common service area (CSA) to be used by IRLM. Take one of the following actions:

- Increase the CSA limit.
- Use a local IRLM (that is, an IRLM option that causes IRLM to operate from another address space).
- Using IRLM lock tracing, determine what application is acquiring so many locks that it causes the IRLM CSA limit to be exceeded.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30075

Explanation

During the normal sign-off from IRLM or during the abnormal shutdown of Db2, an AUTO-STOP of IRLM using SVC 34 abnormally terminated. Message DSNT383I is issued.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The name of the CSECT issuing the abend is found in both the SYS1.LOGREC and the SVC dump. Register 2 contains the SVC return code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the IRLM procedure.

00E30076

Explanation

An attempt to sign-off from IRLM failed.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This is probably an internal Db2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller subcomponent has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend. This CSECT is found in both the SYS1.LOGREC and the SVC dump.

The request parameter list (RLPL) used during the sign-off process resides in the IRLM interface manager's communication block (DSNTLMC) from ACOM.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30077

Explanation

A database command processor encountered an error when attempting to create a cursor block (CUB) on a Db2 catalog table.

System action

An error was detected during the generation of messages to satisfy a DATABASE command. A DSNT305I message appears on the console of the requester, with the RC parameter of 12 and a REASON parameter of X'00E30089'.

Operator response

Notify the system programmer.

System programmer response

This is probably an internal Db2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Diagnostic information may be found in the Display Command Communication Area, whose address is found in register 8, and by the Display Command subcode in register 2.

00E30078

Explanation

IRLM called the service controller IRLM interface status exit with register 0 equal to 1 in order to notify Db2 that IRLM is terminating. This is not a Db2 subsystem error.

System action

Db2 is abended when IRLM is terminated before Db2 is terminated. An entry is written to SYS1.LOGREC.

00E30079

Explanation

An error was encountered on return from the Internal Resource Lock Manager (IRLM) IDENTIFY function.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

This may be an internal Db2 error or an operator procedure problem. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

In the SVC dump, register 2 contains the return code and register 3 contains the reason code from the identify function to the IRLM. Examine the reason code in register 3, either from the dump or system console log. A reason code of X'4004' indicates that the identify function code (51, X'33') does not exist in the IRLM SSVT. This may be due to the operator issuing a stop IRLM command followed by a start Db2 command before the IRLM has completed termination processing. The sequence of commands can be determined from the system console log.

A reason code of X'4008' indicates that the IRLM is unavailable, that is, IRLM is not started and the autostart is not requested by parameters in DSNZPARM.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3007A

Explanation

Db2 encountered an IRLM request error indicating that IRLM is not available to take requests.

System action

Db2 terminates because it cannot complete an IRLM request.

Operator response

Notify the system programmer.

System programmer response

Look for the IRLM error code or messages to find out why IRLM is not available to take the Db2 request. Most likely, IRLM is terminating at the same time.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Refer to the IRLM problem determination process.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E3007B

Explanation

An IRLM operation returned a non-zero return code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The application abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

Check whether system activities at the time of the abend caused unexpected results from the IRLM operation. Check the system for any IRLM-related problems that can cause the operation to fail. If necessary, obtain a copy of SYS1.LOGREC, the SVC dump, and lock traces at the time of the abend. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the system for any unusual IRLM activities or messages at the time of the abend.

00E30080

Explanation

An attempt was made to start the Internal Resource Lock Manager (IRLM) using the MGCR (SVC 34), and a nonzero return code was returned.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

Examine the SVC return code to determine whether this is a system problem or a Db2 internal problem. Obtain a copy of SYS1.LOGREC and the SVC dump.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2 contains the SVC return code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the IRLM procedure.

00E30081

Explanation

An attempt was made to start the Internal Resource Lock Manager (IRLM). IRLM did not come up in the time limit specified to Db2.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. Db2 is abended.

Operator response

Notify the system programmer.

System programmer response

If you need to increase the IRLM startup time setting, contact IBM Support for guidance.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.
- Listing of the IRLM procedure.

00E30082

Explanation

IRLM discovered a bad request parameter list (RLPL). This may occur if the RLPL storage is overlaid while an agent is suspended.

System action

The execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An IRLM request was made that IRLM could not honor immediately. IRLM called DSNTLSUS to suspend the request. While waiting, the request parameter list (RLPL) was changed and is no longer valid. Someone may be reusing the RLPL, or the storage may have been overlaid.

Register 2 contains a pointer to the RLPL.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30083

Explanation

This agent has been selected as the victim of a deadlock or timeout.

This reason code is not used in abends.

00E30084

Explanation

Message DSNT305I appears on the console of the requester with RC=8 and REASON=E'00E30084'. This message tells the requester that an error was detected while building the database command display. Other entries in the SYS1.LOGREC help to identify the source of the error.

System action

This is a Db2 subsystem error. No SVC dump is requested because a previous dump of the failing subcomponent is expected.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E30085

Explanation

An error was indicated by the RDS Authorization function. This is an internal Db2 error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The command is abended after displaying a DSNT305I message with an RC parameter of 12 and a REASON parameter of X'00E30089'.

Operator response

Notify the system programmer.

System programmer response

This is an internal Db2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The error return code address of the Display Command Communication Area is found in register 8.

00E30086

Explanation

An error was indicated by the data manager (DM) subcomponent. This is probably an internal Db2 error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The command is abended after displaying a DSNT305I message with an RC parameter of 12 and a REASON parameter of X'00E30089'.

Operator response

Notify the system programmer.

System programmer response

This is probably an internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The error return code of the data manager may be found in the cursor table (CT), the address of which is found in register 7.

00E30089

Explanation

This code is used in the REASON parameter of the DSNT305I database command message to inform the requester that the execution unit supporting the database command processor has terminated. Other

entries in the SYS1.LOGREC identify the source of the error.

System action

A DSNT305I message appears on the console of the requester, with an RC parameter of 12 and a REASON parameter of X'00E30089'. This is probably a Db2 subsystem error. No SVC dump is requested because a prior dump of the failing subcomponent is expected.

Operator response

Notify the system programmer.

System programmer response

See the SYS1.LOGREC for prior failure.

00E30090

Explanation

A service controller internal inconsistency has been encountered during message generation.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, register 2 contains the message number that was to be generated.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30091

Explanation

A failure was detected during the retry process of Db2 recovery.

System action

Db2 is abended after a record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is probably an internal Db2 error. Obtain a copy of SYS1.LOGREC and the an SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This abend is issued by DSNTFRCV of the service controller (SC) subcomponent.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30092

Explanation

A retry recovery failure has been detected. This is a critical error.

System action

Db2 is abended. This is probably a Db2 subsystem error.

Operator response

Notify the system programmer.

System programmer response

Obtain a copy of the SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The service controller recovery module has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend. The name of this CSECT is found in both the SYS1.LOGREC and the SVC dump.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30095

Explanation

Db2 is unable to acquire a modify lock because of an incompatible retained lock held by one or more other Db2 subsystems in the Db2 data sharing group. Retained locks are locks that persist across Db2 abnormal terminations.

System action

SQLCODE -904 is returned to the user. This reason code and the resource name are also returned.

System programmer response

Use the DISPLAY DATABASE command to display the Db2 member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition.

Problem determination:

00E30096

Explanation

Db2 is unable to acquire a modify lock. Lock negotiation failed because this request was involved in lock negotiation with other Db2 subsystems and the request was denied.

System action

A 'resource unavailable' condition is returned to the user. This reason code, the resource type, and the resource name are also returned. For an explanation of

resource-type and *resource-name* values, see [Resource types](#).

System programmer response

Determine why the lock request failed. One possible cause of the lock request failure is if another Db2 subsystem in the Db2 data sharing group is abnormally terminating.

User response

Resubmit the request.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E30097

Explanation

Db2 encountered an IRLM error indicating that IRLM detected an 'out of record list' storage condition.

The record list is a part of the coupling facility lock structured that contains the 'modify locks' (those locks that would be retained in case of a failure).

System action

DSNT500I or SQLCODE -904 is returned to the user. This reason code and the resource name are also returned.

Operator response

Notify the system programmer.

System programmer response

The coupling facility lock structure is declared too small. If this condition becomes a prevalent problem, you need to redistribute the coupling facility lock structure storage resource to make more room for the record list. You can make room for the record list in on of two ways:

- Issue a rebuild.
- Dynamically change the lock structure size.

Refer to Db2 Data Sharing: Planning and Administration for more details about these options.

00E30099

Explanation

A conversion error occurred during Db2 startup. This conversion is used to determine if conversion services are set up correctly.

System action

Db2 terminates.

User response

See message DSNT552I to resolve the problem.

00E3009A

Explanation

During Db2 startup, Db2 detected a difference between the CCSIDs recorded in the BSDS and the CCSIDs specified by the version of DSNHDECP module or user-supplied application defaults module that that was loaded during startup. Db2 startup terminated to avoid potential data corruption issues. Message DSNT108I is generated before the abend occurs.

System action

Subsystem startup is terminated.

Operator response

See message DSNT108I.

System programmer response

Determine the reason for the termination of Db2 startup. See message DSNT108I.

Problem determination

See message DSNT108I.

00E3009B

Explanation

Db2 detected an invalid CCSID specification during startup. Db2 startup has terminated to avoid potential data corruption issues. Message DSNT109I is generated before the abend occurs.

System action

Subsystem startup is terminated.

Operator response

See message DSNT109I.

System programmer response

Determine the reason for the termination of Db2 startup. See message DSNT109I.

Problem determination

See message DSNT109I.

00E3009E

Explanation

The plan depends on new facilities of the release from which fall back has occurred.

System action

The allocation for the user failed.

System programmer response

Warn the user community NOT to run this plan until you have remigrated to the newer release.

User response

Do not use this plan until your Db2 subsystem is remigrated to the newer release.

00E30100

Explanation

This reason code can be returned in the following cases:

- A parallel task running on a Db2 terminates abnormally.
- An assisting Db2 terminates abnormally.

System action

The member name where the failure occurred is returned to the application as the resource name in SQLCODE -904. In a non-data-sharing environment, the member name is blank, and the failure occurs on the local Db2.

Operator response

Enter DISPLAY GROUP from an active Db2 to see if a Db2 subsystem is down. Restart the failed Db2 subsystem.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30101

Explanation

The result of issuing a SETFRR macro indicates that this FRR is not the top FRR.

System action

A record is written to SYS1.LOGREC. An SVC dump is requested.

System programmer response

This is probably a Db2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E30104

Explanation

This reason code is used by the service controller (SC) subcomponent to respond NO on a prepare-to-commit notification.

System action

If the service controller indicates that Db2 cannot commit to perform the work requested by the application since the last commit point, it responds NO on the prepare-to-commit notification (COMMIT1). This forces the commit to be changed to an abort, causing the work performed by the application since the last commit point to be backed out.

00E30105

Explanation

IRLM was informed of a link failure to a coupling facility that contains a lock table being actively used by this data sharing group.

System action

The Db2 subsystem is terminated with this reason code.

System programmer response

See IRLM message DXRxxxE to determine the root cause of the failure and the appropriate corrective action.

Problem determination:

00E30301

Explanation

You have attempted to execute a plan that does not exist. This reason code is used by the automatic BIND function to indicate that no record exists in SYSIBM.SYSPLAN for the plan-ID you are attempting to run, so plan allocation fails.

System action

The plan is not executed.

User response

Determine if the object name was correctly specified. If so, ensure that the plan exists (by selecting from SYSIBM.SYSPLAN).

00E30302

Explanation

This reason code is used by the automatic BIND function to indicate that the plan currently being allocated is not operational. The automatic BIND for the plan failed because the plan was dependent on something that was altered or dropped. An unavailable database might also cause this problem.

System action

The autobind fails, and the plan cannot be allocated.

System programmer response

Determine what made the plan not operational. Make sure the required database is available. Issue a REBIND subcommand for the plan.

00E30303

Explanation

You have attempted to execute a package that does not exist. This reason code is used by the automatic package BIND function to indicate that no record exists in SYSIBM.SYSPACKAGE for the package-ID you are attempting to run, so package allocation fails.

System action

Package allocation fails.

User response

Determine if the object name was correctly specified. If so, ensure that the package exists (by selecting from SYSIBM.SYSPACKAGE).

00E30305

Explanation

This reason code is used by the automatic rebind function to indicate that the package that is currently being allocated is either not operational or in a rebind-advisory status.

If a package becomes invalid, the VALID column in the SYSIBM.SYSPACKAGE table is set to 'N' or 'S'. The next time that the package is allocated, automatic rebinding is triggered.

If the automatic rebind succeeds, the package becomes valid again. (The value in the VALID column is changed to 'Y'.) If the automatic rebind fails, the package remains invalid and the value in the VALID column stays the same.

If the package is not a trigger package, the operative status of the package in the OPERATIVE column is set to one of the following values:

OPERATIVE='R'

FL 504 If autobind phase-in was used, the failure marks the package in rebind-advisory status. The package can still be allocated, and any invalid statements go through incremental bind at execution time.

OPERATIVE='N'

If phase-in was not used for the automatic rebind, the failure marks the package as inoperative. The value of the OPERATIVE column is changed to N. An inoperative package cannot be allocated.

If the package is a trigger package, and the automatic rebind fails, the trigger package does not become inoperative.

System action

Agent allocation fails or DROP package fails for inoperative packages.

System programmer response

Determine what caused the not operational or rebind-advisory status of the package, and issue a REBIND subcommand for the package.

Related concepts

Related reference

[Invalid and inoperative packages \(Managing Security\)](#)

[SYSPACKAGE catalog table \(Db2 SQL\)](#)

[REBIND PACKAGE subcommand \(DSN\) \(Db2 Commands\)](#)

00E30306

Explanation

This reason code is returned when the automatic bind for plan is disabled. The automatic bind is disabled through the installation process.

System action

The plan is not automatically bound.

System programmer response

Rebind the plan prior to execution.

00E30307

Explanation

This reason code is used by the REBIND PACKAGE process to indicate that the REBIND command cannot be phased in. The maximum number of copies for the package has been reached.

System action

An error indication is returned.

System programmer response

The unavailable resource name has the thread token of the long running thread which prevents phased-out copies of the package from being deleted. Quiesce

the thread that executes the phased-out copy of the package, then try the REBIND command again.

00E30402

00E30501

Explanation

A warning occurred because the length of time that a thread was idle exceeded the warning setting for the MONITOR IDLE THREADS keyword in a monitor profile for one of the following filtering scopes:

- LOCATION
- PRDID
- ROLE_AUTHID
- ROLE
- AUTHID
- COLLID_PKGNAME
- COLLID
- PKGNAME
- CLIENT_APPLNAME
- CLIENT_USERID
- CLIENT_WRKSTNNAME

The server thread was holding Db2 resources and the requesting application did not make a request to the Db2 server thread for an extended period of time.

System action

A warning alert is issued, but the processing continues normally.

Db2 issues message DSNT771I.

Operator response

Notify the system programmer.

System programmer response

Review the information provided in message DSNT771I. Determine why the requesting application did not make a request to the Db2 server in the specified time.

If the application requires additional time:

1. Modify the MONITOR IDLE THREADS warning threshold in the SYSIBM.DSN_PROFILE_ATTRIBUTES table.
2. Issue the START PROFILE command to refresh the warning threshold value.

Related tasks

[Monitoring remote idle threads by using profile tables \(Db2 Administration Guide\)](#)

Related information

[DSNT771I \(Db2 Messages\)](#)

00E30502

Explanation

A thread was canceled because the length of time that a thread was idle exceeded the exception setting for the MONITOR IDLE THREADS keyword in a monitor profile for one of the following filtering scopes:

- LOCATION
- PRDID
- ROLE_AUTHID
- ROLE
- AUTHID
- COLLID_PKGNAME
- COLLID

- PKGNAME
- CLIENT_APPLNAME
- CLIENT_USERID
- CLIENT_WRKSTNNAME

The server thread was holding Db2 resources and the requesting application did not make a request to the Db2 server thread for an extended period of time.

System action

Db2 issues message DSNT772I.

The subsequent system action depends on the ATTRIBUTE1 column value in the SYSIBM.DSN_PROFILE_ATTRIBUTES table:

- If the ATTRIBUTE1 value is EXCEPTION, Db2 abnormally terminates the execution unit, terminates the server thread to release resources that might affect other threads, and terminates the connection with the remote application.
- If the ATTRIBUTE1 value is EXCEPTION_ROLLBACK, the server thread is aborted. The connection with the remote application is maintained.

If the aborted transaction performed database updates, the application environment is placed in a must-abort state so that the application environment is made aware of the resources that have been destroyed as a result of the aborted threads.

Important: If either of the following situations are true, Db2 hides the EXCEPTION_ROLLBACK event from the remote application environment:

- The aborted transaction performed only read-only operations.
- The transaction committed or aborted, but the associated database access thread remained active before it became idle.

Because the EXCEPTION_ROLLBACK event is not visible to the remote application environment in those cases, it might appear to the remote application environment that the database resources are unexpectedly disappearing. For example, held cursors, kept dynamic statements, and declared temporary tables that were created in the transaction are destroyed. Use EXCEPTION_ROLLBACK only if the remote application environment can account for this apparent loss of database resources.

Operator response

Notify the system programmer.

System programmer response

Review the information provided in message DSNT772I. Determine why the requesting application did not make a request to the Db2 server in the specified time.

This condition typically occurs for one of the following reasons:

- The ACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user did not make a request to the Db2 server for an extended period (such as a lengthy user absence). As a result, the server thread becomes susceptible to cancellation because of the timeout value.

Action: Determine why the requesting application did not make a request to the Db2 server in the specified time.

- The INACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user failed to commit before an extended dormant period (such as user absence). It is also possible that, despite committing before an extended dormant period, database resources are still held because of other existing conditions. As a result, the server thread cannot be moved to the inactive state and becomes susceptible to being canceled because of the timeout value.

Action: Determine why the server thread was not moved to the inactive state.

If the application requires additional time:

1. Modify the MONITOR IDLE THREADS exception threshold in the SYSIBM.DSN_PROFILE_ATTRIBUTES table.
2. Issue the START PROFILE command to refresh the exception threshold value.

System programmer response

Review the information provided in message DSNT772I.

Determine if there are sufficient threads allowed for the LOCATION filtering scope. If additional threads are required:

1. Increase the MONITOR ALL THREADS warning threshold value in the SYSIBM.DSN_PROFILE_ATTRIBUTES table.
2. Issue the START PROFILE command to refresh the warning threshold value.

Related tasks

Related reference

[DSN_PROFILE_ATTRIBUTES profile table \(Db2 Performance\)](#)

Related information

[DSNT772I \(Db2 Messages\)](#)

00E3050C**Explanation**

Db2 was unable to service the connection request because the number of concurrent active threads exceeded the exception threshold for the MONITOR ALL THREADS keyword in a monitor profile for the LOCATION filtering scope.

System action

When the MONITOR ALL THREADS exception threshold value is set to zero, the connection is terminated.

Otherwise, the connection remains active and the thread is queued until other threads deallocate or go inactive, providing an available slot. The thread resumes when a slot becomes available and the number of the concurrent active threads goes below the profile exception threshold, unless another thread is next in the queue.

In both cases, Db2 issues message DSNT772I.

Operator response

Notify the system programmer.

System programmer response

Review the information provided in message DSNT772I.

Determine if there are sufficient threads allowed for the LOCATION filtering scope. If additional threads are required:

1. Increase the MONITOR ALL THREADS exception threshold value in the SYSIBM.DSN_PROFILE_ATTRIBUTES table.
2. Issue the START PROFILE command to refresh the exception threshold value.

[DSNT772I](#) (Db2 Messages)

00E30700

Explanation

A resource limit as determined from the active resource limit specification table has been exceeded. The SQL statement has been terminated with an SQLCODE -905.

System action

The current SQL statement contains an SQLCODE -905.

Operator response

Notify the system programmer.

System programmer response

An SQL statement used too much resource space. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data](#) (Collecting data).

User response

See the text for the SQLCODE -905. It will specify the resource limit that was exceeded. The SQLCODE -905 text will also include the name of the resource limit specification table that was used to derive the limit. Determine why the limit was exceeded.

Related information

[-905](#)

UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = *resource-name* LIMIT = *limit-amount1* CPU SECONDS (*limit-amount2* SERVICE UNITS) DERIVED FROM *limit-source*

00E30701

Explanation

A resource was unavailable because the parallel group for a query was stopped, such as when a CLOSE CURSOR was issued before all parallel tasks completed their work.

System action

The SQL statement is terminated with SQLCODE -904.

[Parallel processing](#) (Db2 Performance)

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00E30800

Explanation

An attempt was made to identify to an IRLM that does not support the level of function Db2 needs. Message DSNT803I accompanies this abend reason code.

System action

Message DSNT803I is issued to the console, and Db2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System programmer response

Ensure that the statement in your IRLM startup procedure is referencing the correct IRLM code library and that IRLM is at the appropriate level of maintenance

00E30802

Explanation

Db2 was not able to identify to IRLM because another subsystem already identified to IRLM. Message DSNT811E accompanies this abend reason code.

System action

Message DSNT811E is issued to the console. Db2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System programmer response

IRLM Version 2.1 enforces a one to one (1:1) mapping between IRLM and Db2. Multiple DBMS subsystems can no longer use the same IRLM. Ensure that:

- Each Db2 subsystem is associated with its own IRLM subsystem.
- The correct IRLM procedure name and subsystem name are specified in the Db2 system parameters.

Problem determination:**00E30803**

Explanation

An error occurred in one of the Db2-supplied exits to IRLM. This abend reason code is issued only in a Db2 sharing data environment and indicates an internal error in Db2 or IRLM.

System action

A record is written to SYS1.LOGREC and an SVC dump is initiated. Db2 terminates abnormally.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E30805

Explanation

Db2 could not activate one of the exits used with IRLM for data sharing. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is initiated. Db2 terminates abnormally.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E30806

Explanation

IRLM could not successfully join its IRLM data sharing group. Message DSNT800I accompanies this abend reason code.

System action

Message DSNT800I is issued to the console, and Db2 abnormally terminates with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System programmer response

Some possible reasons why IRLM could not join its data sharing group are:

- The lock structure is not properly defined in the active MVS CFRM administrative policy. The lock structure name is a concatenation of the Db2 data sharing group name and the string 'LOCK1', separated by an underscore (_). For example, if the Db2 data sharing group name is DSNCAT, DSNCAT_LOCK1 would be the lock structure name.

Ensure that the lock structure is properly defined in the active MVS CFRM policy. The name of the lock structure that IRLM attempted to access is given in message DSNT800I. IRLM issues message DXR138E to indicate that the lock structure definition could not be accessed in the active MVS CFRM policy.

- IRLM could not connect the lock structure. The reason for the connect failure is given in IRLM message DXR135E.
- IRLM could not join its data sharing group. The reason for the join failure is given in IRLM message DXR134E.
- IRLM joined the wrong group. The set of IRLMs that are connected to a given lock structure must all be members of the same group.

Ensure that the GROUP parameter is correctly specified in the IRLM startup procedure. If you give an incorrect group name, IRLM connects the lock structure, and then times out waiting for responses from other connectors. IRLM issues message DXR133I for the timeout.

Problem determination:**00E30807**

Explanation

Db2 failed on the IRLM Identify request because no lock structure name was specified. Message DSNT810E accompanies this abend reason code.

System action

Message DSNT810E is issued to the console, and Db2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System programmer response

This condition occurs if you are not running Db2 in data sharing mode, but the associated IRLM is running with global scope (SCOPE=GLOBAL in the IRLM startup procedure). If you are not running Db2 in data sharing mode, ensure that the associated IRLM startup

procedure specifies SCOPE=LOCAL. Conversely, if you are running Db2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

Problem determination:

00E30808

Explanation

Db2 issued an IRLM PURGE request to purge retained locks, but the PURGE request was not successful. This abend reason code accompanies message DSNT807I.

System action

A record is written to SYS1.LOGREC and an SVC dump is initiated. The Db2 restart process is terminated.

System programmer response

The IRLM return and reason codes are in the SYS1.LOGREC record.

Problem determination:

00E30809

Explanation

Db2 failed on the IRLM Identify request because IRLM did not return the lock structure version ID. Message DSNT809I accompanies this abend reason code.

System action

Message DSNT809I is issued to the console, and Db2 abnormally terminates with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System programmer response

This condition occurs if you are running Db2 in data sharing mode, but the associated IRLM is running with local scope (SCOPE=LOCAL in the IRLM startup procedure). If you are running Db2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL. Conversely, if you are not running Db2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL.

Problem determination:

Chapter 18. X'E4.....' codes

Reason code identifiers that begin with 00E4 communicate normal and error situations with Db2 utilities.

Many of the utilities codes ask you to determine the failing environment. This means that you should determine the following things:

- The address space in which the failure occurred
- The utility that was running
- Whether it was a restart of a utility that failed previously
- Whether the job step invocation was through the DSNUTILB program
- Whether a -DISPLAY or -TERM UTILITY command was involved.

To assist you in determining the problem, register 2 might contain a secondary reason code. This secondary reason code might be an IBM internal reason code; therefore, it might not be documented in this manual.

When Db2 resources are unavailable to utilities, message DSNT500I is issued along with the utility reason code. Refer to message DSNT500I for the correct action.

00E40000

Explanation

A function of Db2 was invoked and attempted to establish a functional recovery environment. The functional recovery element (FRE) that was created was not the first one.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

Operator response

Notify the system programmer.

Problem determination

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40001

Explanation

No cursor table was present at entry to database services portion of utility.

System action

The utility job step that caused the function to be requested is abended. Utility processing is not initiated.

System programmer response

This is an internal error. Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40002

Explanation

The caller of the database services portion of the utility was in the wrong protect key.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

If a JOBLIB or STEPLIB is being used in the batch utility job, check that all application program libraries included in the concatenation are authorized.

Check that the batch utility program DSNUTILB was included in the MVS program properties table during the installation of Db2. The entry for DSNUTILB in the MVS program properties table was provided by MVS. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40003

Explanation

An error occurred while getting FRBPARM from application storage.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment., in particular whether invocation was through program DSNUTILB. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If the environment was DSNUTILB, the problem could be internal.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40004

Explanation

An error occurred while getting FRB from application storage.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. In particular, determine whether invocation was through program DSNUTILB. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If the environment was DSNUTILB, the problem could be internal.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40005

Explanation

A nonzero reason code was returned from MVS sort or DFSORT could not be loaded.

System action

Any error message generated by sort in conjunction with the nonzero reason code is directed to the device/

data set identified by the UTPRINT DD statement in the utility job step.

Error message DSNU044I, that contains the nonzero reason code, is directed to the device/data set identified by the SYSPRINT DD statement in the utility job step.

If DFSORT cannot be loaded, the utility output contains DSNU1640I.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

User response

Determine the cause of the error. If the error can be corrected, the utility may be restarted from the beginning of the sort phase by using the 'RESTART(PHASE)' parameter. If the error prevents the utility from completing, the -TERM command should be issued to remove the stopped utility from the system. The -TERM UTILITY should seldom be used when the stopped utility is REORG.

Problem determination

This abend is accompanied by the utility message DSNU044I, that contains the sort reason code and an SVC dump, or by a DSNU1640I message. In most cases, the error messages from SORT that are sent to the device/data set identified by the UTPRINT DD statement identify the problem. The dump may not be needed. If SORT is unable to open the UTPRINT data set, only the message and abend are provided. In this case, correct the problem associated with the UTPRINT DD statement, and restart the job with the RESTART(PHASE) option. If DFSORT could not be loaded then make sure that the DFSORT program libraries are accessible by the utility job.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40006

Explanation

An error was detected while manipulating the utility-in-progress bits of the database exception table (DBET). The error might occur due to one of the following conditions:

- The SYSIBM.SYSUTIL table and the DBET are out of sync.
- The utility-in-progress condition was not properly reset after execution of a prior utility.
- A resource unavailable condition exists.

System action

Utility processing is abended. This abend might be accompanied by message DSNT500I. An SDUMP might be requested.

System programmer response

Use the -DISPLAY UTILITY command to display the status of any utilities in progress. Determine if another utility is active on the same table space. Use the -DISPLAY DATABASE command to determine if the table space has a utility-in-progress condition set on.

The utility-in-progress bit is turned on only for table spaces. If a utility is run against an index, the utility-in-progress bit is turned on for the appropriate table space.

A utility-in-progress condition set without a corresponding entry for an active or stopped utility in the SYSUTIL table is an inconsistent condition caused by a prior error. To resolve this, issue a -START DATABASE command specifying the proper table space with the ACCESS(FORCE) parameter. This causes the utility-in-progress status to be cleared.

If the problem cannot be corrected, determine the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If applicable, correct the resource unavailable condition identified by the DSNT500I message. For an explanation of the *resource-type* value, see [Resource types](#). Either restart the utility from the last commit point or terminate the utility and submit it again.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code. Consult the system programmer to diagnose the problem.

Problem determination

If the condition cannot be corrected, determine the failing environment.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.

00E40007

Explanation

The COPY utility function is unable to open the table space as directed. The failure can occur because the table space is currently not available. The failure can also be an internal error.

System action

If the table space is currently not available, a DSNT500I RESOURCE UNAVAILABLE message is directed to the device or data set identified by the

SYSPRINT DD statement. The utility job step is placed in the stopped state.

Operator response

After the environmental information is determined, an operator with SYSOPR authority can terminate the utility job step and free the resources, but this might not be necessary.

System programmer response

If a DSNT500I message preceded the abend, use the contents of that message for problem determination. Otherwise, determine the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If the abend was accompanied by a DSNT500I message, use that message to determine the cause of the resource unavailability. You can restart the utility when the resource becomes available, or you can terminate the utility job step and resubmit the job at a later time.

If a DSNT500I message was not issued, an internal processing error occurred. Provide the system programmer with dumps and messages for fault analysis.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

Related reference

[COPY \(Db2 Utilities\)](#)

Related information

[DSNT500I \(Db2 Messages\)](#)

00E40009

Explanation

An error was detected while attempting to access the target object (table space or index space).

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. The DSNT500I message might be preceded by other related messages on the console. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4000A

Explanation

An error has been detected while force closing a page set.

System action

Utilities processing is abended.

System programmer response

This is an internal error. Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4000C

Explanation

This is an internal control error. The utility subcomponent that manages the function control flow associated with Db2 database services has been requested to perform a function that it does not recognize.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources (this might not be necessary).

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

To determine how much of the requested function within the job step was completed, examine the data set/device identified by SYSPRINT. Consult the system programmer to diagnose the problem. Determine whether the utility job step should be terminated in order to release resources.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4000D

Explanation

An error was detected while scanning or updating table SYSIBM.SYSUTIL.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4000E

Explanation

An error was detected while attempting to create a cursor block (CUB).

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

Related information

[DSNT500I \(Db2 Messages\)](#)

[Resource types for messages and codes in Db2 for z/OS](#)

Various messages, reason codes, and SQL codes in Db2 for z/OS include type codes that identify particular types of resources. In some cases, specific resource names are also identified.

00E4000F

Explanation

An error was detected while checking or setting the state of the database exception table (DBET). This abend might be accompanied by message DSNT500I.

System action

Utilities processing is abended. An SDUMP might be requested.

User response

Correct the 'resource unavailable' condition identified by message DSNT500I. Either restart the utility from the last commit point or terminate the utility and restart it from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

If the condition cannot be corrected, determine the failing environment.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40010

Explanation

A request to IRLM on behalf of a Db2 utility to lock a page or an entire table space has failed. This is either an internal Db2 or an IRLM problem. The error occurred in the database services address space.

System action

The utility job is abended. An SVC dump is requested (with the address of the IRLM parameter list, RLPL, in register 4). The utility is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources (this might not be necessary).

System programmer response

Check the IRLM return and reason codes in the RLPL. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Consult the system programmer to diagnose the problem. Determine if the utility should be terminated.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40011

Explanation

An attempt to extend the error range information in the database allocation table (DBAT) failed.

System action

The I/O error that did not get recorded in the DBAT table was reported in error message DSNU086E, that was directed to the device/data set identified by the SYSPRINT DD statement. The utility job step is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

The system programmer should be notified and given the relevant environmental information. Subsequent to its correction, the stopped utility can be restarted using the RESTART option, or it can be terminated and resubmitted at a later time.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40012

Explanation

An error was detected while attempting to find a database descriptor block (DBD) address.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- UTPRINT output, produced by utility invocation of SORT.

00E40013

Explanation

An error was detected while creating a ECB exit for -STOP DB2.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40014

Explanation

An error was detected from the terminate thread function.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40015

Explanation

A RECOVER utility was initiated with the ERROR RANGE option specified. The request was rejected when it was determined that there was not a sufficient number of alternate tracks for the pages in the error range to be recovered.

System action

The abend was issued in the database services address space. The dumps requested are dependent upon the JCL of the utility job step. The utility job step is abended. The utility is placed in the 'stopped' state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources (this might not be necessary).

User response

Recovery can be accomplished by resubmitting the RECOVER utility without the ERROR RANGE option. Recovery can be by data set or the table space as a whole.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40016

Explanation

A Recover utility was initiated with the ERROR RANGE option specified. An error was detected by the media manager while processing a MMCNVT macro invocation. This is an internal error within either Db2 or the media manager.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources if that should prove necessary (this might not be necessary).

System programmer response

The MMCNVT macro converts a VSAM RBA to its physical track address (CCHHR). At the time of abend, the following registers contain relevant information:

R2

Address of media manager interface block (MMIB).

R3

Address of field containing VSAM RBA to be converted.

R4

Address of area to receive CCHHR.

R5

MMCNVT places UCB address here.

R8

Return code from media manager. If you suspect an error in media manager, refer to [z/OS DFSMSdfp Diagnosis](#).

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40017

Explanation

An error was detected from terminate identify.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40018

Explanation

Either an error was detected during the execution of a restarted utility or a condition was detected that might have required restart of a utility. A message is issued prior to this abend code to indicate the type of error.

System action

Utility processing is abended.

System programmer response

Check messages issued prior to this abend code to determine the cause of the error. Correct the error, and restart the job.

User response

Notify the system programmer.

Problem determination

This abend is forced to allow restart of the utility when work data sets are used and the disposition is (MOD,DELETE,CATLG).

00E4001A

Explanation

An error was detected while using SVC 99 to allocate, deallocate, or retrieve information dynamically on the data set.

System action

Utility processing is abended.

System programmer response

Determine the failing environment. If the utility is called from a stored procedure, check to see if the refresh of WLM cannot progress, for example because of an MVS authorization error. If the WLM refresh failed, issue a VARY command to refresh the WLM environment.

User response

Notify the system programmer.

Problem determination

This is a Db2 internal error. If the error occurs during utility execution through a stored procedure, this ABEND indicates that a failure occurred during an SVC 99 operation, and the utility cleanup (ESTAE) will attempt to refresh the WLM address space.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4001B

Explanation

A Db2 utility has attempted to allocate a data set to the generic unit name SYSALLDA, but the allocation has failed. This dynamic allocation was attempted because the utility had been requested to perform sorts in parallel, a DFSPARM data set was present in the job JCL, the DFSPARM data set was allocated to SYSIN, and no SORTDEVT specification was supplied in the utility control statement.

System action

Utility processing is abended.

User response

If the failing utility was REORG, and the UNLOAD phase had completed, restart the utility after taking one of the following actions:

- Delete the DFSPARM data set from the job JCL.
- Create a DASD data set containing the DFSORT control statements you want to use and change the job JCL to point to that data set instead of SYSIN.

If the failing utility was not REORG, or if it was REORG and the UNLOAD phase had not completed, use the -TERM command to terminate the utility. Then resubmit the job after taking one of the following actions:

- Delete the DFSPARM data set from the job JCL.
- Create a DASD data set containing the DFSORT control statements you want to use and change the job JCL to point to that data set instead of SYSIN.
- Use the SORTDEVT keyword in the utility control statement to specify a generic device unit name (such as SYSDA) that can be used to do the dynamic allocation.

00E4001C

Explanation

An error was detected while attempting to map externals to a specific file object descriptor (OBD).

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4001D

Explanation

An error was detected while attempting to read a row from the SYSIBM.SYSSYNONYMS table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4001E

Explanation

An error was detected while attempting to read a row from the SYSIBM.SYSTABLES table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility

from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E4001F

Explanation

An error was detected while attempting to read a row from the SYSIBM.SYSINDEXES table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more

information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40020

Explanation

The utility batch address space attempted a resource access request (RARQ) to the database services address space (*ssnmDBM1*) but the database address space has ended or is in the process of shutting down.

System action

Utilities processing is abended.

System programmer response

Restart the failed utility job steps or terminate and resubmit them.

User response

Notify the system programmer.

Problem determination

It is normal for utility jobs which began when the database services address space (*ssnmDBM1*) was running, to abend with this code if the database address space terminates while the utility is running. Diagnose the issue that caused the database services address space (*ssnmDBM1*) to shut down.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40021

Explanation

Utility processing was performing an authorization check for the utility user and specified object, when an error was detected. A necessary resource for the check was not available.

System action

Utility processing is abended.

System programmer response

Make the resource available and take one of the following actions:

- Terminate the utility by issuing a -TERM UTILITY command, and resubmit the utility.
- Resubmit the utility with the RESTART parameter.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This abend is accompanied by the message DSNT500I, that identifies the unavailable resource. The message is written to the SYSPRINT data set.

Related tasks

[Restarting an online utility \(Db2 Utilities\)](#)

Related reference

[-TERM UTILITY command \(Db2\) \(Db2 Commands\)](#)

Related information

[DSNT500I \(Db2 Messages\)](#)

00E40022

Explanation

An error was detected while attempting to read a row from the SYSIBM.SYSUTIL table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40023

Explanation

The internal protocols required for utility update of table the SYSIBM.SYSUTIL have been violated. Utility modifications to SYSIBM.SYSUTIL were not committed.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic item listed in

- REPAIR dump of all SYSUTIL pages.

00E40024

Explanation

Internal protocols required for utility serialization were violated. Specifically, utility serialization cleanup was not invoked upon completion of utility processing. This error can happen if during utility restart, the utility control statement is modified improperly.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the TERM UTILITY command to release the resources claimed by the stopped utility, however this action might not be necessary.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- REPAIR dump of all SYSUTIL pages.

Related reference

[-TERM UTILITY command \(Db2\) \(Db2 Commands\)](#)

00E40025

Explanation

Utility processing attempted to allocate resources for this utility job step. The allocate protocol has returned a nonzero return code.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility, but this might not be necessary.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40027

Explanation

An error has been detected while attempting to update a row of the SYSIBM.SYSUTIL table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40028

Explanation

An error has been detected while attempting to COMMIT.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40029

Explanation

An error has been detected while attempting to read a row from the SYSIBM.SYSUTIL table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary

reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4002A

Explanation

During utility restart processing, a record in the SYSUTILX checkpoint/restart area was not recognized. The utility might not be restartable.

System action

Utility processing is abended.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- DSN1LOGP detail report that contains log records associated with the damaged page.
- Detailed description of events immediately prior to and during the abend.
- UTPRINT output, produced by utility invocation of SORT.
- All dumps taken by the attachment facility or requesting application.

00E4002B

Explanation

The utility check pending protocol detected invalid parameters for the setting or resetting of the check pending state.

System action

The utility job is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4002D

Explanation

This abend is issued as a result of an error other than the 'resource unavailable' condition that was encountered while attempting to update a Db2 catalog for the setting or resetting of the check pending state.

System action

An SVC dump is requested, the error flag in the DBA table is set on for the table space for which the check pending state is being set or reset, and processing continues.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Determine the reason for the catalog access error. This abend is accompanied by console message DSNU972I. See the problem determination for this message for a description of how processing is affected by this error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4002E

Explanation

During utility serialization or utility restart, an attempt to either read or retrieve from SYSUTIL or SYSUTILX has failed.

System action

Db2 abends the utility job.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Unformatted DSN1PRNT output of the DSND01.DBD01 page set. Locate the inconsistent DBD in the DSND01.DBD01 page set by using the method described in [Finding a DBD in a dump \(Diagnosing Db2 problems\)](#).

00E40030

Explanation

A -DISPLAY UTILITY or -TERM UTILITY command has failed in the command subsystem.

System action

Command processing is terminated. For -TERM UTILITY, all previous actions taken by the command are backed out.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This error is accompanied by additional messages and/or SVC dumps that identify the failure in the utility command subsystem. Refer to this manual under those messages and/or codes for additional problem determination.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40033

Explanation

Internal control blocks were scanned for internal IDs representing the SYSIBM.SYSUTIL table. No corresponding ID was found.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the TERM UTILITY command to release the resources claimed by the stopped utility, but this might not be necessary.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic item listed in

- REPAIR dump of all SYSUTIL pages.

00E40034

Explanation

The utility message generator was unable to obtain the requested storage. The available storage used to buffer messages produced by the database memory is full and a request to obtain more storage from subpool 229 failed.

System action

Utility processing abends. No SYSABEND dump or SVC dump is requested.

User response

This abend occurs due to a system resource limit. It might be necessary to modify the utility control statement.

If the abend occurs as a result of the LOAD utility, attempt to restart the job. If failure recurs, it might be necessary to change the discard limit or correct the situation that caused many error messages to be produced.

If the abend occurs as a result of the REPAIR utility, change the beginning page number to the last page number printed plus one, or change the number of pages to be dumped to a smaller number. Resubmit the job.

If the abend occurs as a result of the REBUILD INDEX utility, the unique index might have to be dropped and re-created as a nonunique index. If a unique index is required and the data contains a large number of duplicates, the duplicates must be reduced before attempting to rebuild the index again.

Problem determination

Refer to the prior error messages to determine how to correct the problem.

00E40035

Explanation

The -START ACCESS FORCE command was issued when DSNDB01.SYSUTILX was in a pending state, which prohibits further processing. The pending state was either copy or recovery pending.

System action

Utility processing is abended.

System programmer response

Issue a -DISPLAY DATABASE command to determine the state of DSNDB01.SYSUTILX. If the state is copy pending, do a full image copy. If the state is recovery pending, use the RECOVER utility to recover DSNDB01.SYSUTILX.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer so that the pending condition can be resolved.

00E40040

Explanation

An error was returned from the DSNILREQ protocol during page level locking. This abend code is accompanied by message DSNT500I that explains the 'resource unavailable' condition.

System action

Utility processing is abended and the utility is placed in a stopped state.

System programmer response

If the conditions identified in the DSNT500I message can not be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Then, either restart the utility from the last commit point or terminate the utility and restart it from the beginning.

Problem determination

Refer to the description for message DSNT500I.

For an explanation of the *resource-type* value, see [Resource types](#).

00E40045

Explanation

A failure has occurred during an attempt to free storage.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can terminate the utility job step and free the resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40051

Explanation

Invalid OTYPE was passed to DSNUGMAP.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can terminate the utility job step and free up any resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40053

Explanation

An invalid OBID of zero was found by the module that maps external object names to OBIDs.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can terminate the utility job step and free any resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

OBIDs are extracted from the Db2 catalog.

The OBID for a table space is found in the SYSIBM.SYSTABLESPACE table. The OBID for a table is found in the SYSIBM.SYSTABLES table. The OBID for an index is found in the SYSIBM.SYSINDEXES table. If the object exists, the OBID cannot be zero.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40070

Explanation

A utility data set could not be opened. The abend was issued to place the utility in the stopped state for review and correction.

System action

Utility error message DSNU034I, DSNU036I, DSNU037I, DSNU039I or DSNU041I was issued to identify the DD statement associated with the DCB that could not be opened. If none of those messages were issued, the SYSPRINT DD statement was omitted. The utility job step is placed in the stopped state.

Operator response

An operator with SYSOPR authority can terminate the utility to release the held resources, but this may not be necessary.

System programmer response

Correct the JCL, and resubmit the job.

User response

If the ddname is one you submitted, review and correct it. Then resubmit the job. If the ddname is one the system provided, consult the system programmer. If neither message was issued, verify that the SYSPRINT DD statement exists.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40071

Explanation

An I/O error was encountered on a required OS/VS data set. An abend was issued to place the utility in a stopped state for review and correction. Resubmit the utility.

This abend might also be issued by a utility that uses subtasks, if one subtask encounters an abend B37, D37, or E37 on a data set, and another subtask tries to write to the data set.

System action

One of two utility error messages (DSNU032E or DSNU040I) is sent to the data set or device associated with the SYSPRINT DD statement of the utility job step. The error message identifies the error and the data set in error.

If the abend is issued by utility subtasks, DSNU016I is issued instead of DSNU032E or DSNU040I.

The utility is stopped at the beginning of the phase that used the OS/VS data set.

Operator response

An operator with SYSOPR authority can terminate the utility and release any held resources (this might not be necessary).

User response

If the utility message was DSNU032E, the job can be restarted if an undamaged output data set is provided. Obtain an undamaged output data set, and restart the

utility job step with the RESTART(PHASE) option. The job cannot be restarted if an unload data set, during the RELOAD phase of either the LOAD or REORG, is used as input instead of output.

If the utility message was DSNU040I, determine the problem as described in Problem Determination. Then either resubmit the utility job using the RESTART option, or terminate the utility job step.

If the utility message was DSNU016I, determine the cause of the B37, D37, or E37 abend and take the appropriate action. Normally, you will need to either allocate more storage for the data set, or change the allocation to a volume that has more space available.

Problem determination

Problem determination depends upon which error message was directed to the data set/device identified by the SYSPRINT DD statement.

If DSNU032E was issued, an I/O error was encountered on a required utility work data set. The message describes the error and the data set in error.

If DSNU040I was issued, an error has occurred during BSAM access to the data set defined by the DD statement specified in the message. The DECB provided as a hexadecimal string contains the ECB in the first four bytes. The first byte of the ECB contains status bits that indicate the cause of the error.

There might be an IOS (I/O subsystem) message on the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for the message. Refer to the appropriate MVS publication for the meaning of the status bits.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

[DSNU040I \(Db2 Messages\)](#)

00E40072

Explanation

An error was encountered while processing a BSAM data set.

System action

A message identifying the error might have been sent to the data set/device associated with the SYSPRINT DD statement of the utility job step. If no prior message was produced, a dump was requested. The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

Notify the user or system programmer.

System programmer response

Review the job output and failing environment. If a message was produced to identify the error, correct the error and resubmit or restart the job. If no message was produced, then a dump should have been requested. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If a message was produced to identify the error, refer to that message description for the proper action. If no message can be found, then notify the system programmer.

Problem determination

Problem determination depends upon which error message, if any, was directed to the data set/device identified by the SYSPRINT DD statement. If a message was produced, it describes the type of error and data set involved. Refer to the message description for information on what action to take.

If no message was produced, then this might be an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40073

Explanation

An internal error was encountered while processing a BSAM data set. The utility in progress issued an internal read to a BSAM data set after end-of-file was returned for the data set.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40074

Explanation

An internal error was encountered while processing a BSAM data set. The utility in progress issued an internal point to a BSAM data set which is opened for write. Point is only valid for data sets opened for read.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Source listing of the failing application program.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E40075

Explanation

An end-of-data (EOD) has been encountered while attempting to reposition an input data set during the restart of a utility.

System action

Processing is abnormally terminated. A system dump is requested.

User response

Review the JCL and ensure that the input data set is correct. Further analysis might be necessary.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E40076

Explanation

The DYNALLOC SVC returned an unexpected return code when attempting to deallocate a data set.

System action

Processing is halted.

Operator response

If necessary, an operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

System programmer response

This error may occur for a data set allocated by a JCL DD card or by a TEMPLATE utility control statement. If the problem determination indicates an error in the way the data set was specified, fix the JCL DD card or the TEMPLATE control statement and resubmit the job. If a problem is indicated in the I/O subsystem, then correct the problem before resubmitting the job.

User response

If the problem persists, then notify the system programmer.

Problem determination

The abend code is accompanied by message DSNU031I which provides the data set name, return code and reason code values returned from the dynamic allocation request. Refer to *MVS Authorized Assembler Services Guide* for a complete description of the possible return and reason codes from DYNALLOC. Error messages in the job log might give more information about the problem. Analyze these messages to determine the source of the error and the actions required to correct the error.

00E40079

Explanation

A utility work data set has a block size that is too small to accommodate the data to be written. An abend is issued to place the utility job step in a stopped state. This allows the error to be reviewed and corrected, and the job step to be resubmitted.

System action

Utility error message DSNU038I is directed to the device/data set identified by the SYSPRINT DD statement. The utility job step is placed in the stopped state.

User response

Delete the data set in error. Change the JCL so that the block size for the data set with the ddname nominated in error message DSNU038I is at least the indicated block size. Resubmit the utility job step with RESTART(PHASE) option.

Problem determination

Utility error message DSNU038I is directed to the device/data set identified by the SYSPRINT DD statement. It gives the name of DD statement that

defines the data set with the inadequate block size and gives the minimum block size in bytes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40080

Explanation

An error has been detected during utility termination cleanup. The DSNXKACC CLOSEALL protocol has returned an error.

System action

The utility job step is placed in the stopped state.

Problem determination

This abend code might be accompanied by a DSNT500I error message that might indicate a correctable problem.

If the DSNT500I message has not been issued or if the problem can not be corrected, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40081

Explanation

The REORG utility has completed the UNLOAD phase while processing in a shared mode and has attempted to change to an exclusive mode for the RELOAD and subsequent phases. Utility processing has detected an internal error.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic item listed in

- REPAIR dump of all SYSUTIL pages.

00E40082

Explanation

An error has been detected by utility serialization protocols. Protocols were issued in the wrong order.

This is an internal error and cannot be corrected by the user.

System action

Utility processing is abnormally terminated and the utility is placed in a stopped state. An SDUMP is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

The -TERM UTIL command can be issued to free resources held by the failing utility.

00E40083

Explanation

An error was detected by utility serialization protocols. Required parameters are missing or contain invalid values.

This is an internal error and cannot be corrected by the user.

System action

Utility processing is abnormally terminated and the utility is placed in a stopped state. An SDUMP is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Issue the -TERM UTIL command to free resources held by the failing utility.

00E40085

Explanation

A utility serialization LOCK or UNLOCK request has received an error from the IRLM. Either message DSNU099I is issued prior to this abend code to provide information about the error or message DSNIO02I is issued if the problem occurred while running the START DATABASE ACCESS(FORCE) command.

System action

Either the utility job step is terminated and the utility is placed in a stopped state or the START DATABASE command abnormally terminates.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command if the user does not want to attempt to restart the utility. For the START DATABASE command, rerun the command.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). For the START DATABASE command, no response is needed.

User response

Notify the system programmer. An attempt can be made to restart the utility or rerun the START DATABASE command.

00E40090

Explanation

Utility processing is unable to invoke the designated utility, because an internal error has occurred. The specified utility is not recognized by the utility job controller.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40091

Explanation

Utility access path creation was invoked specifying an incorrect OBID.

System action

The utility job step is terminated, placing the utility in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40096

Explanation

Utility access path creation has detected an invalid OBID. The specified value is too small, too large, or does not exist in the subsystem.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E400A0

Explanation

An error was detected while the internal structure to access the tables of a table space was being built. The table space had no tables.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E400A1

Explanation

Utility has detected the number of database objects to be processed exceeds the maximum amount allowed.

System action

The utility job is abended, and the utility is placed in the stopped state.

System programmer response

The utility cannot be restarted. An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

00E400AE

Explanation

A DSNGDALT macro invocation returned a nonzero return code. An attempt to modify a DBD by setting the OBDPSRBAFmt or OBDPIRBAFmt bit on was unsuccessful. This state is informational, indicating whether the page set is or is not in extended RBA format.

System action

Processing is abended.

Operator response

If the failing utility is a REBUILD INDEX during a Disaster Recovery, this abend might be avoided by modifying the REBUILD INDEX statement. Terminate the utility and resubmit it by specifying RBALRSN_CONVERSION NONE on the REBUILD INDEX statement. Alternatively, contact IBM Support for guidance on preventing object conversion by Db2

utilities, and how to remove the workaround when the Disaster Recovery is completed.

System programmer response

During some Disaster Recovery scenarios DSNDB01.DBD01, DSNDB01.SYSDBDXA or their indexes might not be available yet, causing this abend code.

User response:

This abend might be caused by an unavailable resource. Check for a DSNT500I message that is being issued before the abend. A dump is suppressed in this case. If no 'resource unavailable' condition is indicated, notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

Related information

[DSNT500I \(Db2 Messages\)](#)

00E400AF

Explanation

A DSNGDALT macro invocation has returned a nonzero return code. An attempt to modify a DBD by setting the OBDIFIB bit on was unsuccessful.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

This abend might be caused by an unavailable resource. Check for a DSNT500I message being issued prior to the abend. A dump will be suppressed in this case. If no 'resource unavailable' condition is indicated, notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E400B0

Explanation

Utilities invocation of CREATE THREAD has ended abnormally.

System action

The utility job step is terminated. No record of the utility job step remains in the system.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E400C0

Explanation

This code is issued for the following situations:

- A -STOP DB2 MODE(FORCE) command has been entered while a utility was executing.
- A -STOP DB2 MODE(QUIESCE) command has been entered while a utility with multiple input statements was executing and the current input statement execution has completed.
- During abnormal system termination.

System action

Utility processing is abended.

System programmer response

Determine the reason that the -STOP DB2 command was issued. After Db2 has been started again, the utility job can be restarted.

User response

Notify the system programmer.

00E400C1

Explanation

Db2 failed while attempting to latch or unlatch an index page. This is an internal error.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E400C2

Explanation

Db2 received an unexpected return code from MVS. This is an internal error.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E400C3**Explanation**

An error was detected during the restart of a utility that uses a TEMPLATE name specification to dynamically allocate the data sets. The data sets that need to be reused for restart were not found.

System action

Utility processing is abended.

User response

Examine the JCL and ensure that the TEMPLATE control statement specifies the correct disposition for the data sets. Further analysis might be needed.

Problem determination

This abend is forced to allow restart of the utility when work data sets are used and the disposition is not MOD, DELETE, and CATLG (for example, not

```
DISP=(MOD,DELETE,CATLG)
```

).

00E400CA**Explanation**

Db2 received an error when accessing the integrated catalog facility catalog.

System action

The utility job step that caused the function to be requested abnormally terminated. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

Examine the SYSLOG for error messages to help determine the cause of the failure.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E400CD**Explanation**

Db2 received an error while trying to allocate a tape device.

System action

The utility job step that caused the function to be requested abnormally terminated. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E400D0**Explanation**

A conversion error occurred during the conversion of a string to a different coded character set.

This code typically accompanies message DSNU299I, which can provide additional information.

System action

The utility job abends. The dump is suppressed.

User response

Review the contents of message DSNU299I and take the appropriate action.

Problem determination

If the problem persists, contact IBM Support Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that

were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- The dump from an execution of the utility with the DIAGNOSE ALLDUMPS statement in the utility job.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related information

[DSNU299I \(Db2 Messages\)](#)

00E400D5

Explanation

An attempt to retrieve restart or redo information for utility processing was unsuccessful.

System action

Utilities processing abends. The abend might be accompanied by other messages. An SDUMP might be taken.

System programmer response

If the abend code was received for the BACKUP SYSTEM utility, try running BACKUP SYSTEM again. If the abend occurs repeatedly, review the checkpoint frequency of each Db2 member and the group bufferpool checkpoint frequency. Consider adjusting them to make them uniform with each other.

If register 2 or the utility job output contains an undocumented reason code, it is an internal IBM code. Collect the information that is identified in the problem determination section and contact IBM Support.

User response

Check the other messages in the utility job output to determine the cause of the error. If possible, correct the problem and restart the utility. If the error prevents the utility from completing, terminate the utility and start it again from the beginning.

Register 2 or the utility job output might contain a secondary Db2 reason code that provides more information about the problem. If the secondary reason code is not documented among the other Db2 reason codes, notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E400E4

Explanation

An attempt to modify the catalog information was unsuccessful. The RBA_FORMAT column in SYSINDEXPART or SYSTABLEPART could not be updated. This column is informational, indicating whether the object is or is not in extended RBA format.

System action

Utilities processing abends. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

Operator response

If the failing utility is a REBUILD INDEX during a Disaster Recovery, this abend might be avoided by modifying the REBUILD INDEX statement. Terminate the utility and resubmit it by specifying RBALRSN_CONVERSION NONE on the REBUILD INDEX statement. Alternatively, contact IBM Support for guidance on preventing object conversion by Db2 utilities, and how to remove the workaround when the Disaster Recovery is completed.

System programmer response

If DSNT500I was not issued and register 2 contains an undocumented reason code, it is an internal IBM code. Collect the information that is identified in the problem determination section and contact IBM Support.

User response

Correct the resource unavailable condition that was identified by the DSNT500I message. Either restart the utility from the last checkpoint, or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented among the other Db2 reason codes, notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

Related information

[DSNT500I \(Db2 Messages\)](#)

00E400E5

Explanation

An error occurred while attempting to invalidate the dynamic statement cache for a table space, table, or index.

System action

Utility processing abends.

User response

If the error is caused by a 'resource unavailable' condition, try to identify a related DSNT500I or DSNT376I message in the console output for problem determination. Ensure that other applications have performed a commit operation, or START DYNQUERYCAPTURE commands have completed. Then, try the request again.

If no apparent reason can be found for this error, contact IBM Support.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

[DSNT500I \(Db2 Messages\)](#)

00E40100

Explanation

Db2 failed during execution of the DSNBGETP macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If the problem is caused by a resource that is unavailable, resolve the unavailable resource and run the utility again. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This problem can be caused by a resource not available condition or it can be an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40101

Explanation

Db2 failed during execution of the DSNBSETW macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40102

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNICCOB macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40103

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNICCUB macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40104

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIDISP macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40105

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIDLET macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40106

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNILRDO macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40107

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIIISRT macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility

from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40108

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNINEXH macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40109

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIPGER macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more

information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010A

Explanation

Db2 failed during execution of the DSNIPSCB macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010B

Explanation

Db2 failed during execution of the DSNIPZOP macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2,

you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010C

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIREPL macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010D

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNISETH macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010E

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNISRCF macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4010F

Explanation

The data manager subcomponent of Db2 failed during execution of the DSNIURBA macro.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40110

Explanation

The data space manager subcomponent of Db2 failed during execution of the reset of an index space or table space page set.

System action

The utility job is abnormally terminated. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility or terminate the utility and submit it again.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40111

Explanation

The data space manager subcomponent of Db2 failed during execution of the DSNPXTND macro.

System action

The utility job is abended. DSM provides diagnostic information.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40112

Explanation

DSNUGMAP, a utilities program, failed.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40113

Explanation

The data space manager subcomponent of Db2 failed during execution of the reset of an index space or table space page set.

System action

The utility job is abnormally terminated. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message and either restart the utility or terminate the utility and submit it again. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that will give more information about the problem. Notify the system programmer.

Problem determination

See message DSNT500I in this manual for a 'resource unavailable' condition.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40114

Explanation

Db2 failed during execution of DSNICLPS.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40115

Explanation

The data manager subcomponent of Db2 failed during execution of DSNIUSTP.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40116

Explanation

Either DSN3SYNC or DSN3ABRT failed.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40117

Explanation

DSNURBXB, a utilities module, failed.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40118

Explanation

The data space manager subcomponent of Db2 failed during execution of the DSNPGNPO macro.

System action

The utility job is abended. The DSM provides any required diagnostic information, such as messages, dumps, or log records.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

00E40119**Explanation**

This abend reason code is issued in these instances:

- During recovery, a full image copy was not found for the Db2 directory or the Db2 catalog table space.
- The MERGECOPY utility did not recognize a record from the SYSIBM.SYSCOPY catalog table.

System action

The utility job is abended.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

When the recovery of the Db2 catalog or directory table space is requested, make sure that a full image copy has been taken first. If the MERGECOPY utility abended, either issue a select statement or run the REPORT utility to check the SYSIBM.SYSCOPY table for invalid rows.

00E4011A**Explanation**

An error occurred in the RECOVER utility while applying log with log RBA=0.

System action

The utility job is abended.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Make sure the SYSLGRNX table space is not empty before applying the log.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Listings of SYSIBM.SYSCOPY and either SYSIBM.SYSLGRNX, SYSLGRNG, or both.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00E4011B**Explanation**

The data manager subcomponent of Db2 failed during the execution of DSNIHDFM or DSNIHIFM.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility or terminate the utility and execute it from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E4011C

Explanation

The log manager subcomponent of Db2 failed during execution of the DSNJLGR macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Register 2 contains a secondary reason code. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of Db2 log output.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Db2 log output, including any Db2 recovery log archive tapes.
- Listings of SYSIBM.SYSCOPY and either SYSIBM.SYSLGRNX, SYSLGRNG, or both.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4011D

Explanation

Db2 detected an error during execution of the DSNIDDRN macro. This is an internal error.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- Detailed description of events immediately prior to and during the abend.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- REPAIR dump of all SYSUTIL pages.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period from the last IPL to the time of the failure.

00E4011F

Explanation

The RECOVER utility is unable to clear the group buffer pool pending status.

System action

The RECOVER utility abends with this code.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40120

Explanation

A delete of SYSLGRNX information failed during -TERM UTILITY command processing for a REORG utility in the RELOAD phase.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40121

Explanation

A RDJFCB macro invocation returned a nonzero return code.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

This is probably a user error. A DD statement might be missing or specified incorrectly. If the DD statements appear to be correct, there might be another cause of the error and you should notify the system programmer.

Problem determination

The DD statement referred to by the COPYDDN Utility keyword might be missing or specified incorrectly. If COPYDDN was not specified, a DD statement with a default name equal to SYSCOPY must be present in the job step.

00E40122

Explanation

A IEFAB4UV invocation returned a nonzero return code.

System action

Processing is abnormally terminated.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

User response

Notify the system programmer.

00E40123

Explanation

The RECOVER TABLESPACE utility cannot access the SYSIBM.SYSVOLUMES catalog table to process a concurrent copy produced by the DFDSS DUMP command.

System action

The RECOVER TABLESPACE utility abends.

System programmer response

Resolve the access problem to the SYSVOLUMES catalog table. Then restart the RECOVER TABLESPACE utility.

Problem determination

See the console for additional diagnostic messages.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40124

Explanation

A down level internal control block was detected.

System action

The utility job step that requested the function is abended. The abend is accompanied by message DSNU424I.

System programmer response

Refer to the APAR mentioned in message DSNU424I.

User response

Refer to the APAR mentioned in message DSNU424I.

Problem determination

Refer to the APAR mentioned in message DSNU424I.

00E40125

Explanation

The RECOVER utility was recovering an index space with index versioning active. The utility issued the DSNDBIXD macro which calls the Index Manager subcomponent. An error occurred while the Index Manager was building an internal control block.

System action

The RECOVER INDEX/INDEXSPACE utility abends.

System programmer response

Determine the failing environment. For information on identifying and reporting the problem., see [Diagnostic aids for single systems and data sharing \(Diagnosing Db2 problems\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40126

Explanation

The RECOVER utility was recovering an index space with index versioning active. The utility issued the DSNDDIDPB macro which calls the Index Manager subcomponent. An error occurred while the Index Manager was building the Index Descriptor Page.

System action

The RECOVER INDEX/INDEXSPACE utility abends.

System programmer response

Determine the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40163

Explanation

An error was detected during activity history recording insert of SYSIBM.SYSLGRNG or SYSLGRNX.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40164

Explanation

An error was detected during activity history recording update of SYSIBM.SYSLGRNG or SYSLGRNX.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40165

Explanation

An error was detected during an execution unit switch while performing application history recording or drop processing.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40166**Explanation**

A delete of SYSIBM.SYSLGRNX information failed during DROP processing.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40167**Explanation**

A delete of SYSIBM.SYSCOPY information failed during DROP processing.

System action

Processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40168**Explanation**

The buffer manager (BM) subcomponent of Db2 failed during the execution of the DSNBPFP macro.

System action

The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is a Db2 subsystem internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40170

Explanation

The COPY or RECOVER utility was executing in PARALLEL mode. An error occurred in the data transport mechanism while data was being transferred between the batch and the online Db2 address spaces.

System action

The COPY or RECOVER utility abends.

System programmer response

Determine the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40189

Explanation

An error was detected while inserting records from SYSIBM.SYSCOPY.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point, or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40190

Explanation

An error was detected while scanning the SYSIBM.SYSCOPY catalog table.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40191

Explanation

An error was detected while deleting records from SYSIBM.SYSCOPY.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40192

Explanation

An invalid call to DSNULOG1 was detected when a partial recovery function in DSNULOG1 was invoked. The passed parameter is not a TOCOPY or TORBA to SYSCOPY, SYSUTILX, or DSNDB01.

System action

Utility processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

00E40193

Explanation

An error was detected while a utility was attempting to retrieve catalog table information. This is an internal error.

System action

The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40194

Explanation

This is an internal error. An error was detected running the COPY utility with the SHRLEVEL CHANGE option.

System action

The utility job step that requested the function is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E40195

Explanation

This is an internal error. An error was detected running the COPY utility with the SHRLEVEL CHANGE option.

System action

The utility job step that requested the function is abended. The utility job is placed in the stopped state.

System programmer response

Determine the failing environment.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E40196

Explanation

Db2 detected an error while reading the catalog history tables.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40197

Explanation

Db2 detected an error while deleting rows from the catalog history table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.

00E40198**Explanation**

Db2 detected an error during utility processing of SYSIBM.SYSLGRNX records for log apply. A SYSLGRNX record with a log range that is a candidate for log apply was found for a member that has been destroyed. Log apply processing for this log range is not possible because the logs and BSDS for a destroyed member are not available.

System action

The utility job abends and an SVC dump is requested.

System programmer response

Use the TERM UTIL command to terminate the utility. Run the REPORT utility on all of the objects, and review the output to determine which object has a SYSLGRNX record for the destroyed member. Choose a recovery point that will not require logs from the destroyed member to recover the identified object.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

REPORT (Db2 Utilities)

00E40201**Explanation**

RUNSTATS was unable to reposition and continue processing after a COMMIT.

System action

Utility processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40202**Explanation**

An error was detected while scanning a table space or index during RUNSTATS processing.

System action

Utilities processing is abended.

System programmer response

If message DSNT500I was issued, refer to that message for problem determination. Otherwise, this is an internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If message DSNT500I was issued, assure that the indicated resource is available and resubmit the job, otherwise notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40215

Explanation

Db2 detected an error while updating the statistics in the SYSIBM.SYSINDEXSTATS or SYSIBM.SYSINDEXSTATS_HIST catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code. Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40216

Explanation

An error was detected while updating the statistics in the SYSIBM.SYSCOLSTATS catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message, terminate the utility, and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code. Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40217

Explanation

An error was detected while updating the statistics in the SYSIBM.SYSCOLDISTSTATS catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message, terminate the utility, and start it again from the beginning. Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40218

Explanation

Db2 detected an error while updating the statistics in the SYSIBM.SYSLOBSTATS or SYSIBM.SYSLOBSTATS_HIST Catalog table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40220

Explanation

An error was detected while accessing the SYSIBM.SYSTOGROUP catalog table during STOSPACE processing.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40221

Explanation

An error was detected while accessing the SYSIBM.SYSTABLEPART catalog table.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40222

Explanation

An error was detected while accessing the SYSIBM.SYSINDEXPART catalog table during STOSPACE processing.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40223

Explanation

An error was detected while accessing the SYSIBM.SYSTABLESPACE catalog table.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40224

Explanation

An error was detected while accessing the SYSIBM.SYSINDEXES catalog table during STOSPACE processing.

System action

Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40225

Explanation

An error has been detected by DSNPSCAT during STOSPACE processing.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40226

Explanation

An error occurred while updating the statistics in the SYSIBM.SKSKEYTARGETSTATS catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the resource unavailable condition identified by the DSNT500I message. Terminate the utility and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40227

Explanation

An error was detected while updating the statistics in the SYSIBM.SYSKEYTARGETS or SYSIBM.SYSKEYTARGETS_HIST catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the resource unavailable condition that is identified by the DSNT500I message. Terminate the utility, and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40228

Explanation

An error was detected while updating the statistics in the SYSIBM.SYSKEYTGTDISTSTATS catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the resource unavailable condition identified by the DSNT500I message, terminate the utility, and start it again from the beginning. If DSNT500I was not

issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40229

Explanation

An error was detected while updating the statistics in the SYSIBM.SYSKEYTGTDIST or SYSIBM.SYSKEYTGTDIST_HIST catalog table.

System action

Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the resource unavailable condition identified by the DSNT500I message. Terminate the utility, and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40230

Explanation

An error was detected while accessing the statistics in the SYSIBM.SYSTABLES_PROFILES catalog table.

System action

Utility processing abends. Message DSNT500I might accompany this abend. An SDUMP might be generated.

System programmer response

If the condition identified cannot be corrected, determine the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If message DSNT500I accompanies this code, correct the resource unavailable condition identified by the message. Terminate the utility, and start it again from the beginning.

If message DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40231

Explanation

Invalid data was detected while accessing the statistics in the SYSIBM.SYSCOLSTATS catalog table.

System action

Utility processing abends with message DSNU1384I .

User response

Message DSNU1384I indicates the invalid column data that was found in the catalog table. Correct the catalog data identified by the message. Terminate the utility, and start it again from the beginning.

Related tasks

[Collecting statistics by using Db2 utilities \(Db2 Performance\)](#)

Related reference

Related information

[DSNU1384I \(Db2 Messages\)](#)

00E40300

Explanation

An error occurred in END INDEX LOAD processing following a sequence of index entry loads.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40301

Explanation

An error was encountered while attempting to obtain the high used RBA for the data sets associated with the table space being reorganized.

System action

Processing abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

Determine the reason the high used RBA could not be obtained, correct the situation, and restart the utility.

Problem determination

The data sets associated with the table space being reorganized must be opened in order to obtain the high used RBA. Ensure that the data sets are available and can be opened by the utility.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40302

Explanation

An error occurred while attempting to force a page set closed.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40303

Explanation

An attempt was made to access the SYSIBM.SYSINDEXES catalog table to retrieve the NAME, CREATOR, TBNAME and TBCREATOR columns. An error was returned from the DSNXKACC protocol used to access SYSIBM.SYSINDEXES.

System action

The utility job is abended. Unless a 'resource unavailable' condition was indicated, a SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If a 'resource unavailable' message was issued, refer to the description for that message. If the unavailable resource becomes available, the utility step is restartable.

Problem determination

This might be an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40304

Explanation

An error occurred during key/RID pair delete processing for a nonclustering index.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40305

Explanation

An error occurred during the reset of an index space or table space page set or page set partition.

System action

The utility job is abended. The abend may be accompanied by message DSNT500I. The DSNT500I may be preceded by other related messages on the console. An SDUMP may be taken.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message and either restart the utility or terminate the utility and submit it again. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that will give more information about the problem. Notify the system programmer.

Problem determination

See message DSNT500I in this manual. See the secondary reason code from register 2.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40306

Explanation

An error occurred during a locate or create PSCB for a table space or index space page set.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40307

Explanation

An error occurred during the creation of a dynamic cursor block (CUB) for a table space or index space page set.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40308

Explanation

An error occurred while attempting to allocate or deallocate storage for the table space record buffer.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40309

Explanation

An error occurred during the construction of an index entry. The error occurred while reading the table space record, while extracting the key from the table space record, or while connecting the entry into the index.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4030A

Explanation

A mismatch was found between the total number of keys processed during the current phase and the total number of keys expected to be processed in this phase.

System action

The utility job is abnormally terminated, and all target objects are placed in rebuild pending state. Message DSNU255I was issued earlier to report both the keys processed and the keys expected. A dump is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

TERM the utility and re-access the indexes by running REPAIR utility to reset the rebuild pending states on indexes. Run the CHECK INDEX utility to determine if any of the affected indexes are inconsistent. Inconsistent indexes may be recovered by the REBUILD INDEX or RECOVER utility.

Problem determination

If working data set was manipulated by user during restart process, make sure it was handled properly.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E4030B

Explanation

A mismatch was found between the total number of records processed during the current phase and the total number of records expected to be processed in this phase.

System action

The utility job is abnormally terminated. Message DSNU254I was issued earlier to report the records that were processed and the records that were expected. A dump is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the System Programmer.

Problem determination

Make sure that the unload data set was handled correctly.

Collect the following diagnostic items: listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E4030C

Explanation

An internal error occurred while building the dictionary.

System action

The utility is stopped.

Operator response

If necessary, an operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items: listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E4030D

Explanation

A LOAD or REORG utility detected an index that was potentially in a physically inconsistent state, which

prohibited the LOAD or REORG utility from completing its processing for that index.

System action

The utility job is abended. No SYSABEND dump or SVC dump is requested.

User response

If the abend occurred during REORG utility processing, all indexes that were not built must be rebuilt using the Db2 Rebuild Index utility. To determine which indexes did not complete processing, use the Db2 -DISPLAY DATABASE command with the SPACENAM and RESTRICT options. Indexes that have not completed processing are in a 'RBDP' (rebuild pending) or 'PSRBD' (page set rebuild pending) state. Terminate the failed REORG utility using the Db2 -TERM UTIL command. Submit a job to rebuild the inconsistent indexes using the Db2 REBUILD or RECOVER Index utility.

If the abend occurred during LOAD utility processing, the data might need to be rebuilt if one or more of the indexes not built is unique. In that case, rebuilding the indexes without first rebuilding the data could cause error messages for duplicate keys to be issued during the REBUILD utility processing.

Problem determination

Message DSNU548I is issued before this abend and specifies which index was in a 'PSRDB' (page set rebuild pending) state. The LOAD or REORG utility could not process an index in such a state and abnormally terminated. 'PSRDB' is set for secondary indexes of a partitioned table space and indicates that the index might be physically inconsistent. This occurs when a Db2 utility physically alters such an index during utility processing (that is, during the build process for that index). If the utility is unable to complete that process, the index is left in the 'PSRDB' state and must be rebuilt before Db2 can use it.

00E4030E

Explanation

In REORG with SHRLEVEL CHANGE, during processing of the log, a log record is inconsistent with the table that maps between old and new RIDs. Specifically, one of these is true:

- The log record implies that before an update, the data record was a pointer data record, but the mapping table implies that the data record was a regular or overflow data record.

- The log record implies that before an update, the data record was a regular or overflow data record, but the mapping table implies that the data record was a pointer data record.

System action

The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

System programmer response

This is an internal error. Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E4030F

Explanation

After the last iteration of log processing, one or more index keys in the shadow copy are not unique.

REORG with SHRLEVEL CHANGE operates as follows:

1. Unloads data from the original copy of the area (table space or partition) being reorganized
2. Reloads into a shadow copy of that area
3. Iteratively applies the log (which records applications' writing of the original copy) to the shadow copy so that the shadow copy and the original copy contain the same data

If the table space has any unique indexes, those indexes will enforce uniqueness of the relevant index

keys in the original copy. Those index keys should also be unique in the shadow copy.

System action

The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

System programmer response

This is an internal error. Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40310

Explanation

An error occurred during the restart of a LOAD or REORG utility execution. An appropriate error message is issued.

System action

The utility is abended.

User response

Respond to the error message issued prior to the abend by making the correction in the input as indicated. Then restart the LOAD or REORG utility execution.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40311

Explanation

Commit processing failed because of one of the following reasons:

- One of the resource managers voted NO.
- The service controller (SC) subcomponent responded NO on a prepare-to-commit notification.
- A resource unavailable condition or a timeout condition prevented completion of commit processing.

System action

Utility processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Check for a resource unavailable condition in message DSNT500I or a timeout condition in message DSNT376I. Correct the condition. Then take one of the following actions:

- Restart the utility from the last commit point.
- Terminate the utility and start it again from the beginning.

Problem determination

The problem might be due to a communication error. Refer to the CAUSE field in the corresponding DSNU016I or DSNU017I message.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40312

Explanation

An error occurred during abort processing.

System action

The utility is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40313

Explanation

An error occurred while the first or next key entry was being retrieved from an index.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40314

Explanation

An error occurred while repositioning the cursor block (CUB) to the last index entry that was retrieved.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40315

Explanation

An error occurred while repositioning the main cursor block (CUB). The error occurred at the location defined by the record identifier (RID) of the last table space record that was retrieved.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40316

Explanation

An error occurred while the first or next record entry was being retrieved from a table space.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40317

Explanation

An object descriptor block (OBD) could not be found for the OBID associated with the object descriptor.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

The name of the CSECT involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40318

Explanation

An error occurred while preparing for or ending a series of data record loads or while attempting a data record load.

One possible cause for this error is that the primary space allocation for the shadow data set is too small.

System action

The utility job is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40319

Explanation

An error occurred while retrieving information from the SYSIBM.SYSTABLES catalog table.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4031A

Explanation

One or more broken pages were detected in the shadow data set while copying pages for the inline copy during REORG TABLESPACE SHRLEVEL(CHANGE). Message DSNU518I in the job output identifies each broken page.

System action

The utility job is abended. An SDUMP of the database services address space (*ssnmDBM1*) is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Definitions of table spaces, tables, and indexes involved in the error.
- REPAIR dump of all SYSUTIL pages.
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period from the last IPL to the time of the failure.
- DSN1COPY-generated copy of the table and index, taken before any recovery is performed.
- Definitions of table spaces, tables, and indexes involved in the error. The object identifiers (OBIDs) identified with each table in the table space with the error can be obtained from SYSIBM.SYSTABLES.
- Copy of the log for this period, so that additional DSN1LOGP reports can be produced for problem determination.
- Printed contents of the SYSIBM.IPNAMES table.
- Printed contents of the SYSIBM.IPLIST table.

Related information

[DSNU518I \(Db2 Messages\)](#)

00E4031B

Explanation

For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming.

The original name of a data set is in the form catname.DSNDBx.dbname.pname. I0001.Annn. The shadow name of a data set is in the form catname.DSNDBx.dbname.pname. S0001.Annn. The temporary name of a data set is in the form catname.DSNDBx.dbname.pname. T0001.Annn. REORG uses such data sets for indexes as well as data.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

1

In the switch phase, it renames the original data set from the original name to the temporary name

2

In the switch phase, it renames the shadow data set from the shadow name to the original name

3

In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for Db2-managed data sets.

This abend code means that during the switch phase of REORG, one of these errors was detected:

1

On rename 1, a data set with a temporary name already exists.

2

On rename 2, a data set with an original name already exists.

These error conditions can arise for a Db2-managed or user-managed data set.

Message DSNU360I also appears, with the name of the data set and with a context code of 1, or 2.

System action

The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

User response

Take one of the following actions:

- Delete the data set and then restart the utility.
- TERM the utility. Delete the data set before trying to execute REORG again with SHRLEVEL REFERENCE or CHANGE.

00E4031C

Explanation

For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or

CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming.

The original name of a data set is in the form `catname.DSNDBx.dbname.pname. I0001.Annn`. The shadow name of a data set is in the form `catname.DSNDBx.dbname.pname. S0001.Annn`. The temporary name of a data set is in the form `catname.DSNDBx.dbname.pname. T0001.Annn`. REORG uses such data sets for indexes as well as data.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

- 1** In the switch phase, it renames the original data set from the original name to the temporary name
- 2** In the switch phase, it renames the shadow data set from the shadow name to the original name
- 3** In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for Db2-managed data sets.

If a -TERM UTILITY is issued after any renaming, the -TERM UTILITY undoes the renaming that the REORG performed by renaming:

- 4** The original data set from the shadow name to the temporary name
- 5** The shadow data set from the original name to the shadow name
- 6** The original data set from the temporary name to the original name

During REORG, or during -TERM UTILITY, an attempt to rename a data set failed due to a system problem. This error condition can arise for a Db2-managed or user-managed data set.

Message DSNP027I also appears, with the old and new names of the data set and with other information.

System action

The job step that caused the function to be requested abends. The utility job or the -TERM UTILITY command is placed in the stopped state.

System programmer response

This is an internal error. Determine the failing environment. If you suspect an error in Db2, you might

need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

If this condition arises during renaming 1, 2, or 3, and you can correct the problem. Choose between these actions:

- Correct the problem and then RESTART the utility.
- TERM the utility.

If this condition arises during renaming 1, 2, or 3, and you cannot correct the problem, TERM the utility and notify the system programmer.

If this condition arises during renaming 4, 5, or 6, notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IDCAMS LISTCAT output for the ICF (VSAM) catalog that contains the Db2 subsystem catalog that defined the failing index or table.
- VTOC listing of the disk volume on which the failing operation occurred.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E40320

Explanation

A failure occurred while attempting to restart the RELOAD phase of the LOAD or REORG utility.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40321

Explanation

An error occurred while retrieving information from the SYSIBM.SYSCOLUMNS catalog table.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40322

Explanation

An error occurred while attempting to add an entry to an index.

System action

Processing of the index for which the error occurred is terminated. The index is internally identified as an unavailable resource. A utility error message identifies the index for which the error occurred. An SVC dump of the database services storage is requested but will be suppressed if a previous 'resource unavailable' message has been issued to document the condition. The processing of index entries for other indexes proceeds.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40323

Explanation

An error occurred during the execution of a LOAD or REORG utility. Prior to this abend, error messages identifying the specific problem were issued. The abend is issued so that work data sets, which will be needed if the utility is restarted, are saved.

System action

Utility processing is abended. No SYSABEND dump or SVC dump is requested.

User response

Respond to the error messages issued prior to the abend. Correct the input and either -TERM the utility and resubmit it or resubmit the utility with the RESTART parameter. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

When work data sets are used and the disposition is MOD, DELETE, and CATLG,

(DISP=(MOD,DELETE,CATLG)), this abend still allows you to restart the utility. Refer to the prior error messages to determine how to correct the problem.

00E40324

Explanation

An error occurred during the construction of an index entry. The error occurred while extracting the key from the table space.

System action

The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40325

Explanation

An error occurred during the construction of an index. The error occurred while loading the index entries into the index page set.

System action

The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40326

Explanation

An error occurred during the construction of an index. The error occurred during sort.

System action

The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40327

Explanation

An error occurred when Db2 retrieved information from the SYSIBM.SYSXMLRELS catalog table.

System action

The utility job abnormally terminates. Db2 requests a SYSABEND dump of batch storage.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

Related reference

[SYSXMLRELS catalog table \(Db2 SQL\)](#)

00E40333

Explanation

An error occurred while attempting a forced write of RELOAD phase data buffers.

System action

RELOAD phase processing is terminated. An SDUMP of the database services address space (ssnmDBM1) is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40334

Explanation

LOAD or REORG utility processing was attempting to retrieve COLUMN information from the SYSIBM.SYSFIELDS catalog table when an error was detected.

System action

Utility processing is abended. An SDUMP is requested unless this abend is accompanied by a DSNT500I message written to the SYSPRINT data set.

System programmer response

Correct the indicated error, if possible, and resubmit the terminated utility job with the RESTART parameter. If the problem can not be corrected, and if you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

If this abend is due to an unavailable resource, message DSNT500I provides sufficient problem determination and correction information. Register 2 contains a secondary reason code that might provide additional information.

00E40335

Explanation

An error has been detected while attempting to read a row from the SYSIBM.SYSRELS table.

System action

The utility job is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40336

Explanation

LOAD or REORG utility used the DSNXIFPS protocol to invoke a field procedure for encode or decode and an error code was returned that indicates a Db2 internal error.

System action

Utility processing is abended. An SDUMP is requested.

User response

Notify the system programmer.

Problem determination

This is an internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40340

Explanation

The LOAD or REPAIR utility used the DSNXVCCR protocol to invoke a conversion routine for a date/time data type. An error code was returned that indicates a Db2 internal error.

System action

The utility job is abended. An SDUMP of the database services address space (ssnmDBM1) is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40341

Explanation

A failure occurred during reset processing for a LOAD REPLACE or LOAD PART REPLACE utility.

System action

The utility job is abended. An SDUMP of the database services address space (ssnmDBM1) is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40343

Explanation

The LOAD or REORG utility used the DSNJCKLO protocol to obtain the current log RBA. An error code was returned that indicates a Db2 internal error.

System action

The utility job is abended. An SDUMP of the database services address space (*ssnmDBM1*) is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40345

Explanation

The subtask performing an MVS sort terminated abnormally.

System action

Any error message generated by sort in conjunction with the abend is directed to the device/data set identified by the UTPRINT DD statement in the utility job step.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

User response

Determine the cause of the error. If the error can be corrected, the utility can be restarted from the beginning of the reload phase by using the 'RESTART(PHASE)' parameter. If the error prevents the utility from completing, the -TERM command should be issued to remove the stopped utility from the system.

Problem determination

This error can be caused by abend 00E40005 and error message DSNU044I issued from the subtask. If

this is the case, correct the error causing the subtask to abend. In most cases, the error messages from SORT that are sent to the device/data set identified by the UTPRINT DD statement identify the problem. The dump might not be needed. If SORT is unable to open the UTPRINT data set, only the message and abend are provided. In this case, correct the problem associated with the UTPRINT DD statement, and restart the job with the RESTART(PHASE) option.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40346

Explanation

The LOAD or REORG subtask creating a COPY data set terminated abnormally.

System action

Any error message generated by the subtask in conjunction with the abend is directed to the device and data set identified by the SYSPRINT DD statement in the utility job step.

Operator response

An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

User response

Determine the cause of the error. If you can correct the error, restart the utility from the beginning of the reload phase by using the 'RESTART(PHASE)'

parameter. If the error prevents the utility from completing, issue the -TERM command to remove the stopped utility from the system.

Problem determination

This error can be caused by out of space situations on the data sets identified by the COPYDDN and RECOVERYDDN keywords. If this is the case, correct the data set allocations and restart the job with the RESTART(PHASE) option.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00E40347

Explanation

This utility's main task is abending because one of its subtasks terminated abnormally. The subtask itself issues an abend before this one is issued.

System action

Any error message generated by the subtask in conjunction with the abend is directed to the device and data set identified by the SYSPRINT DD statement in the utility job step.

Operator response

An operator with SYSOPR authority can issue the TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

User response

Determine the cause of the error in the subtask. If you can correct the error, restart the utility from the

beginning of the phase by using the 'RESTART(PHASE)' parameter. If the error prevents the utility from completing, issue the TERM UTILITY command to remove the stopped utility from the system.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00E40350

Explanation

An error has been returned from LOB MANAGER insert or retrieve.

System action

Utilities processing is abended.

User response

Register 2 contains a secondary Db2 reason code that will give more information about the problem. Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40351

Explanation

LOAD RESUME YES for a table space containing a table with CLOB, BLOB or DBCLOB columns cannot be restarted in the RELOAD phase with the RESTART(PHASE) parameter.

System action

Utilities processing is abended.

User response

Either terminate or restart the utility.

To restart the utility: Specify the RESTART parameter on the utility job to restart at the last commit point.

To terminate the utility: Use the -TERM UTILITY command to terminate the utility, then run the CHECK LOB utility to identify any LOBs in the LOB table space that are not associated with a row in the base table.

Related tasks

00E40353

Explanation

An error was detected while reorganizing a LOB table space.

System action

Utilities processing is abended.

User response

Register 2 contains a secondary Db2 reason code that will give more information about the problem. Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

00E40355

Explanation

An error was detected while unloading or reorganizing a table space. A seclabel column was found to be in error.

System action

Utilities processing is abended.

User response

Register 2 contains a secondary Db2 reason code that will give more information about the problem. Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40356

Explanation

The LOAD utility used the DSNXVNUM protocol to invoke a conversion routine for decimal floating-point data type. An error was returned that indicates an environmental error.

System action

The utility job is abended. An SDUMP of the database services address space (*ssnmDBM1*).

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

If the reason code is 24 ('18'X), then the failure is caused by an incorrect Language Environment (LE) system error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40357

Explanation

An error was detected during REORG processing after an ALTER TABLE statement with a DROP COLUMN clause was issued.

System action

The utility job is abended. An SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40358

Explanation

An internal error occurred when the compression dictionary data set (CDDS) was accessed.

System action

The utility is placed in the stopped state.

Operator response

If the utility is holding resources that are required by other jobs, issue the -TERM UTILITY command to release the held resources.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- IDCAMS PRINT output of the CDDS data set, or a copy of the CDDS data set.

00E40401

Explanation

An error has been detected while scanning for a specified key in REPAIR by KEY processing.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40403

Explanation

An error has been detected while scanning for the requested RECORD during REPAIR by record processing.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40404

Explanation

An error has been returned from the get-page function, DSNBGETP.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the

JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40405**Explanation**

An error has been returned from the open-piece function, DSNBOPPP.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40406**Explanation**

An error has been returned from the replace-page function, DSNBRELP.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40410**Explanation**

The data manager protocol DSNISETR returned an error.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

00E40411

Explanation

An error has been returned from a DSNIDLET or DSNODELL protocol during REPAIR DELETE processing.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

00E40413

Explanation

An error has been detected by the REPAIR utility.

System action

The utility job step is placed in the stopped state. Message DSNT500I might be issued in conjunction with this error.

Problem determination

A DSNT500I error message issued in conjunction with this error might indicate a correctable problem. If DSNT500I was issued in conjunction with the error, correct the conditions that it describes and try the request again.

If the DSNT500I message has not been issued or if the problem can not be corrected, collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

Related information

[DSNT500I \(Db2 Messages\)](#)

00E40414

Explanation

An error was detected while trying to determine the highest member ID in the data sharing environment. This is an internal error.

System action

Utilities processing is abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40415

Explanation

An error was detected while trying to determine the member name for the data sharing member ID. This is an internal error.

System action

Utilities processing is abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E40417

Explanation

An object descriptor block (OBD) could not be found for the object identifier (OBID) that is associated with the object descriptor. Either the database descriptor (DBD) address or the OBID is zero.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This code identifies an internal error. The name of the control section (CSECT) that is involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- The DBID and OBID shown in the abend diagnostics that precede the DSNU016I message in the failing utility job step.

Related information

[DSNU016I \(Db2 Messages\)](#)

00E40500

Explanation

An error was returned by the reset function, DSNPRSPS or DSNPREST.

System action

Utilities processing is abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This abend might be accompanied by one or more DSN messages to the operator's console. The DSN messages might indicate a user error that can be corrected. If DSN messages do not accompany this message, the likely cause of the abend is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40517

Explanation

An object descriptor block (OBD) could not be found for the object identifier (OBID) that is associated with the object descriptor. The failure occurred accessing the object descriptor for the Db2 Catalog.

System action

The utility job is abended. A SYSABEND dump of batch storage is requested.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This code identifies an internal error. The name of the control section (CSECT) that is involved is given in VRARRK5. The full CSECT name given in the dump title.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.
- The DBID and OBID shown in the abend diagnostics that precede the DSNU016I message in the failing utility job step.

Related information

[DSNU016I \(Db2 Messages\)](#)

00E40600

Explanation

There was a utility abend on the batch side of Db2. This abend can be issued by either the CATMAINT or the REPAIR DBD utility. The utility terminates and all work up to the time of abend is backed out.

System action

The execution unit driving this function proceeds normally. A user dump is requested.

Operator response

Notify the system programmer, request the user dump, and print the SYS1.LOGREC, and the BSDS.

System programmer response

If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

SYSOUT might contain the record being processed at the time of abnormal termination.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

2

Address of the error message

5

Address of the load table

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40601

Explanation

There was a utility abend in the Db2 database services address space (*ssnmDBM1*).

This abend can be issued by either the CATMAINT or the REPAIR DBD utility. The utility terminates and all work up to the time of abend is backed out. This error occurs when CATMAINT receives a non-zero SQL code when issuing SQL statements to alter the catalog.

System action

The execution unit driving this function proceeds normally.

Operator response

Notify the system programmer, request the SVC dump, and print the SYS1.LOGREC, and the BSDS.

System programmer response

Check the DSNU778I message in the job output.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

If this reason code is issued as the result of running the CATMAINT job during a migration effort, and it is accompanied by SQL code -601, perform the following steps:

1. Terminate the CATMAINT job.
2. Fall back to the previous version of Db2 for z/OS.
3. Drop the object name that is identified by SQL code -601.
4. Redefine the object name that is identified by SQL code -601 with IDCAMS.
5. Update to the version of Db2 for z/OS that you are migrating to.
6. Run the CATMAINT job again.

If this reason code is issued as the result of running a REPAIR DBD DIAGNOSE job, you might need to report the error to IBM software support.

Problem determination

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR

Content

2

Address of the error message

7

Address of CT

Check the utility job output for detailed error messages and resolve them.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40706

Explanation

The CHECK DATA utility detected an error while processing primary keys matching. The data manager protocol DSNKSET returned an error.

System action

Utility processing abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40707

Explanation

The CHECK DATA utility detected an error while processing primary keys matching. The data manager protocol DSNKNEX returned an error.

System action

Utility processing abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40708

Explanation

The CHECK DATA utility detected an error while positioning records for cascade delete processing. The data manager protocol DSNISSETD returned an error.

System action

Utility processing abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E40709

Explanation

An error has been detected by the CHECK DATA utility during positioning of records for cascade delete processing. The data manager protocol DSNINEXD has returned an error.

System action

Utilities processing is abended.

Operator response

Notify the system programmer.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the error condition identified by the DSNT500I message, terminate the utility and restart it from the beginning.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E4070A

Explanation

The CHECK DATA utility detected an error during insert records processing. The data manager protocol DSNISRT returned an error.

System action

Utility processing abended.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Review the definition of the exception tables involved to determine if the following conditions are causing the error:

- The exception table has referential constraints.
- The exception table has unique indexes.
- The exception table "table-name2" is identical with "table-name1" in the FOR EXCEPTION keyword.

If none of these is the cause, notify the system programmer.

Problem determination

If the errors listed in the User Response section are not the cause, this is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E4070D

Explanation

An error was detected while attempting to update the EPOCH column of SYSIBM.SYSTABLEPART table.

System action

Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. For an explanation of the *resource-type* value, see [Resource types](#).

If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem determination

If the condition cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E4070F**Explanation**

An error was detected during the execution of a restarted utility. A message is issued prior to this abend code to indicate the type of error.

System action

Utility processing is abended.

User response

Check messages issued prior to this abend code to determine the cause of the error. Correct the error, and restart the job.

Problem determination

This abend is forced to allow restart of the utility when work data sets are used and the disposition is (MOD,DELETE,CATLG).

00E40800**Explanation**

When the utility performs dynamic allocation of sort data sets, the total number of data sets in each sort group must be less than 255. This reason code might be issued after message DSNU3341I.

System action

Utility processing abends.

System programmer response

Provide more disk space for sort work data sets by either adding volumes to the sort pool or by defragmenting the existing sort volumes. Then resubmit the job.

Problem determination

Sort work data sets are allocated in primary quantities only, so this error occurs when the sort volumes are very fragmented or are used to their full capacity.

Verify the number of free tracks and the size of the largest contiguous block of tracks on your sort volumes to see whether more volumes need to be added to the sort pool or if defragmentation is necessary. Defragmentation might be required if many

tracks are still available on each volume but the largest contiguous block is very small.

Related information

[DSNU3341I \(Db2 Messages\)](#)

00E40900**Explanation**

The DIAGNOSE utility forced an ABEND. The specified instance of the specified utility TRACEID or message, from the DIAGNOSE ABEND utility input statement, was encountered during utility processing while DIAGNOSE mode was on.

System action

The utility is abended as requested.

User response

Continue with the diagnosis procedure in progress.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The ABEND option of the DIAGNOSE utility was invoked to force an abend on a particular instance of a specified utility TRACEID or message. The instance of that TRACEID or message was encountered during utility processing while DIAGNOSE mode was active and an abend was forced to occur at that point.

00E40901**Explanation**

The DIAGNOSE utility failed while attempting to set the batch utility address space nonswappable.

System action

Utility processing is abended.

System programmer response

Determine the environment for the SYSEVENT TRANSWAP failure. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Terminate the utility and restart it from the beginning. If the problem persists, wait until fewer applications are running on the system before resubmitting the job.

Problem determination

The DIAGNOSE utility attempted to set the batch utility address space nonswappable by issuing a SYSEVENT TRANSWAP operation. The operation failed to set the address space nonswappable.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E40902

Explanation

A bad parameter has been detected for the DIAGNOSE WAIT function.

System action

Utilities processing is abended. An SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00E40903

Explanation

An error has been detected while creating the service task for the DIAGNOSE WAIT function.

System action

Utilities processing is abended. An SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

,

00E40904

Explanation

An error has been detected during the DIAGNOSE WAIT function.

System action

Utilities processing is abended. An SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

,

00E40905

Explanation

An error has been detected while deleting the service task for the DIAGNOSE WAIT function.

System action

Utilities processing is abended. An SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

,

00E40906

Explanation

An error has been detected while issuing a WTOR message.

System action

Utilities processing is abended. An SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

,

00E40907

Explanation

An error has been detected while attempting to map externals to a specific database descriptor (DBD).

System action

Utilities processing is abended. The abend may be accompanied by message DSNT500I. An SDUMP may be taken.

Operator response

Notify the system programmer.

System programmer response

If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the

problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Correct the 'resource unavailable' condition identified by the DSNT500I message and either restart the utility from the last commit point or terminate the utility and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary Db2 reason code that will give more information about the problem.

Problem determination

See message DSNT500I in this manual. For an explanation of the *resource-type* value, see [Resource types](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

00E40908

Explanation

The utility function is unable to process the data because the data type of the column was altered from DECIMAL(19,0) to BIGINT, but a value in the column is outside the range of BIGINT.

System action

Utilities processing is abended. The utility job is placed in the stopped state.

Programmer response

Alter the column data type back to DECIMAL(19,0) and refer description of the ALTER TABLE statement for information about how to change DECIMAL(19,0) columns to BIGINT.

Related concepts

Numeric data types (Db2 SQL)

Related reference

ALTER TABLE statement (Db2 SQL)

00E41000**Explanation**

An internal error has occurred. A utility general service was called incorrectly.

System action

The utility job step is placed in the stopped state.

Operator response

None

System programmer response

This abend should never occur. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

The general services DSNUGDYN and DSNUGTDS can be bypassed by not using TEMPLATE dynamic allocation.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
- UTPRINT output, produced by utility invocation of SORT.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (for 04E and 04F abends). Availability of this dump is dependent on the failing environment.

- SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent on the failing environment.

00E41002**Explanation**

An error occurred during the loading of an XML column.

System action

The utility job is abended. A SYSABEND dump is requested.

User response

Notify the system programmer.

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E4D5D2**Explanation**

This abend is placed at logic points that will occur only through a programming error.

System action

Utility processing abends.

User response

Any 00E4D5D2 is an internal error. The abend message identifies the module and offset that is in error.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E4E2D7

Explanation

Thisabend is issued by the following Db2-supplied utility stored procedures:

- DSNUTILS
- DSNUTILU
- DSNUTILV

An unexpected SQL error occurred during the execution of the stored procedure. These errors are usually caused by an environment or installation problem.

System action

The stored procedure abnormally terminates with SQLCODE -471.

System programmer response

Check the WLM address space for the routine that is specified in the message for the -471 SQLCODE

to determine the cause of the problem. Review the installation process and ensure that the correct levels of libraries were used, and that all of the installation steps were followed.

User response

Notify the system programmer.

Problem determination

If you cannot correct the problem, gather information about the failing environment.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Detailed description of events immediately prior to and during theabend.
- Output from the BIND attempt.
- All dumps created by this failure.

Chapter 19. X'E5.....' codes

Reason code identifiers that begin with 00E5 communicate normal and error situations with the agent services manager.

00E50001

Explanation

A latch acquisition request violates latch deadlock prevention protocols. If the request was unconditional, the execution unit owns a latch at a level equal to or greater than the level of the requested latch. If the request was conditional, the execution unit already owns a latch at the requested level. This is a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer of the abend.

System programmer response

Collect the necessary diagnostic material. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This abend is issued by the in-line expansions of the latch acquisition macros DSNVLTHS and DSNVLTHX.

At the time of the abend, diagnostic information has been placed in general registers 2 through 5.

Register

Contents

2

Latch class number (1-32).

3

Address of the latch.

4, 5

Latch class name (1 to 8 characters, left-justified).

Registers 2-12 of the invoking module were saved in the save area pointed to by register 13 at the time the error was detected.

It is the responsibility of the requesting resource manager to have functional recovery in place before requesting a latch. It is expected that a record will

be written to SYS1.LOGREC and a Db2 SVC dump will be requested. Examine SYS1.LOGREC and, if available, the SVC dump to determine the subcomponent and module requesting the latch.

00E50002

Explanation

A release latch request was issued for a latch not held by the requesting execution unit. This is a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer of the abend.

System programmer response

Collect the necessary diagnostic material. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This abend is issued from within the in-line expansions of the latch release macros DSNVUNLS and DSNVUNLX and from module DSNVXULO.

At the time of the abend, diagnostic information is placed in general registers 2 through 5.

If the abend is issued from the in-line expansion macros, then the registers are set as follows:

Register

Contents

2

Latch class number (1-32)

3

Address of the latch

4, 5

Latch class name (1-8 characters, left justified)

If the abend is issued from DSNVXULO, then the registers are set as follows:

Register Contents

- 2** Latch class number (1-32)
- 3** Address of the latch
- 4** Address of the holder of the latch
- 5** First waiter for the latch

Registers 2-12 of the abending module were saved in the save area pointed to by register 13 at the time the error was detected.

It is the responsibility of the requesting resource manager to have functional recovery in place while holding a latch. A record is written to SYS1.LOGREC, and a Db2 SVC dump is requested. Examine SYS1.LOGREC and, if available, the SVC dump to determine the subcomponent and module requesting the latch.

00E50003

Explanation

An execution unit that is requesting a latch already owns that latch. This is a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50004

Explanation

An error was found while attempting to resume a waiter after a latch was released. This abend is issued when the next resource options block (ROB) to be resumed is the same as the immediately previous ROB. That is, the ROBCHNA of a ROB points to itself.

System action

The current execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC, and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50005

Explanation

A resource options block (ROB) which was to be added to a latch waiter chain was discovered to be on the chain already. The same ROB cannot be on the same latch waiter chain twice. This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register three contains the address of the ROB which would have been added to the latch waiter chain.

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50006

Explanation

An execution unit which, according to tracking information, is currently suspended on a latch waiter chain issued a request to acquire a latch. A single execution unit cannot be doing both at the same time. This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50007

Explanation

An execution unit which, according to tracking information, is currently suspended on a latch waiter chain issued a request to test or to release a latch. A single execution unit cannot be doing both at the same time. This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50008

Explanation

A latch manager module detected that an execution unit requesting latch manager service pointed to an invalid execution block (EB). This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50009

Explanation

A latch manager module detected an invalid resource options block (ROB) while processing a request for service. This is probably a Db2 subsystem error.

This may be either an abend reason code or a Db2 subsystem termination code.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50012

Explanation

A caller in TCB mode requested the SRB redispach function. SRB redispach can only be requested by SRB-mode callers. This is probably a Db2 subsystem error.

System action

The requesting task is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic material. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine in DSNVSDC0 creates diagnostic material, an entry in SYS1.LOGREC and a Db2 SVC dump is requested. These must be examined to determine the task and resource manager which made the illegal request.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50013

Explanation

A Db2 execution unit has been abended. This abend code must ultimately be issued by resource managers when the CANCEL exit is driven as a result of a suspend request.

System action

The agent cancel processing continues.

Normally, this situation does not result in a dump. However, a dump might result if the situation is encountered by other resource managers, outside of Db2. When that happens, the dump can be ignored or suppressed.

Operator response

Notify the system programmer only if the abend results in the termination of the Db2 subsystem.

System programmer response

This reason code may be issued as a result of any connected TCB abend, or operator -STOP DB2 MODE(FORCE) command. No further action is required.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If Db2 abends, examine the SVC dump to determine the suspended resource manager and the state of the

failing subcomponent. For example, the ACEMC (must complete) bit should be off.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50014

Explanation

Either the execution block (EB) or the agent services global communication area (VGCA) was invalid. The error was detected when the agent services resume function attempted to resume a TCB in an address space other than the primary of the resume requester. This is a subsystem error.

System action

The error is percolated (passed) to the recovery routine for the TCB that was to have been resumed.

Operator response

Notify the system programmer.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An entry is written to SYS1.LOGREC, and a Db2 dump is requested by the FRR DSNVSRP. Examine the SVC dump and determine the resource manager module requesting the resume operation. Register 3 contains the SRB address. Register 5 contains the EB address. If the VGCA is invalid, its address is in register 8. The EB in question is that of the target TCB.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50015**Explanation**

The MVS control block (either RB or STSV - SRB Status Save Area) that was the intended object of a resume request was invalid. The RB or STSV address was obtained from the Db2 EB (execution block) at offset X'1C' This is a subsystem error.

System action

If the CSECT that abends is DSNVRSRB, the error is percolated (passed) to the recovery routine for the TCB that was to have been resumed. If the CSECT that abends is DSNVSR, the error is percolated to the Db2 SRB recovery task DSNVRCT. Ultimately, the subsystem may be terminated abnormally. If the CSECT that abends is DSNVSDC0, the error will be retried one time and, if unsuccessful, the Db2 subsystem is terminated with a 00E50054 reason code.

Operator response

Notify the system programmer.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry and a Db2 SVC dump are requested by the FRR DSNVSRR and by the recovery routine in DSNVSDC0. Register 6 contains the target EB address.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E5001A**Explanation**

A CANCEL THREAD command caused the thread to be terminated. A dump is provided for diagnostic purposes as a result of the CANCEL command DUMP keyword.

System action

Db2 writes a SYS1.LOGREC record and requests an SVC dump. The execution unit abends.

Operator response

Notify the system programmer.

System programmer response

The command might have been used to terminate a thread that was in a state where no processing was occurring and the thread could not continue.

If you suspect an internal Db2 error, obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (Db2, IMS, CICS, or TSO).

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

The module that was suspended while waiting for some action to be taken is the module that issued the abend.

00E50029**Explanation**

The Agent Services function which establishes the Db2 tasking structure abends with this reason code following the detection of a load module which was loaded without the 31-bit addressing capability. The abend is preceded by message DSNV029.

System action

Subsystem start-up is terminated.

System programmer response

See message DSNV029I.

00E50030

Explanation

A request was made to initialize an already-initialized Db2 address space. This is a subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Examine the SVC dump and determine the resource manager module (contents of register 14 in save area pointed to by register 13) that invoked DSNVASIM.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 6 contains the address of the EB. Field EBPASCE contains the ASCE address of the address space to be initialized.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50031

Explanation

An agent termination request was issued from a secondary execution unit for an agent created with APLOPT=1. This is an invalid use of the terminate allied agent function.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Determine the resource manager module that invoked DSNVTRTH. Register 14, in the save area pointed to by register 13, contains the return address of the invoking module. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

A record is written to SYS1.LOGREC, and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50032

Explanation

An agent services manager functional request was issued with an invalid specification of the ACE operand. This is an invalid use of the requested service.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Verify that the ACE control block is a valid allied agent. If you suspect an error in Db2, If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 1 at entry to the module normally contains the ACE address. However, if register 1 at entry to DSNVTRTH is zero, then the address at register 6 is the ACE address to be terminated. That address points to the EBROB which, in turn, points to the ROBACE.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50035

Explanation

During the processing of a request to perform system agent allocation, a resource manager returned a nonzero return code from an allocation notification. This is a subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The error is recorded on SYS1.LOGREC, and an SVC dump is requested. Register 7 contains the nonzero allocation return code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50036

Explanation

A request was made to perform system agent allocation for an agent that had already been allocated.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The error is recorded on SYS1.LOGREC, and an SVC dump is requested. The fullword address at register 6, which points to the EBROB, should have been zero. That address points to the ROBACE which, in turn, points to the ACERAL.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50040

Explanation

Db2 subsystem termination was invoked following an unrecoverable error while processing a terminate allied agent request at the thread, sign on, or identify level. The FRR (DSNVTFR) covering module DSNVTRTH was unable to recover. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50041

Explanation

Db2 subsystem termination was invoked following an unrecoverable error while processing a terminate agent structure request. The FRR (DSNVTFR) covering module DSNVFACE was unable to recover. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50042

Explanation

An execution unit which, according to tracking information, is currently suspended on a latch waiter chain is in the agent termination process. This may indicate that a latch manager request is still incomplete or has not been serviced properly. This is probably a Db2 subsystem error.

System action

The current execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50044

Explanation

A terminate agent request was issued for an agent with an active unit of recovery (URE). This is an invalid use of the terminate allied agent service and is a subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The error is recorded on SYS1.LOGREC, and an SVC dump is requested. Register 1 at entry to the module contains the ACE address of the agent to be terminated. The ACEURE field should have been zero.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50045

Explanation

Db2 subsystem termination was invoked following an unrecoverable error while processing a create allied agent service request at the thread, sign on, or identify level. The FRR (DSNVCFRR) covering module DSNVCRTN was unable to recover. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50046

Explanation

Db2 subsystem termination was invoked following an unrecoverable error while processing a create agent structure request. The FRR (DSNVCFRR) covering module DSNVGACE was unable to recover. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50047

Explanation

Db2 subsystem termination was invoked following an unrecoverable error while processing a Format EB RMRQ request. The FRR (DSNVCFRR) covering module DSNVFEB was unable to recover. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50050

Explanation

The MVS cross-memory lock (CML) of the system services address space (*ssnmMSTR*) was held by the invoking resource manager execution unit during invocation of the cancel, suspend, resume, or SRB redispach functions. This violates the entry protocols for these functions.

System action

The requesting execution unit is abended.

Because resource manager serialization cannot be maintained without the use of this lock, normal recovery is not possible for this abend. The recovery routine terminates the Db2 subsystem through invocation of the agent services subsystem termination protocol.

An '00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA, indicating that synchronization services was responsible for Db2 subsystem termination.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Internal protocols specify that no MVS locks may be held at DSNVSR or DSNVSDC0 invocation

Determine the invoking resource manager, the function requested, and the current owner (ASCB) of the CML lock at the time of the error. Diagnostic information for this error may be obtained through the SYS1.LOGREC and Db2 SVC dump materials provided.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50051

Explanation

The resource manager requesting the resume function specified the TCTL=YES option while executing in TCB mode. This violates the entry protocols for this function. This is a subsystem error.

System action

Mainline processing is abended with an '04E' abend code and this reason code.

Because this error is an internal resource manager protocol violation, normal recovery is not possible for this abend. The recovery routine terminates the Db2 subsystem through invocation of the agent services subsystem termination protocol. An '00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for Db2 subsystem termination.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Internal protocol documentation specifies that the TCTL=YES option is valid only for resource managers executing in SRB mode at time of invocation. Determine the invoking resource manager at time of error. Diagnostic information for this error may be obtained through the SYS1.LOGREC and Db2 SVC dump materials provided.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50052

Explanation

The MVS cross-memory lock (CML) of the system services address space (*ssnmMSTR*) could not be released during termination processing of the cancel, suspend, resume, or SRB redispatch functions.

System action

Mainline processing is abended with an '04E' abend code and this reason code.

Because resource manager serialization can no longer be maintained without the use of this lock, normal recovery is not possible for this abend. The recovery routine terminates the Db2 subsystem through invocation of the agent services subsystem termination function.

An '00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for Db2 subsystem termination.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

For this abend to occur, the CML lock must have been successfully obtained at some point during mainline processing. Determine the invoking resource manager, the function requested, and the current owner (ASCB) of the CML lock at the time of the error. Diagnostic information for this error may be obtained through the SYS1.LOGREC and Db2 SVC dump materials provided.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Link pack area map (LPAMAP) and nucleus load module map, obtained by executing AMBLIST.

00E50054

Explanation

The Db2 subsystem is abended by the synchronization services recovery routine when an unrecoverable error is encountered during recovery processing for the suspend, cancel, resume, or SRB redispach functions. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated. This reason code is associated with an '04F' abend code indicating that synchronization services was responsible for termination.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

One of the following conditions was encountered during recovery processing for the requested function:

- Unable to complete resume processing for an SRB mode execution unit that was suspended at time of error.
- Errors were encountered during primary recovery processing causing entry to the secondary recovery routine.

- Recovery initiated retry to mainline Suspend/Resume code caused retry recursion entry into the functional recovery routine.
- Unable to obtain or release the cross-memory lock (CML) of the system services address space (ssnmMSTR) either during mainline processing or during functional recovery processing (for example, reason code '00E50051' or '00E50052').
- The invoking resource manager requested the TCTL=YES option of the resume function while executing in TCB mode (for example, reason code '00E50051').

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50055

Explanation

The synchronization services functional recovery routine was unable to successfully complete resume processing for a suspended TCB mode execution unit. The resume processing was requested by the cancel or resume functions. This reason code is placed in the SDWACOMU field of an SDWA.

System action

Because the suspended TCB mode execution unit must not be permitted to remain in a suspended state, the recovery routine invokes the MVS CALLRTM (TYPE=ABTERM) service to abend the execution unit with an '04F' completion code. Depending upon which execution unit was terminated, the Db2 subsystem may be abended.

Operator response

Notify the system programmer, and restart Db2 if necessary.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Scan the MVS system log and the contents of SYS1.LOGREC for Db2 abends occurring immediately

before the abend of the execution unit. Follow the failure analysis procedures for the specific abends. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Link pack area map (LPAMAP) and nucleus load module map, obtained by executing AMBLIST.

00E50059

Explanation

When preparing to resume an SRB, the target EB (execution block) was validated by checking the EB identifier code in the first halfword of the control block. The identifier code was in error.

System action

If the CSECT detecting the error is DSNVSR, the error is percolated (passed) to the Db2 SRB recovery task DSNVRCT. Ultimately, Db2 is terminated abnormally.

If the CSECT detecting the error is DSNVSDC0, the code detecting the error will be retried once. If validation fails, the Db2 subsystem is terminated abnormally with a 00E50054 reason code.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

A LOGREC entry and a Db2 dump are requested by the FRR DSNVSRR and by the recovery routine in DSNVSDC0. Register 6 contains the address of the invalid EB.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50062

Explanation

An application request (RARQ) was issued to a resource access list (RAL). At the time of the request, the RAL had the RAL suppress (RALSUPPR) flag on, and the function vector list entry (FVLE) that was accessed (through FRBFVLE) did not have FVLEBIT0 on. This is not allowed. That is, the FVLE function is not allowed during RAL suppress.

This error may indicate that an IMS/VS or CICS caller had completed Commit Phase 1 and that the next request was not Commit Phase 2, Abort, or Terminate with the Commit or Abort option. This abend is the result of an internal system problem, possibly the Db2 attachment facility or the requesting IMS/VS or CICS subsystem.

This abend reason code is issued by the following macro: DSNARARQ

System action

The allied task requesting the RARQ is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routines of the module invoking the DSNARARQ macro should have requested SYS1.LOGREC recording and either an SVC or application dump (or both.) The FRB contains the FRBRALE and FRBFVLE entries. It also contains the pointers to the RAL and to the execution block address (FRBEB). Register 3 contains the address of the RAL from FRBRAL. Register 4 contains the address of the RALE as located by the FRBRAL pointer (and as

indexed by FRBRALE). Register 6 contains the address of the EB from FRBEB.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- CICS trace listing.
- CICS attachment facility MVS SNAP dump.
- CICS transaction dump.
- IMS trace output.
- IMS dependent region, control region dump, or both.

00E50063

Explanation

A resource access request (RARQ) was issued to a function vector list entry (FVLE) that is valid but unauthorized for this allied user at this time. This abend occurs if a request is issued out of sequence. For example, two consecutive CREATE THREAD requests would give this result. This abend also occurs if a request is issued that is never authorized for the caller. For example, it occurs if a BATCH protocol user issues a PREPARE request. A program call (PC) is issued to module DSN3ABND, which issues the X'04E' abend with this reason code.

System action

The task issuing the RARQ is abended. However, Db2 recovery may translate this abend to a return code 256 with this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is a user error. The issuer of the RARQ was not authorized to use the requested function at this time. The following diagnostic information is available:

- An entry in the Db2 trace table is made for entry to module DSN3ABND. The items traced are the RALE and the FVLE of the intended DSNARARQ request. To determine the sequence of DSNARARQ requests, examine the previous trace table entries for the same execution block (EB).
- An application dump is requested with Db2-supplied control blocks. This includes the FRB associated with the intended DSNARARQ request. Fields FRBRALE and FRBFVLE contains the indexes for the intended request.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50065

Explanation

RMRQ linkage was requested, specifying a function code that is undefined in the resource manager function table (RMFT) of the designated resource manager.

System action

The execution unit under which RMRQ was requested is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine of the abended resource manager module requested SYS1.LOGREC recording and a Db2 SVC dump. Register 14 points to the resource manager module that requested linkage to the undefined function.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50069

Explanation

This abend code is issued during recovery processing for the suspend function when executing in SRB mode under the recovery routine established by the MVS SRBSTAT(SAVE) service. Because the recovery routine established by this service is the only routine in the FRR stack at the time of error, normal RTM percolation to the invoking resource manager recovery routine is not possible.

After recovery processing for the initial mainline error has successfully completed, the RTM environment is exited through retry to a routine that restores the original FRR stack. This routine then issues an '04E' abend with this reason code. This causes entry into the original recovery routine established during suspend initialization.

System action

After this abend is intercepted by the original suspend recovery routine, a SYS1.LOGREC entry and Db2 SVC dump are requested to document the original error. The original recovery reason code is placed in the SDWACOMU field of the SDWA indicating the actions performed during recovery processing of the initial error. Control is then returned to the invoking resource manager's recovery routine through RTM percolation.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Because this abend is used only to permit the transfer of the initial recovery reason code to the invoking resource manager's recovery routine, no further recovery actions are required for this abend. Diagnostic information for the initial error encountered

during mainline processing may be obtained through the SYS1.LOGREC and SVC dump materials provided.

00E50070

Explanation

This abend reason code is issued in response to a delete service task request specifying purge. Additionally, any service task not deleted by the owning resource manager at subsystem shutdown is abended with this reason code.

System action

This abend usually occurs through MVS CALLRTM and, in certain cases, is issued by the service task dispatcher executing under the TCB being abended. The service task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

If the service task is abended with a completion code of X'04F', no Db2 SVC dump is taken. Some resource managers have elected to terminate their service tasks with the purge option. Consequently, the abend may or may not be an actual error. At the time of the abend, register 6 points to the execution block (EB) of the execution unit that was active when the abend occurred. The EBSQH field in turn contains a pointer to the service queue header associated with the abending service task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50071

Explanation

This abend reason code is issued following a cancel return from the resume service during an attempt to notify the create service task requester. Because the requester has been terminated, the newly created service task must be terminated.

System action

The service task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, register 6 points to the execution block (EB) assigned to the service task dispatcher. The EBSQH field, in turn, contains a pointer to the service queue header associated with the abending service task. From the SQH, determine the requesting resource manager. Prior SYS1.LOGREC entries may indicate why the requester was terminated.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50072

Explanation

This abend reason code is issued following an unanticipated cancel return from DSNVSR for an execution unit not expected to be canceled. This code

is also a subsystem termination reason code if the abend was issued by module DSNVCST0.

System action

The Db2 subsystem is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

At the time of the abend, register 6 points to the execution block (EB) associated with the abending execution unit.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50073

Explanation

Execution unit switch processing detected an invalid execution block (EB) or an invalid resource options block (ROB). This is probably a Db2 subsystem error.

System action

The current execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and

reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address which should have pointed to a valid control block but did not.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50074

Explanation

This abend reason code is issued in response to a nonzero return code from ATTACH during an attempt to create a service task.

System action

The ATTACH is retried. If a failure occurs again, Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2 if necessary.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 2, in the SDWA, contains the return code from the ATTACH request.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50075

Explanation

On an execution unit switch request, an invalid service queue header (SQH) and/or service task identifier (STID) was specified. Alternately, the specified or implicit address space may be invalid. This is an internal Db2 protocol error.

System action

The requester is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50076

Explanation

A request was made for an execution unit switch to a service task currently undergoing delete processing. This is an internal Db2 protocol error.

System action

The requester is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch. A resource manager should not request deletion of a service task and then attempt to execute under the same task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00E50077

Explanation

A deadlock condition was encountered. A request was made to either delete or synchronously execute a service task already participating in a chain of service tasks leading to the current request. This is an internal subsystem protocol error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the function. If the recording FRR is EUS1FRRE, then the deadlock was detected by the execution unit switch service. Otherwise, the error was found during a delete service task request.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50078

Explanation

A request was received to create a service task, but the service task controller is terminating. This code is also a subsystem termination reason code if the abend was issued by module DSNVCST0.

System action

The requesting execution unit is terminated. The entire subsystem may also be terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Using the SYS1.LOGREC entry and associated SVC dump, determine the resource manager requesting the creation of a service task. Db2 was probably already terminating when this error was encountered. New service tasks cannot be created during subsystem termination.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50079

Explanation

An invalid address space (ASCE) was specified as the target of an execution unit switch request. This

can occur if the target is an allied address space or if the address space was concurrently undergoing termination.

This abend code may also be issued when a passed agent services control block is determined to be invalid.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch, suspend, resume, cancel, or SRB dispatch function. Using register 6 as a pointer to the execution block (EB), verify that the agent services control blocks (the execution block, and the ROB, or resource options block) are valid.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50080

Explanation

An execution unit (SRB or TCB) processor determined that the current MVS Functional Recovery Routine (FRR) stack contained one or more entries for FRR's which should not exist. This check is made at the conclusion of a resource manager function executing under the SRB or TCB.

System action

An SVC dump is requested specifying an abend code of X'04E' and this reason code. The extraneous FRR entries are deleted from the stack. Execution continues. The application is not notified.

Operator response

Notify the system programmer of the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

MVS console data is logged and the SVC dump is taken. No record is written to SYS1.LOGREC.

One or more resource manager functions created an FRR which was not deleted. Examine the current FRR stack in the PSA of the active CPU. The only valid stack entries are those established by Db2 and MVS Dump Services and, if DSNVEUS2, an entry established by that module. The format of the FRR stack is provided as data area FRRS in the appropriate MVS debugging guides.

00E50081

Explanation

A TCB execution unit processor determined that the list of active ESTAE exits associated with the TCB contained one or more entries for ESTAEs which should not be active. This check is made at the conclusion of a resource manager function executing under the TCB.

System action

An SVC dump is requested specifying an abend code of X'04E' and this reason code. The extraneous ESTAE entries are deleted. Execution continues. The application is not notified.

Operator response

Notify the system programmer of the SVC dump.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

MVS console is logged and the SVC dump is taken. No record is written to SYS1.LOGREC.

One or more resource manager functions created an ESTAE exit which was not deleted. Locate the TCB requesting the dump (It will be a Db2 service task in the home address space at the time the dump was requested.) Field TCBSTABB points to a chain of ESTAE Control Blocks (SCB) for active exits. The only valid SCBs are for the ESTAE exit established (with a token) by DSNVEUS3 and an ESTAI exit established when the task was created. SCBs are located in LSQA. The SCB format is provided as a data area in the appropriate MVS debugging guides.

00E50094

Explanation

The macro service to get a resource options block (ROB) determined that a ROB taken from the ROB cache was not formatted properly. This can occur if the queue which controls the ROB cache was overlaid, if the ROB itself was overlaid, or if there is a programming error in Db2.

System action

The requesting execution unit is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register zero, which should appear in the SYS1.LOGREC entry for this abend, contains the address which should have pointed to a ROB but apparently did not.

Use the SYS1.LOGREC entry and the associated dump to examine the area which should have been a ROB. It may also be helpful to examine the chain of ROBs in the cache. This chain is anchored in the Db2 DSNDVGCA control block.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50095

Explanation

The macro service to release a resource options block (ROB) determined that a ROB passed to it for release was not formatted properly and did not, in fact, appear to be a ROB at all. This can occur as a result of a storage overlay or if there is a programming error in Db2.

System action

The requesting execution unit is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register zero, which should appear in the SYS1.LOGREC entry for this abend, contains the address which should have pointed to a ROB but apparently did not.

Use the SYS1.LOGREC entry and the associated dump to examine the area which should have been a ROB.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50096

Explanation

A request was made to suspend an execution unit but the resource options block (ROB) which is required for this request is invalid. This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the necessary diagnostic materials. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address which should have pointed to a valid ROB but did not.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50097

Explanation

A request was made to resume an execution unit but the resource options block (ROB) which is required for this request is invalid. This is probably a Db2 subsystem error.

System action

The requesting execution unit is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of the abend, general register zero contains the address which should have pointed to a valid ROB but did not.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50098

Explanation

A request was made to resume an execution unit but a non-zero return code was received from the IEAMSCHD service attempting to schedule a client or enclave SRB.

System action

The requesting execution unit is abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer and rerun the application.

Problem determination

At the time of the abend, general register zero contains the return code from IEAMSCHD.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50100

Explanation

The ASCE could not be found during recover stack processing. This is an internal subsystem error.

This abend reason code is issued by the following macro: DSNVRSTK

System action

The requesting recovery routine is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Using register 6 as the address of the execution block (EB), check that field EBPASCE contains a valid ASCE address. Also determine the recovery module invoking the macro from the information provided by the SYS1.LOGREC entry and the associated SVC dump.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50101

Explanation

The agent cancel function was unable to establish an ESTAE while preparing to cancel all active allied agents during processing of the -STOP DB2 MODE(FORCE) command.

System action

The abend is passed on to a subsystem support subcomponent (SSS) ESTAE. Probably, Db2 is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

The inability to establish an ESTAE is normally due to insufficient free space in the local system queue area (LSQA) for an ESTAE control block (SCB). If necessary, increase the size of the system services address space (*ssnmMSTR*).

Problem determination

Review the associated SVC dump for usage and free areas in the LSQA subpools belonging to the system services address space.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50102

Explanation

An unrecoverable error occurred while canceling all active agents during processing of the -STOP DB2 MODE(FORCE) command. This is a subsystem termination reason code.

System action

The subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Review the SYS1.LOGREC entries for failures immediately preceding subsystem termination. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50105**Explanation**

This is an internal error.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps created by this failure.

00E50106**Explanation**

This is an internal error.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps created by this failure.

00E50107**Explanation**

This is an internal error.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps created by this failure.

00E501A1**Explanation**

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E502A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E503A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E504A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50500

Explanation

An MVS LOCAL or CML lock could not be obtained during Db2 subsystem abnormal termination processing.

System action

The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal Db2 subsystem termination is completed under a different execution unit if possible.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry is requested. Reason code '00E50504' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of subsystem termination at the time of error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50501

Explanation

An MVS local or CML lock could not be released during Db2 subsystem abnormal termination processing.

System action

The execution unit is abended. The error is recorded on SYS1.LOGREC. Db2 subsystem termination is completed under a different execution unit if possible.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry is requested. Reason code '00E50504' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of subsystem termination at the time of error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50502

Explanation

An MVS LOCAL lock could not be obtained during Db2 subsystem abnormal termination processing.

System action

The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal Db2 subsystem termination is completed under a different execution unit if possible.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry is requested. Reason code '00E50502' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of the subsystem termination at the time of error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50503

Explanation

An MVS LOCAL lock could not be released during Db2 subsystem abnormal termination processing.

System action

The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal Db2 subsystem termination is completed under a different execution unit if possible.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry is requested. Reason code '00E50503' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of the subsystem termination at the time of error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50504

Explanation

This reason code is used to define the format of the information recorded in the SDWA variable recording area (VRA) by the subsystem termination processor. The code identifies additional information provided in the VRA for abends encountered in module DSNVATRM.

System action

Recording of the error encountered during subsystem termination continues.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E50505

Explanation

This reason code is used to define the format of the information recorded in the SDWA variable recording area (VRA). The code identifies additional information provided in the VRA for abends encountered in module DSNVATR4.

System action

Recording of the error encountered during subsystem termination continues.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E505A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E506A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50701

Explanation

A failure occurred during Commit Phase 1. This abend is used to effect abort, deallocation, and end-UR processing.

System action

The Db2 subsystem is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Standard Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the abend. Register 6 contains the address of the active EB when the commit failed. The Db2 global trace table contains an entry for the commit-UR function exit. The entry contains return and reason codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50702

Explanation

An error occurred while processing in SRB mode which could not be recovered.

System action

The Db2 subsystem abnormally terminates with this reason code.

Operator response

Notify the system programmer and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump of the original failure was requested by the recovery routine for DSNVEUS2 and a record written to SYS1.LOGREC. For more information, see Appendix E, “Db2 abend completion codes (X'04E' and X'04F),” on page 1391.

00E50703

Explanation

This subsystem termination reason code is used following an error while attempting to resume a suspended execution unit. The successful completion of resume processing was indoubt.

System action

The Db2 subsystem is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50704

Explanation

An error occurred in the Db2 Service Task Controller which could not be recovered.

System action

The subsystem is terminated with this reason code. Additionally, if no SDWA was provided to the recovery routine, a subsystem termination dump is requested.

Operator response

Notify the system programmer and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If an SDWA was available, a Db2 dump of the original failure was requested and should be analyzed to determine the nature of the original error. If no SDWA was available, the standard MVS SVC dump taken by subsystem termination must be analyzed. The Service Task Controller is the first descendent TCB of the job step TCB in the failing home address space. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

00E50705

Explanation

A subsystem termination was requested for one of the following reasons:

1. An agent was flagged as executing in 'must complete' mode,
2. An execution unit holds a latch,
3. An agent is marked as being on a latch waiter queue, when none of these conditions should be true. Additionally, the subsystem termination may have been preceded by an abend with this reason code.

System action

The Db2 subsystem is abended.

Operator response

Notify the system programmer and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to the accompanying abend code to determine the failure while in 'must complete' state. Refer to Appendix E, "Db2 abend completion codes (X'04E' and X'04F)," on page 1391 for information about X'04F' and X'04E' abend completion codes.

If subsystem termination was requested by module DSNVEUS2, a standard MVS SVC dump will be generated.

The 'must complete' indicator is bit ACEMC. Latch-held indicators are in field EBLTCHLD. Latch waiter status information is in field EBLWSI.

Usually these conditions occur as the result of a prior failure where the associated recovery routine did not perform correct resource cleanup. The condition may also occur if a resource manager function does not release all latches and/or reset the 'must complete' bit before returning control to either DSNVEUS2 or DSNVEUS3.

00E50706

Explanation

Either an unrecoverable error occurred while processing an End-of-Task condition on a Db2 service task or an asynchronous service task terminated for reasons other than an explicit "Delete Service Task" request. An abend with this reason code is requested if the latter situation occurs.

System action

The subsystem terminates with this reason code. Additionally, if no SDWA was provided to the recovery routine, a subsystem termination dump is requested.

Operator response

Notify the system programmer of the failure and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If an SDWA was available, a Db2 dump of the original failure was requested and should be analyzed to determine the nature of the original error. If no SDWA was available, the standard MVS SVC dump taken by subsystem termination must be analyzed. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

00E50707

Explanation

An ESTAE could not be established to protect a service task, the service task controller, or the recovery control task. This is a subsystem termination reason code.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Review the usage and the free areas in the LSQA subpools of the two Db2 address spaces. If necessary, increase the private area size of the failing address space.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

If subsystem termination was requested by module DSNVRCT, a standard MVS SVC dump was requested. If insufficient private storage is the cause of the problem, other Db2 resource managers may have abended. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50708

Explanation

An abend occurred while connecting an allied agent to the system services address space (*ssnmMSTR*). The connection must complete so that the allied agent can be terminated.

System action

The Db2 subsystem terminates with this reason code.

Operator response

Notify the system programmer of the failure and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump of the original error was requested and a record entered into SYS1.LOGREC. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

00E50709

Explanation

Subsystem termination was requested following a failure in a service task, the service task controller, or the recovery control task that could not be recovered by the ESTAE of the failing task.

System action

The Db2 subsystem is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. Determine the registers and the failing task at the time of the error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50710

Explanation

An abend occurred while disconnecting an allied agent from its home address space. The disconnect function is required before the agent can be connected to the Systems Services address space and then terminated.

System action

The Db2 subsystem terminates with this reason code.

Operator response

Notify the system programmer of the failure and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump of the original error was requested and a record entered into SYS1.LOGREC. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

00E50711

Explanation

An error occurred in a latch manager function and the status of one or more execution units waiting for a latch is indoubt. The latch manager functional recovery routine could not determine whether all waiting execution units had been resumed.

System action

The Db2 subsystem terminates with this reason code.

Operator response

Notify the system programmer of the failure and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries looking for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump of the original error was requested and a record entered into SYS1.LOGREC. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

00E50712

Explanation

An error occurred in a latch manager function attempting to terminate the holder of a Db2 latch. The holder's TCB has been set nondispatchable by MVS and a CALLRTM to terminate this TCB has failed.

System action

The Db2 subsystem is terminated with this reason code.

Operator response

Notify the system programmer of the failure and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A Db2 dump of the error is requested and a record entered into SYS1.LOGREC. Register 3 at time of error contains the latch-holder's TCB address in the home address space and register 4 contains the return code from CALLRTM. Refer to Appendix E, "Db2 abend completion codes (X'04E' and X'04F')," on page 1391 for information about X'04E' and X'04F' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50713

Explanation

The agent services recovery control task was entered in the suspend CANCEL exit. Subsystem termination was requested with this reason code.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. It may be necessary to analyze the MVS SVC dump requested by the subsystem termination processor. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An MVS SVC dump was requested by the subsystem termination processor.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50715

Explanation

Subsystem termination was requested following an unrecoverable error in a Db2 SRB mode execution unit.

System action

The SRB-related task was abended as a result of SRB to TCB percolation. The Db2 subsystem is abended.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to the appropriate CICS documentation for information about about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50717

Explanation

The subsystem was terminated, because resource manager ESTAE exits could not be purged for the default service task.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If an abend preceded the subsystem termination request, Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50719

Explanation

A failure occurred in a service task, the service task controller, or the recovery control task and was not recovered by the ESTAE of the failing task. No SDWA was provided to the ESTAE exit. This is a subsystem termination reason code.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. Register 3 contains the abend code of the original error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Module DSNVSTAI was unable to generate a standard Db2 SYS1.LOGREC entry and SVC dump, because system diagnostic work area (SDWA) was not provided by the recovery termination management (RTM) facility of MVS. An MVS SVC dump was requested by system termination. To determine the location of the error, examine the RB structure of the failing TCB.

Db2 diagnostic information may have been obtained by other recovery routines if an abend preceded the subsystem termination request. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50725

Explanation

Subsystem termination was requested because of an unrecoverable error in a Db2 scheduled SRB-mode execution unit.

System action

The SRB-related task DSNVRCT abnormally terminated due to SRB to TCB percolation; therefore the Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. If necessary, analyze the MVS SVC dump requested by subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials obtained as a result of abends occurring prior to subsystem termination. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

An MVS SVC dump was requested by system termination. To determine the location of the error, examine the RB structure of the failing TCB. Register 1 contains the original SRB abend code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50727

Explanation

A secondary failure occurred during agent services functional recovery processing. This is a subsystem termination reason code.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends occurring immediately prior to the subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). Determine the functional recovery routine that failed and the registers at the time of the error.

Problem determination

Db2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. If the subsystem termination request was issued by module DSNVEUS2, an MVS SVC dump was requested. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50730

Explanation

A thread being processed through thread deallocation was found to still have an outstanding unit of recovery and is marked as being inflight. This is a subsystem termination reason code.

System action

The Db2 subsystem is terminated with this reason code.

Operator response

Contact the system programmer.

System programmer response

Scan the SYS1.LOGREC entries and associated console listing for one or more Db2 abends prior to subsystem termination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50731

Explanation

A critical system monitoring task has terminated because of repeated abends.

System action

Db2 terminates with this reason code.

Operator response

Notify the system programmer

System programmer response

Scan the SYS1.LOGREC entries for one or more Db2 abends immediately before the subsystem termination.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E50732

Explanation

An unrecoverable error occurred when Db2 attempted to allow a bind request to break in on an idle thread.

System action

Db2 terminates with this reason code. A record is written to SYS1.LOGREC and a Db2 SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E507A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E508A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E509A1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50AA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50BA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50CA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50DA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50EA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E50FA1

Explanation

An error was detected during processing. This error is related to one of the following protocols:

- Pause and release
- Suspend and resume

System action

The requesting execution unit terminates abnormally. A record is written to SYS1.LOGREC and an SVC dump is generated.

Operator response

Notify the system programmer.

System programmer response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Chapter 20. X'E6.....' codes

Code identifiers that begin with 00E6 communicate normal and error situations with the instrumentation facility. These codes include instrumentation facility abend codes and instrumentation facility interface reason codes.

The instrumentation facility issues X'E6.....' codes in the following fields of the instrumentation facility communications area (IFCA):

IFCARC1

Return codes.

IFCARC2

Reason codes.

For more information about the IFCA, see: [Instrumentation facility communications area \(IFCA\) \(Db2 Performance\)](#).

00E60008

Explanation

This reason code is used to indicate that MVS and Db2 dispatching units do not match. There is an internal Db2 dispatching unit problem which should not occur.

System action

The function being traced is abended. The Db2 subsystem remains operational and the functional recovery of TRACE will retry if possible.

Problem determination

The problem is either the ASID of EB primary (EBPASCE->ASCE->ASID) did not match the EPAR ASID, or the ASID of the EB home (EBHASCE->ASCE->ASID) did not match the MVS home dispatching unit (PSAAOLD->ASCB->ASID), or the PSATOLD did not match the EBEXU field. Analyze the dump and previous SYS1.LOGREC entries do isolate the cause of the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60086

Explanation

An internal logic problem occurred trying to obtain the MVS CML lock.

System action

The request is abended.

Operator response

Notify the system programmer.

System programmer response

Request the SYS1.LOGREC and SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60087

Explanation

An internal error occurred attempting to free the MVS CML lock.

System action

The request is abended.

Operator response

Notify the system programmer.

System programmer response

Request the SYS1.LOGREC and SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This error is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60088

Explanation

An internal logic problem occurred on a READS request. The event is being traced asynchronously, which is not allowed.

System action

The request is abended.

Operator response

Notify the system programmer.

System programmer response

Request the SYS1.LOGREC and SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is an internal error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60100

Explanation

The reason codes 00E60100 through 00E60199 are used by the instrumentation facility component (IFC) when a trace event occurs for which IBM service personnel have requested a dump using the DSN1SDMP utility.

System action

The abending agent might be retried or terminated, depending upon the serviceability dump request.

Problem determination

The abend is issued on the occurrence of a specified trace event. A SVC dump is taken to the SUS1.DUMPxx data set. Problem determination methods depend on the condition that IBM service personnel are attempting to trap.

The abending agent might be retried or terminated, depending upon the serviceability dump request.

Problem determination

The abend is issued on the occurrence of a specified trace event. A SVC dump is taken to the SUS1.DUMPxx data set. Problem determination methods depend on the condition that IBM service personnel are attempting to trap.

[DSN1SDMP \(Db2 Utilities\)](#)

00E60800

Explanation

The command was completed, but the return area was not large enough to accommodate all the output messages. The return area contains the last complete message segment that fit. The IFCABM field in the IFCA indicates the number of bytes moved to the return area. The IFCABNM field in the IFCA indicates the number of bytes which were not moved because the return area was too small.

User response

Allocate more storage for the return area, if desired, and reissue the request.

00E60801

Explanation

The command was partially completed, but an internal error was encountered. Check the return area for a message.

User response

Dependent upon the message in the return area.

00E60802**Explanation**

The instrumentation facility request was partially completed, but the return area was not large enough to accommodate all the output. The return area contains the last complete record that fit. The IFCABM field in the IFCA indicates the number of bytes moved to the return area for the READS or READA request. The IFCABNM field in the IFCA indicates the number of bytes that could not fit in the return area.

User response

Allocate more return area storage and reissue the request.

00E60803**Explanation**

No data was returned from the READA request because none was available. Either the OPn storage buffer was empty or the application program had already retrieved all the trace records.

00E60804**Explanation**

No data was returned from the READS or READA request, or no data was returned for at least one of the requested IFCIDs on a READS request for multiple IFCIDs. This can happen for one of these reasons:

- The destination OPx value specified in the IFCA was not active for a READA request.
- The qualification information specified did not match a process for a READS request.
- No information was available for a READS request.
- The user return area on a READS or READA request was too small to receive even a single record.

User response

If the OPn destination was not active, then activate the OPn destination or issue the request using an OPn destination that is active.

If the IFCABNM field (number of bytes not moved) is nonzero, then the user return area is too small. Increase the size of the user return area, and resubmit the request.

00E60805**Explanation**

The request for information resulted in an abend.

User response

Dependent upon the abend code in the log record. Refer to the IFCABM field in the IFCA (the number of bytes moved to the return area) to determine if partial information was returned.

Problem determination

See EREP log record in SYS1.LOGREC. See the Environmental Record Editing and Printing program (ERE) User's Guide and Reference for instructions on how to print SYS1.LOGREC.

00E60806**Explanation**

The request for information resulted in an abend, perhaps because one of the parameters on the call was invalid. If a SYSUDUMP or SYSABEND DD statement is present in your JCL, you will receive an abend dump.

User response

Dependent upon the abend code.

Problem determination

See abend code in abend dump or EREP log record in SYS1.LOGREC. Examine the parameter list. Among other possible causes, the high-order bit of the last parameter must be on in order to indicate the end of the parameter list. See the Environmental Record Editing and Printing program (ERE) User's Guide and Reference for instructions on how to print SYS1.LOGREC.

00E60807**Explanation**

The request for information resulted in an abend, possibly because either the ACE token passed was invalid or became invalid during processing. In this case, no SDUMP is taken and control returns to the application program.

User response

If your application program does not pass a token, you can reissue the previous IFI request from the application program.

Problem determination

If the application program passes an ACE token, the token is probably invalid.

00E60808

Explanation

The request for information resulted in an abend. Perhaps a Db2 structure became invalid while your application program was using it.

User response

To reduce the chance of this occurring, issue requests from a task with a higher priority than Db2 and its users. Certain requests (for example, a READS for IFCIDs 0147 and 0148) are more likely to encounter this type of problem. The request may be reissued. No SDUMP is taken and control is returned to the application program.

00E60809

Explanation

An IFI READS request for the IDCID 129 record was only partially successful. The request attempted to obtain CIs that have yet to be written. All available complete CIs were returned.

User response

No response is needed. All available CI's were returned.

Problem determination

Examine the WQALLRBA and WQALLNUM fields of the READS request. $(WQALLRBA + (WQALLNUM * 4KB)) >$ ending RBA of the last complete CI in the log.

00E6080A

Explanation

On a READS request for IFCID 316, the request was partially successful. The return area was not big enough to accommodate all the output. The return area contains up to the last record that fits.

User response

Allocate more return area storage and reissue the request.

00E6080B

Explanation

On a READS request for IFCID 317, no data was returned because a matching statement was not found.

User response

Ensure that the statement identifier for a currently cached statement is provided and reissue the request.

00E6080C

Explanation

On a READS request for IFCID 316, no data was returned because no statements matched the qualification criteria. This reason code can occur when WQALFLTR = X'02' and no cached statements exceed the threshold specified in WQALFVAL. This reason code can also occur if the dynamic statement cached but no statements have yet been inserted into the cache.

User response

Adjust the qualification criteria and reissue the request.

00E60810

Explanation

A READS request for IFCID 0254 was partially successful. The return area was not large enough to accommodate all output. The return area contains as many complete records as can fit.

User response

Allocate more return area storage and reissue the request.

Problem determination:

00E60811

Explanation

On a READS request for IFCID 0254, no data was returned because no qualified data sets or group buffer pools were connected.

User response

Ensure that the qualified data sets or group buffer pools are connected, and reissue the request.

00E60812

Explanation

On a READS request for IFCID 0306, log records are returned. The end-of-scope log point has been reached and no position is held in the log. The end-of-scope log point is returned in field QW0306ES, and the number of records is returned in field QW0306CT from the QW0306 section.

User response

A WQALMODT request to terminate the log position might be necessary to release held resources, or a WQALMODF request after a pause to initiate a first call.

Problem determination:

00E60813

Explanation

On a READS request for IFCID 0306, no data is returned because no log records were found that met the criteria. No position is held in the log. The end-of-scope log point is returned in field QW0306ES and zero is returned in field QW0306CT from the QW0306 section.

User response

If this is caused by a WQALMODN call, issue a WQALMODF call after a pause to initiate a first call. However, there is still no guarantee that log records will be returned that meet the criteria.

Problem determination:

00E60814

Explanation

On a READS request for IFCID 0306, a WQALMODT call was invoked to terminate log position when no position is held in the log.

Problem determination:

00E60815

Explanation

On a READA or READS request for multiple members of a data sharing group, the return area was not large enough to hold all the data returned from other members. This reason code is returned in field IFCAGRSN of the IFCA.

User response

Increase the size of the return area.

00E60816

Explanation

On a READA or READS request for multiple members of a data sharing group, no data was returned from other members of the data sharing group. This reason code is returned in field IFCAGRSN of the IFCA.

00E60820

Explanation

The command request did not complete normally. Check the IFCABM field in the IFCA to see if any message segments have been returned. There are many reasons for this condition, including:

- Command authorization failure
- Command processor abend
- Command syntax error
- Command output limit being exceeded.

Problem determination

To determine the reason for the failure, analyze the message or messages that are returned.

00E60821

Explanation

The request was not processed because a specified IFCID is not valid for the READS or WRITE function.

User response

Remove or replace the invalid IFCID.

Problem determination

Check the IFCA diagnostic area (IFCAD) for the IFCID in error.

00E60823

Explanation

The WRITE request was not processed because the IFCID specified was not active.

User response

Activate the IFCID or reissue the request with a different IFCID.

00E60824

Explanation

An authorization failure occurred. On a READA request, the ownership token specified did not match the owner of an active trace, or on either a READA or READS request the user did not have the correct monitor authority.

User response

Reissue the request with the correct ownership token for the desired OPn destination or obtain the appropriate monitor authority, as needed.

Problem determination

Examine the specified ownership token and the monitor authority of the user.

00E60825

Explanation

Stack storage was not available for copying the output area.

00E60826

Explanation

On a READA request, the destination specified did not match a valid destination.

User response

Reissue the request using a valid destination.

00E60827

Explanation

On a READA request, the destination specified did not have an instrumentation facility buffer assigned. The application program must start a trace to the destination specified before attempting a READA request.

User response

Start a trace to the desired destination, and reissue the request.

00E60828

Explanation

On a READS request for IFCID 149 or 150, IRLM was not able to return all the data that was applicable to the queried agent or resource. IRLM can return a maximum of 32KB of lock data about a given agent or

resource. If IRLM notifies Db2 that more than 32KB of lock data is applicable for a given agent or resource, then Db2 does not request the information from IRLM. No data is returned, and reason code 00E60828 is issued by IFI.

User response

The READS request for IFCID 149 OR 150 continues to return code 00E60828 until less than 32KB of lock data is applicable to the given agent or resource that the READS request for IFCID 149 or 150 is querying. You can continue to issue READS requests for IFCID 149 or 150 with no guarantee that the volume of lock data has decreased.

00E60829

Explanation

On a READS request, an unexpected return code was received from IRLM.

00E60830

Explanation

An unexpected return code was received on a READS request.

User response

Reissue the request. If the condition persists, contact IBM Support and tell them the message you are encountering.

00E60831

Explanation

A number of abends have occurred while processing instrumentation facility interface (IFI) requests, resulting in the disabling of all IFI request and MONITOR trace processing.

User response

Take the following actions:

1. If an SVC dump was not produced, take a z/OS console dump of all Db2 address spaces prior to issuing a command to clear the condition.
2. To clear the condition, issue one of the following commands:
 - If you do not need to start additional traces, issue the -DISPLAY TRACE command.
 - If you need to start additional traces, issue the -START TRACE command.

The condition might not be cleared by issuing the command through the IFI COMMAND function.

Problem determination

Collect the following diagnostic items and forward them to the system programmer:

- A listing of the SYSLOG data set for the period of time that spans the failure.
- The SVC dump, if one was produced.
- A z/OS console dump of all Db2 address spaces, if an SVC dump was not produced.

Related reference

[-DISPLAY TRACE command \(Db2\) \(Db2 Commands\)](#)
[-START TRACE command \(Db2\) \(Db2 Commands\)](#)

00E60832

Explanation

The IFCID specified on a READS was not active.

User response

Issue a -START TRACE for monitor class 1.

00E60833

Explanation

A request for storage from the log-read storage pool has failed due to exhaustion of available storage or four log-read read requests are already holding storage from the pool.

User response

Allow other active READS requests for IFCID 129 to finish and then reissue the request.

Problem determination

Examine the activity of READS requests for IFCID 129. If requests for more than 64 CIs are active at the same time, storage problems may occur.

00E60834

Explanation

An unexpected return code was received from log manager macro DSNJOLGR.

User response

Reissue the request. If the problem persists, contact your IBM service representative.

Problem determination

Examine the validity of WQALLRBA and WQALLNUM fields.

00E60835

Explanation

An unexpected return code was received from Log Manager Macro DSNJLGR.

User response

Reissue the request. If the problem persists, contact your IBM service representative.

Problem determination

Examine the validity of WQALLRBA and WQALLNUM fields.

00E60836

Explanation

An unexpected return code was received from log manager macro DSNJCLGR.

User response

Reissue the request. If the problem persists, contact your IBM service representative.

Problem determination

Examine the validity of WQALLRBA and WQALLNUM fields.

00E60837

Explanation

On an IFI READS request for IFCID 1 or 2, storage was not available to satisfy the request.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Reissue the request. This condition is only temporary and should be extremely rare. If this condition persists, contact your IBM support representative, and tell them the message you are encountering.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60838

Explanation

On a READS request for IFCID 0254, a resource was unavailable while attempting to collect statistics for a specific group buffer pool.

User response

Reissue the request. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The group buffer pool name and the reason code returned from the internal macro are saved in fields IFCAGBPN and IFCAROB.

00E60839

Explanation

On a READS request for IFCID 149 or 150, IRLM was not able to return all the data that was available to the queried agent or resource. IRLM can return a maximum of 32KB of lock data about an agent or resource. If IRLM notifies Db2 that more than 32KB of lock data is available for that agent or resource, Db2 requests the information from IRLM, but returns up to 32KB of information to the application and IFI issues this reason code.

Problem determination:

00E6083A

Explanation

On a READS request for IFCID 316 or IFCID 317 no data was returned because Dynamic Statement Caching is not active on this Db2 system.

User response

The Dynamic Statement Cache must be activated through a system initialization parameter before READS requests can be processed for IFCID 316 or 317.

00E60840

Explanation

An invalid function was specified. The function specified does not match one of the IFI supported functions.

User response

Correct the function field of the DSNWLI call so that it is a left-justified, 8-character field containing WRITE, READA, READS, or COMMAND.

00E60841

Explanation

The IFCA was specified incorrectly. The return code and reason code will be placed at the correct offset in the erroneous IFCA. The IFCA length might be invalid, or the IFCA eye-catcher (IFCAID) might be missing.

User response

Examine the length of the IFCA and the eye-catcher field of the IFCA. Correct any mistakes.

Problem determination

See the return and reason codes placed at the correct offset in the erroneous IFCA.

00E60842

Explanation

The return area was specified incorrectly. The length might be invalid. The length of the return area must be a fullword. The valid range for the return area length on IFI READS requests is X'000000064' to X'7FFFFFFF'. The valid range for the return area length on all other IFI requests is X'000000064' to X'00100000'.

User response

Respecify the return area length to conform to the valid range.

00E60843

Explanation

The IFCID area was specified incorrectly. The length might be invalid. The valid range is from X'0006' to X'0044'.

User response

Respecify the IFCID area length field to conform to the valid range.

Problem determination

Examine the length field of the IFCID area.

00E60844

Explanation

The qualification area was specified incorrectly. The length might be invalid, or the WQAL eye-catcher (WQALEYE) might be missing.

User response

Correct any incorrect specification of the qualification area length and eye-catcher fields.

Problem determination

Examine the length and eye-catcher fields of the qualification area.

00E60845

Explanation

An IFCID that was specified for a READS or a WRITE request was invalid.

User response

Replace the invalid IFCID with a valid one, or remove the invalid IFCID from the request.

Problem determination

Check the IFCIDs in the IFCID area that is specified in the *ifcid-area* field in the READS or WRITE request. The IFCIDs must conform to the following rules:

- For a READS request, IFCIDs must be greater than or equal to 1 (X'0001') and less than or equal to 511 (X'01FF').
- For a WRITE request, only the IFCIDs that are listed in [WRITE \(Db2 Performance\)](#) can be specified.

00E60846

Explanation

The output area was specified incorrectly.

User response

Correct either the output area length or the output area parameter on the DSNWLI call, depending on which one is in error.

Problem determination

The length might be invalid; the valid range is from X'000A' to X'1000'. Also, the output area parameter on the DSNWLI call may have been specified as zero. The output area parameter must point to a valid output area.

00E60847

Explanation

The buffer information area was specified incorrectly.

User response

Check that the buffer information area has an eye-catcher value of 'WBUF' and a length value equal to the length of 'WBUF' and correct any invalid values.

Problem determination

The length might be invalid, or the 'WBUF' eye-catcher might be missing.

00E60849

Explanation

The parameters are specified incorrectly on the IFI command request.

User response

If the selective dump function is not being used, check that the parameters are specified correctly on the IFI request. If the selective dump function is being used, notify the system programmer.

Problem determination

If the selective dump function is not being used, check that the parameters are correctly specified on the command request. Among other possible causes, the high-order bit of the last parameter must be on in order to indicate the end of the parameter list. For assembler users, this can be done by using the VL option on the call. Another possible cause is the sixth parameter is specified on the IFI request. The sixth parameter is reserved for the selective dump function.

00E60850

Explanation

An invalid WQALLTYP value was specified on a READS request.

User response

Correct the invalid WQALLTYP value and reissue the request.

Problem determination

Examine the validity of the WQALLTYP field. It must be 'CI'.

00E60851

Explanation

An invalid WQALLMOD value was specified on a READS request.

User response

Correct the invalid WQALLMOD value and reissue the request.

Problem determination

Examine the validity of the WQALLMOD field. It must be 'F' or 'R'.

00E60852

Explanation

An invalid WQALLRBA value was specified on a READS request. The starting CI log RBA must end in X'000'.

User response

Correct the invalid WQALLRBA value and reissue the request.

Problem determination

Examine the validity of the WQALLRBA field. It must end in X'000'.

00E60853

Explanation

An invalid WQALLNUM value was specified on a READS request. The valid range is X'0001' to X'0007'.

User response

Correct the invalid WQALLNUM value and reissue the request.

Problem determination

Examine the validity of the WQALLNUM field. The valid range is X'0001' to X'0007'.

00E60854

Explanation

The specified WQALLRBA was not in the active log.

User response

Correct the invalid WQALLRBA value and reissue the request.

Problem determination

Examine the validity of the WQALLRBA field. Check the beginning RBA of the active log. The WQALLRBA field must be greater than or equal to the beginning RBA value of the active log. The RBA of the first CI in the active log will be returned in field IFCAFCI or it can be determined by running the print log map (DSNJU004) utility.

00E60855

Explanation

A log RBA value past the end of the current active log was specified. The specified WQALLRBA value was beyond the end of the log. The CI has yet to be written.

User response

Correct the invalid WQALLRBA value and reissue the request.

Problem determination

Examine the validity of the WQALLRBA field. Check the ending RBA of the log. The WQALLRBA field must be less than the ending RBA value.

00E60856

Explanation

No complete CI's are available from the RBA specified in WQALLRBA.

User response

Lower the value in WQALLRBA by at least X'1000' or wait until at least one CI has been written beyond the RBA specified in WQALLRBA and reissue the request.

Problem determination

Examine the WQALLRBA field and determine whether or not one complete CI beyond WQALLRBA has been written to the log.

00E60857

Explanation

This code indicates that an IFI READS request for IFCID 185 contained an invalid WQALCDDC value.

System action

Control returns to the user program with return code 0000000C in field IFCARC1 and reason code 00E60857 in field IFCARC2.

User response

WQALCDDC is a user-specified field in the QUAL_AREA of an IFI READS for IFCID 185. Reissue the request with a valid WQALCDDC value. For IFI READS requests for IFCID 185, the valid values are A, Y, and N. If a value is not specified, a value of A is used as the default.

Related concepts

[Errors and IFI \(Db2 Performance\)](#)

Related reference

[Instrumentation facility communications area \(IFCA\) \(Db2 Performance\)](#)

00E60858

Explanation

This code indicates that an IFI READS request for IFCID 185 was denied because the system parameters

indicate that data capture processing is not allowed on this Db2 system. The system parameter field SPRMCD C is set to 'no'.

System action

Control returns to the user program with return code 0000000C in field IFCARC1 and reason code 00E60858 in field IFCARC2.

User response

Inspect system parameter SPRMCD C. If change data capture is not allowed on this system, consult with the database administrator to determine if the system parameter should be changed to 'yes' to allow Db2 data capture processing.

Related concepts

[Errors and IFI \(Db2 Performance\)](#)

Related reference

[Instrumentation facility communications area \(IFCA\) \(Db2 Performance\)](#)

00E60859

Explanation

An IFI READS request for IFCID 129 was made to pass the last partially full log CI to the log exit, but the log exit is not active. Either the log exit (DSNJW117) was not installed, or an error in the exit has deactivated the exit.

User response

Either install the log capture exit, or look for message DSNJ150E indicating that the log capture exit has been deactivated. See the description for DSNJ150E for more information about reactivating the log capture exit.

00E60860

Explanation

On a READS request for IFCID 0254, an error was encountered while collecting statistics for a group buffer pool.

User response

Reissue the request. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The group buffer pool name is saved in field IFCAGBPN. The reason and return code from the internal macro are saved in fields IFCAR0B and IFCAR1B.

00E60861

Explanation

An invalid WQALGBPN value was specified on a READS request.

User response

Correct the invalid WQALGBPN value and reissue the request.

Problem determination

Examine the validity of the WQALGBPN field. The qualifier is an 8-byte group buffer pool name in which an imbedded X'00' is used as a pattern character.

00E60863

Explanation

On a READS request for IFCID 0306, a resource was unavailable while attempting to read the log.

User response

Resolve the unavailable resource, and reissue the request. You cannot retry the request with the WQALLMOD value set to 'N' after a READS request fails. Set the WQALLMOD value in the qualification area to 'F' or 'D' when you retry the READS request.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related reference

[Qualification fields for READS requests \(Db2 Performance\)](#)

00E60864

Explanation

On a READS request for IFCID 0306, the return area supplied was not large enough to hold one log record. No log record is returned, but position is held in the log.

User response

Increase the size of the return area and issue a WQALMODN request. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The size of the return area required is returned in field IFCABSRQ of the IFCA return area.

00E60865

Explanation

On a READS request for IFCID 0306, no data is returned for a WQALMODF call because log position is already held in the log, possibly by a previous WQALMODF call.

User response

You might want to use a WQALMODN request instead.

Problem determination:

00E60866

Explanation

On a READS request for IFCID 0306, no data is returned for a WQALMODN call because no log position is held in the log.

User response

A WQALMODF call might be necessary before a WQALMODN call.

Problem determination:

00E60867

Explanation

An invalid WQALLRBA value was specified on a READS request for IFCID 0306. The specified value exceeds the end-of-log.

User response

Correct the WQALLRBA field. A pause might also be necessary before you issue a WQALMODF request again.

Problem determination:

00E60868

Explanation

The return area was specified incorrectly for IFCID 0306. The return area did not reside in ECSA storage.

User response

Respecify the return area and make sure that it resides in ECSA storage.

Problem determination:

00E60869

Explanation

An invalid WQALLCRI field was specified on a READS request for IFCID 0306.

User response

Correct the invalid WQALLCRI field and reissue the request.

Problem determination

Check the validity of the WQALLCRI field. It must be X'00'.

00E60870

Explanation

An invalid WQALLOPT field was specified on a READS request for IFCID 0306.

User response

Correct the invalid WQALLOPT field and reissue the request.

Problem determination

Check the validity of the WQALLOPT field value. It must be X'00', X'01', X'02', or X'03'.

If the READS request is issued from a Q Capture program that is running in proxy mode in a GDPS Continuous Availability with zero data loss environment, X'02' and X'03' are not valid.

00E60871

Explanation

On a READS request for IFCID 306, log records are returned, but data is not decompressed as requested.

Problem determination

See the reason code in field QW0306DG to determine why decompression was not performed. One reason code can be 00C90064, which means that the decompression dictionary changed since the log record was written.

00E60872

Explanation

On a READS request for IFCID 0306, no data is returned for a WQALMODD call because log position is already held in the log, possibly by a previous WQALMODF or WQALMODN call.

User response

If WQALMODD is desired, make sure that a WQALMODT call has been issued first.

Problem determination:

00E60873

Explanation

On a READS request for IFCID 0306, no data is returned for a WQALMODF call because the RBA supplied was too old. This is because Db2 has migrated into and out of or out of data sharing mode.

User response

The change of mode into and out of data sharing also changes the log sequencing from RBA to LRSN and back to RBA. A log read application that is sensitive to log sequencing should take an appropriate action. A cold start of the application might be necessary.

Problem determination:

00E60874

Explanation

An invalid value was specified for WQALFFLD on a READS request for IFCID 316 or 401.

See the definition in the DSNDWQAL parameter block for valid values.

User response

Correct the invalid WQALFLTR value and reissue the request.

00E60875

Explanation

An invalid value was specified for WQALFFLD on a READS request for IFCID 316 or 401.

See the definition in the DSNDWQAL parameter block for valid values. This error might also be issued if WQALFLTR = X'02' is specified with WQALFFLD = 'A'.

User response

Correct the invalid WQALFFLD value and reissue the request.

00E60876

Explanation

The READS request failed because either WQALPLOC, WQALPCOL, or WQALPPNM could not be converted to UTF-8.

User response

Reissue the request. If the problem persists, contact Db2 Support.

00E60878

Explanation

An IFI READS request for IFCID 0306 or IFCID 0401 was issued on a thread that was not allocated for processing SQL statements. Because the thread was not allocated for SQL processing, no plan was allocated and the requested information was not available.

User response

Reissue the IFI READS request on a thread that is allocated to process SQL statements.

Related tasks

[Invoking IFI from a monitor program \(Db2 Performance\)](#)

[Invoking the call attachment facility \(Db2 Application programming and SQL\)](#)

00E60879

Explanation

An IFI proxy READS request for IFCID 0306 was issued on a Db2 subsystem that was not a data sharing member.

System action:

The READS request fails.

User response

Issue an IFI proxy READS request only on a Db2 data sharing member that is set up in proxy mode.

Related reference

[READS \(Db2 Performance\)](#)

[Qualification fields for READS requests \(Db2 Performance\)](#)

[CDDS_MODE in macro DSN6LOGP \(Db2 Installation and Migration\)](#)

00E60880

Explanation

One of the following situations occurred:

- An IFI proxy READS request for IFCID 0306 was issued on a Db2 data sharing member that was not in proxy mode.
- An IFI READS read request for IFCID 0306 was not a proxy READS request, but the request was issued on a Db2 data sharing member that was in proxy mode.

System action:

The READS request fails.

User response

When you issue a proxy READS request, specify a WQALLCRI value of X'01', X'02', X'03', or X'04'. If the READS request is not a proxy request, specify another valid WQALLCRI value.

Related reference

[READS \(Db2 Performance\)](#)

[Qualification fields for READS requests \(Db2 Performance\)](#)

[CDDS_MODE in macro DSN6LOGP \(Db2 Installation and Migration\)](#)

00E60881

Explanation

One of the following situations occurred:

- An IFI proxy READS request for IFCID 0306 was issued on a Db2 data sharing member that detected that the compression dictionary data set (CDDS) is stopped for all access.
- An IFI proxy READS request for IFCID 0306 was issued on a Db2 data sharing member that detected that the CDDS is logically damaged.

System action:

The READS request fails.

User response

The application that issued the IFI call takes these actions:

1. Stops the READS request for replication.
2. Issues a message that indicates that the CDDS is logically damaged, and online CDDS recovery is needed.
3. After the CDDS is recovered, establishes a new starting log point, and restart processing of log records.

Administrator response

After replication is stopped, take these actions:

1. Issue the STOP CDDS command from one of the members in the proxy Db2 data sharing group.
2. When you receive a message that says that online CDDS recovery is needed, recover the CDDS on the source Db2 data sharing group.
3. Issue the START CDDS command from one of the members in the proxy Db2 data sharing group.
4. Restart the data capture request using a new log point on one of the members in the proxy Db2 data sharing group.

Related tasks

[Recovering the compression dictionary data set without bringing down a Db2 data sharing group in a GDPS Continuous Availability with zero data loss environment \(Db2 Administration Guide\)](#)

[Qualification fields for READS requests \(Db2 Performance\)](#)

[-STOP CDDS \(Db2\) \(Db2 Commands\)](#)

[-START CDDS command \(Db2\) \(Db2 Commands\)](#)

1. The application stops the READS request for replication.
2. The application uses the secondary reason code that was returned on the failed READS request to determine the type of CDDS access error.
3. The user collects the following information:
 - The Db2 console log for the member of the proxy data sharing group where capture is running.
 - Any diagnostic dumps that are generated.
 - The capture job log for the application that issued the IFI 306 READS request.
4. The application issues a message that indicates that online CDDS recovery is needed, if the secondary reason code indicates that the CDDS is logically damaged.
5. After the CDDS error is resolved, the user restarts the READS request for replication.

Administrator response

After replication is stopped, take these actions:

1. When you receive a message that says that online CDDS recovery is needed, recover the CDDS on the source Db2 data sharing group.
2. After the IFI application restarts, issue the appropriate command on the proxy data sharing group to warm start data capture.

Related tasks

[Recovering the compression dictionary data set without bringing down a Db2 data sharing group in a GDPS Continuous Availability with zero data loss environment \(Db2 Administration Guide\)](#)

Related reference

[READS \(Db2 Performance\)](#)

[Qualification fields for READS requests \(Db2 Performance\)](#)

00E60882

Explanation

An IFI READS request for IFCID 0306 was issued on a member of a proxy Db2 data sharing group. The CDDS might be logically damaged.

System action:

The READS request fails.

User response

The application that issued the IFI call or the user takes these actions on a member of the proxy Db2 data sharing group:

00E60886

Explanation

This reason code is used to indicate that an invalid IAMQ function was passed to module DSNWVZXT. This problem should not occur.

System action

The function requested is abended. The Db2 subsystem remains operational and the functional recovery will retry if possible.

Problem determination

The IAMQ function requested does not match a function handled by DSNWZXT. Analyze the dump and previous SYS1.LOGREC entries to isolate the cause of the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60887

Explanation

The reason code is set by the Instrumentation Statistics Facility FRR routine when an abend condition occurs during statistics gathering. The reason code only appears in the VRA data of SYS1.LOGREC to indicate the WWAB block exists in the variable recording area following the standard Db2 information.

System action

Depending on the number of errors the Instrumentation Statistics Facility may be turned off. The FRR will attempt a retry to RTM to keep the Db2 subsystem operational.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Normally the standard SYS1.LOGREC entries provide the necessary information to isolate the failing module. The WWAB control block in the variable recording area provides the resource manager RMID last called (WWABRMID) and the RMID of which resource manager Instrumentation Statistics Facility called when the failure occurred (WWABFRMS). If WWABFRMS is binary zero, then the error occurred in the Instrumentation Statistics Facility.

00E60888

Explanation

The reason code is set by the Instrumentation Accounting Facility FRR routine when an abend condition occurs during the accounting function. The reason code only appears in the VRA data of SYS1.LOGREC to indicate the WWAB block exists in the variable recording area following the standard Db2 information.

System action

Depending on the number of errors the Instrumentation Accounting Facility may be turned off. The FRR will attempt a retry to RTM to keep the Db2 subsystem operational.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Normally the SYS1.LOGREC standard entries provide the necessary information to isolate the failing module. The WWAB control block in the variable recording area provides the resource manager RMID last called (WWABRMID) and the RMID of which resource manager Instrumentation Statistics Facility called when the failure occurred (WWABFRMS). If WWABFRMS is binary zero, then the error occurred in the Instrumentation Accounting Facility.

00E60889

Explanation

An internal error has occurred on an IFI request. The reason code only appears in the variable recording area (VRA) data of SYS1.LOGREC to indicate the FRR tracking (FRT) area exists in the VRA following the standard Db2 information.

System action

The IFI request abnormally terminates.

Problem determination

The recovery routine for the CSECT that issues this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information

about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E60900

Explanation

This is an informational code. One or more data rows defined with DATA CAPTURE CHANGES might not have been retrieved.

System action

All successfully retrieved data rows defined with DATA CAPTURE CHANGES are returned in the return area. One header instance of 0185 is returned for each data row associated with a failure or warning. A reason code in field QW0185RC in the header indicates the reason for the failure or warning.

Problem determination

Inspect the reason code in QW0185RC to determine the cause of each failure or warning.

00E60901

Explanation

The available buffer is not large enough to hold the largest 0185 record instance.

System action

No data is returned.

User response

Reissue the IFI READS request for IFCID 0185 with a larger return area. The suggested size of the new area is 4KB more than the original size.

00E60902

Explanation

The IFI READS request for IFCID 0185 is invalid. The READS request tried to retrieve captured Db2 table changes, but no data was captured for the current SQL statement.

System action

No data is returned.

User response

Ensure that the IFI READS request follows the current SQL statement and precedes any subsequent SQL

statement. Captured data must be retrieved at the time of the SQL call.

00E60903

Explanation

One or more data rows marked with DATA CAPTURE CHANGES were not retrieved. In addition, there is insufficient space in the return area to hold all the data in an IFI READS request for IFCID 0185. This is a combination code for 00E60900 and 00E60802.

System action

As many complete 0185 records as can fit are returned in the return area. Also, one 0185 header record is returned for each failed data row. The reason code in field QW0185RC in the header indicates the reason for the failure.

User response

Refer to the description of reason codes 00E60900 and 00E60802 for details.

00E60904

Explanation

The IFI READS request for IFCID 0185 could not be executed successfully because a resource was not available. Some 0185 record instances might have been returned to the return area before the problem occurred.

System action

The last 0185 record instance returned is type D (QW0185TP = D). Field QW0185RC contains a reason code for the specific unavailable resource. In addition, the data portion (QW0185DR) of this record instance contains the following message:

```
UNSUCCESSFUL EXECUTION CAUSED BY AN  
UNAVAILABLE RESOURCE. REASON reason,  
TYPE OF RESOURCE type,  
AND RESOURCE NAME name
```

In the message, *reason* is identical to field QW0185RC. The variables *type* and *name* identify the specific resource that is unavailable at the time.

User response

Retrieve all returned record instances. Examine the reason code (QW0185RC) for each instance for other possible errors or warnings. Use the reason code in QW0185RC and the error message in QW0185DR to determine why the resource is unavailable.

Related concepts

Db2 reason codes

Reason codes are typically presented as a value in a message that Db2 issues. The reason codes provide specific details about the circumstances of a particular instance of the message.

Related information

[Resource types for messages and codes in Db2 for z/OS](#)

Various messages, reason codes, and SQL codes in Db2 for z/OS include type codes that identify particular types of resources. In some cases, specific resource names are also identified.

00E60A00

Explanation

An outdated data description was detected. A requester specified no data description to be returned in an IFI READS request for IFCID 0185. That is, the WQALCDD field of the qualification area is set to N, but a description change (ALTER TABLE ADD) that requires a refresh of the data description occurred.

This reason code does not apply to the success or failure of the IFI request, but rather to the status of the data in the IFCID 0185 record.

System action

The system returns an IFI record with this reason code. The 0185 record instance that contains the reason code has the header portion only, and the timestamp, log RBA, and operation code fields in the header contain only zeros.

This reason code is issued one time only for each table within each SQL scope.

User response

Either use an SQL DESCRIBE statement to get the new description, or consider changing the IMS DataPropagator exit routine to set WQALCDD to A or Y.

00E60A01

Explanation

The data row marked with DATA CAPTURE CHANGES is rejected by the installation-defined edit procedure 'proc-name' for the object table. This reason code does not apply to the success or failure of the IFI request, but rather the status of the data in the IFCID 0185 record.

System action

The following message is returned in the data area of 0185:

```
VIOLATION OF INSTALLATION DEFINED  
EDIT PROCEDURE proc-name.  
REASON CODE: reason-code
```

In the message, *proc-name* is the edit procedure name and *reason-code* is EXPLRC2 returned by the edit procedure.

User response

Examine the edit procedure for any errors. If it is not an edit procedure error, determine the requirements imposed by the edit procedure.

00E60A08

Explanation

The following message is returned in the data portion of the data row area in the 0185 trace record:

```
COLUMN column_name ON TABLE table_name  
IN VIOLATION OF INSTALLATION DEFINED  
FIELD PROCEDURE. RT: return_code, RS:  
reason_code, MSG: message_token.
```

An installation field procedure returned an error indicated by *return_code* for column *column_name* on table *table_name*. Use *return_code* to determine the problem. The *return code* can be:

4

Invalid value on decode

8

Invalid parameter value

12

Field procedure error on any function

Use *reason_code* and *message_token* for additional information. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

System action

Whenever this reason code is present in the QW0185RC field in the record header, no record is returned in the data row section for this table. The message listed above takes its place. The length of the record corresponds to the message length.

Programmer response

Examine the field procedure for any errors. If it is not a field procedure error, determine the requirements imposed by the field procedure.

00E60A09**Explanation**

The following message is returned in the data portion of the data row area in the 0185 trace record:

```
INCORRECT DATA RETURNED FROM FIELD PROCEDURE
fieldproc_name FOR TABLE table_name AND
COLUMN column_name,
MSG: message_token
```

Unexpected data was returned from field procedure *fieldproc_name* and for column *column_name* on table *table_name*. For more information see *message_token*. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

System action

Whenever this reason code is present in the QW0185RC field in the record header, no record is returned in the data row section for this table. The message listed above takes its place. The length of the record corresponds to the message length.

Programmer response

Correct the field procedure so that it returns values and their descriptions that are mutually consistent.

00E60A0A**Explanation**

The following message was returned in the data portion of the data row area in the 0185 trace record: AN INSTALLATION FIELD PROCEDURE HAS RETURNED A RETURN CODE IN REGISTER 15 OTHER THAN AN EXPECTED 0 OR 4

This indicates that an installation field procedure returned an unexpected error. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

System action

Whenever this reason code is present in the QW0185RC field in the record header, no record is returned in the data row section for this table. The message listed above takes the place of the record. The length of the record corresponds to the message length.

Programmer response

Examine the field procedure for the specific return code generated.

00E60A0B**Explanation**

This is a warning code, and does not represent an error. For the corresponding data row with this reason code in field QW0185RC, a date or time column value was returned in the ISO format, even though the date/time installation option was specified as LOCAL. Invocation of local date and time exits is not supported for captured data. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

System action

A date or time column value was returned in the ISO format even though the installation option was specified as LOCAL.

Programmer response

The requester needs to be aware that a date or time was returned in ISO format since the LOCAL date and time installation option, which was in effect at the time of capture, is not supported for data capture.

00E60B00**Explanation:**

A START TRACE command with the SCOPE(GROUP) option was issued to start an audit trace, and at least one of the specified audit policies was a tamper-proof audit policy. Tamper-proof audit policies cannot be started by using the SCOPE(GROUP) option.

System action:

The tamper-proof audit policy is not started.

User response:

To start a tamper-proof audit policy on all members of a data sharing group, issue the START TRACE command on each member of the data sharing group.

00E60B01**Explanation**

An installation field procedure wrote beyond the end of the output buffer.

System action

The execution unit requests an SVC dump, and terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

Correct the field procedure.

Problem determination

At the time of abend the register contents are:

R2

The first 4 characters of the field procedure name

R3

The second 4 characters of the field procedure name

Related concepts

[Field procedures \(Db2 Administration Guide\)](#)

00E60B02

Explanation

Invalid data was returned from the edit procedure. The data is invalid for one or more of these reasons:

- The first byte or the last byte of the input record was modified by the exit.
- The length of the edited data is greater than the maximum allowed for this row, or less than one.
- The exit returned a row that overran the output area.

System action

An execution unit requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E60B03

Explanation

An internal inconsistency was detected by Db2 during data propagation processing.

System action

An execution unit requests an SVC dump. The execution unit then terminates abnormally.

Operator response

Notify the system programmer.

Problem determination

At the time of abend, register 2 points to the error message.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E60B04

Explanation

During the retrieval of captured table data in preparation for propagation to IMS, an invalid data type was found. This data type is not supported for propagation from Db2 to IMS. Since the invalid data type cannot be returned to the Data Propagator (DPROP) exit routine, processing is terminated abnormally. This is an internal Db2 error.

System action

An execution unit requests an SVC dump, and terminates abnormally.

Operator response

Notify the system programmer.

System programmer response

The current SQL statement performed an INSERT, UPDATE, MERGE, or DELETE, for a Db2 table that was defined with DATA CAPTURE CHANGES. The captured data changes are reflected in the Db2 log.

Check the captured table data information returned to DPROP for propagation to determine which data type is invalid.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Chapter 21. X'E7.....' codes

Reason code identifiers that begin with 00E7 communicate normal and error situations with the relational data system.

00E70001

Explanation

A "record not found" condition has been reported to RDS for internal use.

Operator response

No action is required.

00E70004

Explanation

An inconsistency has been detected in the subsystem catalog tables.

System action

The application program abends.

Operator response

Notify the system programmer or database administrator.

System programmer response

Notify the database administrator if appropriate. Otherwise, use the information under the Problem Determination section to resolve the problem.

Problem determination

The module name and the name of the inconsistent subsystem catalog table can be found in the SQLCA. For information about how to find the SQLCA, see [Finding the SQLCA \(Diagnosing Db2 problems\)](#).

Register 7 is the cursor table pointer and is always restricted entirely over the relational data system (RDS) subcomponent.

Dump the page set containing the inconsistent subsystem catalog using the DUMP option of the REPAIR utility.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Dump of page set from DUMP option of REPAIR.

00E70005

Explanation

A relational data system (RDS) subcomponent internal inconsistency was detected.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

This code generates an SVC dump and SYS1.LOGREC entries. Use information from those two sources and from the Problem Determination section of this code to resolve the problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The abend code can be issued by any of the RDS modules. The module name can be found in the SQLCA. SQLERRD1 in the SQLCA contains a unique code that identifies the location within the module where the error was detected. SQLERRM might contain some meaningful information for this particular error.

For information about how to find the SQLCA, see [Finding the SQLCA \(Diagnosing Db2 problems\)](#).

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Listing of the results produced by the SQL statements.

00E70006

Explanation

An internal inconsistency has been reported to the relational data system (RDS) subcomponent by the RDS subcomponent of Db2.

System action

The application program abends.

Operator response

Provide a print of the SVC dump to the system programmer.

System programmer response

Use the information in the 'Problem Determination' section of this message to resolve the problem.

User response

Notify the system programmer.

Problem determination

The abend code may be issued by any of the RDS interpreter modules (DSNX...). The module name appears in the SQLCA. SQLERRD1 in the SQLCA contains a unique code that identifies the location within the module at which the error was detected. SQLERRM contains information describing the particular error.

For information about how to find the SQLCA, see [Finding the SQLCA \(Diagnosing Db2 problems\)](#).

Collect the following diagnostic item listed in

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00E70007

Explanation

A bad application-supplied address was encountered while trying to copy SQLCA back to the application program.

System action

The application program abends.

System programmer response

Contact the application programmer.

Problem determination

The register contents at the time of abend are as follows:

R2

A decimal code identifying the data:

1

FRB address is bad.

2

FRBPARM has the bad address used to locate the RDIIN.

18

RDICODEP has the bad address used to locate the SQLCA.

R3

The bad application data area address.

R4

The length of the data.

R5

The key of the data or the address of the CT if the SQLCA contains SQLCODE -902.

R8

The address of the FRB in the application address space (RDIIN) or the address of the RDA if the SQLCA contains SQLCODE -902

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- CICS attachment facility MVS SNAP dump.

.

00E70009

Explanation

An invalid value or a return code(EXPLRC1) of 12 was returned by the Access Control Authorization exit routine, DSNX@XAC.

System action

The authorization check is abended. An SVC dump is requested by Db2 functional recovery. If EXPLRC1=12, then the Access Control Authorization exit routine is no longer invoked and authorization checking is performed by Db2.

Operator response

Notify the system programmer.

System programmer response

If message DSNX210I has been issued to the System Console, retrieve the return code (EXPLRC1) and reason code (EXPLRC2) from this message and refer to the exit routine's documentation to determine the course of action to be taken.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The abend with this reason code is issued because the access control authorization exit routine returned an invalid value in one of the return fields or returned a return code (EXPLRC1) of 12. The register contents at the time of abend are set as follows:

- Register 3 points to the field that has the invalid value. This field may be in the EXPL or XAPL control block. The control block eye catcher will enable you to distinguish between the two.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E7000A

Explanation

A relational data system (RDS) subcomponent abended because one or more parallel tasks abended.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

Use the information in the Problem Determination section of this message to resolve the problem.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E7000C

Explanation

The application program supplied an invalid address.

System action

The application program abends.

Operator response

Notify the user or system programmer.

System programmer response

Assist the user in determining the invalid address.

User response

Correct the invalid address. See Problem Determination for instructions on how to determine the failing SQL statement and the bad address. Use this information to determine the application's incorrect setting of the address.

Problem determination

At the time of abend the register contents are:

R2

A decimal code identifying the bad data:

1 (1)

The bad FRB address used to locate the FRBPARM.

2 (2)

FRBPARM has the bad address used to locate the RDIIN.

3 (3)

RDIVPARM has the bad address used to locate the SQLDA length.

4 (4)

RDIVPARM has the bad address used to locate the SQLDABC.

5 (5)

RDIVPARM has the bad address used to locate the SQLDA length.

6 (6)

RDIAUXPA has the bad address used to locate the SQLDA length.

- 7 (7)**
RDIAUXPA has the bad address used to locate the SQLDABC.
- 8 (8)**
PVDPTR has the bad address used to locate the data variable.
- 9 (9)**
PVINFO has the bad address used to locate the indicator variable.
- 10 (A)**
Either RDIVPARM or RDIAUXPA has the bad address used to locate the PVARs structure.
- 11 (B)**
RDIAUXPA has the bad address used to locate the SQLN.
- 12 (C)**
RDIAUXPA has the bad address used to locate the SQLDAID.
- 13 (D)**
RDIAUXPA has the bad address used to locate the SQLDABC.
- 14 (E)**
RDIAUXPA has the bad address used to locate the SQLD.
- 15 (F)**
RDIAUXPA has the bad address used to locate the SQLVAR.
- 16 (10)**
PVINFO has the bad address used to locate the indicator variable.
- 17 (11)**
PVDPTR has the bad address used to locate the data variable.
- 18 (12)**
PVDPTR has the bad address used to locate the data variable.
- 19 (13)**
PVDPTR has the bad address used to locate the data variable.

R3
The bad data address.

R4
The length of the data.

R5
The key of the data.

R8
If register 2 = 8 or 9, R8 contains the address of the RDIVPARM. If register 2 = 16 or 17, R8 contains the address of the RDIAUXPA. Otherwise, R8 contains the address of the RDIIN. This is the application's invocation parameter list. The

address of the RDIIN may not be valid if the RDIIN could not be located (Register 2 = 1 or 2).

The program name identifies the failing program. The statement number refers to the statement number in the Db2 precompiler listing. The SQL statement executed can then be found in the application program's compiler/assembler listing. For example, if the statement number is X'00E6', refer to statement number 230 in the Db2 precompiler listing. This precompiler statement number can be cross-referenced to the program's compiler/assembler listing.

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- CICS attachment facility MVS SNAP dump.

Use the following offsets to trace through the control blocks.

PVARs:

Offsets	Len	Description
0 (0)	4	LENGTH OF BLOCK
4 (4)	12	PVENTY, OCCURS ONCE FOR EACH HOST VARIABLE IN THE SQL STATEMENT

PVENTRY:

Offsets	Len	Description
0 (0)	2	COLUMN TYPE
2 (2)	2	COLUMN LENGTH
4 (4)	4	PVDPTR, POINTER TO HOST VARIABLE DATA
8 (8)	4	PVINFO, POINTER TO INDICATOR

FRB:

Offsets	Len	Description
0 (0)	4	BLOCK IDENTIFIER "FRB"
4 (4)	2	RAL ENTRY NUMBER
6 (6)	2	FVL ENTRY NUMBER
8 (8)	4	FRBPARM, POINTER TO PARAMETER LIST (RDIIN)
12 (C)	2	PARAMETER COUNT
14 (E)	2	RETURN CODE
16 (10)	4	REASON CODE
20 (14)	4	FEEDBACK

Offsets	Len	Description
24 (18)	4	PRH PC LX/EX VALUE
28 (1C)	2	REQUEST QUALIFIER VALUE
30 (1E)	2	RESERVED
32 (20)	0	END OF USER FRB SECTION

RDIIN:

Offsets	Len	Description
0 (0)	2	PARM LIST LENGTH
2 (2)	2	FLAGS
4 (4)	2	CALL TYPE
6 (6)	8	PROGRAM NAME
14 (E)	8	TIMESTAMP
22 (16)	2	SECTION #
24 (18)	4	PTR TO ERROR CODE STRUCTURE
28 (1C)	4	RDIVPARM PTR TO USER INPUT VARIABLES (PVAR STRUCTURE)
32 (20)	4	RDIAUXPA PTR TO Db2 RETURN VARIABLES (PVAR STRUCTURE)
36 (24)	2	STATEMENT #
38 (26)	2	STATEMENT TYPE

00E7000E

Explanation:

A 'resource not available' condition was detected. Refer to the documentation for the message that contains this reason code for the actions to take and problem determination instructions.

00E7000F

Explanation

A deadlock condition has been detected.

System action

The requested operation is not performed.

System programmer response

If the deadlock condition becomes chronic, examine the mix of applications running to determine why the deadlock is occurring.

User response

Rerun the application.

Problem determination

The requested operation is not performed. Message DSNT375I is issued and an SQLCODE -904 is issued. For more information, refer to the SQLCODE or to the description of the DSNT375I message.

00E70010

Explanation

A timeout condition has been detected.

System action

The requested operation is not performed.

User response

Rerun the application.

Problem determination

The requested operation is not performed. Message DSNT376I is issued and an SQLCODE -904 is issued. For more information, refer to the SQLCODE or to the description of the DSNT376I message.

00E70011

Explanation

During an authorization check for plan or command authorization, an execution unit switch took place to a new execution unit and the new execution unit abended.

System action

The calling execution unit is also abended.

Operator response

Notify the system programmer. Print SYS1.LOGREC. Also print the dump from any previous dump data set if the failing module name is DSNXACKP or the dump title is 'RDS AUTHCHK'.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

See problem determination. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The module issuing this abend reason code has invoked the DSNXCHK macro to perform an authorization check for either the application plan or the command authorization. The DSNXCHK macro does a cross-memory execution unit switch to module DSNXACKP. Look for a previous dump in which the failing module name is DSNXACKP, the dump title is RDS AUTHCHK, or the failure is an allocation failure.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E70012

Explanation

A user exit has written beyond the end of the output buffer.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

Correct the exit routine. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

At the time of abend the register contents are:

- R2 contains the first 4 characters of the exit routine name.
- R3 contains the next 4 characters of the exit routine name.

If the exit routine name is DSNXVDTX then DECPDLEN contains the LOCAL DATE LENGTH specified on the Db2 Installation Application Programming Defaults Panel. The exit routine wrote beyond this length in returning a local date format to Db2.

If the exit routine name is DSNXVTMX then DECPTLEN contains the LOCAL DATE LENGTH specified on the Db2 Installation Application Programming Defaults Panel. The exit routine wrote beyond this length in returning a local time format to Db2.

00E70013

Explanation

DRDS at the server site supplied an invalid address.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the results produced by the SQL statements.

00E70014

Explanation

Db2 could not validate the data definition control support tables during startup.

System action

The requested operation is not performed.

Operator response

Notify the system programmer.

System programmer response

Provide a print of the SVC dump to the system programmer. Use the information in the 'Problem Determination' section. The data definition control support tables could not be validated. No data definition SQL statements can be executed until these tables can be validated.

Register 2 contains the address of a message that indicates the reason for the problem. Db2 startup

continues. Correct the problem if it still exists. Db2 will attempt to validate the data definition control support tables when the user attempts to execute any data definition SQL statements.

Collect the following diagnostic item listed in

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the results produced by the SQL statements.

00E70015

Explanation

Db2 was abnormally terminated because the Access Control Authorization exit has indicated that it is unable to process authorization checks and that Db2 should be terminated.

System action

The authorization check task is abended. An SVC dump is requested by Db2 functional recovery. A message is issued to the operator console, and Db2 subsystem is terminated.

System programmer response

Use the information in the 'Problem Determination' section of this message to resolve the problem.

Problem determination

Locate operator console message DSNX210I. This message has the return and reason codes from the exit. Since the Access Control Authorization exit (DSNX@XAC) is external to Db2, you will need to refer to its documentation for an explanation of these codes and a resolution to the problem.

00E70016

Explanation

Db2 terminated abnormally because the version of the Access Control Authorization exit routine (DSNX@XAC) is incompatible with this version of Db2.

System action

The access control authorization exit initialization task terminated abnormally. An SVC dump is requested by Db2 functional recovery, message DSNX210I is issued to the operator console and Db2 is terminated.

System programmer response

Install the version of the access control authorization exit routine compatible with this level of Db2 and restart Db2.

Related concepts

[Access control authorization exit routine \(Managing Security\)](#)

Related information

[DSNX210I \(Db2 Messages\)](#)

00E70020

Explanation

The table name is specified using a LIKE predicate for the audit policy in the SYSIBM.SYSAUDITPOLICIES table. More than one table name match the specified LIKE predicate and at least one of these tables is not defined in the supported table space types. Only the following table space types are supported for auditing:

- Universal table spaces
- Traditional partitioned table spaces
- Segmented table spaces

System action

The audit policy is started, but the table defined in the unsupported table space is not audited.

This reason code is in the IFCID 0362 trace record.

System programmer response

To identify the tables that are not being audited, join the SYSIBM.SYSAUDITPOLICIES, SYSIBM.SYSTABLES, and SYSIBM.SYSTABLESPACE tables on the basis of the table name (OBJECTSCHEMA and OBJECTNAME values from SYSIBM.SYSAUDITPOLICIES), excluding supported table space types.

Related concepts

[Db2 audit policies \(Managing Security\)](#)

Related reference

[SYSAUDITPOLICIES catalog table \(Db2 SQL\)](#)

[SYSTABLES catalog table \(Db2 SQL\)](#)

[SYSTABLESPACE catalog table \(Db2 SQL\)](#)

00E70021

Explanation

Either the specified audit policy is not defined or an attempt was made to use it before new functions are activated on the subsystem.

System action

The audit policy is not started.

System programmer response

Verify that the audit policy is defined and that new functions are activated on the subsystem. If the policy has not been defined, define it and then start it. If new function is not activated on the system yet, delay running the program until new function is activated.

00E70022

Explanation

Either no category is specified for the audit policy or the specified category value is invalid for the audit policy.

System action

The audit policy is not started.

This reason code is in the IFCID 0362 trace record.

System programmer response

If no category is defined, specify at least one category for the audit policy.

If the category value is invalid, correct the category value for the specified audit policy:

COLLID

Specify that PACKADM authority is to be audited.

DBNAME

Specify that DBCTRL, DBADM, or DBMAINT authority is to be audited.

If the length of the DBNAME value is greater than 8, correct the length to 8 characters or fewer.

Specify the correct values and then start the audit policy.

Related concepts

[Db2 audit policies \(Managing Security\)](#)

Related reference

[Audit category \(Managing Security\)](#)

[Administrative authorities in Db2 for z/OS \(Managing Security\)](#)

00E70023

Explanation

One of the following conditions has occurred:

- The required object schema or object name is not specified for the OBJMAINT or EXECUTE category in the audit policy.
- The object type specified in the audit policy is not valid. The valid object types are table, clone table and implicit table created for XML columns.

System action

The audit policy is not started.

This reason code is in the IFCID 0362 trace record.

System programmer response

The object schema and object name are required for categories OBJMAINT and EXECUTE. If the object schema or object name is not specified, then specify the object schema or object name and start the audit policy.

If the object type is not valid, specify the correct value and start the audit policy.

Related tasks

[Creating and activating audit policies \(Managing Security\)](#)

Related reference

[Audit category \(Managing Security\)](#)

00E70024

Explanation

None of the tables that are specified in the audit policy exist for auditing.

System action

The audit policy is not started.

This reason code is in the IFCID 0362 trace record.

System programmer response

The table name specified in the audit policy is not defined. Define the table and then start the audit policy.

Related tasks

[Creating and activating audit policies \(Managing Security\)](#)

00E70025

Explanation

None of the tables that are specified in the audit policy are defined as supported table space types. Only the following table space types are supported for auditing:

- Universal table spaces
- Traditional partitioned table spaces
- Segmented table spaces

System action

The audit policy is not started.

This reason code is in the IFCID 0362 trace record.

System programmer response

To identify the tables that are not being audited, join the SYSIBM.SYSAUDITPOLICIES, SYSIBM.SYSTABLES and SYSIBM.SYSTABLESPACE tables on the basis of the table name (OBJECTSCHEMA and OBJECTNAME values from SYSIBM.SYSAUDITPOLICIES), excluding supported table space types.

Related concepts

00E70026

Explanation

PROG AUTH(ENABLE) was specified when the plan was bound to enable program authorization. One or more of the following objects that are required for program authorization do not exist:

- Table SYSIBM.DSNPROG AUTH
- Index SYSIBM.DSNPROG AUTH_IND X1

System action

The request to allocate a plan to the program is denied.

User response

Take the following actions:

1. Check whether table SYSIBM.DSNPROG AUTH and index SYSIBM.DSNPROG AUTH_IND X1 exist. If they do not exist, create them. Use the definitions of those objects in installation job DSNTIJS G as a model.

2. Add rows to table SYSIBM.DSNPROG AUTH for programs for which you need to do program authorization.
3. Rerun the program.

00E70028

Explanation

PROG AUTH(ENABLE) was specified when the plan was bound to enable program authorization. One or more of the following objects are not defined correctly:

- Table SYSIBM.DSNPROG AUTH
- Index SYSIBM.DSNPROG AUTH_IND X1

System action

The request to allocate a plan to the program is denied.

User response

Take the following actions:

1. If the table definition is in error, drop table SYSIBM.DSNPROG AUTH, and create SYSIBM.DSNPROG AUTH with the correct definition. Use the definition in installation job DSNTIJS G as a model.
2. Add rows to table SYSIBM.DSNPROG AUTH for programs for which you need to do program authorization.
3. If the index definition is in error, drop index SYSIBM.DSNPROG AUTH_IND X1, and create SYSIBM.DSNPROG AUTH_IND X1 with the correct definition. Use the definition in installation job DSNTIJS G as a model.
4. Rerun the program.

00E70031

Explanation

The maximum number of audit policies is exceeded in the subsystem. No more than 64 audit policies can be started in a subsystem.

System action

The audit policy is not started. This reason code is in the IFCID 0362 trace record.

System programmer response

Issue the following command to identify the audit policies that are started:

Then, issue a STOP TRACE command to stop an audit policy before starting more audit policies.

Related concepts

[Db2 audit policies \(Managing Security\)](#)

Related reference

[-DISPLAY TRACE command \(Db2\) \(Db2 Commands\)](#)

[-STOP TRACE command \(Db2\) \(Db2 Commands\)](#)

00E70032

Explanation

The key label could not be updated due to a security server authorization error for key label access. This error can occur in either of the following cases:

- After an SQL statement with the KEY LABEL clause is issued
- After the SET SYSPARM command is run to modify the ENCRYPTION_KEYLABEL subsystem parameter value

System action

The requested operation is not performed.

System programmer response

For additional problem determination, review the SQLCODE -4755 for the SQL statement and DSNX243I message on the Db2 system console for online update of system parameter.

Problem determination:

Refer to [RACROUTE REQUEST=FAST AUTH \(standard form\) \(Security Server RACROUTE Macro Reference\)](#) to determine the problem.

00E70033

Explanation

The online update of the ENCRYPTION_KEYLABEL subsystem parameter could not be completed because the function level is set for a previous level or the function level cannot be determined.

System action

The requested operation is not performed.

System programmer response

Issue the DISPLAY GROUP command to determine the current function level. Reissue the -SET SYSPARM command.

00E70034

Explanation:

The key label is not defined in the Integrated Cryptographic Service Facility (ICSF). An online update of the ENCRYPTION_KEYLABEL subsystem parameter could not be completed.

System action

The requested operation is not performed.

System programmer response:

Contact the ICSF administrator to define the key label. After the key label is defined, rerun the SET SYSPARM command.

00E70035

Explanation:

IBM zSystems™ AI Optimization Library (zAIO) is not installed. The requested function could not be completed.

System action

The requested function could not be completed.

System programmer response:

Ensure that zAIO is installed in z/OS.

00E70069

Explanation

An installation error was detected while the CICS Attachment Facility was attempting to establish the connection to Db2 for your CICS transaction. This error can be caused by the following situations:

- The current CICS transaction identifier was not found in any of the resource control table (RCT) entries.
- A valid authorization name was not found using the RCT entry for this CICS transaction. The AUTH= parameter in the RCT specifies up to three sources for authorization checking. None of these yielded a valid name for checking. For example, the RACF group might have been specified, but the user was not a member of any RACF group. Or terminal identifier might have been specified, but the transaction was being run without a terminal.

System action

The request is not processed.

System programmer response

Check the RCT table specifications for this transaction to determine if they are missing or incorrect. If modification is needed, change the RCT source and install the RCT again.

Problem determination

You might be able to use the DSNCL DISPLAY command to check for the existence of an RCT entry for this transaction. If an entry exists, refer to the RCT source. Look at the AUTH= parameter list and determine why CICS was unable to establish a valid authorization name for checking.

Related tasks

[Controlling CICS connections \(Db2 Administration Guide\)](#)

[Controlling the CICS attachment facility from an application \(Db2 Application programming and SQL\)](#)

[Migration step 4: Connect CICS to Db2 \(optional\) \(Db2 Installation and Migration\)](#)

Related information

[DSNCL DISPLAY \(CICS Transaction Server for z/OS\)](#)

[Recovering Db2 when the CICS attachment facility cannot connect to Db2 \(Db2 Administration Guide\)](#)

00E7006A

Explanation

While processing your request, the IMS Attachment Facility could not identify the Db2 subsystem. The Db2 identification must be defined to the IMS control region, the DL/I batch region, and any dependent region accessing the Db2 subsystem.

System action

The connection is not established.

System programmer response

To make the identification to the IMS regions, you must create a subsystem member (SSM) in the IMSVS.PROCLIB library and identify the SSM to the applicable IMS regions.

Related concepts

[IMS attachment facility \(Introduction to Db2 for z/OS\)](#)

Related tasks

[Controlling IMS connections \(Db2 Administration Guide\)](#)

[Connecting the IMS attachment facility \(Db2 Installation and Migration\)](#)

00E7006B

Explanation

The CICS or IMS Attachment Facility detected that a shutdown was in progress for the Db2 subsystem while processing your request. This might occur during initial connection processing or during subsequent requests, depending on the type of Db2 shutdown.

System action

The connection is not established.

Operator response

Restart the Db2 subsystem.

User response

Before you can continue, you must restart the Db2 subsystem. Contact the operator to restart the subsystem, and then resubmit your transaction.

00E70081

Explanation

An SQL statement was issued, but the object that was referenced by the statement cannot be created, altered, renamed, or dropped. The object is referenced by a prepared dynamic SQL statement that is currently stored in the dynamic statement cache and is in use by an application.

System action

The requested operation is not performed.

Programmer response

The requested operation cannot be performed until other applications are not referencing the object by using dynamic SQL. Invalidating a cached statement that references the object by using RUNSTATS does not accomplish this task.

Instead, ensure that other applications have quiesced or performed a commit operation. Then, try the request again. You can also increase the value of the DDLTOX subsystem parameter so that the statement can wait longer while other applications that reference the object quiesce or perform a commit operation.

Problem determination

An SQLCODE -904 is issued. The message tokens for that message report the name and type of the object that was referenced.

The resource name is in the form *statement-ID* or *member-name.statement-ID*. *statement-ID* is the statement identifier of the statement in the dynamic statement cache that has a claim on an object that cannot be created, altered, renamed, or dropped. If the application is running in a data sharing environment, *member-name* is the name of the data sharing member on which the statement is running.

See [Collecting data for a cached dynamic statement that blocks another statement with reason code 00E70081 \(Diagnosing Db2 problems\)](#) for instructions on how to collect information about the statement that is causing the error.

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00E70082

Explanation

One for the following situations has occurred:

- The user has reached the maximum number of outstanding stored procedures or opened cursors for the current thread.
- The application has called the maximum number of user-defined external scalar functions for the current thread.

System action

No additional stored procedures or user-defined external scalar functions can be invoked, and no more cursors are allowed to be opened.

Programmer response

For stored procedures, change applications to close cursors as soon as possible, and issue COMMIT often to allow the result sets to be cleared.

For user-defined external scalar functions, increase the MAX_UDF subsystem parameter value, or change applications to run fewer functions concurrently in a Db2 thread.

Related reference

[MAX STORED PROCS field \(MAX_ST_PROC subsystem parameter\) \(Db2 Installation and Migration\)](#)

[MAX UDFS field \(MAX_UDF subsystem parameter\) \(Db2 Installation and Migration\)](#)

00E70083

Explanation

An SQL statement was issued, but an object that was referenced by the statement cannot be created, altered, renamed, dropped or revoked. The object is referenced by a stabilized dynamic SQL statement prepared from SYSDYNQRY into the dynamic statement cache, and the unit of work was not committed. The object might also be referenced by an outstanding START DYNQUERYCAPTURE command.

System action

The requested operation is not performed.

User response

The requested operation cannot be performed until other SQL statements or START DYNQUERYCAPTURE commands are not referencing the object.

Ensure that other applications have performed a commit operation, or START DYNQUERYCAPTURE commands have completed. Then, try the request again.

Problem determination

An SQLCODE -904 is issued. The message tokens for that message report the name and type of the object that was referenced.

Related reference

[-START DYNQUERYCAPTURE command \(Db2\) \(Db2 Commands\)](#)

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-*

code, TYPE OF RESOURCE *resource-type*, AND

00E7009A

Explanation

A DECLARE GLOBAL TEMPORARY TABLE statement or OPEN CURSOR (of a scrollable cursor) was issued, but the operation cannot be performed due to one of the following reasons:

- A work file database has not been created yet.
- A table space has not been created in the work file database yet.
- No table space in the work file database has a page size that is large enough for the declared global temporary table.
- A table space in the work file database is not available at this time.

System action

The operation is not allowed.

Operator response

Notify the system programmer.

System programmer response

To perform the operation, you must create the required work file database or create a table space with a large enough page size.

Problem determination

The requested operation is not performed. An SQLCODE -904 is issued.

Related concepts

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00E7009B

Explanation

An invalid operation has been attempted on an incomplete table that was created in a previous release of Db2. The table definition is incomplete due to a missing unique index on a primary key or unique key.

The following DDL operations are not allowed:

- ALTER TABLE
- CREATE INDEX
- DROP INDEX

System action

Db2 does not process the operation.

Operator response

Notify the system programmer.

System programmer response

In order to perform the operation on the object, you must use the release of Db2 in which the table was created.

Problem determination

Db2 does not perform the requested operation, and issues SQLCODE -904. For more information, refer to Part 1, “SQL codes,” on page 1.

00E7009C

Explanation

An attempt was made to execute a statement that depends on an unavailable catalog object. The catalog object will be available after the catalog is updated to the necessary level.

System action

The operation is not allowed.

Operator response

Notify the system programmer.

System programmer response

To perform the operation, you must update the catalog to the required level. To do this, run installation job DSNTIJTC.

Problem determination

The requested operation is not performed. SQLCODE -904 and message DSNT501I are issued.

Related tasks

[Migration step 16: Tailor the Db2 13 catalog: DSNTIJTC \(Db2 Installation and Migration\)](#)

[Installation step 16: Tailor the Db2 catalog: DSNTIJTC \(Db2 Installation and Migration\)](#)

Related information

[-904](#)

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

[DSNT501I \(Db2 Messages\)](#)

00E7009D

Explanation

The code level of the Db2 catalog is incompatible with the current code level of:

- A Db2 subsystem that is starting, or
- A datasharing group

System action

Db2 cannot start. Message DSNX208E or DSNX209E is displayed on the system console to describe the problem. An SVC dump is requested for the DSNX208E problem.

Operator response

Notify the system programmer.

System programmer response

Before Db2 can start, each Db2 subsystem must use a level of code that is compatible with the catalog.

Problem determination

Db2 does not start. Message DSNX208 or DSNX209 display a reason code or level information that helps with problem diagnosis.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Unformatted DSN1PRNT output of the DSNCB01.DBD01 page set. Locate the inconsistent DBD in the DSNCB01.DBD01 page set by using the method described in [Finding a DBD in a dump \(Diagnosing Db2 problems\)](#).

00E7009E

Explanation

The object is dependent on facilities of a release of Db2 that is newer than the release that you are currently running (fall back).

System action

The operation is not allowed.

Operator response

Notify the system programmer.

System programmer response

In order to perform the operation on the object, you must use the release of Db2 that supports the new facilities.

Problem determination

The requested operation is not performed. An SQLCODE -904 and/or message DSNT501I is issued. Message DSNT501I describes which object has the release dependency.

00E7009F

Explanation

An error occurred while loading the catalog DBD during start-up processing.

System action

If message DSNX204I is issued to the console, Db2 is started ACCESS(MAINT). Otherwise, the current START command processing is terminated.

Operator response

Notify the system programmer.

System programmer response

Obtain copies of SYS1.LOGREC and the SVC dump. If message DSNX204I was issued to the console, see the description of that message.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Register 2 points to a character string that describes the specific error encountered.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E700A6

Explanation

Failure in Db2 code supporting LE.

System action

The application program abends.

Operator response

Notify the system programmer. Print SYS1.LOGREC.

System programmer response

See problem determination.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E700A7

Explanation

LE returned an unexpected return code to Db2.

System action

The application program abends.

Operator response

Notify the system programmer. Print SYS1.LOGREC.

System programmer response

See problem determination.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

At the time of abend, register R2 contains two bytes of the function code presented to LE, followed by two bytes of the unexpected return code sent back to Db2 from LE.

Confirm Db2 is running with the correct release of LE with the required service level. Refer to the Program Directory to determine the minimum level of OS/390® and LE and fixes that are required.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E700A8

Explanation

Db2 detected internal inconsistency while processing a call to Preinitialized Language Environment for Authorized Programs.

System action

The application program abends.

Operator response

Notify the system programmer. Print SYS1.LOGREC.

System programmer response

If the location of the abend is DSNXGRDS.DSNXLEII:P005, the unexpected return code and reason code were returned to Db2 from the Preinitialized Language Environment for Authorized Programs, which usually indicates a setup error. Check whether recent changes to the z/OS environment (such as the REGION size or LE library location, among others) might have affected the operation of Db2 and the Preinitialized Language Environment for Authorized Programs.

If the abend was in a different location, it was likely caused by an internal Db2 consistency.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E70100

Explanation

This is an internal RDS error. The SQLWARN0 field does not contain a valid value while determining SQLSTATE field value.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related concepts

[SQL communication area \(SQLCA\) \(Db2 SQL\)](#)

Related reference

[Description of SQLCA fields \(Db2 SQL\)](#)

00E70105

Explanation

This is an internal RDS error. One of the SQLWARNx fields does not contain a valid value while determining SQLSTATE field value.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related concepts

[SQL communication area \(SQLCA\) \(Db2 SQL\)](#)

[Description of SQLCA fields \(Db2 SQL\)](#)

00E70106**Explanation**

Db2 received a functional request and encountered an internal authorization error. The function cannot be processed.

System action

The function is rejected with this reason code. If the request was SQL, then the SQLCODE is -922.

Operator response

Notify the system programmer.

System programmer response

Please call IBM Support to resolve this problem.

00E70110**Explanation**

The commit failed because the application was not connected to the Current Server.

System action

The reason code or SQLCODE -900 is returned to the application which is in an unconnected state.

Operator response

For Communication failure, refer to DSNL500I message.

System programmer response

Diagnose the failure that left the user application in an unconnected state. See “Problem Determination” section below.

User response

A previous failure has left your application in an unconnected state. Notify the system programmer that a system failure occurred during execution of your application. Any changes made in the last unit of work is rolled back. Re-run your application after determining the state of the Current Server database.

Problem determination

Refer to the previous SQL error in the application.

00E70115**Explanation**

The unit of work was placed in a state where a rollback operation is required. This can happen when an abend occurs during the execution of a stored procedure, a user defined function (UDF), or a restricted SQL operation was issued from a stored procedure.

System action

In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer response

Correct the stored procedure or UDF, rebind it and resubmit the calling application.

00E70121**Explanation**

User ID, password not valid in an IMS or CICS environment. An SQL CONNECT with user ID, password was issued from an IMS or CICS application.

System action

The SQL CONNECT request is not processed. The application is placed in the connectable and unconnected state.

00E70122**Explanation**

The user ID or password submitted on a request to CONNECT to the local Db2 exceeded the maximum length supported. The maximum length for each is 8 characters.

System action

The SQL CONNECT request was not processed. The application is placed in the connectable and unconnected state.

00E70123**Explanation**

A stored procedure was terminated because an ASUTIME threshold was exceeded.

System action

The CALL statement is terminated and Db2 returns an SQLCODE -905 to the calling application unless the stored procedure is called, and interrupted, at a Db2 z/OS server related system and the connection with the remote client system is via SNA.

User response

No action is required.

Related tasks

[Limiting resources for a stored procedure \(Db2 Performance\)](#)

Related information

-905

UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = *resource-name* LIMIT = *limit-amount1* CPU SECONDS (*limit-amount2* SERVICE UNITS) DERIVED FROM *limit-source*

00E70124

Explanation

Db2 was unable to add an entry to an access list. Db2 needs the entry for a cross-memory move.

System action

The SQL statement is rejected with SQLCODE -904 and this reason code.

System programmer response

If the problem persists, use the DSN1SDMP utility to generate a Db2 dump and contact IBM Support.

Related information

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

00E70911

Explanation

The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back. RC00E70911 is the same as the SQLCODE -911. For more information, refer to the SQL return code.

System action

The statement cannot be executed. The application is rolled back to the previous COMMIT.

Operator response

Notify the system programmer.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E70913

Explanation

The application was the victim in a deadlock or experienced a timeout. RC00E70913 is the same as the SQLCODE -913. For information, refer to the SQL return code.

System action

The statement cannot be executed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72008

Explanation

The relational data system (RDS) sort subcomponent has determined that there is not enough storage to continue the sort process.

System action

The application program abends.

Operator response

Notify the system programmer.

System programmer response

The CT is formatted and a return code with a value of 8 is returned from the sort subcomponent to indicate a resource was unavailable. Check the SYSOUT message file for any errors detected by the sort subcomponent.

00E72018

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected an internal inconsistency. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is a unique decimal code that identifies the error location and error type.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72048

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected an internal inconsistency. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SPL.
- R3 is a unique decimal code that identifies the error location and error type.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72058

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected that the number of unsorted records input to sort did not equal the number of sorted records returned by sort minus the number of records removed from the sort by the evaluation of aggregate functions. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72068

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected an internal inconsistency in the merge process. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are: R2 points to the SRTCOMM.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72078

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The Sort subcomponent has detected a sort work file management inconsistency in the merge process. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SPL.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72088

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected an error from the Data Manager. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is a unique decimal code that identifies the error location and error type of the Data Manager request that failed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72098

Explanation

The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The sort subcomponent has detected an invalid request for tag sort processing. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is a unique decimal code that identifies the error location and error type.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72100

Explanation

Db2 detected an internal inconsistency in sort during parallel query processing.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System programmer response

This is a Db2 internal error.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is a unique decimal code that identifies the error location and error type.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E72200

Explanation

Db2 detected an internal inconsistency in sort during parallel query processing. This is a Db2 internal error.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator response

Notify the system programmer. Provide a print of the SVC dump to the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SPL.
- R3 is a unique decimal code that identifies the error location and error type.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E73001

Explanation

The SQL statement or utility could not be executed because the required level of z/OS is not installed.

System action

For an SQL statement, the statement is rejected with SQLCODE -20101 and this reason code. For a utility, the utility is rejected with message DSNT500I and this reason code.

System programmer response

Refer to the Program Directory to determine the minimum level of z/OS that is required for the syntax used in the statement or utility.

00E73002

Explanation

The SQL statement could not be executed because of a resource unavailable condition. The resource is Language Environment.

System action

The SQL statement is rejected with SQLCODE -20101 and this reason code.

System programmer response

Refer to the system console for preceding errors. Correct the cause of these errors and restart the Db2 subsystem.

00E73003

Explanation

The SQL statement could not be executed because the statement needed a level/feature of OS/390 that is not installed. Db2 attempted to load a required Language Environment load module and was unable to do so.

System action

The SQL statement is rejected with SQLCODE -20101 and this reason code.

System programmer response

Refer to the Program Directory to determine the minimum level of OS/390 that is required for the syntax used in the statement.

00E73004

Explanation

The SQL statement could not be executed because of a resource unavailable condition. The resource was an LE token.

System action

The SQL statement is rejected with SQLCODE -20101 and this reason code.

System programmer response

Refer to the system console for preceding errors. Confirm that the zparm keyword LEMAX is greater than zero. If the problem is persistent, consider increasing the number of LE tokens that the Db2 subsystem is allowed to create. See the Installation Guide for more information on LE tokens.

00E73005

Explanation

The SQL statement or utility operation could not be completed because a hardware resource is not available.

System action

The SQL statement is rejected with SQLCODE -20107 or the utility issues message DSNT500I and terminates.

System programmer response

Examine the -20107 or DSNT500I message to identify the type of hardware resource that is not available. Refer to Program directories for Db2 13 (Db2 for z/OS in IBM Documentation) to determine the minimum level of hardware support that is needed for the syntax used in the statement or utility.

Related information

[DSNT500I \(Db2 Messages\)](#)

[-20107](#)

HOST VARIABLE OR PARAMETER NUMBER
position-number CANNOT BE USED AS
SPECIFIED BECAUSE REASON *reason*

00E73006

Explanation

The SQL statement or online update of the subsystem parameter could not be completed because a functional requisite is not available.

System action

The requested operation is not performed.

System programmer response

Examine the information returned with SQLCODE -904 to identify the type of resource that is not available. For an explanation of the *resource-type* value, see [Resource types](#).

If ICSF was the unavailable resource, review the Db2 system console for possible DSNX211I messages during Db2 startup for additional problem determination.

Problem determination

Refer to the [Program Directory](#) to determine the minimum functional requisite that is needed for the syntax used in the statement.

00E73007

Explanation:

The UUID generation function GENERATE_UUID or GENERATE_UUID_BINARY cannot be used because requisite true random number generation features were not available. The requisite features are available with IBM z14® or later hardware.

System action

The statement that contains the function cannot be processed.

System programmer response

Enable IBM z14 or later hardware.

Related reference

[GENERATE_UUID scalar function \(Db2 SQL\)](#)
[GENERATE_UUID_BINARY scalar function \(Db2 SQL\)](#)

00E79000**Explanation**

Db2 received an SQL CALL statement for a stored procedure. The CALL statement was not accepted because one or more columns of the SYSIBM.SYSROUTINES catalog table for the procedure contains invalid values.

System action

The statement cannot be executed. A DSNX9xx message is displayed on the MVS system console to describe the error that was detected.

Programmer response

Use ALTER PROCEDURE or ALTER FUNCTION to correct the invalid column values in the SYSIBM.SYSROUTINES table.

00E79001**Explanation**

Db2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement was not accepted because the routine was stopped. Possible reasons are:

- the STOP PROCEDURE ACTION(REJECT) command was issued for this procedure, or
- the STOP FUNCTION ACTION(REJECT) command was issued for this user-defined function, or

- there was a previous abnormal termination of the routine.

System action

The statement cannot be executed.

Programmer response

If the user-written routine was stopped by an abnormal termination, correct the cause of the abnormal termination.

Use the -START PROCEDURE command to activate the stored procedure.

Use the -START FUNCTION command to activate the user-defined function.

Problem determination:

00E79002**Explanation**

Db2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement was not accepted because the procedure could not be scheduled before the installation-defined time limit expired. This can happen for any of the following reasons:

- The Db2 STOP PROCEDURE(name) or STOP FUNCTION SPECIFIC command was in effect. When this command is in effect, a user-written routine cannot be scheduled until a Db2 START PROCEDURE or START FUNCTION SPECIFIC command is issued.
- The dispatching priority assigned by WLM to the caller of the user-written routine was low, which resulted in WLM not assigning the request to a TCB in a WLM-established stored procedure address space before the installation-defined time limit expired.
- The WLM application environment is quiesced so WLM will not assign the request to a WLM-established stored procedure address space.

System action

The statement cannot be executed.

Programmer response

If the routine was stopped, use the Db2 -START PROCEDURE or -START FUNCTION command to activate the user-written routine.

The cause of the timeout condition might be one of the following situations:

- If goal mode is being used to manage the number of WLM-established stored procedure address spaces, the dispatching priority assigned to the caller of the stored procedure might be too low. If the work is of low priority, WLM might leave it queued for a longer period of time.
- The WLM application environment is quiesced. Issue *MVS DISPLAY WLM,APPLENV=wlmenv* command to verify the status of the application environment. The *MVS VARY WLM,APPLENV=wlmenv* command can be used to activate the environment if it is quiesced.

00E79004

Explanation

Db2 received an SQL CALL statement for a stored procedure. The stored procedure could not be accepted, because the stored procedures address space is not active. The stored procedures address is not active if START DB2 ACCESS (MAINT) is specified or, START DB2 LIGHT (YES) is specified.

System action

The statement cannot be executed.

Programmer response

Re-invoke the routine once Db2 has been started without ACCESS(MAINT) or LIGHT(YES).

Problem determination:

00E79006

Explanation

Db2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement cannot be accepted, because the load module for the user-created routine is not compatible with Language Environment preinitialization environment.

System action

The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

Programmer response

Ensure the routine is compiled with a level of the compiler which generates a module that can be a target of a Language Environment preinitialization CEEPIPI call. Ensure that the routine is link edited with the Language Environment runtime library.

Verify that the user-written routine is described correctly in SYSIBM.SYSROUTINES as a main or sub program. This failure can occur if the procedure options for the stored procedure indicate it is a sub program and the specification in the catalog indicates it is a main program.

Message DSNX962I will also be displayed on the MVS system console. This message indicates the specific Language Environment preinitialization service that failed and the failing return code.

-471

INVOCATION OF FUNCTION OR PROCEDURE
name FAILED DUE TO REASON rc

00E79007

Explanation

An attempt to call a Db2 stored procedure or UDF invocation failed because the host language specified in the LANGUAGE clause of CREATE PROCEDURE or CREATE FUNCTION did not match the language reported by Language Environment.

System action

The attempt to call the stored procedure fails, and the procedure is marked STOP-REJ.

System programmer response

Use the ALTER FUNCTION or ALTER PROCEDURE statement to correct the LANGUAGE attribute specified for the user-defined function or procedure.

00E79008

Explanation

The SQL CALL statement could not be processed. The SECURITY attribute of the user-defined function

or procedure requested that a specific security environment be established. An error occurred while attempting to establish this security environment.

System action

The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

System programmer response

Additional error messages might have been generated by the external security product to describe the error. Use the ALTER FUNCTION or ALTER PROCEDURE statement to modify the SECURITY attribute specified for the user-defined function or procedure.

00E7900A

Explanation

A stored procedure defined as NO WLM ENVIRONMENT was invoked. Execution in the Db2-managed stored procedures address space (SPAS) is no longer supported.

System action

The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

Programmer response

Use ALTER PROCEDURE to modify the definition of the stored procedure to specify a valid WLM ENVIRONMENT. If the stored procedure accesses Db2, the load module identified in EXTERNAL NAME must be link edited with RRS attach (DSNRLI).

00E7900B

Explanation

The SQL CALL statement could not be processed. Db2 determined that the user-defined function or procedure was to be run in a specific WLM-established address space, but the necessary WLM services are not available.

The user-defined function or procedure specified a non-blank WLM ENVIRONMENT attribute.

System action

The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

System programmer response

Issue the START FUNCTION SPECIFIC or START PROCEDURE command to allow the altered user-defined function or procedure to be called.

Programmer response

Use the ALTER FUNCTION or ALTER PROCEDURE statement to modify the WLM ENVIRONMENT attribute specified for the user-defined function or procedure, or specify the NO WLM ENVIRONMENT clause.

00E7900C

Explanation

SQL CALL statement or user-defined function invocation could not be processed. The WLM application environment name specified for the user-written routine is not defined or is currently not available for Db2 use in the active WLM policy.

System action

The SQL statement is rejected with SQLCODE -471 and this reason code.

Programmer response

Use the -ALTER PROCEDURE or -ALTER FUNCTION command to update the WLM ENVIRONMENT to specify an application environment that is defined and active in the active WLM policy, or update the WLM policy to contain a valid application environment name.

If the WLM policy definition is updated, use the MVS WLM VARY command to activate this new definition.

If the WLM application environment is quiesced, use the MVS WLM VARY APPLENV= applenv, RESUME command to activate the application environment.

00E7900F

Explanation

Insufficient storage space available for the parameter list to a user-defined function or stored procedure, or a LOB host variable used in REXX exceeds the 16MB maximum. This error is caused by a single parameter or a group of parameters requiring more contiguous storage than Db2 can obtain.

System action

The SQL statement is rejected with SQLCODE -904 and this reason code.

Programmer response

Validate the length of each parameter.

If LOBs are being used, consider using LOB locators instead.

Related tasks

[Tuning routines with storage-consuming parameter lists \(Db2 Performance\)](#)

00E79010

Explanation

Db2 received an SQL CALL statement for a stored procedure. The CALL statement was not accepted because one or more columns of the SYSIBM.SYSROUTINES catalog table for the procedure contains invalid values. The value of the column was valid in a prior release of Db2, but is invalid in this release of Db2.

Possible reasons for this include a LANGUAGE column with value COMPJAVA.

System action

The statement cannot be performed. SQLCODE -471 is returned on the SQL CALL statement with this reason code.

Programmer response

Use ALTER PROCEDURE to correct the invalid column in the SYSIBM.SYSROUTINES catalog table.

To migrate a LANGUAGE COMPJAVA stored procedure to LANGUAGE JAVA, use the following procedure:

1. Ensure that you have a WLM application environment that has been set up to run LANGUAGE JAVA.
2. Put the .class file containing the stored procedure code into a directory that is identified in CLASSPATH in the JAVAENV for your LANGUAGE JAVA WLM application environment. Alternatively, you may put the .class file into a Java JAR file and invoke the SQLJ.INSTALL_JAR built-in stored procedure.
3. Issue an ALTER PROCEDURE command against the stored procedure that specifies LANGUAGE JAVA and WLM ENVIRONMENT *java applenv*.

00E79100

Explanation

An internal Db2 error was encountered while processing a stored procedure request.

System action

The task encountering the error is abended.

System programmer response

This is a Db2 internal error.

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- SYSABEND, SYSUDUMP, or SYSMDUMP output.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E79101

Explanation

Db2 received an unexpected return code from a WLM service.

System action

A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00E79102

Explanation

An error occurred while attempting a Java Native Interface function to invoke a Java stored procedure.

System action

The SQL CALL statement fails with SQLCODE -471 and reason code 00E79102.

Programmer response

Check the operator console for message DSNX961I. This message contains information about the Java error.

00E79106

Explanation

Db2 could not process an SQL CALL statement for a REXX stored procedure. There were errors associated in setting up an environment to run a REXX stored procedure. See the system console for the associated DSNX993I message.

System action

The SQL statement fails with this reason code and SQLCODE -471.

Programmer response

Use the information provided in the DSNX993I message, and the TSO and REXX messages in ddname SYSTSPRT for diagnosis. You can find TSO and REXX message explanations in [TSO/E REXX Reference](#).

00E79109

Explanation

A routine was defined to run in a WLM application environment that was not set up correctly for the language that was specified.

Java routines must be run in a WLM application environment that has been set up to run Java routines. This application environment cannot be used to run non-Java routines.

System action

The SQL CALL statement SQLCODE -471 and this reason code.

System programmer response

Use the ALTER PROCEDURE statement if you need to change the WLM application environment.

To set up a WLM application environment to run LANGUAGE JAVA routines, add a JAVAENV DD statement to the startup procedure for the stored procedure address space. The JAVAENV DD statement specifies a data set that contains environment variables for running Java routines.

Programmer response

Contact the system programmer

00E7910A

Explanation

Insufficient storage space available for Native SQL PL debugging. This error can be caused by symbol data that requires more contiguous storage than the SQL PL debug agent can obtain in the WLM managed Db2 SPAS.

System action

SQLCODE -904 is returned to the user with this reason code.

Programmer response

Refresh the WLM ENVIRONMENT FOR DEBUG MODE. Reduce the number of concurrent tasks permitted in the WLM Environment. Consider using fewer variables and shorter variable names in the SQL PL routine.

00E7910D

Explanation

The storage required for the dynamic statement cache exceeded the limit set by the EDMSTMTC subsystem parameter.

System action

SQLCODE -904 is returned with this reason code.

System programmer response

Increase the value of the EDMSTMTC subsystem parameter.

-904

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-*

code, TYPE OF RESOURCE *resource-type*, AND
RESOURCE NAME *resource-name*

DSNS003I (Db2 Messages)

00E79200

Explanation

A Control Center 390 stored procedure encountered an unexpected abnormal termination or error condition.

System action

The Control Center 390 stored procedure terminates, and returns a failing return code to the calling application. The Control Center 390 stored procedure retries from the abnormal termination, so Db2 will not detect that the stored procedure has abnormally terminated. The count of abnormal terminations maintained by Db2 will not be incremented for this abnormal termination.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Control Center 390, contact IBM support.

Problem determination

The error is recorded on SYS1.LOGREC, and an SVC dump is requested.

00E79201

Explanation

Db2 received an SQL statement containing an invocation of a user-defined function. The statement was not accepted because of a prior failing invocation of the user-defined function from the application. The prior failing invocation left the Db2 structures for the user-defined function task in an unusable state.

System action

The statement cannot be executed. SQLCODE -471 is returned with this reason code. If the user-defined function was defined with FINAL CALL YES, then it will be invoked at final call processing time.

Programmer response

Correct the error in the user-defined function program that caused the prior invocation to fail. Modify the invoking application so that it does not continue to invoke the user-defined function after a negative SQLCODE is issued.

00E79300

Explanation

Table creation has failed because Db2 cannot implicitly create a database, or cannot choose an existing available database with naming convention DSNxxxxx. The DSNxxxx value can range from DSN00001 to DSNnnnnn, where *nnnnn* is the maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, with a default value of 10000.

The cause of this failure is usually:

- A lock timeout exists.
- A deadlock condition exists.
- Db2 was unable to access catalog pages.
- On systems that contain a large number of databases: Db2 might have run out of resources to implicitly create a new database.

System action

The CREATE TABLE statement fails.

System programmer response

Use the GET DIAGNOSTICS statement to obtain information about the error conditions that have occurred. Analyze the error conditions to determine whether follow-up actions are necessary. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of Db2 log output.
- Listing of the results produced by the SQL statements.
- Listing of Db2 catalog tables.
- Definitions of table spaces, tables, and indexes involved in the error.

- Results from SELECT * from SYSIBM.SYSDATABASE.

Related reference

[CREATE TABLE statement \(Db2 SQL\)](#)

[GET DIAGNOSTICS statement \(Db2 SQL\)](#)

00E7F801**Explanation**

An internal logic error occurred in the accelerator service.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E7F802**Explanation**

An internal logic error occurred when an accelerator service functional service was invoked.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Chapter 22. X'E8.....' codes

Reason code identifiers that begin with 00E8 communicate normal and error situations with initialization procedures.

00E80001

Explanation

A required parameter was not passed via the MVS MGCR service which started the Db2 address space. The parameter must be the address of SCOM for the system services address space (*ssnmMSTR*) or the address on an ASCE for the database services address space (*ssnmDBM1*) or the DDF address space (*ssnmDIST*).

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the parameter value in error.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.

00E80002

Explanation

The Db2 subsystem services address space was not started by a valid subsystem or an error occurred during MVS IEFSSREQ processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of an 8-byte field that contains the following diagnostic information: bytes 1 through 4, the subsystem name; bytes 5 through 8, the contents of register 15 that contains the return code set by the MVS IEFSSREQ macro.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.

00E80003

Explanation

An unsupported pending function request was detected during processing in the system services address space (*ssnmMSTR*).

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the pending function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80004

Explanation

An error occurred when a POST was issued from a resource manager address space to the system services address space (*ssnmMSTR*) in order to indicate that the Db2 subsystem startup function completed successfully.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The system services address space (*ssnmMSTR*) might be abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80005

Explanation

An error occurred when a POST was issued from a resource manager address space to the system services address space (*ssnmMSTR*) in order to indicate that the allied authorization function completed successfully.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Probable cause is that the system services address space (*ssnmMSTR*) is abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80006

Explanation

An unsupported pending function request was detected during processing in the resource manager address space.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the pending function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8000E

Explanation

MVS was unable to establish an ESTAE for the Db2 address space control task.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the ESTAE macro return code.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8000F

Explanation

The expected latent parameter passed by the MVS MGCR macro service is invalid. The cause was probably an attempt to start Db2 by some means other than the command -START DB2.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.

00E80011

Explanation

MVS was unable to make the address space nonswappable.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.

00E80012

Explanation

An error occurred when a POST was issued from the system services address space to a resource manager address space in order to indicate the results of the MGCR invocation.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The resource manager address space might be abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.

00E80013

Explanation

MVS was unable to create a resource manager address space.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of an 8-byte field that contains the following diagnostic information: bytes 1 through 4, the four character resource manager address space name; bytes 5 through 8, the MGCR return code.

Probable cause is that the MVS auxiliary storage management has inhibited the starting of new address spaces because of a shortage of real storage.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8001F

Explanation

An unsupported function request was detected by the Db2 address space start function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8002F

Explanation

An unsupported function request was detected by the Db2 address space stop function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80031

Explanation

An unsupported input parameter was detected for allied address space initialization.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80032**Explanation**

An unsupported input parameter was detected for allied address space termination.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80033**Explanation**

This reason code accompanies a X'04F' system abend code. This module detected that the Db2 subsystem was terminating. Refer to the appropriate

CICS documentation for information about X'04F' and X'04E' abend completion codes.

System action

The caller's task abnormally terminates with code X'04F'.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80034**Explanation**

An unsupported input parameter was detected for allied address space initialization.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8003C

Explanation

An address space control element (ASCE) could not be located for the executing address space during EOM processing.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8003D

Explanation

An unrecovered resource (for example, a latch) was detected for a must-complete function.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8003E

Explanation

MVS was unable to establish an ESTAE in an address space about to be initialized as a Db2 allied address space.

System action

The caller's task abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8003F

Explanation

An unsupported function request was detected by the allied address space control function.

System action

The caller's task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80041

Explanation

An error occurred when a POST was issued from an allied address space to the system services address space (*ssnmMSTR*) in order to indicate a pending allied authorization request.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The system services address space (*ssnmMSTR*) might be abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80042

Explanation

An error occurred when a POST was issued from the system services address space (*ssnmMSTR*) to a resource manager address space in order to indicate a pending allied authorization request.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The resource manager address space might be abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8004F

Explanation

An unsupported function request was detected by the allied address space authorization function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80051

Explanation

An error was detected in the command that was used to start the Db2 subsystem. There are two conditions that can cause this error. If the -START DB2 command is in error, this abend results.

Secondly, if the Db2 subsystem is not running (had never been started, or had been stopped), any Db2 command that is entered is interpreted as being a -START DB2 command. In this second case, the subsystem starts just long enough to discover that the command actually is not a -START DB2 command and then issues the abend.

System action

The Db2 subsystem is terminated.

Operator response

Reenter the command if it was entered in error; otherwise advise the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

This error does not cause a SYS1.LOGREC record to be written or an SVC dump to be requested. A diagnostic tool (for example, MVS SLIP) is required to get subcomponent diagnostic information.

Problem determination

Register 9 contains the address of a 12-byte field that contains the following diagnostic information: bytes 1 through 4, the address of the buffer that contains the command used to start Db2; bytes 5 through 8, the general command processor return code; bytes 9 through 12, the IPC command processor return code,

or 'FFFFFFF' if bytes 5 through 8 contain a positive value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80052

Explanation

A resource manager provided notification of failure during facility startup notification processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested Db2 subsystem termination.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80053

Explanation

A resource manager provided notification of failure during release work notification processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested Db2 subsystem termination.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80054

Explanation

The recovery manager (RM) subcomponent provided notification of an error during restart recovery processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the return code from the recovery manager subcomponent.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80055

Explanation

The recovery manager (RM) subcomponent detected an error during Db2 checkpoint processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the return code from the recovery manager subcomponent.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80056

Explanation

During startup, Db2 was unable to access DSN6FAC in ZPARMS and therefore was unable to determine whether the distributed data facility was to be loaded.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

Assemble DSN6FAC and re-link-edit the DSNZPARM load module.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

00E80057

Explanation

An error occurred while trying to start a Db2 resource manager address space. A possible cause of this problem would be a JCL error in a start up procedure. Note that the error is probably not in the address space that issued this abend.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

00E80058

Explanation

The version of Db2 that you are attempting to start is not compatible with this version of z/OS. This version of Db2 requires an IBM zSystems processor running z/OS 2.4 or later.

System action

Message DSNY012I is issued. The Db2 subsystem is not started.

Operator response

Notify the system programmer.

System programmer response

Change the Db2 start-up procedures to use a version of Db2 that is compatible with the version of z/OS that you are using, or provide the required level of z/OS.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

[DSNY012I \(Db2 Messages\)](#)

00E80059

Explanation

An error was detected during Db2 initialization processing indicating that the location name is not specified in the DDF communication record from the BSDS.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

Complete the following steps:

1. Verify that the location name in the DDF communication record from the BSDS is specified. A location name must be specified even if DDF is not used.
2. Use the change log inventory utility (DSNJU003) to add or update the location name in the DDF communication record in the BSDS.
3. Start Db2 again.

Problem determination

See installation job DSNTIJUZ, job step DSNTLOG, for an example that uses DSNJU003 to update the DDF communication record. If you used the installation CLIST to install or migrate to this version of Db2, then DSNTIJUZ member in your prefix.NEW.SDSNSAMP library is customized to update the DDF communication record with the values that you specified during installation.

00E8005A

Explanation

An attempt was made to start Db2 on a processor that either does not support z/Architecture®, is not enable for 64-bit addressing, or was not enabled to provide

a minimum of 128GB of FREE 64-bit SHARED virtual storage for this Db2.

System action

The Db2 subsystem is not started.

This abend is accompanied by message DSNY011I.

Operator response

Notify the system programmer.

System programmer response

You can either:

- Change the Db2 start-up procedures to use a version of Db2 that is compatible with the version of MVS that you are using.
- Provide the required level of MVS with required features enabled.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

[DSNY011I \(Db2 Messages\)](#)

00E8005C

Explanation

An attempt was made to start Db2 on a processor that is not the minimum level required on this release of Db2.

System action

The Db2 subsystem is not started. This abend is accompanied by message DSNY027I.

System programmer response

Take one of the following actions:

- Change the Db2 start up procedures to use a version of Db2 that is compatible with the processor that you are using.
- Start this release of Db2 on a processor that is supported by this release of Db2.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related information

[DSNY027I \(Db2 Messages\)](#)

00E8005F

Explanation

An unsupported function request was detected by the Db2 subsystem startup control function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80061

Explanation

A resource manager initialization table (RMIT) that has an invalid format was detected.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of an 8-byte field that contains the name of the load module in which the invalid resource manager initialization table (RMIT) format exists.

Probable cause is that the load module does not contain an RMIT or, the linkage editor entry control statement does not specify the RMIT as the module entry point.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8006F

Explanation

An unsupported function request was detected by the definitional control block management function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8007F

Explanation

An unsupported function request was detected by the application program call parameter management function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80081

Explanation

An invalid initialization load module list (ILML) was detected.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The module might not contain an initialization load module list or the linkage editor entry control statement might not specify the initialization load module list as the module entry point.

Register 9 contains the address of an 8-byte field that contains the name of the module that holds the invalid initialization load module list.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80084

Explanation

A resource manager provided notification of failure during subsystem startup notification processing.

System action

The Db2 subsystem is terminated.

Operator response

Verify that you entered the -START DB2 command using the correct DSNZPARM initialization parameter module. If it was not, reenter the command with the correct DSNZPARM module. Otherwise, notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested Db2 subsystem termination.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.
- Listing of DSNZPARM module used.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Output of the GTF trace (if requested by IBM).

00E8008F

Explanation

An unsupported function request was detected by the resource manager initialization function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80091

Explanation

An error occurred when a POST was issued from the control address space to a resource manager address space in order to indicate that Db2 shutdown is to be initiated for that address space.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

The resource manager address space might be abnormally terminating.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8009F

Explanation

An unsupported function request was detected by the Db2 subsystem shutdown control function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800AF

Explanation

An unsupported function request was detected by the resource manager termination function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800B1

Explanation

A service task could not be created during processing of the -STOP DB2 command.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the return code from the create-service task function of the agent services manager (ASM) subcomponent.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800CE

Explanation

MVS was unable to establish an ESTAE for the stop-work notification function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the ESTAE macro return code.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800D1

Explanation

A resource manager provided notification of failure during local memory-create notification processing.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 8 contains the address of a 4-byte field that contains the RMID of the resource manager that requested Db2 subsystem termination.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800D2

Explanation

An error was encountered while attempting to obtain the MVS LOCAL lock.

System action

The Db2 subsystem is terminated.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800D3

Explanation

An error was encountered while attempting to release the MVS LOCAL lock.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E800DF

Explanation

An unsupported function request was detected by the address space global common services function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

Obtain a print of SYS1.LOGREC and the SVC dump. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80100

Explanation

The Db2 subsystem was abended because the Db2 address space control task ESTAE was entered. This reason code is issued for all abend completion codes, except for the X'04E' abend completion code.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

The Db2 subsystem is unable to determine the cause of the error.

Problem determination

The subcomponent that caused the error is unknown. Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.
- Contents of the BSDS (both copies if dual BSDS in use) obtained by using the Db2 print log map (DSNJU004) utility.
- Output of the GTF trace (if requested by IBM).

00E8011D

Explanation

An unrecovered resource (for example, a latch) was detected for a must-complete function.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8011E

Explanation

The allied address space task primary ESTAE detected that MVS was unable to establish the secondary ESTAE.

System action

Abnormal termination of allied address space is continued.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8011F

Explanation

The allied address space task primary ESTAE was entered without a subsystem diagnostic work area (SDWA) provided by MVS RTM.

System action

Abnormal termination of the allied address space is continued.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8012D

Explanation

The allied address space task secondary ESTAE detected an unrecovered resource (for example, a latch) for a 'must complete' function.

System action

The Db2 subsystem abnormally terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8012F

Explanation

The allied address space task secondary ESTAE was entered without a subsystem diagnostic work area (SDWA) provided by MVS.

System action

Continue with the abnormal termination of the allied address space.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80130

Explanation

The FRR that protects the -START/-STOP DB2 command processor function was entered while a valid -STOP DB2 command was being processed.

System action

The Db2 subsystem terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80140**Explanation**

The ESTAE that protects the stop work notification function was entered.

System action

The Db2 subsystem terminates.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Refer to the appropriate CICS documentation for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80150**Explanation**

An initialization entry point list having an invalid format was detected.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of an 8-byte field that holds the name of the load module in which the invalid initialization entry point list exists.

Probable cause is that the module does not contain an initialization entry point list or the linkage editor entry control statement does not specify the initialization entry point list as the module entry point.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80151**Explanation**

An invalid module entry point address was detected in an initialization entry point list entry.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 12-byte field that contains the following diagnostic information: bytes 1 through 8, the name of the load module that contains the initialization entry point list with the invalid entry; bytes 9 through 12, and the entry number of the initialization entry point list entry. Probable cause is that the initialization entry point list entry defines an invalid module entry point or defines a valid entry point for a module that has not been included in the loaded module.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E8015F

Explanation

An unsupported function request was detected by the module entry point list (MEPL) management function.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem determination

Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00E80160

Explanation

During Db2 startup processing, the Initialization Procedures subcomponent detected a load module with an invalid AMODE or RMODE attribute. The abend is preceded by message DSNY006I or by DSNY007I.

System action

Subsystem startup is terminated.

Operator response

See message DSNY006I or message DSNY007I.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

See message DSNY006I or message DSNY007I.

Problem determination

See message DSNY006I or message DSNY007I.

00E80161

Explanation

During Db2 subsystem startup processing, the Initialization Procedures subcomponent detected a load module that was not at the same version of Db2 as the subsystem being started.

System action

Subsystem startup is terminated.

Operator response

See message DSNY010I.

System programmer response

The recovery routine for the CSECT issuing this reason code records information in the variable recording area

(VRA). If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

See message DSNY010I.

Problem determination

See message DSNY010I.

00E80162

Explanation

The DSNHDECP module supplied by Db2 is being used to start Db2. Db2 requires site-dependent settings that are specified in the DSNHDECP module that was created when Db2 was installed. The installation-generated DSNHDECP module typically resides in the SDSNEXIT library.

System action

The Db2 subsystem is not started.

Operator response

Notify the system programmer.

System programmer response

See message DSNT527I.

00E80163

Explanation

A Db2 subsystem could not start because the Db2 ERLY code was not at the correct level for the version of that Db2 subsystem.

System action

Db2 startup abnormally terminates.

System programmer response

To solve the problem, follow these steps:

1. Verify that you are specifying the correct *prefix.SDSNLINK* library in your link list. If not, correct the library name.
2. Install a version of the Db2 ERLY code that is compatible with the at Db2 version that you are starting.

See [Choosing link list options \(Db2 Installation and Migration\)](#) for information about compatibility of ERLY code levels and at Db2 versions.

3. Activate the ERLY code by performing a z/OS IPL or issuing the command -REFRESH DB2,EARLY.

Related tasks

[Choosing link list options \(Db2 Installation and Migration\)](#)

Related reference

[-REFRESH DB2,EARLY command \(Db2\) \(Db2 Commands\)](#)

Related information

[DSNY028I \(Db2 Messages\)](#)

00E80170

Explanation

You requested a facility that was not loaded or started at the time Db2 started. Whether or not to load or start a facility is contained in the DSN6FAC member in ZPARMS.

This reason code is returned to the calling CSECTs by DSNYNFAC along with a return code of 8.

This is not an error in DSNYNFAC. If an error exists, it might be in the calling CSECT or in the DSN6FAC member in ZPARMS.

System action

This is determined by the caller of DSNYNFAC.

Operator response

Notify the system programmer.

System programmer response

If it can be determined that DSN6FAC is in error, assemble DSN6FAC with corrections and re-link-edit the DSNZPARM load module.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of DSNZPARM module used.

Chapter 23. X'E9.....' codes

Reason code identifiers that begin with 00E9 communicate normal and error situations with the system parameter manager.

00E90101

Explanation

This reason code is issued when a Db2 directory cannot be opened. This is probably a Db2 subsystem error.

This abend reason code is issued by the module identified in the SYS1.LOGREC entry for this abend code.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Obtain a print of SYS1.LOGREC and the SVC dump.

Problem determination

This abend results when any one of a number of Db2 internal directories cannot be opened. One customer-usable directory can also cause this abend if it cannot be opened. This is the DSNZPARM directory that is established at installation.

This directory may have a name different from that specified at installation, because the customer has the option of changing the name during installation. Ensure that the DSNZPARM directory (or its equivalent) is available to be opened.

If the DSNZPARM directory (or its equivalent) is available, the problem is a Db2 subsystem problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

This abend is intercepted by an FRR or ESTAE for the subcomponent or module that issued the DSNZOPEN request. The module containing the abended request is identified in the SYS1.LOGREC entry. This information may be useful in communicating with IBM about the problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.
- Listing of DSNZPARM module used.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E90201

Explanation

An incorrect parameter was encountered. This reason code is issued by module DSNZTGET in response to a DSNZGDE request. This is a Db2 subsystem error.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Obtain a print of SYS1.LOGREC and the SVC dump.

Problem determination

Locate the caller's save area by examining register 13 in the SYS1.LOGREC register save area. Registers 0 and 1 in the caller's save area identify the incorrect parameter(s).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.
- Listing of DSNZPARM module used.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

00E90202

Explanation

An error was found in the directory control information for a Db2 directory.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Obtain a print of SYS1.LOGREC and the SVC dump.

Problem determination

This abend results when incorrect control information is found for any one of a number of Db2 internal directories. One customer-usable directory can also cause this abend: the DSNZPARM directory that is established during installation. (This directory might have had a different name specified during installation.) Ensure that the DSNZPARM directory or its equivalent is available.

If the DSNZPARM directory or its equivalent is available, the problem is a Db2 subsystem problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.
- Listing of DSNZPARM module used.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

Related reference

[DSNTIPO: Operator functions panel \(Db2 Installation and Migration\)](#)

00E90203

Explanation

An error was found in the descriptor control information for a Db2 directory.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer.

System programmer response

Obtain a print of SYS1.LOGREC and the SVC dump.

Problem determination

This abend results when the descriptor control information is incorrect for any one of a number of Db2 directories. One customer-usable directory can also cause this abend: the DSNZPARM directory that is established at installation. (This directory might have had a different name specified during installation.) Ensure that the DSNZPARM directory or its equivalent is available.

If the DSNZPARM directory or its equivalent is available, the problem is a Db2 subsystem problem. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- Listing of the JCL procedures used to initialize DB2 address spaces.
- Listing of DSNZPARM module used.
- SYSPRINT output, including JCL, for the application program or batch job, and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.

Related reference

[DSNTIPO: Operator functions panel \(Db2 Installation and Migration\)](#)

00E90403

Explanation

A failure occurred when Db2 processed the -SET SYSPARM command. This error can be caused by inconsistent data or an internal error in Db2.

System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer. Collect the following materials listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

System programmer response

Obtain the SYS1.LOGREC and SVC dump from the operator.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E90404

Explanation

Db2 has detected an error while processing the -SET SYSPARM command.

System action

A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit abends.

Operator response

Notify the system programmer. Collect the following materials listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

System programmer response

Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00E90405

Explanation

An error occurred while Db2 was attempting to create a service task during -SET SYSPARM command processing.

System action

A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator response

Notify the system programmer. Collect the following materials listed in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

System programmer response

Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Chapter 24. X'F1.....' codes

Reason code identifiers that begin with 00F1 communicate normal and error situations with service facilities.

The DSN1LOGP service aid can abend with user abend code X'099'. You can find the corresponding abend reason code in register 15 at the time of error.

00F10100

Explanation

An internal error has been detected in the DSN1LOGP service aid.

Operator response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F10101

Explanation

The stand-alone log read function returned an invalid RBA. See the explanation for message DSN1211E.

Operator response

If you determine that the data set is a log data set and it is not damaged, you might need to report the problem.

For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Chapter 25. X'F3.....' codes

Reason code identifiers that begin with 00F3 communicate normal and error situations with the subsystem support subcomponent.

Many of these abend reason codes are returned in register 15 at the time of an X'0Cx' system abend and not as the reason code for an X'04E' abend. This is indicated in the descriptions that follow.

00F30001

Explanation

This reason code may be returned to subsystem-type recovery coordinators when they connect to Db2 or during processing of indoubt threads to inform the coordinator that further recovery coordination actions are required.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

Processing continues.

00F30002

Explanation

The requested Db2 subsystem, as specified by the subsystem name, is not active. The option to notify the requester, either via an ECB post or a SEND/MODIFY MVS command, is accepted.

System action

The request to notify the caller when the subsystem is active is queued for processing during subsystem startup.

User response

Retry the connection request after Db2 has been started.

00F30003

Explanation

An abend has occurred during an attempt to access or modify the caller-provided function request block (FRB) while executing in the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to an attachment-provided function request block (FRB). A subsequent X'0Cx' abend indicates an FRB addressability problem. This abend is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30004

Explanation

An abend has occurred during an attempt to access the attachment-provided parameter list while executing in the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to an attachment-provided parameter list. A subsequent X'0Cx' abend indicates a parameter addressability problem.

This abend is probably the result of a logic error in the attachment facility. For call attachment users, the abend may have been caused by a bad parameter address passed to call attachment.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30005

Explanation

An error was detected during processing of a request to establish or delete a 'termination ECB'. Either a parameter value was incorrect or an abend occurred while accessing the attachment-provided parameter list.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the nonabend case, either the ECB address was zero or the Request Code was not 'Establish' or 'Delete'. If the reason code is in register 15 on an abend, either the parameter list or a parameter value was not addressable in the caller's PSW key.

The error may be the result of an internal error in the attachment facility. Call attachment users should check that the supplied ECB address is not zero and that it is addressable in their PSW key.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30006

Explanation

A failure occurred while processing the 'Subsystem Name' during connection processing. In the abend

case, connection processing failed when accessing the 'Subsystem Name' in the caller's PSW key. In the nonabend case, MVS was unable to locate a Db2 subsystem with the specified name.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken in your recovery routine for abend analysis. If the named subsystem could not be found, verify that the correct subsystem name was specified. Call attachment users should note that the Translate function cannot be invoked for this reason code.

Problem determination

If the named subsystem could not be found, scan the MVS system log to verify that it was initialized during MVS IPL processing.

If this reason code was specified in register 15 on an abend, check that the subsystem name value is addressable in the caller's PSW key.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00F30007

Explanation

A failure occurred while processing the 'Connection Type' parameter during connection processing. Either the 'Connection Type' value was invalid or an abend occurred accessing the parameter using the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. This failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30008

Explanation

A failure occurred while processing the 'Notify Message/Startup ECB' parameter during connection processing. An abend occurs while accessing the parameter or while verifying that the ECB word was addressable in the caller's PSW key. In the nonabend case, either the parameter had a zero length or the supplied ECB address was zero.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure may be due to a logic error in the attachment facility. Call attachment users should verify that the Startup ECB address is nonzero and that the ECB word is addressable in their PSW key.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30009

Explanation

A request was received to establish a termination ECB, but a termination ECB had already been established for the connected task.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or invoking application.

User response

A dump should be taken for problem analysis.

Problem determination

This failure is probably the result of a logic error in the attachment facility.

00F30010

Explanation

A request was received to delete a termination ECB, but a termination ECB has not been established for the connected task.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or invoking application.

User response

A dump should be taken for problem analysis.

Problem determination

This failure is probably the result of a logic error in the attachment facility.

00F30011

Explanation

A connection or other work request was received, but the designated Db2 subsystem is not active. If the request was to connect to the subsystem, and the

Notify Message/Startup ECB was supplied, it was not accepted.

In some instances, this code may be reported if the application program issued an RRSF IDENTIFY function request and RRS/MVS was not available.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or invoking application.

User response

If the failure occurred on a connection request and a Notify Message/Startup ECB was provided, a dump should be taken for problem analysis. Reconnect to Db2 when the subsystem is active again.

If RRS/MVS was not available for an RRSF IDENTITY request, ensure RRS/MVS is active and retry the request.

Problem determination

The Notify Message or Startup ECB could not be accepted for one of two reasons.

- Storage for a buffer could not be obtained, or
- the length of the Message/ECB parameter was zero.

In the latter case, the attachment facility is probably in error. If insufficient storage was available for a buffer, the size of the CSA in 24-bit storage should be increased.

In some instances, the failure was reported because the application required an RRSF IDENTITY request and RRS/MVS was not active. Additional checking is needed when RRS/MVS is involved.

00F30012

Explanation

The requested Db2 subsystem, as specified by the subsystem name, is not active. The option to notify the requester, either via an ECB post or a SEND/MODIFY MVS command, is accepted, but overlays a previous Notify Message/Startup ECB request.

System action

The request to notify the caller when the subsystem is active is queued for processing during subsystem startup.

User response

Retry the connection request after Db2 has been started.

00F30013

Explanation

The requester is not authorized to connect to this Db2 subsystem. This condition might indicate an attempted security violation.

System action

The connection request is denied.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. Refer the user to your security administrator if the user should be granted authorization to a Db2 subsystem.

User response

Verify that you have specified the correct RACF authorization ID. If necessary, request authorization to access the Db2 subsystem from your security administrator.

Problem determination

During TCB connection processing, Subsystem Support invokes the RACROUTE service (causing a RACF RACHECK) to verify the authorization ID associated with the requester. If the RACF return code indicates the requester is not authorized to connect to this Db2 subsystem, the connection request is terminated with this reason code.

Related concepts

[Managing access through RACF \(Managing Security\)](#)

[Introduction to the RACF access control module \(RACF Access Control Module Guide\)](#)

00F30014

Explanation

The requester of a Subsystem Support function (for example, ABORT) for a connection is not in the same PSW key as when the connection was created.

System action

The requester's task is abended with code X'04E'.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This failure may be the result of a logic error in the attachment facility or an intentional attempt to violate Db2 connection protocols. The error should be evaluated in the same way as a system X'0C2' abend, an attempt by a nonprivileged program to perform privileged operations.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30015

Explanation

The attachment facility specified an invalid combination of values of FRBRALE and FRBQUAL. No Program Request Handler exists to service the call.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility and requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. The FRBRALE and FRBQUAL values in the caller's FRB should be examined to determine which one is in error. Not all combinations of valid FRBRALE and FRBQUAL values are supported. Each RALE is supported differently.

00F30016

Explanation

The attachment facility specified an invalid FRBRALE value. The value is outside the limits of those supported for the requesting connection. This can occur in many cases, one of which is when an SQL call is requested with a blank plan name by the requester.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility and requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. FRBRALE contains the invalid value that was passed. The value passed is not consistent with the resources allocated to the connected application.

If the plan name contains blanks, an SQL call is invalid. The requester should respecify the plan name and issue the request again.

00F30017

Explanation

The attachment facility specified an invalid FRBQUAL value. The value is outside the limits of those supported for the requesting connection.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility and requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. FRBQUAL contains the invalid value that

was passed. The value passed is not consistent with the resources allocated to the connected application.

00F30018**Explanation**

The requester's TCB is not connected to this instance of the Db2 subsystem. The TCB may have been connected to a previous instance.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

Request a new connection to Db2.

Problem determination

This error can occur for one of the following reasons:

- The Db2 subsystem has terminated and the connected application issues a Db2 work request without reestablishing the connection after the subsystem is restarted.
- The connection has been terminated by a CANCEL THREAD command.
- The connection does not seem to be associated with this TCB or address space, possibly due to errors that occurred when the connection was previously used.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00F30019**Explanation**

The requester's primary ASID (PASID) is not equal to the home ASID (PSAAOLD).

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

You may want to take a dump for problem analysis. The request may be retried, but first ensure the CPU is not in cross-memory mode.

Problem determination

No requester of a Db2 attachment facility may be in cross-memory mode. That is, PASID must equal HASID, which must equal SASID.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00F30020**Explanation**

An error was detected while processing the 'Commit Option' on a SSAM termination request. Either the value of the 'Commit Option' parameter was not valid or an abend occurred when accessing the parameter.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure may be the result of a logic error in the attachment facility. Call Attachment users should note that only 'SYNC' and 'ABRT' are valid terminate options.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30021**Explanation**

An attachment facility issued a Subsystem Support request, but provided too few or too many parameters.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or by the requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

This failure is probably the result of a logic error in the attachment facility.

Upon entry to each of the CSECTs listed above, register 1 contains the address of the Function Request Block (FRB). FRBPCNT contains the number of passed parameters and FRBPARM points to a list of parameter addresses. The required number of parameters is unique to the calling protocol for each CSECT.

00F30022**Explanation**

An error was detected while processing the 'Connection Name' for a connection request. Either the value of the 'Connection Name' parameter was not valid or an abend occurred when accessing the parameter.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. A 'Connection

Name' is invalid if it is not a printable string (e.g. binary zeros). The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30023**Explanation**

This reason code may be returned during connection processing if the connection name is already in use by another allied address space, but the connection type is different.

This reason code is not normally visible to users or operators, but may appear in Db2 traces. The ally attempting to connect to Db2 should have produced diagnostic information relating to the connection failure.

System action

The connection request is rejected.

System programmer response

Collect the diagnostics produced by the allied address space which could not connect to Db2.

Problem determination

Follow the instructions indicated by the diagnostics to assure that a different connection name will be used on future attempts to connect to Db2.

00F30024**Explanation**

The 'connection name' or 'connection type' does not match the name or type established by another connected task in the address space.

System action

The connection request is denied.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

All tasks within an address space connecting to the same Db2 subsystem must connect with the same connection name and type. Tasks within TSO and batch address spaces using the 'BATCH' connection type may specify unequal connection names. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- All dumps taken by the attachment facility or requesting application.

00F30025

Explanation

A request to establish a Db2 termination ECB has completed successfully; however, Db2 is stopping. The new termination ECB might not be posted.

System action

Control is returned to the attachment facility.

User response

Since Db2 is stopping, you should attempt to terminate your connection. Next, issue a connect request and provide a Startup ECB. When the Startup ECB is posted, issue the connect request again to re-establish your connection to the restarted Db2.

00F30026

Explanation

The attachment facility specified an invalid FRBFVLE value. The value is outside the limits of those supported for the requesting connection.

System action

The request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility and requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. FRBFVLE contains the invalid value that was passed. The value passed must not be zero and it must be consistent with the resource requested by FRBRALE.

00F30027

Explanation

An error occurred while processing the 'Weighting Factor' parameter. This parameter was provided by the attachment facility on a request to allocate a Db2 plan to the application.

Either an abend occurred accessing the 'Weighting Factor' or the value of the parameter is out of range.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The value of the 'Weighting Factor' must be a positive number between zero and 255. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30028

Explanation

This reason code is returned when previous invocations of Db2 have set the thread into a state such that the only acceptable request that can be made for the thread is ABORT. This could occur, for example, if the ally has issued "Prepare to Commit" and Db2 returned a "No" vote on the call. In this situation, the only acceptable request for the ally to make is ABORT.

This reason code is not normally visible to users or operators, but may appear in Db2 traces. The ally may have produced diagnostics to report this condition, or it may handle this condition internally without requiring outside intervention.

System action

The current allied request is rejected. The state of the thread is unchanged.

System programmer response

Collect any diagnostics produced by the allied address space.

Problem determination

Follow the instructions indicated by the diagnostics, if any.

00F30029

Explanation

This reason code is returned when a COMMIT request is received in an improper context. Either a PREPARE is required before the COMMIT request, or the connection type does not allow a COMMIT request.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The current allied request is rejected. The state of the thread is unchanged.

00F30030

Explanation

An abend has occurred during an attempt to access the caller-provided 'INDOUBT RESOLUTION' parameter while executing in the PSW key. This is probably the result of a logic error in the requesting program.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30031

Explanation

This reason code is returned when a DEALLOCATE request is received from a CICS or IMS thread, but PREPARE has already completed for the thread and either COMMIT or ABORT are the only acceptable requests.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The current allied request is rejected. The state of the thread is unchanged. The ally issuing the DEALLOCATE request may have produced diagnostics related to this error.

System programmer response

Collect the diagnostics produced by the allied address space, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30032

Explanation

An error occurred while processing the 'Indoubt Resolution' parameter. This parameter was provided by the attachment facility on a request to allocate a Db2 plan to the application.

Either an abend occurred accessing the 'Indoubt Resolution' or the value of the parameter is incorrect for this connection type.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. For TSO, batch, and Call Attachment connections, the value of the 'Indoubt Resolution' parameter must be 'NO'. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30033

Explanation

An abend has occurred during an attempt to access the 'Plan Name' parameter while executing in the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure may be the result of a logic error in either the attachment facility or the requesting application.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30034

Explanation

The authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist.

System action

The request to allocate a plan to the authorization ID is denied.

User response

Verify that the correct plan name was specified. If this plan exists, then request execution authority to the plan from either the owner of the plan or from another person given authority to grant execution authority to the plan.

00F30035

Explanation

An abend has occurred during an attempt to access the caller-provided authorization ID while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30036

Explanation

This reason code may be returned during connection processing for a coordinator thread if a coordinator for that connection name already exists. This may be a case of two IMS or CICS systems using the same connection name.

This reason code is not normally visible to users or operators, but may appear in Db2 traces. The ally attempting to connect to Db2 should have produced diagnostic information relating to the connection failure.

System action

The connection request is rejected.

System programmer response

Collect the diagnostics produced by the allied address space which could not connect to Db2.

Problem determination

Follow the instructions indicated by the diagnostics to ensure that a different connection name will be used on future attempts to connect to Db2.

00F30037

Explanation

This reason code may be returned during connection processing for a CICS or IMS dependent (noncoordinator) thread if a coordinator for that connection name does not already exist. This may be an internal error in CICS, IMS, or the attachment package.

This reason code is not normally visible to users or operators, but may appear in Db2 traces. The ally attempting to connect to Db2 should have produced diagnostic information relating to the connection failure.

System action

The connection request is rejected.

System programmer response

Collect the diagnostics produced by the allied address space which could not connect to Db2.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30038

Explanation

An abend has occurred during an attempt to access the 'Correlation ID' parameter while executing in the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30039

Explanation

This reason code may be returned on a PREPARE request if Network ID (NID) is specified, but NID was previously specified on the CREATE THREAD request. NID cannot be specified on both requests. This may be an internal error in CICS, IMS, or the attachment package.

This reason code is not normally visible to users or operators, but may appear in Db2 traces. The ally issuing the PREPARE to Db2 should have produced diagnostic information relating to the connection failure.

System action

The PREPARE request is rejected.

System programmer response

Collect the diagnostics produced by the allied address space which had the failing request.

Problem determination

Follow the instructions indicated by the diagnostics.

00F3003A

Explanation

An error occurred when Db2 allocated a plan to an application. There was a problem with the program name that the attachment facility passed to the plan allocation process.

An abend occurred when the plan allocation process accessed the program name parameter, or the first character of the program name is out of range.

System action

The create thread request is not processed.

System programmer response

See Problem Determination.

Problem determination

If an abend occurred, this reason code is placed in register 15 to indicate that the program name parameter was not addressable in the caller's PSW key. If the value of the program name is invalid, a logic error probably occurred in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F3003B

Explanation:

PROGAUTH(ENABLE) was specified when the plan was bound to enable program authorization. The program name that is associated with this connection is not authorized to use the specified plan name.

System action

The request to allocate a plan to the program is denied.

User response

Take one of the following actions:

- If the SYSIBM.DSNPROGAUTH table contains a row with the program name in the PROGNAME column, verify that the correct plan name is specified for the program.

- If the SYSIBM.DSNPROGAUTH table does not contain a row with the program name in the PROGNAME column, add a row for the program name.

Related tasks

[Managing program authorization \(Managing Security\)](#)

Related reference

[SYSIBM.DSNPROGAUTH table \(Db2 SQL\)](#)

00F30040

Explanation

The allocation of the plan to the connection failed. Either a resource is unavailable or the requested resource (plan) is not known to Db2.

System action

Information on the failing resource name, object type, and a Database Services reason code, that help to explain the allocation failure, are returned to the attachment facility.

System programmer response

Refer to message DSNT500I for identification of unavailable resources and diagnostics to be collected. Refer to [Appendix F, "Resource types for messages and codes in Db2 for z/OS," on page 1393](#) for an explanation of resource type codes.

User response

Unknown plans must be bound before they can be accessed.

Call Attachment users may invoke the TRANSLATE function to move the information returned to the attachment facility into the error message field SQLERRMT in the SQLCA.

Problem determination

See response suggestions above.

00F30042

Explanation

An abend has occurred during an attempt to access the caller-provided recovery coordinator option while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30043

Explanation

A terminate request was received with the 'Deallocate' option, but a unit of recovery is still outstanding for the connection. Either 'SYNC' or 'ABRT' must be requested before resources can be deallocated.

System action

The termination request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

This failure is probably the result of a logic error in the attachment facility or a Db2 connection management error. This reason code is placed in register 0 and the return code is placed in register 15.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- IMS or CICS trace and any dumps.

00F30044

Explanation

This reason code is returned when a DEALLOCATE request is received with uncommitted work outstanding. Either the PREPARE, COMMIT sequence or an ABORT request is required.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The current allied request is rejected. The state of the thread is unchanged. The ally issuing the DEALLOCATE request may have produced diagnostics related to this error.

System programmer response

Collect the diagnostics produced by the allied address space, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30045

Explanation

An error has occurred while attempting to locate the Unit of Recovery associated with a DISPLAY, COMMIT, or ABRT request. This is probably the result of a logic error in the requesting program.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 0 and the return code is placed in register 15.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- CICS trace listing.
- CICS attachment facility MVS SNAP dump.
- CICS transaction dump.
- IMS trace output.
- IMS dependent region, control region dump, or both.

00F30046

Explanation

A terminate request was received with the 'Commit' option, but this option is not supported for this connection type. Only the 'SYNC' or 'ABRT' options are valid for TSO, batch, and Call Attach connections.

System action

The termination request is not processed.

System programmer response

Obtain all dumps taken by the attachment facility or requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

This failure is probably the result of a logic error in the attachment facility.

00F30047

Explanation

This reason code is returned when a RECOVER INDOUBT-ABORT request is received from a CICS or IMS recovery coordinator, but the thread is already in the process of COMMITting.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The current allied request is rejected. The state of the thread is unchanged. The ally issuing the RECOVER INDOUBT-ABORT request may have produced diagnostics related to this error.

System programmer response

Collect the diagnostics produced by the allied address space, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30048

Explanation

An abend has occurred during an attempt to access the attachment-provided 'Network ID' while executing in the caller's PSW key.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30049

Explanation

A request was received to connect the requester's TCB to a Db2 subsystem, but the TCB is already connected.

System action

The connection request is rejected.

System programmer response

Obtain all dumps taken by the attachment facility or requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

The failure is probably the result of a logic error in the attachment facility.

00F30050

Explanation

A Db2 request has been received after a failure during a previous request and cleanup of the previous request did not complete. This can happen if Db2 recovery was bypassed on a previous request. This bypass occurs if the application has an enabled unlocked task (EUT) FRR active and requested a retry back to the application mainline code.

System action

The request is not processed. Db2 will terminate the connection when the TCB terminates.

System programmer response

See Problem Determination.

User response

You must terminate your task. Do not attempt further Db2 requests. Do not request terminating the connection. You should request a dump for problem analysis.

Problem determination

The diagnostic data should be examined for prior failures while processing a request for this connection. Users of the call attachment facility cannot retry from an EUT FRR routine if an error occurs during Db2 processing.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30051

Explanation

This reason code is returned when a RECOVER INDOUBT request is received from a CICS or IMS recovery coordinator, but the thread is still processing in Db2 code other than EOT. The request cannot be

processed at this time but may be successful if issued again later.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The current allied request is rejected. The state of the thread is unchanged. The ally issuing the RECOVER INDOUBT request may have produced diagnostics related to this error.

System programmer response

Collect the diagnostics produced by the allied address space, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30052

Explanation

The caller's connection with Db2 has been terminated, because the caller's recovery coordinator has already terminated.

System action

The request has been processed by terminating the agent.

User response

Your application program may identify to Db2 when its recovery coordinator has identified again.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30053

Explanation

An error occurred while processing the 'Current Level' parameter. This parameter was provided by the attachment facility on a termination request.

Either an abend occurred accessing the 'Current Level' or the value of the parameter is invalid.

System action

The request is not processed.

System programmer response

See Problem Determination.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The value of the 'Current Level' parameter must be zero or a number representing the connection's authority level. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items:

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30054

Explanation

The value of the 'Current Level' parameter does not match the current authority level of the connection. This parameter was provided by the attachment facility on a termination request.

System action

The request is not processed.

System programmer response

Collect all dumps taken by the attachment facility or requesting application.

User response

A dump should be taken for problem analysis.

Problem determination

The failure is probably the result of a logic error in the attachment facility.

00F30055

Explanation

The maximum number of concurrent identify level agents has been exceeded.

System action

The connection request is not processed.

System programmer response

Check the values of the following subsystem parameters that control the maximum number of concurrent identifies:

- CTHREAD
- IDFORE
- IDBACK

User response

Attempt connection to Db2 at a later time.

Related reference

[MAX USERS field \(CTHREAD subsystem parameter\) \(Db2 Installation and Migration\)](#)
[MAX TSO CONNECT field \(IDFORE subsystem parameter\) \(Db2 Installation and Migration\)](#)
[MAX BATCH CONNECT field \(IDBACK subsystem parameter\) \(Db2 Installation and Migration\)](#)

00F30056

Explanation

An IDENTIFY request for connection to Db2 was rejected. Db2 had been started in restricted access mode. Only authorization IDs authorized to perform maintenance functions are permitted access to Db2.

System action

The connection request is not processed.

User response

Retry the connection request after Db2 has been restarted in full access mode.

00F30057

Explanation

An invalid application-supplied address was encountered while accessing the application-provided data.

System action

The application program is abended with code X'04E' and this reason code.

System programmer response

Obtain the dump printout from the application programmer. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The register contents at the time of abend are as follows:

R2

A decimal code identifying the bad data:

1

FRB address is invalid.

2

FRBPARM contains an invalid RDIIN address.

18

RDICODEP contains an invalid SQLCA address.

R3

The invalid application data area address.

R4

The address of the RDIIN.

R5

The virtual storage key of the data.

R8

The address of the FRB in the application address space.

Collect the following diagnostic item listed in

- SYSABEND, SYSUDUMP, or SYSMDUMP output.

00F30058

Explanation

Access to Db2 has been denied by the site's authorization exit.

System action

The request is not processed.

System programmer response

If the request denial was in error, test the Db2 signon exit to determine the cause of the error. Otherwise, no action is required.

User response

Contact your security administrator and request authority to access this Db2 subsystem.

00F30059

Explanation

The return code from the authorization exit was not valid. Field EXPLARC must be set by the authorization exit to either 0 or 12.

System action

The request is not processed.

System programmer response

Diagnostics obtained for the failure must be analyzed and the exit corrected.

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3005A

Explanation

The maximum number of concurrent threads has been exceeded, and queuing was disabled in the OPEN function call for the request.

System action

The create thread request is rejected.

System programmer response

Attempt the create thread request again at a later time.

Related reference

[CONNECT function for CAF \(Db2 Application programming and SQL\)](#)

00F30060

Explanation

Upon return from an authorization exit, the returned value of the SQL ID was not equal to either the returned primary or one of the returned secondary authorization IDs.

System action

The request is not processed.

System programmer response

Diagnostics obtained for the failure must be analyzed and the exit corrected.

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30061

Explanation

An abend occurred while referencing the SIGNON request's secondary authorization ID parameter provided by the attachment facility.

System action

SIGNON processing is terminated.

System programmer response

Analyze the diagnostic data to determine which attachment module may have been in error.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This reason code is placed in register 15 to identify which parameter was not addressable with the caller's PSW key. The failure is probably the result of an error in the attachment facility.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30062

Explanation

Upon return from the SIGNON authorization exit, the returned value of the primary authorization ID is null. The first character is less than or equal to X'40'.

System action

The request is not processed.

System programmer response

Diagnostics obtained for the failure must be analyzed and the exit corrected.

Problem determination

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00F30063

Explanation

The Db2 attachment facility for IMS, CICS, or RRSAP provided a secondary authorization ID value, but no primary authorization ID value. This is a violation of the SIGNON protocol.

System action

The SIGNON request is terminated with a return code of 12 and this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- CICS trace listing.
- CICS attachment facility MVS SNAP dump.
- CICS transaction dump.
- IMS trace output.

- IMS dependent region, control region dump, or both.
- All dumps taken by the attachment facility or requesting application.

This is probably an error in the attachment facility.

00F30064

Explanation

The Db2 attachment facility for IMS, CICS, or RRSAP did not provide a value for the primary authorization ID, and the current primary authorization ID is also null. This is a violation of the SIGNON protocol. A user's connection must have an associated primary authorization ID.

System action

The SIGNON request is terminated with a return code of 12 and this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- CICS trace listing.
- CICS attachment facility MVS SNAP dump.
- CICS transaction dump.
- IMS trace output.
- IMS dependent region, control region dump, or both.
- All dumps taken by the attachment facility or requesting application.

This is probably an error in the attachment facility.

00F30065

Explanation

An error occurred in determining the commit state of the thread.

System action

The caller is abended in DSN3PR00 and DSN3CM00. In DSN3AB00 a dump is taken and an abort is attempted.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced. These can be used to locate the areas for examination, especially the RAL in the dump.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30066

Explanation

An abend occurred during an attempt to access the caller-provided ACEE address field while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The sign-on request is not processed.

User response

You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request that abended.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30067

Explanation

The caller holds a Db2 latch. This is a violation of the Authorization Services request protocol. The caller cannot hold a Db2 latch when requesting connection or sign-on services.

System action

The connection or sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for problem analysis.

Problem determination

A requester of connection or sign-on cannot hold a Db2 latch.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- All dumps taken by the attachment facility or requesting application.
- Determine who the requester was.

00F30068

Explanation

The CCB is being freed. This Authorization Service request specifies the address of a CCB that has previously been requested to be freed.

System action

The connection or sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for program analysis.

Problem determination

Authorization Service requests must be serialized. Once a request to free a given CCB is made, no subsequent Authorization Service request can be made referencing the same CCB.

Collect the following diagnostic items:

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30069

Explanation

The exit environment is incorrect. Either the exit environment was freed after connection processing or an error occurred acquiring storage for a CCB or during connection processing.

System action

The sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for problem analysis.

Problem determination

Collect the following diagnostic items, described in

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30070

Explanation

Functional recovery for the connection or sign-on processing could not be established. The executing module could not establish its ESTAE. This can occur if the current address space has insufficient storage. This may lead to an abnormal termination of the Db2 subsystem.

System action

The connection or sign-on request is not processed. The caller is abended with code X'04E' and this reason code.

Operator response

Notify the system programmer and restart Db2 if necessary.

System programmer response

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private areas expanded.

User response

A dump should be taken for problem analysis.

Problem determination

The caller should produce a SYS1.LOGREC entry and an SVC dump, so that the system programmer can examine the LSQA area.

Collect the following diagnostic items, described in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30071

Explanation

A logic error has occurred. An Authorization Service request has been made that references the same

CCB as a currently processing request. These requests must be serialized.

System action

The connection or sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer. A dump should be taken for problem analysis.

Problem determination

Authorization service requests must be serialized. Once an authorization service request is made referencing a given CCB, no subsequent authorization service requests can be made referencing the same CCB until the first request completes.

Collect the following diagnostic items, described in

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F30072

Explanation

The requester's authorization ID or password could not be verified. This condition may indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. Refer the user to your security administrator if the user should be granted access to a Db2 subsystem. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Verify that you have specified the correct RACF authorization ID and password. If necessary, request authorization to the Db2 subsystem from your security administrator.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the authorization ID or password could not be verified, the connection request is terminated with this reason code.

Related concepts

[Managing access through authorization IDs and roles \(Managing Security\)](#)

[Managing access through RACF \(Managing Security\)](#)

[Introduction to the RACF access control module \(RACF Access Control Module Guide\)](#)

00F30073

Explanation

The parameter flag settings on the Authorization Service request contradict each other. One flag is set to request the build of the exit environment. The other flag is set to request the release of the exit environment. These flags are mutually exclusive.

System action

The connection request is not processed. The caller is abended with code X'04E' and this reason code.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for problem analysis.

Problem determination

Only one of these flags can be set on when requesting connection processing.

Collect the following diagnostic items, described in

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- All dumps taken by the attachment facility or requesting application.

00F30074

Explanation

There is a problem in the execution environment. Connection or sign-on was requested from an SRB-mode execution unit, but the authorization services service task that would normally be switched to does not exist.

System action

The connection or sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). for failure analysis procedures.

User response

Notify the system programmer. A dump should be taken for problem analysis.

Problem determination

Determine why the authorization services service task was not created.

Collect the following diagnostic items, described in

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- All dumps taken by the attachment facility or requesting application.

00F30075

Explanation

RACROUTE returned an error when a request was made to RACROUTE to free an ACEE.

System action

The connection or sign-on request is not processed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for problem analysis.

Problem determination

Collect the following diagnostic items, described in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- All dumps taken by the attachment facility or requesting application.

00F30076

Explanation

An error occurred while attempting to obtain a CCB.

System action

The allied user is abended with code X'04E ' and this reason code.

Operator response

Notify the system programmer.

System programmer response

An SVC dump, associated SYS1.LOGREC entries, and SYSLOG should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

General purpose register 2 contains a reason code from authorization services that indicates the cause of the failure.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30077

Explanation

A plan or package could not be executed for one of these reasons:

- It is disabled in the environment in which you attempted to run.
- The attach library that you are using is from a previous release of Db2 that does not support the ENABLE and DISABLE options of the bind operation.

System action

The plan or package is not executed.

System programmer response

One of the following actions:

- Rebind the plan or package to enable it to execute in the present environment.
- Check the SYSPLSYSTEM or SYSPKSYSTEM catalog table to find an environment in which the plan or package can be executed.
- Correct the attach library.

00F30078

Explanation

An abend occurred during an attempt to access the caller-provided connecting system type code while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

This reason code is placed in register 15 during any access to caller-provided information. When any

abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30080

Explanation

CSECT DSNAPRHX was unable to cancel its ESTAE.

System action

The application program is abended with code X'04E' and this reason code.

System programmer response

See Problem Determination.

User response

Notify the system programmer. The application may be retried.

Problem determination

A nonzero return code was received from the Cancel ESTAE operation. The return code has been placed into Register 2.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30081

Explanation

An abend occurred during an attempt to access the caller-provided accounting token field while executing

in the key of the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30082

Explanation

This reason code is returned when the automatic bind for plan is disabled. The automatic bind is disabled through the installation process.

System action

The plan is not automatically bound.

System programmer response

Rebind the plan prior to execution.

00F30083

Explanation

This reason code is returned because an allied application, or its recovery routine, attempted to issue an SQL request following an abend that could not be retried (that is, CANCEL, DETACH).

System action

Control is returned to the calling program, either the application program or its recovery routine, so that end-of-task processing can take place.

System programmer response

This reason code is issued because an allied application had an MVS CANCEL or DETACH issued against it and its recovery routine either retried back to the application, or did itself, try to execute another SQL statement to Db2. This call is rejected to help allow the application to be processed through end-of-task processing.

User response

If you feel that this is a Db2 problem, notify the system programmer.

Problem determination

If you believe that this error is not the result of the above reason, then collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30085

Explanation

The requester's password could not be verified. This condition might indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Verify that you specified the correct RACF password for this requester.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the password could not

be verified, the connection request is terminated with this reason code.

Related concepts

[Managing connection requests from remote applications \(Managing Security\)](#)

00F30086

Explanation

The requester's password is expired. This condition might indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Change your password so that it is no longer expired.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the password expired, the connection request is terminated with this reason code.

Related concepts

[Managing connection requests from remote applications \(Managing Security\)](#)

00F30087

Explanation

The requester's authorization ID or password could not be verified by the site's security exit routine. This condition might indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the Db2 subsystem from your security administrator.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the site's security exit routine failed to verify the requester, the connection request is terminated with this reason code.

Related concepts

[Managing connection requests from remote applications \(Managing Security\)](#)

00F30088

Explanation

The requester's authorization ID was revoked. This condition might indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the Db2 subsystem from your security administrator.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the requester's authorization ID was revoked, the connection request is terminated with this reason code.

Related concepts

[Managing connection requests from remote applications \(Managing Security\)](#)

00F30089

Explanation

The requester's authorization ID is not defined to RACF. This condition might indicate a security violation.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request.

User response

Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the Db2 subsystem from your security administrator.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the requester's authorization ID is not defined, the connection request is terminated with this reason code.

Related concepts

[Managing connection requests from remote applications \(Managing Security\)](#)

00F3008A

Explanation

FL 505 When processing an authentication token from Db2, RACF found the format of the token invalid.

System action

The connection request is not processed.

System programmer response

Examine the console or SYSLOG output for RACF messages, such as ICH408I, when a connection request is denied.

User response

Verify that the format of the authorization token in the Db2 connection request is valid.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service to validate the authentication token that is received from the Db2 requester. RACF cannot successfully process the token. Db2 issues message DSNL060I and writes the token and related information to an IFCID 415 exception trace record. In addition to Db2 message DSNL060I, use RACF message ICH408I and the IFCID 415 exception trace to determine the exact cause for the invalid token.

00F3008B

Explanation

FL 505 When processing an authentication token from Db2, RACF found the token expired.

System action

The connection request is not processed.

System programmer response

Examine the console or SYSLOG output for RACF messages, such as ICH408I, when a connection request is denied.

User response

A RACF-generated authentication token is defined with an expiration time. Your Db2 systems can use the token in connection requests until it expires. Before or after the token expires, obtain a new one prior to any new connection request.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service to validate the authentication token that is received from the Db2 requester. RACF cannot successfully process the token. Db2 issues message DSNL060I but does not write the token-related information to an IFCID 415 exception trace record. In addition to Db2 message DSNL060I, use RACF message ICH408I and the IFCID 415 exception trace to determine the exact cause for the invalid token.

00F3008C

Explanation

FL 505 When processing an authentication token from Db2, RACF found the signature of the token invalid.

System action

The connection request is not processed.

System programmer response

Examine the console or SYSLOG output for RACF messages, such as ICH408I, when a connection request is denied.

User response

Verify that the correct authorization token is specified in the Db2 connection request.

Problem determination

During remote connection processing, Authorization Services invokes the RACROUTE service to validate the authentication token that is received from the Db2 requester. RACF cannot successfully process the token. Db2 issues message DSNL060I and writes the token-related information to an IFCID 415 exception trace record. In addition to Db2 message DSNL060I, use RACF message ICH408I and the IFCID 415 exception trace to determine the exact cause for the invalid token.

00F30090

Explanation

The application program issued an RRSAF SIGNON or AUTH SIGNON function request, but the application either has OPEN CURSORS or SPECIAL REGISTERS that are not in their initial state and the reuse=INITIAL rule is in effect.

System action

The SIGNON or AUTH SIGNON request is not processed.

User response

You can continue processing with a corrected request.

Problem determination:

00F30091

Explanation

The application program issued an RRSF IDENTIFY function request, but RRS/MVS is not available.

System action

The IDENTIFY request is not processed.

User response

Retry the IDENTIFY request after RRS/MVS has been started.

Problem determination:

00F30092

Explanation

The application program issued an RRSF SIGNON or AUTH SIGNON function request, but the application has issued an SQL request since the last invocation of SRRCMIT or SRRBACK and therefore is not at a point of consistency.

System action

The SIGNON or AUTH SIGNON request is not processed.

User response

You can continue processing with a corrected request.

Problem determination:

00F30093

Explanation

The application program issued an RRSF TERMINATE THREAD or TERMINATE IDENTIFY function request, but the application has issued an SQL request since the last invocation of SRRCMIT or SRRBACK and therefore is not at a point of consistency.

System action

The function request is not processed.

User response

You can continue processing with a corrected request.

Problem determination:

00F30094

Explanation

During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password associated with the requester, and changes the password to a new password (if supplied). If the RACF return code indicates that the requester's new password is invalid, the connection request is terminated with this reason code.

System action

The connection request is not processed.

System programmer response

Examine the console/SYSLOG output for RACF messages issued when the request was denied.

User response

Verify that your new password value meets the installation's requirements for new passwords.

00F30095

Explanation

An internal error was detected in either Db2 or OS/390 RRS.

System action

The application is abended. This error may, in many cases, eventually abend the Db2 subsystem.

Operator response

Notify the system programmer.

System programmer response

This is probably either an error in Db2 or in OS/390 RRS. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with Db2 or with OS/390 RRS.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30096

Explanation

An internal error was detected in either Db2 or RRS Context Services.

System action

The application is abended. This error can, in many cases, eventually abend the Db2 subsystem.

Operator response

Notify the system programmer.

System programmer response

This is probably either an error in Db2 or in RRS. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there can be a problem with Db2 or with OS/390 RRS Context Services.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30097

Explanation

The context_key supplied via the CONTEXT SIGNON function of RRSAF is not associated with the current context.

System action

CONTEXT SIGNON is not performed.

User response

Use CTXSDTA to store the primary authid in the context data associated with the current context before invoking CONTEXT SIGNON. The context_key used to store the data must be the context_key that is passed as input to CONTEXT SIGNON.

Problem determination:

00F30098

Explanation

The CONTEXT SIGNON function of RRSAF requires OS/390 R5 or later.

System action

CONTEXT SIGNON is not performed.

User response

Check the release level of OS/390 that you are running on.

Problem determination:

00F30099

Explanation

The data retrieved using the context_key passed via the CONTEXT SIGNON function of RRSAF is a version not supported by Db2.

System action

CONTEXT SIGNON is not performed.

User response

Determine the version number supported by the Db2 release you are running. This is described in the description of CONTEXT SIGNON in the Db2 Application Programming and SQL Guide. Use CTXSDTA to store the correct version of the context data associated with the current context before invoking CONTEXT SIGNON.

Problem determination:

00F3009A**Explanation**

An attempt to was made to invoke the Db2 API for an agent that was currently performing syncpoint processing. This could occur if an RRSAF attached application invoked Db2 after another control task had already initiated RRS syncpoint processing for the same Db2 agent.

After syncpoint processing has been initiated on behalf of an agent that is connected by RRSAF to Db2, the Db2 API may not be used to access Db2 until the syncpoint processing completes.

System action

The API request is rejected.

User response

Serialize the initiation of RRS syncpoint processing with the use of the Db2 API.

00F3009B**Explanation**

The RRSAF prepare exit was invoked for a Db2 agent that is currently executing in Db2.

This could occur if a control task initiated RRS syncpoint processing for a Db2 agent while an application task was accessing Db2 data using the same Db2 agent.

Once a Db2 agent is active in Db2, another task may not initiate RRS syncpoint processing for the same agent.

System action

Db2 returns ATRABACK to the prepare request. The Db2 agent is abended with reason 00E50013.

User response

Serialize the initiation of RRS syncpoint processing with accessing Db2 data.

Problem determination

An entry recording this condition is written in SYS1.LOGREC.

00F3009D**Explanation**

An abend occurred during an attempt to access the caller-provided user ID while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3009E**Explanation**

An abend occurred during an attempt to access the caller-provided application name while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3009f

Explanation

An abend occurred during an attempt to access the caller-provided workstation name while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F300A0

Explanation

An error occurred while processing the package list parameter. The attachment facility provided this parameter on a request to allocate a Db2 special plan to the application. Either an abend occurred accessing the package list or a package list entry is invalid.

System action

The request is not processed.

User response

A dump should be taken for problem analysis.

Problem determination

For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable. The failure is probably the result of a logic error in the requesting program.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- All dumps taken by the attachment facility or requesting application.

00F300A1

Explanation

The global transaction ID (XID) parameter that was provided on a SIGNON request is invalid for one of the following reasons:

- An incorrect XID value was specified
- The value was specified in an incorrect format
- If an address of a global transaction ID was specified, the length values were not within the valid range

System action

The SIGNON request is not processed.

User response

Correct the XID parameter on the SIGNON request.

00F300A2

Explanation

An IDENTIFY request for connection to Db2 was rejected. Db2 had been started in light mode. Only connection names that have indoubt units of recovery that need to be resolved with this Db2 member are permitted access.

System action

The connection request is not processed.

User response

Retry the connection request after Db2 has been restarted in full access mode, or, attempt to connect to another member of the data sharing group.

00F300A3

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the accounting-string parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE), and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

00F300A4

Explanation

The application program issued a CALL DSNRLI with function SIGNON, AUTH SIGNON, or CONTEXT SIGNON with a accounting-string parameter that is not supported on this version of Db2.

User response

Correct the request, and continue processing.

00F300A5

Explanation

The USER *authorization ID* is not defined in this trusted context *context name*.

System action

The SIGNON request is not processed.

User response

Contact the system administrator to add the user to the trusted context.

00F300A6

Explanation

While executing in the PSW key of the caller, an abend occurred during an attempt to access the trusted user parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

You may retry from your recovery routine (ESTAE), and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

00F300A7

Explanation

A trusted context is referenced by this SET_TRUSTED or SWITCH_USER call, but it is not defined.

System action

The SET_TRUSTED or SWITCH_USER request is not processed.

User response

Ask the system administrator to create the appropriate trusted context.

00F300A8

Explanation

An abend occurred during an attempt to access the caller-provided password parameter while executing in the PSW key of the caller. This problem is probably the result of a logic error in the requesting program.

System action

The SWITCH_USER request is not processed.

User response

Correct the request and continue processing.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00F300A9

Explanation

An abend occurred during an attempt to access the caller-provided location parameter while executing in the PSW key of the caller. This problem is probably the result of a logic error in the requesting program.

System action

The SWITCH_USER request is not processed.

User response

Correct the request and continue processing.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00F300AA

Explanation

An abend occurred during an attempt to access the caller-provided registry parameter while executing in the PSW key of the caller. This problem is probably the result of a logic error in the requesting program.

System action

The SWITCH_USER request is not processed.

User response

Correct the request and continue processing.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00F300AB

Explanation

An abend occurred during an attempt to access the caller-provided original authorization ID parameter while executing in the PSW key of the caller. This problem is probably the result of a logic error in the requesting program.

System action

The SWITCH_USER request is not processed.

User response

Correct the request and continue processing.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00F300AC

Explanation

An abend occurred during an attempt to access the caller-provided security token parameter while executing in the PSW key of the caller. This problem is probably the result of a logic error in the requesting program.

System action

The SWITCH_USER request is not processed.

User response

Correct the request and continue processing.

Problem determination

If necessary, add a SYSDUMP or SYSABEND DD statement to your execution JCL, and run the job again. Then review the dump to determine the reason for the problem.

00F300AD

Explanation

The location that is specified by this SET_TRUSTED call is not the current location. This is probably the result of a logic error in the requesting program.

System action

The SET_TRUSTED request is not processed.

User response

Correct the request.

00F300AE

Explanation

A primary authorization ID is specified by this SWITCH_USER call, but it is not defined in this trusted context

System action

The SWITCH_USER request is not processed.

User response

Ask the system administrator to create the appropriate primary authorization ID in this trusted context.

00F300B0

Explanation

The requester's authorization ID has exceeded the maximum number of concurrent sessions allowed.

System action

The connection request is not processed.

System programmer response

Determine the value of the USER.CSDATA.DSNMUCTL defined for the primary authorization ID in RACF and determine if that value needs to be updated.

Programmer response

Close or end some of the existing connections, and try the request again.

Problem determination

Db2 13 for z/OS in a Common Criteria environment (DSN6SPRM COMCRIT= YES) restricts the number of concurrent threads for a primary authorization ID based upon the custom field USER.CSDATA.DSNMUCTL.

00F30101

Explanation

The parameter contained in the IEFSSNxx member used to initialize Db2 (and other subsystems) is in error. Refer to message DSN3101I for details.

System programmer response

See message DSN3101I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30102

Explanation

The parameter contained in the IEFSSNxx member used to initialize Db2 (and other subsystems) is in error. The Db2 subsystem recognition character must be not be blank. For details, see message DSN3102I.

System programmer response

See message DSN3102I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30103

Explanation

The parameter contained in the IEFSSNxx member used to initialize Db2 (and other subsystems) is in error and/or the named module is not resident in a library available during IPL. Refer to message DSN3103I for details.

System programmer response

See message DSN3103I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30104

Explanation

Module DSN3UR00 was unable to obtain the Db2 subsystem affinity table index for the named subsystem. MVS did not recognize the named subsystem. Refer to message DSN3109I for details.

System programmer response

See message DSN3109I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30105

Explanation

Module DSN3UR00 was unable to load Early module 'DSN3EPX'. Either there was an I/O error, or the named module is not resident in a library available during IPL. Refer to message DSN3105I for details.

System programmer response

See message DSN3105I. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30106

Explanation

A global transaction identifier from RRS could not be extracted for a SIGNON request. The SIGNON request was for a thread that indicated it was part of a global transaction, and that RRS was to provide the global transaction id.

System action

The application is abended.

Operator response

Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer.

System programmer response

This is probably either an error in Db2 or in RRS. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#). If RRS has terminated, restart RRS.

Problem determination

Examine the SVCDUMP to determine the cause of the RRS failure. Register zero contains the return code from the RRS ATRRWID request.

00F30107

Explanation

An abnormal termination occurred during an attempt to access the caller-provided xid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System action

The SIGNON request is not processed.

User response

Correct the problem and submit your job again.

Problem determination

The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30111

Explanation

The Db2 program which establishes Db2 as a z/OS subsystem during initialization of the z/OS master scheduler has determined that either its own load module or a load module loaded by it does not have the attributes AMODE(31) and RMODE(ANY). Message DSN3111I was issued just prior to the abend. This message contains the name of the load module in error.

System action

Db2 subsystem initialization is terminated.

System programmer response

See message DSN3111I.

00F30112

Explanation

Db2 is unable to register the installation-specified command prefix with MVS. The command prefix is specified in the subsystem definition parameter. The subsystem specified by *ssnm* in message DSN3112I is not available.

System programmer response

See message DSN3112I.

00F30113

Explanation

Db2 detected an error in the subsystem definition parameter, which is obtained from the IEFSSNxx member of SYS1.PARMLIB. The subsystem specified by *ssnm* in message DSN3113I is not available.

System programmer response

See message DSN3113I.

00F30114

Explanation

Db2 group attach is not supported on this release of MVS. Db2 found an installation-specified group attach name specified in the subsystem definition parameter, IEFSSNxx, but Db2 group attach is not supported on this release of z/OS

System action

The Db2 subsystem is not available.

Operator response

Notify the system programmer.

System programmer response

Correct the subsystem definition parameter to not specify a group attach name and re-IPL.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested.

Collect the following diagnostic items: CONSOLE LOG, SVCDUMP, and LOGREC.

00F30115

Explanation

Db2 received a nonzero return code from the MVS Name/Token service IEANTCR when Db2 attempted to register the group attach name. The group attach name is specified in the subsystem definition parameter, IEFSSNxx. The Db2 subsystem is unavailable.

System action

The Db2 subsystem is not available.

Operator response

Notify the system programmer.

System programmer response

Contact IBM Support.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC, and a Db2 dump is requested. Register 3 contains the return code, in hexadecimal, that was returned to Db2 from MVS IEANTCR Name/Token services.

Collect the following diagnostic items: CONSOLE, SVCDUMP, LOGREC.

00F30116**Explanation**

The version of the Db2 early code module that you are attempting to use is not compatible with this version of z/OS. .

System action

The Db2 subsystem is not available.

Operator response

Notify the system programmer.

System programmer response

The version of the Db2 early code that was loaded from the LINKLIST library is not compatible with the release of MVS that you are using. Change the concatenation order of the LINKLIST library so that a compatible release of Db2 early code is used.

Problem determination

Diagnostic information is recorded in SYS1.LOGREC and a Db2 dump is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30120**Explanation**

An error occurred when Db2 invoked the Security Authorization Facility R_ticketerv callable service. Db2 attempted to use this callable service to validate a Kerberos ticket received from a remote client. Db2 generated this reason code in conjunction with message DSN3581I.

System action

Authentication fails.

Operator response

Notify the system programmer.

System programmer response

See message DSN3581I for more information.

User response

Notify the system programmer.

00F30121**Explanation**

A Db2 internal error occurred when Db2 invoked the Security Authentication Facility R_ticketerv callable service. Db2 attempted to use this callable service to validate a Kerberos ticket received from a remote client. This reason code is generated in conjunction with message DSN3581I.

System action

Authentication fails. A dump should be taken for problem analysis.

Operator response

Notify the system programmer.

System programmer response

See message DSN3581I for more information. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30122

Explanation

An error occurred when Db2 invoked the Security Authorization Facility R_usermap callable service. Db2 attempted to use this callable service to determine the user ID associated with the principal name received via a Kerberos ticket that was received from a remote client. This reason code is generated in conjunction with message DSN3581I.

System action

Authentication fails.

Operator response

Notify the system programmer.

System programmer response

See message DSN3581I for more information.

User response

Notify the system programmer.

00F30123

Explanation

A Db2 internal error occurred when Db2 invoked the Security Authorization Facility R_usermap callable service. Db2 attempted to use this callable service to validate a Kerberos ticket received from a remote client. This reason code is generated in conjunction with message DSN3581I.

System action

Authentication fails. A dump should be taken for problem analysis.

Operator response

Notify the system programmer.

System programmer response

See message DSN3581I for more information. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

Collect the diagnostic items described in

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30203

Explanation

This reason code is returned when a Db2 program attempts to either activate an already active SSI function code or deactivate an already inactive SSI function code.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

00F30210

Explanation

One of these conditions exists:

- Module DSN3RS0X received a nonzero return code from ENQ (exclusive).
- Module DSN3ENQ0 received a nonzero return code from ENQ (shared) and the indication was other than 'the task already has the resource enqueued'.

This is a serious error.

System action

The caller is abended.

Operator response

Notify the system programmer.

System programmer response

To determine the error return from the ENQ SVC, examine the SVC dump.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced. Register 2 at the time of the abend contains the value passed back by ENQ in register 15. This can be used to locate the response area.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30211

Explanation

One of the following conditions exists:

- Module DSN3DEQ0 wanted to release the resource unconditionally but did not have it to release.
- Module DSN3RS0X received a nonzero return code from DEQ and the indication was other than 'the task had not been assigned control'.

This is a serious error.

System action

The caller is abended. The current request has probably been processed completely. However, processing serialization may not have been maintained.

Operator response

Notify the system programmer.

System programmer response

To determine the error returned from the DEQ SVC, examine the SVC dump.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced. Register 2 at the time of the abend contains the value passed back by DEQ in register 15. This can be used to locate the response area.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30212

Explanation

A function that is allowed only for Db2 key callers was invoked by a supervisor state caller in another key. (Problem state callers receive system X'0C2' abend completion codes instead.)

System action

The caller is abended.

Operator response

Notify the system programmer.

System programmer response

To determine the Db2 service module running in the wrong PSW key, examine the SVC dump.

Problem determination

If the invoker is a Db2 service module, an SVC dump and associated SYS1.LOGREC entries are produced. The invoker should have been in Db2 KEY during the invocation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30213

Explanation

The invoker of module DSN3AC0X passed an invalid action code. The only valid codes are 0 (deactivate) and 1 (activate).

System action

The caller is abended.

Operator response

Notify the system programmer.

System programmer response

To determine the caller of the activate and deactivate service module, examine the SVC dump.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced by a Db2 service module. The save area chain should indicate the invoker of this service module.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30214

Explanation

The invoker of module DSN3AC0X passed an invalid SSOB function code. The valid codes range 1–255.

System action

The caller is abended.

Operator response

Notify the system programmer.

System programmer response

To determine the caller of the activate and deactivate service module, examine the SVC dump.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced by a Db2 service module. The save area chain should indicate the invoker of this service module.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30215

Explanation

The invoker of module DSN3AC0X passed an invalid 'QUEUE' parameter. The storage provided could not be modified in the Db2 PSW key.

System action

The caller is abended with system completion code of X'0C4'.

Operator response

Notify the system programmer.

System programmer response

To determine the caller of the activate and deactivate service module, examine the SVC dump.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced by a Db2 service module. The save area chain should indicate the invoker of this service module. The invoker should have set a correct parameter value before invoking module DSN3AC0X.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30216

Explanation

The ASCB for the newly created Db2 subsystem services address space could not be located. The presumption is that the Db2 subsystem has not been started successfully. Further entry of commands to the Db2 subsystem results in attempts to start Db2.

System action

The current -START command processing is terminated. Subsequent commands are processed as though this command had not been processed.

Operator response

Retry the command. If the command fails again, notify the system programmer.

System programmer response

If the command fails again, request an IPL of MVS, as the failure may be the result of an MVS internal problem.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced. The ASID passed back by the MVS command scheduler for the -START command is not valid.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30217

Explanation

The console ID for the MVS console that entered the current command is not found in the MVS unit control module (UCM) structure. This is a serious error. An internal MVS START command may have been incorrectly issued by an application program that provided invalid input parameters.

System action

The caller is abended.

Operator response

Retry the -START DB2 command. If the command fails again, notify the system programmer.

System programmer response

If the command fails again, request a stand-alone dump and an IPL of MVS, as this may be due to an MVS internal problem.

Problem determination

The SSOB command extension mapped by IEFSSCM contains the invalid console ID.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30218

Explanation

The ERLY block for this Db2 subsystem is in error. The control word that manages command processing is in an undefined state. This is a serious error.

System action

The current TCB is abended. Two possible reasons are:

- There is no Db2 subsystem services address space. Therefore, the initial command state can safely be set in the control word, and the current command can be treated as a 'first' (-START) command. Processing of the command continues.
- The system services address space (*ssnmMSTR*) ASID is known, but the state of the Db2 subsystem is uncertain. In this case, the command facility is considered disabled, and message DSN3108I is returned to the issuer of the command.

Operator response

Notify the system programmer.

System programmer response

Examine the ERLY block field ERLYCMST. If the value of ERLYCMST is greater than 2, the field is in error.

Problem determination

The calling TCB may have requested an SVC dump or created associated SYS1.LOGREC entries.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30219

Explanation

The ERLY block for this Db2 subsystem is in error. The control word that manages EOM broadcast processing is in an undefined state. This is a serious error.

System action

The calling TCB is abended.

Operator response

Cancel Db2. (End of task processing may still work, and it does a more complete clean-up than end-of-memory processing does.) If this does not work, issue the MVS FORCE command for the Db2 address spaces. If the problem is still unresolved, request a stand-alone dump and re-IPL MVS.

System programmer response

Examine the ERLY block field ERLYEMST. If the value of ERLYEMST is greater than 2, it is in error.

Problem determination

The calling TCB may have requested an SVC dump or created associated SYS1.LOGREC entries.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3021A

Explanation

The ERLY block for this Db2 subsystem is in error. The control word that manages identify processing is in an undefined state. This is a serious error.

System action

The calling TCB is abended.

Operator response

Stop the Db2 subsystem and reissue the -START DB2 command.

System programmer response

Examine the ERLY block field ERLYIDST. If the value of ERLYIDST is greater than 2, it is in error.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3021B

Explanation

A return code other than 0, 4, or 8 was received from the MVS internal START command processor. The presumption is that the Db2 subsystem has not been started successfully. Further entry of commands to the Db2 subsystem results in further attempts to start Db2.

System action

The current -START command processing is abended. Subsequent commands are processed as though this command had not been processed.

Operator response

Retry the command. If the command fails again, request a stand-alone dump and re-IPL MVS.

System programmer response

Examine the SVC dump, LOGREC entries, and the console log for indications of an MVS failure.

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3021C

Explanation

Module DSN3EC0X could not establish an ESTAE during the processing of the first (presumed to be the -START command) command. The caller is abended. This can occur if the MVS system address space that is broadcasting the command has insufficient storage.

Further entry of commands to the Db2 subsystem may result in a successful start of Db2.

System action

The caller is abended (without ABDUMP). The current -START command processing is terminated. Subsequent commands are processed as though this command had not been processed.

Operator response

Retry the command. If the command fails again, request a stand-alone dump and re-IPL MVS.

System programmer response

Examine the stand-alone dump, LOGREC entries, and the console log for indications of an MVS failure.

Problem determination

A stand-alone dump is necessary.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- MVS stand-alone dump.

00F3021D

Explanation

Module DSN3RS0X could not establish an ESTAE during either the initialization or termination of the online Db2 subsystem. The caller is abended.

This can occur during initialization if the MVS system address space that is broadcasting the first command (presumed to be the -START command) has insufficient storage. In this case, further entry of commands to the Db2 subsystem may result in a successful start of Db2.

This can occur during termination if the current address space (usually system services, in case of EOM broadcast, an MVS system address space) has insufficient storage. In this case, after the Db2 subsystem has shut down, further entry of commands to the Db2 subsystem may result in a successful start of Db2.

System action

The caller is abended (without ABDUMP). The initialization is aborted, but termination proceeds.

Operator response

Retry the command. If the failure persists, a re-IPL of MVS is necessary and the system programmer should be notified. A stand-alone dump should be requested first.

System programmer response

Examine the stand-alone dump, LOGREC entries, and the console log for indications of an MVS failure.

Problem determination

A stand-alone dump is necessary.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.
- MVS stand-alone dump.

00F3021E

Explanation

Module DSN3RTR0 could not establish an ESTAE while in the process of routing control to the actual ESTAE routine. The caller (RTM) is abended. This causes the original error to percolate to a higher-level recovery routine and causes this abend to be shown in an RTM recovery environment.

This can occur if the current address space (usually an allied address space) has insufficient storage.

System action

The caller is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private area expanded.

Problem determination

A SYSUDUMP is requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3021F

Explanation

Module DSN3RS0X discovered that the SSVT was not set to its initial state at Db2 subsystem initialization or termination time. An abend is issued in order to record SYS1.LOGREC data and request an SVC dump.

System action

The caller is not abended. The SSVT is reset to its initial state. Subsystem initialization or termination continues.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The SVC dump contains an image of the SSCVT and the SSVT.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30220

Explanation

Module DSN3RS0X discovered that the PRHB was not set to its initial state at Db2 subsystem initialization or termination time. An abend is issued in order to record SYS1.LOGREC data and request an SVC dump.

System action

The caller is not abended. The PRHB is reset to its initial state. Subsystem initialization or termination continues.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The associated SYS1.LOGREC entries and SVC dump contain the relevant information.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30230

Explanation

The module DSN3SSLM discovered that a user exit still exists for an allied address space that is being disconnected from Db2. This is an internal error.

System action

The connection between the allied address space and the Db2 subsystem is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A previous part of the disconnection process between Db2 and an allied address space has either not completed or terminated in error. The SVC dump and associated SYS1.LOGREC entries contain the relevant material for problem analysis.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30310**Explanation**

A nonzero return code was received from the recovery manager. It is issued by module DSN3RIA0 (application resolve-indoubt-UR) and by module DSN3RIM0 (resource manager resolve-indoubt-UR).

System action

This is a Db2 error. The invoker is abended.

Operator response

Notify the system programmer.

System programmer response

Collect the related materials. Determine the called recovery manager module and the module that issued the abend.

Problem determination

The associated SYS1.LOGREC entry indicates which module issued the abend. Check the recovery manager resolve-indoubt exit trace for the return code.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30311**Explanation**

Module DSN3RIM0 could not establish an ESTAE during the processing of a resolve-indoubt (RMRQ) request. This can occur if the current address space has insufficient storage. This probably leads to an abnormal termination of the Db2 subsystem.

System action

The caller is abended (without ABDUMP).

Operator response

Notify the system programmer, and restart Db2 if necessary.

System programmer response

Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

Problem determination

The caller should produce a SYS1.LOGREC entry and an SVC dump, so that the system programmer can examine the LSQA area.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30312**Explanation**

Module DSN3RIA0 could not establish an ESTAE during the processing of a resolve-indoubt-UR (RARQ) request. This can occur if the current address space has insufficient storage.

System action

The caller is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

Problem determination

The caller should produce a SYS1.LOGREC entry and an SVC dump.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30313

Explanation

A CCB could not be allocated. This could occur when the storage pool has no more free space available.

System action

The request to obtain a CCB is not processed. The application program is abended with code X'04E' and this reason code.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

A dump should be taken for problem analysis.

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30400

Explanation

This reason code is returned when a Db2 program makes a duplicate request to be called when a specific SSI function code is encountered on the SSI.

This reason code is not normally visible to users or operators, but might appear in Db2 traces.

System programmer response

Collect the diagnostics produced by the application program reporting the failure, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30401

Explanation

This reason code is returned when a Db2 program makes a request to no longer be called when a specific SSI function code is encountered on the SSI, but the control block representing the original request to be called is busy and cannot be deleted now. The request is processed when the control block is no longer busy.

This reason code is not normally visible to users or operators, but might appear in Db2 traces.

System programmer response

Collect the diagnostics produced by the application program reporting the failure, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30402

Explanation

This reason code is returned when a Db2 program makes a request to no longer be called when a specific SSI function code is encountered on the SSI, but the control block representing the original request to be called cannot be found.

This reason code is not normally visible to users or operators, but might appear in Db2 traces.

System programmer response

Collect the diagnostics produced by the application program reporting the failure, if any.

Problem determination

Follow the instructions indicated by the diagnostics.

00F30405

Explanation

The Db2 subsystem was abended by module DSN3SSI1 because the system services address space's jobstep task terminated.

System action

The Db2 subsystem is terminated.with an SVC dump.

Operator response

You can start Db2 again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error which should have recorded an entry in SYS1.LOGREC data set and requested an SVC dump. Examine the SYS1.LOGREC entries and SVC dumps to determine the actual cause of the error. Refer to Appendix E, “[Db2 abend completion codes \(X'04E' and X'04F\)](#),” on page 1391 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30406

Explanation

The Db2 subsystem was abended by module DSN3SSI1 because the system services address space was forced to an end-of-memory condition.

System action

The Db2 subsystem is terminated.with an SVC dump.

Operator response

You can start Db2 again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data sets and requested an SVC dump. Examine the SYS1.LOGREC entries and SVC dumps to determine the actual cause of the error. Refer to Appendix E, “[Db2 abend completion codes \(X'04E' and X'04F\)](#),” on page 1391 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30407

Explanation

The Db2 subsystem was abended by module DSN3SSI1, because the jobstep task in a resource manager address space terminated.

System action

The Db2 subsystem is terminated.with an SVC dump.

Operator response

You can start Db2 again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. Examine the SYS1.LOGREC entries and SVC dumps to determine the actual cause of the error. Refer to [Appendix E, “Db2 abend completion codes \(X'04E' and X'04F\),” on page 1391](#) for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30408

Explanation

The Db2 subsystem was terminated because a Db2 resource manager address space is in end-of-memory processing.

System action

The Db2 subsystem is terminated.with an SVC dump.

Operator response

Db2 can be started again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30409

Explanation

The Db2 subsystem was abended by module DSN3SSES, because an allied task going through either end-of-task or one of its terminating ancestor tasks was in a Db2 must-complete function or was still holding Db2 latches.

System action

The Db2 subsystem is terminated.with an SVC dump.

Operator response

Db2 may be started again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F3040A

Explanation

The Db2 subsystem was abended by module DSN3SSI1 issuing ABEND04E 00F3040A because Db2 detected a previous error where an allied address space was not in a good state when going through end-of-memory. The reason might be one or more agents

that were in a Db2 must-complete state or that were still holding Db2 latches.

System action:

The Db2 subsystem is terminated with an SVC dump.

Operator response

Db2 can be started again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Check the SYSLOG for the name of the job that terminated at end-of-memory, which can be found in a location similar to *jobname* in following example:

```
$HASP310 jobname TERMINATED AT END OF MEMORY
*DSNV086E -ssn DB2 ABNORMAL TERMINATION
REASON=00F3040A
```

This situation is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F3040B**Explanation**

See message DSN3001I.

System programmer response

See message DSN3001I.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3040C**Explanation**

The Db2 subsystem was abended because the SSSS IEFSSREQ service agent (EB) was in a Db2 must-complete function upon return from the agent services create allied agent function.

System action

The Db2 subsystem is terminated with an SVC dump.

Operator response

Db2 may be started again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F3040D**Explanation**

The Db2 subsystem was abended because the SSSS IEFSSREQ service agent (EB) was in a Db2 must-complete function upon return from the agent services terminate allied agent function.

System action

The Db2 subsystem is terminated with an SVC dump.

Operator response

Db2 may be started again after it terminates.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F3040E

Explanation

The Db2 subsystem was abended after a failure during processing of an IDENTIFY, COMMAND, or MVS HELP subsystem interface broadcast. The recovery routine DSN3SSES attempted to clean up processing and pass the error to the caller, but was unable to do so.

System action

The Db2 subsystem is terminated.

Operator response

The Db2 subsystem should be restarted.

System programmer response

Scan the SYS1.LOGREC entries for the initial error and subsequent abends encountered by module DSN3SSES. The ESTAE DSN3SSES is established at least three times. Repetitive errors within the ESTAE module ultimately result in a subsystem termination with this reason code.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3040F

Explanation

The Db2 subsystem was abended because a Db2 latch, critical to the deferred end of task (EOT) termination process, was held by an MVS dispatchable unit, normally in an allied address space, which was no longer being dispatched and was, therefore, unable to release the latch.

System action

The Db2 subsystem is terminated with an SVC dump.

Operator response

Db2 may be started again after it terminates. The system programmer should be notified.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error associated with an allied address space and especially in the case where the allied address space has been forced to an end-of-memory condition.

The console output should be examined for errors associated with allied address spaces.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30410

Explanation

The Db2 subsystem was abended, because the end-of-task listening module failed during a must-complete window. End-of-task processing is considered to be in a must-complete state until an ESTAE has been established. The 'user' of this ESTAE routine was the allied end-of-task listening module DSN3EOT0.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30411

Explanation

The Db2 subsystem was abended because the abnormal termination of an agent failed during end-of-memory (EOM) processing for an allied address space. The 'user' of this ESTAE routine was the allied EOM routine DSN3EOM0.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer. Db2 may be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30412

Explanation

The Db2 subsystem was abended because the abnormal termination of an agent failed during resolve-indoubt processing for an allied agent. The 'user' of this ESTAE routine was the resolve-indoubt-UR RMRQ routine DSN3RIM0.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer. Db2 may be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30413

Explanation

The Db2 subsystem was abended, because the abnormal termination of an agent failed. However, this recovery routine was unable to determine who its caller was. It should be one of the following callers: DSN3EOT0, DSN3EOM0, or DSN3RIM0.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and has requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30414

Explanation

The Db2 subsystem was abended, because module DSN3SSI1 (or its caller, DSN3CLOX) was unable to establish the ESTAEs during the processing of a command SSI call. This is probably an MVS problem, because these modules are executing in the MVS CONSOLE address space.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates. If the failure persists, request a stand-alone dump, and re-IPL MVS.

System programmer response

This can occur if the MVS system address space that is broadcasting the command has insufficient storage. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 is unable to write a SYS1.LOGREC record or request a dump. The MVS CONSOLE function should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or Db2. Other unrelated failures in the MVS CONSOLE address space would indicate an MVS problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

00F30415

Explanation

The Db2 subsystem was abended because module DSN3SSI1 (or its caller, DSN3CLOX) was unable to establish the ESTAEs during the processing of an EOM SSI broadcast. This is probably an MVS problem, because these modules are executing in the z/OS master scheduler address space.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates. If the failure persists, request a stand-alone dump and re-IPL z/OS.

System programmer response

This can occur if the MVS master scheduler address space has insufficient free virtual storage. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 is unable to write a SYS1.LOGREC record or request a dump. The z/OS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or Db2. Other unrelated failures in the z/OS master scheduler address space would indicate an MVS problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

00F30416

Explanation

The Db2 subsystem was abended, because module DSN3EOM0 was unable to establish the ESTAE during the processing of an EOM for an allied address space.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates. If the failure persists, request a stand-alone dump and re-IPL MVS.

System programmer response

This can occur if the MVS master scheduler address space that is broadcasting the EOM has insufficient free virtual storage. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Db2 is unable to write a SYS1.LOGREC record or request a dump. The z/OS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or Db2. Other unrelated failures in the z/OS master scheduler address space would indicate an MVS problem.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator-initiated dump command or SLIP trap exit.

00F30417

Explanation

The Db2 subsystem was abended because of a failure in the first end of task (FEOT) processing for a task that had established subsystem affinity to Db2.

System action

The Db2 subsystem is terminated.

Operator response

Db2 can be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30418**Explanation**

The Db2 subsystem was abended because of a failure in the end-of-memory (EOM) processing for an address space that had established subsystem affinity to Db2.

System action

The Db2 subsystem is terminated.

Operator response

Db2 may be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30419**Explanation**

The Db2 subsystem was abended because a Db2 latch, critical to the Deferred End of Task (EOT) Termination process, was held by an MVS dispatchable unit, normally in an allied address space, which was no longer being dispatched and was, therefore, unable to release the latch.

System action

The Db2 subsystem is terminated with an SVC dump.

Operator response

Db2 may be started again after it terminates. The system programmer should be notified.

System programmer response

At least one SVC dump and associated SYS1.LOGREC entries should be available.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error associated with an allied address space and especially in the case where the allied address space has been forced to an end-of-memory condition.

The console output should be examined for errors associated with allied address spaces.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3041A**Explanation**

An ESTAE could not be established by the deferred end-of-task (EOT) processor. This error could occur only during Db2 subsystem startup. Probably, an ESTAE could not be established because of a shortage of LSQA space.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If the failure persists, increase the size of the system services address space (ssnmMSTR) private area.

Problem determination

An SVC dump and associated SYS1.LOGREC entry should be available.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F3041B**Explanation**

The deferred end-of-task (EOT) processor could not locate an AGNT block for the ACE of the agent in abnormal termination. This is a system error.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry and associated SVC dump were requested. Register 8 at the time of the abend contains the ACE pointer. The AGNT block whose AGNTEB field points to the EB contained within the ACE could not be located.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F3041C**Explanation**

The Db2 subsystem was abended because of a failure of a MEMTERM request for an allied address space.

System action

The Db2 subsystem is terminated.

Operator response

Db2 can be started again after it terminates.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

User response

Notify the system programmer.

Problem determination

The recovery routine DSN3SSES recorded data on the SYS1.LOGREC data set and requested an SVC sump. The SYS1.LOGREC entries and the SVC dumps should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30420**Explanation**

A failure occurred during deferred end-of-task (EOT) processing for an agent.

System action

The Db2 subsystem is terminated.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Determine the module that failed and the registers at the time of the error.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

A SYS1.LOGREC entry and associated SVC dump were requested.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30429**Explanation**

A Db2 subsystem task (normally a service task) going through end-of-task (EOT), or one of its terminating ancestor tasks, was a Db2 must-complete function or was still holding one or more Db2 latches.

System action

The Db2 subsystem is terminated with an SVC dump.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

At least one SVC dump and associated SYS1.LOGREC record(s) are available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has recorded data in SYS1.LOGREC and requested an SVC dump. The SYS1.LOGREC record(s) and SVC dump should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

00F30450**Explanation**

CSECT DSN3CLOX could not establish an ESTAE during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

System action

The allied address space is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the identify request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

Problem determination

A dump should be produced by the allied task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30451**Explanation**

CSECT DSN3SSI1 could not establish its ESTAEs during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

System action

The allied task is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the identify request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

Problem determination

A dump should be produced by the allied task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30452**Explanation**

CSECT DSN3ID30 could not establish an ESTAE during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

System action

The allied task is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the identify request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

Problem determination

A dump should be produced by the allied task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30453**Explanation**

CSECT DSN3SSI1 could not establish its ESTAEs during the processing of an SSI call other than FEOT, EOM, HELP, COMMAND, and IDENTIFY. This can occur if the current address space has insufficient storage.

System action

The allied task is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

Problem determination

A dump should be produced by the allied task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30454**Explanation**

After discovering an error during the processing of an SSI call, module DSN3SSI1's retry routine found an unknown retry point when it was attempting to retry into the mainline code. This is a Db2 subsystem error.

System action

The allied task is abended.

Operator response

Notify the system programmer.

System programmer response

The user may retry the relevant SSI call. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC

dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30455

Explanation

CSECT DSN3ID80 could not establish its ESTAE during the processing of the identify termination request. This can occur if the current address space has insufficient storage.

System action

The allied task is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

Problem determination

A dump should be produced by the allied task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30456

Explanation

CSECT DSN3TM00 could not identify its caller. The only callers supported are: EOT, EOM, RIUR, and CNCL.

System action

The calling task is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The caller's recovery routine may record on the SYS1.LOGREC data set and request an SVC dump. Module DSN3TM00 caller's parameter list, recorded in the trace entry, should be examined to determine the cause of the error, and new caller support should be added to DSN3TM00, if necessary.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30457

Explanation

CSECT DSN3TM00 found that the agent termination did not take place after an extra termination request (DSNARQ).

System action

The caller is abended. The caller may, in many cases, eventually abend the Db2 subsystem.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The caller's recovery routine records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with the subsystem support subcomponent termination routines (namely DSN3ID80, DSN3SI80, and/or DSN3CT80).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30458

Explanation

The Db2 subsystem is abended because a user-exit module, either DSN3@ATH or DSN3@SGN, is not link-edited with the AMODE (31) attribute.

System action

Subsystem start-up is terminated.

Operator response

Db2 may be restarted after the link-edit attributes of DSN3@ATH and/or DSN3@SGN have been changed to AMODE (31) RMODE (ANY).

System programmer response

Link-edit the user-exit module, specifying the attributes AMODE (31) RMODE (ANY).

Problem determination

Refer to the JCL specifying link-edit attributes for the user exit module.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- SYSABEND, SYSUDUMP, or SYSMDUMP output.

00F30459

Explanation

The Db2 connection associated with an allied TCB could not be terminated. A RARQ request to terminate the connection could not be issued because either:

- The Resource Access List (RAL) address was zero in field ACERAL, or
- The SSAM Function Vector List (FVL) address in the RAL was zero.

System action

The Db2 subsystem is terminated with a reason code of X'00F30420'.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

.

00F30460

Explanation

The application is running in a WLM-established stored procedure address space and is attempting to connect to Db2 using a type of Db2 Attach other than RRSAF.

System action

The application is abended.

Operator response

Notify the system programmer.

System programmer response

Use the MVS VARY WLM,APPLENV=name,REFRESH command to refresh the load module in storage.

Programmer response

Modify, relink and rerun the application.

Problem determination

The problem may be that the Stored Procedure is link edited with or has loaded the Db2 call attachment facility language interface module DSNALI. Stored procedures that run in WLM-established address spaces must be link edited with or must load the RRS attachment facility language interface module DSNRLI.

00F30461

Explanation

Db2 was unable to successfully restart with OS/390 RRS because of an internal error in either Db2 or OS/390 RRS.

System action

Db2 is not connected to RRS and all services dependent on that connection are unavailable. This means that applications may not connect to Db2 using RRSAF and that WLM-established address spaces may not be used for Db2 stored procedures until Db2 successfully restarts with OS/390 RRS.

Operator response

Notify the system programmer.

System programmer response

Stop and then start OS/390 RRS. Stop and then start Db2. If the problem persists, perform an OS/390 RRS cold start. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30501

Explanation

A nonzero return code has been received from the system parameter manager (SPM) subcomponent of Db2 when attempting to read a descriptor from the DSN3DIR1 directory. This descriptor is required in order to complete processing of the active sign-on or create thread. This is a serious error.

System action

The requester is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump should be available. Either the module issuing the abend has made an error in compounding the descriptor name (it is a concatenation of connection type and indicators representing the request type) or the descriptor, or information in the DSN3DIR1 directory is incorrect.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30502

Explanation

A nonzero return code was received from agent service's create allied agent function during an identify or sign-on request. This indicates an allocation error that should not occur for these levels of capability.

System action

The requester is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump and associated SYS1.LOGREC entries should be available. Examine the Db2 trace table to determine which resource manager triggered the error indication. Also, the DSN3DIR1 entry for the appropriate protocol should be checked to ensure that only SSAM is specified to participate in allocation.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30503

Explanation

The member DSN6SYSP is missing from DSNZPARM.

System action

Db2 subsystem startup processing stops.

System programmer response

Verify that:

- The system parameters load module is for the release of Db2 being started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

Problem determination

DSN6SYSP CSECT is missing from the DSNZPARM load module.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30571

Explanation

This reason code is returned when a Db2 program attempts to UNSPECIFY an already inactive Program Request Handler (PRH). The indicated PRH is inactive. This reason code merely provides extra information.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

00F30572

Explanation

This reason code is returned when a Db2 program attempts to SPECIFY a Program Request Handler (PRH) and there was one already active. The new specification overlays the older specification.

This reason code is not normally visible to users or operators, but may appear in Db2 traces.

System action

The new specification replaces the old one.

00F30573

Explanation

The invoker of DSN3SPRH specified an invalid value for a resource access list entry (RALE). The RALE is outside the limits of those supported by the application program support CALL routine. (The application program support CALL routine routes control to the program request handlers.)

System action

The requester is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump and associated SYS1.LOGREC entries are produced by a Db2 service. Register 2 at the entry to the abend contains the resource access list element (RALE) value passed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30574

Explanation

The invoker of DSN3SPRH specified an invalid request qualifier (QUAL) value. The QUAL is outside the limits of those supported by the application program support call routine that routes control to the program request handlers (PRHs).

System action

The requester is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump and SYS1.LOGREC entry are produced by a Db2 resource manager. Register 2 at the entry to the abend contains the QUAL value passed.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30580

Explanation

The DSN3CONN request for the EOM, first EOT or identify SSI call during the 'release-work' notification has resulted in a nonzero return code (see message DSN3580I).

System action

The requester is abended.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The original return and reason code appear in the DSN3580I message issued by DSN3AMI2. An SVC dump and associated SYS1.LOGREC entries are produced by some Db2 resource manager.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30581

Explanation

CSECT DSN3AMI2 found an unknown type of notify message in a message buffer. This is a Db2 subsystem error.

System action

An abend is issued, and the startup/shutdown ESTAE creates a SYS1.LOGREC entry and take an SVC dump.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

Examine the SYS1.LOGREC entries and SVC dumps. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The SVC dump that is produced contains the relevant material for problem analysis. These buffers are set up by DSN3CLOX.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30597

Explanation

A protocol violation has been detected for an identify request. A noncoordinator identify request has been requested from a task that is not a subtask of the active coordinator. This occurs for protocols only where TCB hierarchy must be observed (SASS) and

only when a coordinator has already identified itself to Db2.

System action

The allied task is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump may be produced by the allied address space.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30598

Explanation

A protocol violation has been detected for an identify request. A noncoordinator identify request has been requested in a PSW key different from KEY of the active coordinator at its identify. This occurs only when a coordinator has already identified itself to Db2.

System action

The allied task is abended, and the request is not processed.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

An SVC dump may be produced by the allied address space.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30599

Explanation

The allied memory function of the subsystem support subcomponent (SSAM) has attempted to remove an AGNT block (representing a connected allied coordinator task) from the chain of active AGNT blocks before all the dependent AGNT blocks have been removed. This AGNT block would normally be removed only during SSAM terminate processing or during EOT processing for the coordinator task. However, in these cases, dependents are terminated bottom up, and this situation, if it occurs, is a serious one. This message probably represents a logic error in the subsystem support subcomponent's allied memory function (SSAM).

System action

The requesting SSAM module is abended. The connection name associated with the error is probably unable to continue communication with Db2 until Db2 subsystem is terminated and restarted.

Operator response

Notify the system programmer. If necessary, stop and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has created SYS1.LOGREC entries and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30601

Explanation

Asynchronous events occurred which caused the premature termination of the thread. The thread could not be recovered.

There may be other abends or messages concerning this allied user indicating what the asynchronous events were.

System action

The allied user is abended with code X'04E ' and this reason code.

Operator response

The system programmer should be notified.

System programmer response

An SVC dump associated SYS1.LOGREC entries and SYSLOG should be available.

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30610

Explanation

CSECT DSN3AMT3 could not establish an ESTAE during the processing of an 'end stop-work force'

notification. This can occur if the current address space (usually system services) has insufficient storage. This may lead to abnormal termination of Db2.

System action

The caller is abended (without ABDUMP).

Operator response

Notify the system programmer and, if necessary, restart Db2.

System programmer response

If necessary, increase the private area size of the failing address space.

Problem determination

An SVC dump and related SYS1.LOGREC entry are requested by the initialization procedures (IP) subcomponent job-step task.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30801

Explanation

The Db2 subsystem was abended by module DSNAPRHX. DSNAPRHX was called and the request was passed on to the Db2 subsystem. However, upon return, it was discovered that the requesting (calling) TCB was in a Db2 must-complete function or was still holding Db2 latches.

System action

The Db2 subsystem is terminated. An MVS SVC dump is requested.

Operator response

Notify the system programmer, and restart Db2.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

This is usually caused by a previous error that has created SYS1.LOGREC entries and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30802

Explanation

CSECT DSNAPRHX, on the return path (normal nonerror path) from the requested function, found that the FRBUDATA flag was on. This is a Db2 subsystem error.

System action

The requesting task gets the FRB return and reason codes as set by the requested function. The task is not abended.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The SYS1.LOGREC entries and SVC dump should be examined to determine the actual cause of the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30803

Explanation

CSECT DSNAPRHX could not establish its ESTAE during the processing of an application program support call. This can occur if the current address space has insufficient storage.

System action

The allied task is abended (without ABDUMP).

Operator response

Notify the system programmer.

System programmer response

The user may retry the request. If necessary, increase the private area size of the application address space.

Problem determination

The allied task may have requested an SVC dump.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30805

Explanation

The caller's connection with Db2 has been terminated, because the Db2 subsystem has terminated or is in the process of terminating abnormally.

System action

The request may have been processed or aborted.

User response

The requester may identify to Db2 when it becomes operational again.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30806

Explanation

An error occurred during SMF Usage processing. The error is associated with the SMF IFAUSAGE PRToken or the IEANTRT token that stores the PRToken.

System action

Processing terminates.

User response

Collect the information that is identified in the problem determination section and contact IBM Support.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Related reference

[IFAUSAGE — Collecting Usage Data \(MVS System Management Facilities \(SMF\)\)](#)

[IEANTRT — Retrieve the token from a name/token pair \(MVS Assembler Services Reference\)](#)

00F30901

Explanation

Db2 has lost its cross-memory authority to an allied address space because the ally has released its authorization index.

System action

The allied address space is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30902**Explanation**

Db2 has detected a recursive abend condition while processing end-of-task for a task in an allied address space.

System action

The allied address space is terminated.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30903**Explanation**

An abend has occurred while processing End-of-Task for the control address space or a resource manager address space.

System action

The address space is forced to end-of-memory with this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F30904**Explanation**

End-of-Task occurred for the control address space or a resource manager address space and Db2 could not establish an ESTAE to protect its processing. Insufficient storage may be the reason the ESTAE could not be established.

System action

The address space is forced to end-of-memory with this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Problem determination

Attempt to determine if one or more Db2 address spaces is storage-constrained. Examination of the console output for the time period preceding this condition may reveal other messages or indications that the terminating address space was storage-constrained.

00F30905**Explanation**

End-of-task occurred for the job step task in an allied address space.

Db2 would normally attempt to terminate the address space's connection to Db2, but it was unable to protect its processing by establishing an ESTAE (extended specify task abnormal exit). Insufficient storage might be the reason that the ESTAE could not be established.

This abend code can also be issued when an allied address space is canceled or has gone through abnormal termination and Db2 determines that the address space control element for this allied address space is not deleted or orphaned. In this case, which is not a Db2 error, code 00F30905 is issued to provide documentation for this condition.

System action

The address space is forced to end-of-memory with this reason code.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Problem determination

Attempt to determine if any allied address spaces are storage-constrained, are canceled or have gone through abnormal termination. If an allied address space is canceled or has gone through abnormal termination, you can ignore this abend code or suppress the dump from 00F30905.

Examination of the console output for the time period preceding this condition may reveal other messages or indications that the terminating allied address space was storage-constrained.

00F31100

Explanation

An internal program request was made for an unknown function due to an invalid FRB request qualifier value in FRBQUAL. This condition is considered to be an internal logic error.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F31104

Explanation

Db2 encountered a logic error while processing an internal program request.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F31105

Explanation

Db2 encountered a logic error while processing an internal program request.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F31106

Explanation

Db2 encountered a logic error while processing an internal program request.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F31107

Explanation

Db2 encountered a logic error while processing an internal program request.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F31108

Explanation

Db2 encountered a logic error while processing an internal program request.

System action

The request is abnormally terminated.

System programmer response

Contact IBM Support.

Problem determination

Gather any dump and trace materials that are related to the problem.

00F33100

Explanation

The Db2 thread is 'read-only'.

System action

A prepare issued by the application program was processed through Phase 1. Db2 discovered there were no resources modified and no need for commit or abort to be subsequently issued.

User response

May effect a path length savings by not issuing the subsequent commit or abort which normally follows prepare. No further action is required to complete the unit of recovery; the unit of recovery is complete.

00F3AFFF

Explanation

An unrecoverable error return code was received from the RACROUTE REQUEST=VERIFY macro service. The return code was other than 0, 4, or 8.

System action

The SIGNON request is abended. An SVC dump is requested by Db2 functional recovery.

Operator response

Notify the system programmer.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The abend with this reason code is issued by the sample SIGNON exit after the implementation in the user's installation. It indicates that an unrecoverable error occurred with the RACROUTE REQUEST=VERIFY macro service.

GPR 2 at the time of abend will contain the original RACROUTE return code from GPR 15. GPR 3 at the time of abend will contain the reason code returned by the RACROUTE macro service in GPR 0, if any.

Refer to [RACROUTE REQUEST=AUTH: Return codes and reason codes \(Security Server RACROUTE Macro Reference\)](#) for descriptions of the RACROUTE return and reason codes.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

Chapter 26. X'F7.....' codes

Reason code identifiers that begin with 00F7 communicate normal and error situations with the group manager.

00F70001

Explanation

Db2 could not find the system parameters CSECT DSN6GRP.

System action

The Db2 subsystem terminates.

Operator response

Restart Db2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.

System programmer response

Investigate the system parameters load module.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70003

Explanation

The Db2 subsystem parameters specified that data sharing should be active. Db2 startup checking failed for either of two reasons:

- The group and member names contained in the subsystem parameters are not equal to the group and member names contained in the Db2 *ssnmMSTR* JCL start procedure, or
- The Db2 member is already active on another MVS system.

System action

Db2 terminates.

Operator response

Make sure the correct subsystem parameter load module name was specified for the Db2 that failed

to start. Restart Db2 with the correct subsystem parameter name.

System programmer response

Make sure the subsystem parameter name specified is the correct one for the Db2 subsystem and is not for a different member or group. You cannot share subsystem parameters among the members of a data sharing group. Make sure the group and member names specified in the subsystem parameters are equal to the group and member names contained in the Db2 *ssnmMSTR* JCL start procedure.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70401

Explanation

Db2 could not find the system parameters CSECT DSN6GRP.

System action

The Db2 subsystem terminates.

Operator response

Restart Db2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.

System programmer response

Investigate the system parameters load module.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70402

Explanation

Db2 could not create a service task for the group basic services function.

System action

The Db2 subsystem terminates.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70403

Explanation

Db2 could not find the system parameters CSECT DSN6SPRM.

System action

The Db2 subsystem terminates.

Operator response

Restart Db2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.

System programmer response

Investigate the system parameters load module.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70404

Explanation

Db2 could not open the SCA member information record.

System action

Db2 terminates.

Operator response

Check if the CF SCA structure is allocated. Restart Db2. If the problem occurs again, notify the system programmer.

System programmer response

Check if correct policy is active.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70405

Explanation

Db2 encountered an unexpected error while trying to read from or write to the shared communications area (SCA).

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70406

Explanation

Db2 issued an XCF macro IXCQUERY, but it failed. (XCF is the cross-system coupling facility component of MVS.)

System action

The Db2 subsystem terminates.

Operator response

Check the MVS console for XCF-related error messages. Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the Db2 subsystem. If the problem reoccurs, notify the system programmer.

System programmer response

Investigate the reason for this unexpected error. Refer to [z/OS MVS Sysplex Services Reference](#) for information about XCF return and reason codes.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70407

Explanation

The member name and member ID do not match in the BSDS, the XCF function data set, or the SCA structure. The following list contains possible reasons of the detected inconsistency (register 0 contains a reason code and a combination of registers 1 through 5 might contain the mismatched values):

- 1**
The member ID for this member in the BSDS data set is greater than the allowed maximum (248). Register 2 contains the member ID in the BSDS data set.
- 2**
The member name for this member ID in the SCA does not match the member name in the BSDS data set. Registers 2 and 3 contain the member name in the SCA. Registers 4 and 5 contain the member name in the BSDS data set.
- 3**
A member name saved in the SCA does not match the name saved in XCF couple data set for the same member ID. Registers 2 and 3 contain the member name in the SCA. Registers 4 and 5 contain the member name saved in the XCF couple data set. Register 7 contains the member ID.
- 4**
The member ID saved in the BSDS data set does not match what is saved in the XCF couple data set for the starting member. Register 2 contains the member ID in the BSDS data set. Register 3 contains the member ID in the XCF couple data set.
- 5**
The member ID saved in the BSDS data set does not match what is saved in the SCA structure for the starting member. Register 2 contains the member ID in the BSDS data set. Register 3 contains the member ID saved in the SCA structure.

6

The starting member name is not found in the SCA entry. Registers 2 and 3 contain the starting member name.

7

The data sharing group already has 248 members started for it.

System action

The Db2 subsystem terminates.

User response

Review the explanation and compare the information for member names and member IDs in the BSDS data set, XCF couple data set, and the Db2 SCA coupling facility structure.

00F70408

Explanation

Db2 issued an MVS XCF IXCJOIN request, but it failed. (XCF is the cross-system coupling facility component of MVS.)

System action

The Db2 subsystem terminates.

Operator response

Check the MVS console for XCF-related error messages. Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the Db2 subsystem. If the problem reoccurs, notify the system programmer.

System programmer response

Investigate the reason for this unexpected error. Refer to [z/OS MVS Sysplex Services Reference](#) for information about XCF return and reason codes.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70409

Explanation

Db2 encountered an unexpected error while trying to read from or write to the local bootstrap data set (BSDS).

System action

The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F7040A

Explanation

Db2 detected an unexpected error during deletion of a Db2 service task.

System action

Db2 terminates.

System programmer response

Investigate the problem and call IBM Support.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70410

Explanation

Db2 detected an unexpected error during IRLM locking.

System action

Db2 terminates.

System programmer response

Investigate the problem.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70600

Explanation

The connection to the shared communications area (SCA) was lost.

System action

Db2 terminates because Db2 data sharing cannot function without the SCA.

System programmer response

Figure out why the SCA link to this central processor complex (CPC) is lost and correct the problem. Then restart Db2.

User response

Notify the system programmer.

Problem determination

If there is an active SFM policy which specifies that a rebuild of the SCA should occur, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Related concepts

[Problem: Loss of SCA structure \(Db2 Data Sharing Planning and Administration\)](#)

[How Db2 recovers from coupling facility failures \(Db2 Data Sharing Planning and Administration\)](#)

Related tasks

[Defining coupling facility structures \(Db2 Installation and Migration\)](#)

00F70601

Explanation

The shared communications area (SCA) structure failed. Db2 initiated dynamic rebuild of the structure. However, the rebuild process failed and Db2 cannot continue without the SCA.

System action

Db2 terminates.

System programmer response

Correct the SCA structure and restart Db2. If all DB2s in the group terminate with this code, the next Db2 restart might do a group restart.

User response

Notify the system programmer.

Problem determination:

00F70602

Explanation

Db2 cannot connect to the shared communications area (SCA) coupling facility structure.

System action

Because Db2 data sharing cannot function without the SCA, Db2 terminates.

System programmer response

Refer to message DSN7506A for more information

User response

Notify the system programmer.

Problem determination:

Related information

[DSN7506A \(Db2 Messages\)](#)

00F70603

Explanation

Db2 encountered an error in accessing the shared communications area (SCA) coupling facility structure.

System action

Since Db2 data sharing cannot function without the SCA, Db2 terminates.

System programmer response

Refer to message DSN7508I for more information.

User response

Notify the system programmer.

Problem determination:

00F70604

Explanation

Db2 cannot rebuild the shared communications area (SCA) coupling facility structure.

System action

Because Db2 data sharing cannot function without the SCA, Db2 terminates.

System programmer response

Refer to messages DSN7506A and DSN7508I for more information

User response

Notify the system programmer.

Problem determination:

00F70605

Explanation

Db2 cannot create a needed service task. This is a Db2 internal error.

System action

Db2 terminates.

System programmer response

Investigate the problem.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70606

Explanation

Db2 detected an unexpected error. This is a Db2 internal error.

System action

Db2 terminates.

System programmer response

Investigate the problem.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70607

Explanation

Db2 detected that the shared communications area (SCA) coupling facility structure reached the directory entry limit of 200.

System action

Db2 terminates because Db2 data sharing cannot function without the SCA.

System programmer response

Investigate the problem.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70608

Explanation

Db2 detected an unexpected error. This is a Db2 internal error.

System action

Db2 terminates.

System programmer response

Investigate the problem.

User response

Notify the system programmer.

Problem determination

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

00F70609

Explanation

The SCA structure is full.

System action

The Db2 that was writing an entry in the SCA terminates because the critical function cannot continue when the SCA entry is not written.

System programmer response

Reclaim space in the SCA by removing exception conditions. If these actions do not free up enough space, or if this problem continues, you might need to increase the size of storage for the SCA.

Related concepts

[Problem: storage shortage in the SCA \(Db2 Data Sharing Planning and Administration\)](#)

[SCA list structure size \(Db2 Installation and Migration\)](#)

Chapter 27. X'F9.....' codes

Reason code identifiers that begin with 00F9 communicate normal and error situations with the general command processor.

An entry in the SYS1.LOGREC data set is requested for all of the following abnormal termination conditions. The SDWA variable recording area (VRA) contains the information provided by the DSNWRCRD function. When VRA space permits, the recordable section of the diagnostic data table (DDT control block) is also placed in the VRA. If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

All general command processor modules use register 10 as a base register. This may be helpful when attempting to match a register value to a module map.

00F90000

Explanation

A command processor has been invoked via the application program support function while the local lock of the caller's address space was held. CSECT DSN9SCNF tried to obtain the lock in order to obtain a response message buffer, but it was unable to do so. This represents a logic error in the function that submitted the command to the application program support function.

System action

Command execution was abended. If the command was properly entered, it may have been partially or completely executed.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS).

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

00F90001

Explanation

A command processor has been invoked via the application program support function. CSECT DSN9SCNF obtained the LOCAL lock of the caller's address space prior to obtaining a response message buffer, but was then unable to release the lock. This condition, if it occurs, is a serious one.

System action

Command execution was abended. If the command was properly entered, it may have been partially or completely executed.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS).

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90002**Explanation**

The routines of the multiple console support (MCS) service of MVS were unable to initialize. CSECT DSN9SCNM attempted to create the console task controller service task, but the task was not successfully created. This condition may indicate a problem in the address space. If it occurs, this is a serious error.

System action

Subsystem initialization is aborted, causing the Db2 subsystem to terminate.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. Restart the Db2 subsystem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90003**Explanation**

The routines of the multiple console support (MCS) service of MVS were unable to initialize. CSECT DSN9SCNM or DSN9SCN6 attempted to create a console service task but the task was not successfully created. This condition, if it occurs, is a serious one.

System action

If the abend was issued by CSECT DSN9SCNM, Db2 subsystem initialization is aborted, causing the Db2 subsystem to terminate. If the abend was issued by CSECT DSN9SCN6, the command from the associated console is executed under a different service task and should proceed normally.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90004**Explanation**

The routines of the multiple console support (MCS) service of MVS detected a logic error. CSECT DSN9SCN7 received a return code from the command preprocessor (the DSN9CMD service) that indicated an intolerable condition. A return code of X'04' is issued if the DSN9CMD calling parameters are invalid (the command text length is not a positive number or the PHB address is zero).

A return code of X'24' is provided if storage for a tokenized command statement (TCS) cannot be obtained from the global storage pool obtained by CSECT DSN9SCNP. The TCS storage request is the first storage request made using this pool. This is not a user error.

System action

The command was not executed.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, “X'F9.....' codes,” on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90005

Explanation

A routine of the multiple console support (MCS) service of MVS was not able to create an ESTAE recovery environment. This condition is detected when the ESTAE service of MVS returns a nonzero return code. The command from the associated MCS console is not executed. Refer to the appropriate MVS publication for an explanation of ESTAE return codes.

System action

Command processing is terminated.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying

and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

If available, the diagnostic data table (DDT control block) will appear in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, “X'F9.....' codes,” on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90006

Explanation

The agent allocation routine was not able to allocate command processing capability to an agent. This failure occurs, because there is a damaged control block in global storage (CSA). The control block is the command global data area (CGDA). The address of the CGDA is in the general command processor RMFTRUSE field. This is not a user error.

System action

Agent allocation is terminated.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS) or the Db2 subsystem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, “X'F9.....' codes,” on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90007

Explanation

The command parsing routines have attempted to update one of the command statistical counters that are kept in local storage. However, the counter control block validation field is wrong, indicating a damaged control block. The counter control block is located via the 'CGDASTA' address in the command global data area (CGDA) control block. The CGDA address is in the general command processor RMFTRUSE field. This is not a user error.

System action

The statistical update is not completed. The statistics block address is cleared from the CGDA to prevent future failures. No further command statistical counts are maintained. Processing for the command is retried and should complete normally.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90008

Explanation

The recovery manager control routine has been called, but register 6 did not contain the address of an execution block (EB) on entry to DSN9SCN9. Because recovery logic requires the address of the EB, CSECT DSN9SCN9 cannot proceed. The EB hexadecimal control block identifier and the block length are compared to known values in order to validate the EB address. This is not a user error.

System action

The function requesting the recovery management service is abended.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS) or the Db2 subsystem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F90009

Explanation

This reason code is used to document that CSECT DSN9SCN9 has added information to the SDWA variable recording area (VRA) following the data provided by the DSNWRCRD service. If DSN9SCN9 records a failure in SYS1.LOGREC and the reason

code in the VRA is not of the form X'00F9xxxx', the reason code is changed to X'00F90009'. This is done so that anyone examining a SYS1.LOGREC entry can determine, from the reason code, what additional data has been placed in the VRA. The reason code is the first data item in the VRA, as mapped by macro IHAVRA.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F9000A

Explanation

The command parsing routines attempted to obtain a descriptor using the DSNZGDE service of the system parameter manager but the expected descriptor was not found (the DSNZGDE return code was X'04'). All descriptors used by the parser are contained in CSECT DSN9SCNA. This failure probably indicates incorrect data in CSECT DSN9SCNA.

System action

Command execution was abended. The command was not executed.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS) or the Db2 subsystem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see [Chapter 27, "X'F9.....' codes," on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F9000B

Explanation

The command parsing routines attempted to obtain storage from the storage pool (PHB) provided on a DSN9SCAN service request. Normally, this is CSA storage in the pool built by CSECT DSN9SCNP. The storage request could not be satisfied, either because no CSA storage was available or because an unreasonably large amount of storage was requested. The amount of storage requested is determined by the length of the command being parsed. Normally, it is several hundred bytes.

System action

Command execution is abended.

Operator response

Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment facility (IMS or CICS) or the Db2 subsystem.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The diagnostic data table (DDT control block) appears in the subsystem diagnostic work area (SDWA) variable recording area (VRA). Register 8 contains the address of the tokenized command statement (TCS) control block, and register 9 contains the requested storage length. The TCS is the Db2 internal representation of the command text. For additional diagnostic information, see [Chapter 27, “X'F9.....' codes,” on page 1341](#).

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F9000C

Explanation

The command preprocessor (GCPC) mainline routine (DSN9SCNP) encountered a validation error when examining the message chains returned from the command processor.

The command processor invoked attempted to return a message formatted for inclusion in an MVS Multiple Line WTO.

System action

Command execution is abended.

Operator response

Notify the system programmer.

System programmer response

This error reflects a failure identified during Db2 internal protocol verification. The command in error is identified by message DSN9017I. Register 8 points to the start of the response message chain returned by the command processor. Register 9 points to the

message within the message chain that was found to be in error.

System programmer response

If you suspect an error in Db2, you might need to report the problem. For information about identifying and reporting the problem, see [Collecting diagnostic data \(Collecting data\)](#).

Problem determination

The GCPC Diagnostic Data Table (DSNDDDT Control Block) is recorded in the Variable Recording Area of the SDWA associated with the error.

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Dynamic dump, taken to SYS1.DUMPxx data set, by Db2 (04E and 04F abends).
- A listing of the SYS1.LOGREC data set, obtained by executing IFCEREP1.

00F9000D

Explanation

The command preprocessor (GCPC) start-up routine (DSN9SCNE) discovered that the ERLY block is out-of-date. This error indicates that the current early code is not yet compatible with this version of Db2; a required early code PTF is missing.

System action

The Db2 subsystem start-up is terminated.

Operator response

Notify the system programmer.

System programmer response

Check the Program Directory, apply the required early code PTF and re-IPL MVS.

Appendix A. SNA sense codes

You might encounter SNA sense codes when you work with Db2. Some of these codes are issued by Db2 when an error is detected on an LU 6.2 conversation. Other codes are not issued by Db2, but they are related to complex problems that are associated with Db2 use of SNA functions and can be difficult to diagnose.

Many other SNA sense codes are not described here. For information about all SNA sense codes, including the ones that are not described here, see [Sense data \(Systems Network Architecture Formats\)](#).

080F6051

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the remote site did not accept the security information contained in the SNA FMH5.

System action

The attempt to access the remote database resource fails, and the failure is reported to the application.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

System programmer response

If the remote site is a Db2 subsystem, refer to the DSNL030I message at the remote site for the cause of the security failure. Additionally, an ALERT is recorded in NetView (if the NetView product is available) to describe the security failure.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the security failure at the remote site.

Verify each of the following:

- The USERNAMES column of the SYSIBM.LUNAMES table at the local Db2 system must specify either 'O' or 'B', if you intend authorization IDs and PASSWORDs to be sent on LU6.2 ALLOCATE requests to the remote site.
- The authorization ID and PASSWORD sent on the LU6.2 ALLOCATE request are specified correctly in the SYSIBM.USERNAMES table.
- If you intend to translate the authorization IDs, ensure the NEWAUTHID column of the SYSIBM.USERNAMES table is the authorization ID to be used at the remote site.
- If password encryption is used (ENCRYPTPSWDS='Y' in the SYSIBM.LUNAMES table), the remote site must be a Db2 subsystem.

The ENCRYPTPSWDS column of the SYSIBM.LUNAMES table must be correctly set at both the local and remote Db2 subsystems.

- The correct password is sent to the remote site.
 - For encrypted passwords, the password sent to the remote Db2 subsystem is obtained by extracting the password from the local security subsystem of the authorization ID in the NEWAUTHID column of the SYSIBM.USERNAMES.
 - If password encryption is not used, the password is taken from the PASSWORD column of the SYSIBM.USERNAMES table.

User response

Notify the communications database administrator.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNames and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

080F6052

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the security subfields in the FMH5 were not formatted as required by the LU6.2 architecture.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer response

Contact the administrator for the client system. The client system might have a software defect.

080FFF00

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the password supplied to the server has expired.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer response

Change the password at the remote database server, so that the password is no longer expired.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

080FFF01

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the password supplied to the server was incorrect.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User response

Supply the correct password on the connection request.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

080FFF02

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the userid specified on the request was revoked at the server system.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User response

Contact the security administrator at the server to have your userid re-activated.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

080FFF03

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because the userid supplied to the server was invalid.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User response

Supply a valid userid on your connection request.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

080FFF04

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because no userid was present in the connection request.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer response

Contact the administrator of the client system. The client must be configured to include a userid on connection requests.

080FFF05

Explanation

An attempt to allocate a VTAM LU6.2 conversation failed because a password was not supplied in the connection request.

System action

The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer response

Contact the administrator of the client system. The client must be configured to transmit a password in the connection request.

This is known in LU6.2 as SECURITY=PGM on the ALLOCATE verb.

08120000

Explanation

A VTAM LU6.2 conversation was terminated due to a resource shortage.

System action

The LU6.2 conversation is terminated.

System programmer response

If the site issuing this sense code is a Db2 subsystem, refer to the DSNL030I message at the Db2 site for the cause of the failure.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

084B0000

Explanation

A VTAM LU6.2 conversation was terminated due to a resource shortage.

System action

The LU6.2 conversation is terminated.

System programmer response

If the site issuing this sense code is a Db2 system, refer to the DSNL500I message at the Db2 site for the cause of the failure.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

084B6031

Explanation

A VTAM LU6.2 conversation was terminated due to a resource shortage.

System action

The LU6.2 conversation is terminated.

System programmer response

If the server site issuing this sense code is a Db2 system, refer to the DSNL030I message at the Db2 site for the cause of the failure.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

08570008

Explanation

A VTAM LU6.2 conversation is not allowed because the LU session required for the processing of the request is not active.

System action

The LU6.2 conversation is terminated.

System programmer response

If the server site issuing this sense code is a Db2 subsystem, make sure DDF is started.

If the remote site is not a Db2 subsystem, obtain any diagnostic information about the inactive LU at the remote site.

User response

Notify the system programmer about the network failure.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

08640000

Explanation

A DEALLOCATE TYPE(ABEND_PROG) verb was issued to terminate the LU6.2 conversation. This occurs when an unrecoverable error was detected during distributed database processing.

System action

An error was encountered which required the LU6.2 conversation to be terminated abnormally. The conversation is terminated using DEALLOCATE TYPE(ABEND_PROG), which is detected as a communication error at the remote site.

System programmer response

Look for messages or SVC dumps at the site which issued the DEALLOCATE TYPE(ABEND_PROG).

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

08640001

Explanation

A DEALLOCATE TYPE(ABEND_SVC) verb was issued to terminate the LU6.2 conversation. This occurs when a remote system encounters an unrecoverable error in attempting to satisfy a distributed database request.

System action

An error was encountered which required the LU6.2 conversation to be terminated abnormally. The conversation is terminated using DEALLOCATE TYPE(ABEND_SVC), which is detected as a communication error at the remote site.

System programmer response

If the site issuing DEALLOCATE TYPE(ABEND_SVC) was not coming down, look for messages or SVC dumps at that site that would cause the conversation to be terminated.

User response

If the site issuing the DEALLOCATE TYPE(ABEND_SVC) is a Db2 subsystem, that Db2 site is in the process of stopping the distributed data facility (DDF). You must try your request again once DDF is restarted at that site.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.

08640002

Explanation

An SNA conversation was terminated with an SNA ABEND_TIMER indication.

System action

When communication with the coordinator of a unit of work fails and the commit/abort decision has not yet been received, Db2 uses the 08640002 SNA sense code to terminate conversations with all other LUs involved in the unit of work. This informs the other LUs in the unit of work that a 2-phase commit communication outage occurred. All LUs involved in the unit of work are still able to determine the outcome of the unit of work, because either Db2 or the remote system performs the SNA resynchronization protocol to determine the coordinator's decision (commit or abort) for the unit of work.

System programmer response

No action is required.

10086011

Explanation

An invalid LUWID value was detected in the data received from a remote site. When a remote site sends a request using application-directed access, the first portion of the data contains an SNA FMH5 header. This header contains the invalid LUWID.

System action

The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

System programmer response

The remote site is required to send a valid LUWID value when using application-directed access.

Verify that the remote site issuing this request is indeed attempting to start a conversation using application-directed access. It is possible that the remote site mistakenly attempted to start a conversation with Db2, using the transaction program name (TPN).

If the remote site is attempting to start a conversation using application-directed access, contact the support group for the remote site to determine why an invalid LUWID is being transmitted.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

Explanation

A remote site sent a request that specifies an unknown transaction program name (TPN). The first message in the request contains an SNA FMH5 header, which specifies the TPN to be used.

System action

The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

System programmer response

This error is usually caused by one of these errors:

- 100.0% (1) 5.0 (1)

Db2 returns this sense code to an application at a remote site when the application mistakenly routes an LU6.2 ALLOCATE request to Db2. In most cases, the remote site selected the wrong partner LU name (the Db2 LU name) on the LU6.2 ALLOCATE verb.

- A Db2 server received an invalid Transaction Program Name (TPN) from a DRDA requester. The only DRDA TPN that Db2 considers valid is X'07F6C4C2'.
- If Db2 receives this sense code from a remote site, one of the following can potentially be the cause:
 1. If you are using application-directed access, the remote site does not support application-directed access. This can occur if the remote site is a Version 2 Release 2 system, which does not support application-directed access.
 2. If you are using system-directed access, the remote site issues this sense code if it is not another Db2 site. System-directed access is only supported between Db2 subsystems. Other systems do not support this function.
 3. The SYSIBM.LOCATIONS table does not specify the correct LUNAME value for your intended destination. This causes VTAM to route your request to the wrong site, which probably does not support distributed database functions.
 4. The remote site does not support distributed two-phase commit protocols, but the VTAM APPL definition for the remote LU specifies that two-phase commit protocols are supported. This can occur if the remote site is a Version 2 system which has SYNCLVL=SYNCPPOINT specified in its VTAM APPL definition. For Db2 Version 2 systems,

the VTAM APPL definition statement should specify SYNCLVL=CONFIRM (the default), since Version 2 systems do not support distributed two-phase commit protocols.

If none of the above explains the failure, you must contact the support group for the remote site to determine why an invalid TPN is being transmitted.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

10086031

Explanation

A remote site rejected a request using system-directed access because it contained program initialization parameters (PIP) in the SNA FMH-5 header. This error indicates the remote site is not another Db2 subsystem.

System action

The attempt to allocate an APPC conversation is rejected.

System programmer response

If Db2 receives this sense code when attempting to start a conversation, the SYSIBM.LOCATIONS table probably has an incorrect LUNAME value for the failing site. If the wrong LUNAME is provided, VTAM routes the request to the wrong network destination.

User response

The failing SQL statement specified an SQL object that was either:

- An ALIAS for a remote object
- Or a three-part name identifying a remote object.

This access method can only be used when the remote object resides on another Db2 subsystem.

If the remote object resides on a different relation database system, you must use application-directed access to access the remote object.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.

10086034

Explanation

An SNA FMH5 was received that requested an APPC conversation type (MAPPED or BASIC), which was not consistent with the transaction program name (TPN) specified.

System action

The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

System programmer response

The conversation type must be BASIC.

If Db2 sends this sense code to a remote site, an APPC application probably mistakenly routed an APPC ALLOCATE request to Db2.

If Db2 receives this sense code from a remote site, the Db2 SYSIBM.LOCATIONS table might have an incorrect LUNAME value for the failing LOCATION. This causes VTAM to route the request to the wrong destination, which can potentially be flagged in this manner.

If none of the above explains the failure, contact the support group for the remote site to determine why the conversation type is being sent incorrectly.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

10086041

Explanation

An SNA FMH5 was received that requested a SYNC_LEVEL that was not consistent with the transaction program name (TPN) specified.

System action

The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

System programmer response

The SYNC_LEVEL must be NONE.

When Db2 sends this sense code, it is usually caused by an APPC application that mistakenly routed an APPC ALLOCATE request to Db2.

If Db2 receives this sense code, the Db2 SYSIBM.LOCATIONS table probably has an incorrect LUNAME value for the failing LOCATION. This causes VTAM to route the request to the wrong destination, which can potentially be flagged in this manner.

If none of the above explains the failure, you must contact the support group for the remote site to determine why the SYNC_LEVEL is being sent incorrectly.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.
- Listing of the contents of the SYSIBM.USERNAMES table at the local Db2 subsystem and the remote Db2 subsystem.
- Statistics Class 4 trace record for the LUWID associated with the failing request.

800A0000

Explanation

A distributed database message was truncated during transmission through the network. When the data is being transmitted, the data is broken up into smaller pieces, based on the SNA RU size specified by your Communications Administrator. This error indicates that one or more device in your network could not accept messages of the size specified in the chosen RU size.

This abend reason code is issued by the following CSECT: None

System action

The conversation is terminated.

System programmer response

The data flowing to the failing destination specified an RU size that was too large for the network connections used to route the data. One of two actions must be taken:

1. The network connections along the path must be changed to support the largest PIU being transmitted (a PIU is 29 bytes longer than the RU size you specify).

For VTAM channel-to-channel connections, the MAXBFRU parameter on the VTAM LINE statement is used to control this function. MAXBFRU specifies the number of 4KB buffers used to pass data over the channel. Since a PIU includes a 29 byte header, MAXBFRU must be at least 2 in order to support an RU size of 4096.

For connections to NCP, the MAXDATA parameter on the PCCU macro must be large enough to hold an entire PIU.

2. If you would rather not change the MAXBFRU and MAXDATA values, a smaller RU size must be specified. This can be accomplished by reducing the RUSIZES parameter for each MODEENT macro used by Db2 in your LOGMODE table.

User response

Notify the systems programmer.

Problem determination

Collect the following diagnostic items:

- Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time that spans the failure.
- Listing of the contents of the SYSIBM.IPNAMES and SYSIBM.LUNAMES tables at the local Db2 subsystem and the remote Db2 subsystem.

Appendix B. New, changed, and deleted codes

Reason codes and SQL codes are added to, changed in, and removed from Db2 13 for z/OS, as necessary.

Lists of new, changed, and deleted reason and SQL codes are available exclusively in the online version of this information.

[New, changed, and deleted codes](#)

Appendix C. z/OS diagnostic services

Db2 uses functional recovery routines that run MVS and z/OS services to provide diagnostic information for assistance in problem determination.

Functional recovery routines used by Db2 run MVS and z/OS services to provide diagnostic information for assistance in problem determination. The following MVS services provide diagnostic information:

SVC dumps

The Db2 abend completion code X'04E' uses the MVS SDUMP service to create SVC dumps. The content and storage areas associated with these dumps vary depending on the specific error and the state of the Db2 subsystem at the time the error.

SYS1.LOGREC entries

Entries are requested in the SYS1.LOGREC data set at the time of the error using the MVS SETRP service. The following are also recorded in SYS1.LOGREC:

- Subsystem abnormal terminations
- Secondary abends that occur in a recovery routine
- Recording requests from recovery routines percolated to by the recovery termination manager.

Variable recording area (VRA) data

Data entries are added to the VRA of the SDWA by using an MVS VRA defined key. VRA data includes a series of diagnostic data entries common to both Db2 abend completion codes. Additional information is provided by the invoking subcomponent recovery routine during initial error processing or recovery termination manager percolation.

During Db2 operation, an abend can occur with an MVS system completion code.

If you receive an MVS abend during Db2 operation, refer to the appropriate MVS publication.

Appendix D. SQLSTATE values and common error codes

Db2 produces SQLSTATE values when it works as an application server or requester.

The SQLSTATE values are based on the SQLSTATE specifications contained in the standards: [ISO/IEC 9075:1992, Database Language SQL](#) and [ANSI X3.135-1992 Database Language SQL](#).

SQLSTATE values are returned to the application in the last five bytes of the SQLCA. Each five-character value is a return code that indicates the outcome of the most recently executed SQL statement.

SQLSTATE values are designed so that application programs can test for specific errors or classes of errors. The first character of an SQLSTATE value indicates whether the SQL statement was executed successfully or unsuccessfully (equal to or not equal to zero, respectively).

SQLSTATE values are comprised of a two-character class code value, followed by a three-character subclass code value. Class code values represent classes of successful and unsuccessful execution conditions. An application might define classes beginning with the characters '7' through '9' or 'I' through 'Z' and subclasses for any class beginning with the characters 'I' through 'Z'.

[Table 3 on page 1359](#) identifies the SQLSTATE class codes. Subsequent tables describe the subcodes for each class code.

SQLSTATE values for Java programs: For information on SQLSTATE values in the range 46600 to 466ZZ, see [SQLSTATes issued by the IBM Data Server Driver for JDBC and SQLJ \(Db2 Application Programming for Java\)](#).

Table 3. SQLSTATE Class Codes		
Class code	Meaning	Subcodes
00	Unqualified Successful Completion	Table 4 on page 1361
01	Warning	Table 5 on page 1361
02	No Data	Table 6 on page 1365
07	Dynamic SQL Error	Table 7 on page 1365
08	Connection Exception	Table 8 on page 1366
09	Triggered Action Exception	Table 9 on page 1366
0A	Feature Not Supported	Table 10 on page 1366
0F	Invalid Token	Table 11 on page 1366
0K	Resignal When Handler Not Active	Table 12 on page 1366
0N	SQL/XML Mapping Error	Table 13 on page 1366

<i>Table 3. SQLSTATE Class Codes (continued)</i>		
Class code	Meaning	Subcodes
10	XQuery Error	Table 14 on page 1366
20	Case Not Found for Case Statement	Table 15 on page 1367
21	Cardinality Violation	Table 16 on page 1367
22	Data Exception	Table 17 on page 1367
23	Constraint Violation	Table 18 on page 1369
24	Invalid Cursor State	Table 19 on page 1370
25	Invalid Transaction State	Table 20 on page 1371
26	Invalid SQL Statement Identifier	Table 21 on page 1371
2D	Invalid Transaction Termination	Table 22 on page 1371
34	Invalid Cursor Name	Table 23 on page 1371
35	Invalid Condition Number	Table 24 on page 1371
36	Cursor Sensitivity Exception	Table 25 on page 1371
38	External Function Exception	Table 26 on page 1371
39	External Function Call Exception	Table 27 on page 1372
3B	Savepoint Exception	Table 28 on page 1372
3C	Ambiguous Cursor Name	Table 29 on page 1373
40	Transaction Rollback	Table 30 on page 1373
42	Syntax Error or Access Rule Violation	Table 31 on page 1373
44	WITH CHECK OPTION Violation	Table 32 on page 1382
46	Java Errors	Table 33 on page 1382
51	Invalid Application State	Table 34 on page 1382

<i>Table 3. SQLSTATE Class Codes (continued)</i>		
Class code	Meaning	Subcodes
53	Invalid Operand or Inconsistent Specification	Table 35 on page 1383
54	SQL or Product Limit Exceeded	Table 36 on page 1384
55	Object Not in Prerequisite State	Table 37 on page 1385
56	Miscellaneous SQL or Product Error	Table 38 on page 1386
57	Resource Not Available or Operator Intervention	Table 39 on page 1388
58	System Error	Table 40 on page 1389
5UA	Common Utilities and Tools	Table 41 on page 1390

<i>Table 4. Class Code 00: Unqualified Successful Completion</i>	
SQLSTATE Value	Meaning
00000	Execution of the operation was successful and did not result in any type of warning or exception condition.

<i>Table 5. Class Code 01: Warning</i>	
SQLSTATE Value	Meaning
01xxx	Valid warning SQLSTATEs returned by an SQL routine or user application. Also used for RAISE_ERROR and SIGNAL.
01003	Null values were eliminated from the argument of an aggregate function.
01004	The value of a string was truncated when assigned to another string data type with a shorter length.
01005	Insufficient number of entries in an SQLDA.
0100C	One or more ad hoc result sets were returned from the procedure.
0100E	The procedure returned too many result sets.
01011	The PATH value has been truncated.
01503	The number of result columns is larger than the number of variables provided.
01504	The UPDATE or DELETE statement does not include a WHERE clause.
01505	The statement was not executed because it is unacceptable in this environment.
01506	An adjustment was made to a DATE or TIMESTAMP value to correct an invalid date resulting from an arithmetic operation.
01507	One or more non-zero digits were eliminated from the fractional part of a number used as the operand of a multiply or divide operation.

<i>Table 5. Class Code 01: Warning (continued)</i>	
SQLSTATE Value	Meaning
01514	The tablespace has been placed in the check-pending state.
01515	The null value has been assigned to a variable, because the non-null value of the column is not within the range of the variable.
01516	An inapplicable WITH GRANT OPTION has been ignored.
01517	A character that could not be converted was replaced with a substitute character.
01519	The null value has been assigned to a variable, because a numeric value is out of range.
01520	The null value has been assigned to a variable, because the characters cannot be converted.
01521	A specified server-name is undefined but is not needed until the statement is executed or the alias is used.
01522	The local table or view name used in the CREATE ALIAS statement is undefined.
01523	ALL was interpreted to exclude ALTER, INDEX, REFERENCES, and TRIGGER, because these privileges cannot be granted to a remote user.
01524	The result of an aggregate function does not include the null values that were caused by evaluating the arithmetic expression implied by the column of the view.
01525	The number of INSERT values is not the same as the number of columns.
01527	A SET statement references a special register that does not exist at the AS.
01528	WHERE NOT NULL is ignored, because the index key cannot contain null values.
01530	Definition change may require a corresponding change on the read-only systems.
01532	An undefined object name was detected.
01533	An undefined column name was detected.
01537	An SQL statement cannot be EXPLAINed, because it references a remote object.
01538	The table cannot be subsequently defined as a dependent, because it has the maximum number of columns.
01539	Connection is successful but only SBCS characters should be used.
01540	A limit key has been truncated to 40 bytes.
01542	Authorization ID does not have the privilege to perform the operation as specified.
01543	A duplicate constraint has been ignored.
01545	An unqualified column name has been interpreted as a correlated reference.
01546	A column of the explanation table is improperly defined.
01548	The authorization ID does not have the privilege to perform the specified operation on the identified object.
01551	A table in a partitioned tablespace is not available, because its partitioned index has not been created.
01552	An ambiguous qualified column name was resolved to the first of the duplicate names in the FROM clause.
01553	Isolation level RR conflicts with a tablespace locksize of page.

<i>Table 5. Class Code 01: Warning (continued)</i>	
SQLSTATE Value	Meaning
01554	Decimal multiplication may cause overflow.
01558	A distribution protocol has been violated.
01560	A redundant GRANT has been ignored.
01561	An update to a data capture table was not signaled to the originating subsystem.
01565	The null value has been assigned to a variable, because a miscellaneous data exception occurred. For example, the character value for the CAST, DECIMAL, FLOAT, or INTEGER scalar function is invalid; a floating-point NAN (not a number); invalid data in a packed decimal field; or a mask mapping error was detected.
01566	The object has been placed in a pending state.
01568	The dynamic SQL statement ends with a semicolon.
01578	The bind process detected operands of an operator that are not compatible.
01590	Type 2 indexes do not have subpages.
01591	The result of the positioned UPDATE or DELETE may depend on the order of the rows.
01594	Insufficient number of entries in an SQLDA for ALL information (i.e. not enough descriptors to return the distinct name).
01596	Comparison functions were not created for a distinct type based on a long string data type.
01597	Specific and non-specific volume IDs are not allowed in a storage group.
01599	Bind options were ignored on REBIND.
01600	SUBPAGES ignored on alter of catalog index.
01602	Optimization processing encountered a restriction that might have caused it to produce a sub-optimal result.
01604	The SQL statement was explained and not executed.
01605	A recursive common table expression may contain an infinite loop.
01608	An unsupported value has been replaced.
01614	There are fewer locators than the number of result sets.
01615	A bind option was ignored.
01616	The estimated CPU cost exceeds the resource limit.
01624	The GBPCACHE specification is ignored because the buffer pool does not allow caching.
01625	The schema name appears more than once in the CURRENT PATH.
01628	The user-specified access path hints are invalid. The access path hints are ignored.
01629	User-specified access path hints were used during access path selection.
01640	ROLLBACK TO SAVEPOINT occurred when there were uncommitted INSERTs or DELETEs that cannot be rolled back.
01643	Assignment to SQLCODE or SQLSTATE variable does not signal a warning or error.
01644	DEFINE NO is not applicable for a lob space or data sets using the VCAT option.
01656	ROLLBACK TO savepoint caused a NOT LOGGED table space to be placed in the LPL.

<i>Table 5. Class Code 01: Warning (continued)</i>	
SQLSTATE Value	Meaning
01658	Binary data is invalid for DECRYPT_CHAR and DECRYPT_DB.
01659	A non-atomic statement successfully processed all requested rows with one or more warning conditions.
01663	NOT PADDED clause is ignored for indexes created on auxiliary tables.
01664	Option not specified following the ALTER PARTITION CLAUSE.
01665	A name or label was truncated.
01666	The last partition's limit key value is set to the highest or lowest possible value.
01668	A rowset FETCH statement returned one or more rows of data, with one or more bind out processing error conditions. Use GET DIAGNOSTICS for more information.
01676	Transfer operation ignored since the authorization ID is already the owner of the database object.
01679	A trusted connection cannot be established for the specified system authorization ID.
01680	The option is not supported in the context in which it was specified.
01681	The trusted context is no longer defined to be used by specific attribute value.
01682	The ability to use the trusted context was removed from some but not all authorization IDs specified in statement.
01683	A SELECT containing a non-ATOMIC data change statement successfully returned some rows, but one or more warnings or errors occurred.
01687	A database resource was not available. Processing continues.
0168B	An operation was partially successful and partially unsuccessful. Use GET DIAGNOSTICS for more information.
0168C	A decimal float operation produced an inexact result.
0168D	A decimal floating point operation was invalid.
0168E	A decimal float operation produced an overflow or underflow.
0168F	A decimal float operation produced division by zero.
0168G	A decimal float operation produced a subnormal number.
0168L	No routine was found with the specified name and compatible arguments.
0168T	WITH ROW CHANGE COLUMNS ALWAYS DISTINCT was specified, but the database manager is unable to return distinct row change columns.
0168X	The combination of target namespace and schema location hint is not unique in the XML schema repository.
0168Z	The statement was successfully prepared, but cannot be executed.
01694	A feature is not enabled or has been ignored.
01695	Adjustment made to a value for a period as a result of a data change operation.
0169A	A configuration parameter was overridden.
0169B	The operation was successful on the Db2 server, but may not have been successful on the accelerator server.

<i>Table 5. Class Code 01: Warning (continued)</i>	
SQLSTATE Value	Meaning
0169D	The accelerator does not exist.
01Hxx	Valid warning SQLSTATEs returned by a user-defined function, external procedure CALL, or command invocation.
01H54	The procedure has returned successfully but encountered an error in the format or content of a parameter. Information about the error in the parameter value is returned in an output parameter.
01H55	The procedure has returned successfully but encountered an internal processing error. Information about the internal error situation is returned in an output parameter.
01H56	The procedure has returned successfully but supports a higher version for a parameter than the one that was specified.
01H57	The procedure has returned output in an alternate locale instead of the locale specified.
01H5A	Data truncation occurred during Bidi transformation.
01H5B	A trusted connection can be established.

<i>Table 6. Class Code 02: No Data</i>	
SQLSTATE Value	Meaning
02000	One of the following exceptions occurred: 1. The result of the SELECT INTO statement or the subselect of the INSERT statement was an empty table. 2. If this is an UPDATE, INSERT, DELETE, or MERGE statement, no rows satisfy the subselect, WHERE clause, or MERGE criteria. No rows were updated, inserted, or deleted. 3. The position of the cursor referenced in the FETCH statement was after the last row of the result table. 4. The fetch orientation is invalid.
02502	Delete or update hole detected.
02504	FETCH PRIOR ROWSET returned a partial rowset.

<i>Table 7. Class Code 07: Dynamic SQL Error</i>	
SQLSTATE Value	Meaning
07001	The number of variables is not correct for the number of parameter markers.
07002	The call parameter list or control block is invalid.
07003	The statement identified in the EXECUTE statement is a select-statement, or is not in a prepared state.
07005	The statement name of the cursor identifies a prepared statement that cannot be associated with a cursor.
07501	The option specified on PREPARE or EXECUTE is not valid.

<i>Table 8. Class Code 08: Connection Exception</i>	
SQLSTATE Value	Meaning
08001	The connection was unable to be established to the application server or other server.
08002	The connection already exists.
08003	The connection does not exist.
08004	The application server rejected establishment of the connection.

<i>Table 9. Class Code 09: Triggered Action Exception</i>	
SQLSTATE Value	Meaning
09000	A triggered SQL statement failed.

<i>Table 10. Class Code 0A: Feature Not Supported</i>	
SQLSTATE Value	Meaning
0A001	The CONNECT statement is invalid, because the process is not in the connectable state.
0A502	The action or operation is not enabled for this database instance.

<i>Table 11. Class Code 0F: Invalid Token</i>	
SQLSTATE Value	Meaning
0F001	The locator value does not currently represent any value.

<i>Table 12. Class Code 0K: Resignal When Handler Not Active</i>	
SQLSTATE Value	Meaning
0K000	A RESIGNAL was issued but a handler is not active.

<i>Table 13. Class Code 0N: SQL/XML Mapping Error</i>	
SQLSTATE Value	Meaning
0N002	A character cannot be mapped to a valid XML character.

<i>Table 14. Class Code 10: XQuery Error</i>	
SQLSTATE Value	Meaning
10501	An XQuery expression is missing the assignment of a static or dynamic context component.
10502	An error was encountered in the prolog of an XQuery expression.
10503	A duplicate name was defined in an XQuery or XPath expression.
10504	An XQuery namespace declaration specified an invalid URI.
10505	A character, token or clause is missing or invalid in an XQuery expression.

<i>Table 14. Class Code 10: XQuery Error (continued)</i>	
SQLSTATE Value	Meaning
10506	An XQuery expression references a name that is not defined.
10507	A type error was encountered processing an XPath or XQuery expression.
10509	An unsupported XQuery language feature is specified.
10601	An arithmetic error was encountered processing an XQuery function or operator.
10602	A casting error was encountered processing an XQuery function or operator.
10606	There is no context item for processing an XQuery function or operator.
10608	An error was encountered in the argument of an XQuery function or operator.
10609	A regular expression error was encountered processing an XQuery function or operator.
10703	The target node of an XQuery basic updating expression is not valid.

<i>Table 15. Class Code 20: Case Not Found for Case Statement</i>	
SQLSTATE Value	Meaning
20000	The case was not found for the CASE statement.

<i>Table 16. Class Code 21: Cardinality Violation</i>	
SQLSTATE Value	Meaning
21000	The result of a SELECT INTO, scalar fullselect, or subquery of a basic predicate is more than one value.
21501	A multiple-row INSERT into a self-referencing table is invalid.
21502	A multiple-row UPDATE of a primary key is invalid.

<i>Table 17. Class Code 22: Data Exception</i>	
SQLSTATE Value	Meaning
22001	Character data, right truncation occurred; for example, an update or insert value is a string that is too long for the column, or a datetime value cannot be assigned to a variable, because it is too small.
22002	A null value, or the absence of an indicator parameter was detected; for example, the null value cannot be assigned to a variable, because no indicator variable is specified.
22003	A numeric value is out of range.
22004	A null value is not allowed.
22007	An invalid datetime format was detected; that is, an invalid string representation or value was specified.
22008	Datetime field overflow occurred; for example, an arithmetic operation on a date or timestamp has a result that is not within the valid range of dates.
2200L	The XML value is not a well-formed document with a single root element.

Table 17. Class Code 22: Data Exception (continued)

SQLSTATE Value	Meaning
2200M	The XML document is not valid.
2200S	The XML comment is not valid.
2200T	The XML processing instruction is not valid.
2200V	A context item is an XML sequence of more than one item.
2200W	An XML value contained data that could not be serialized.
22010	Invalid indicator parameter value.
22011	A substring error occurred; for example, an argument of SUBSTR or SUBSTRING is out of range.
22012	Division by zero is invalid.
22014	Invalid argument for NTILE function.
22016	Invalid argument for NTH_VALUE function.
22018	The character value for a CAST specification or cast scalar function is invalid.
22019	The LIKE predicate has an invalid escape character.
2201R	The XML document is not valid.
22021	A character is not in the coded character set or the conversion is not supported.
22023	A parameter or variable value is invalid.
22024	A NUL-terminated input host variable or parameter did not contain a NUL.
22025	The LIKE predicate string pattern contains an invalid occurrence of an escape character.
22501	The length control field of a variable length string is negative or greater than the maximum.
22502	Signaling NaN was encountered.
22503	The string representation of a name is invalid.
22504	A mixed data value is invalid.
22505	The local date or time length has been increased, but the executing program relies on the old length.
22506	A reference to a datetime special register is invalid, because the clock is malfunctioning or the operating system time zone parameter is out of range.
22508	CURRENT PACKAGESET is blank.
22511	The value for a ROWID or reference column is not valid.
22512	A variable in a predicate is invalid, because its indicator variable is negative.
22522	A CCSID value is not valid at all, not valid for the data type or subtype, or not valid for the encoding scheme.
22525	Partitioning key value is not valid.
22527	Invalid input data detected for a multiple-row insert.
22528	Binary data is invalid for DECRYPT_CHAR and DECRYPT_DB.

Table 17. Class Code 22: Data Exception (continued)

SQLSTATE Value	Meaning
22529	A non-atomic statement successfully completed for at least one row, but one or more errors occurred.
22530	A non-atomic statement attempted to process multiple rows of data, but no row was inserted and one or more errors occurred.
22531	The argument of a built-in or system provided routine resulted in an error.
22532	An XSROBJECT is not found in the XML schema repository.
22533	A unique XSROBJECT could not be found in the XML schema repository.
22534	An XML schema document is not connected to the other XML schema documents using an include or redefine.
22537	A rowset FETCH statement returned one or more rows of data, with one or more non-terminating error conditions. Use GET DIAGNOSTICS for more information.
22539	Invalid use of extended indicator parameter value.
22541	The binary XML value contains unrecognized data.
22542	The INSERT or UPDATE is not allowed because a resulting row does not satisfy row permissions.
22544	The binary XML value contains a version that is not supported.
22546	The value for a routine argument is not valid.
22547	Multiple result values cannot be returned from the scalar function.
225DE	An XML schema cannot be enabled for decomposition.

Table 18. Class Code 23: Constraint Violation

SQLSTATE Value	Meaning
23502	An insert or update value is null, but the column cannot contain null values.
23503	The insert or update value of a foreign key is invalid.
23504	The update or delete of a parent key is prevented by a NO ACTION update or delete rule.
23505	A violation of the constraint imposed by a unique index or a unique constraint occurred.
23506	A violation of a constraint imposed by an edit or validation procedure occurred.
23507	A violation of a constraint imposed by a field procedure occurred.
23508	A violation of a constraint imposed by the DDL Registration Facility occurred.
23509	The owner of the package has constrained its use to environments which do not include that of the application process.
23510	A violation of a constraint on the use of the command imposed by the RLST table occurred.
23511	A parent row cannot be deleted, because the check constraint restricts the deletion.
23512	The check constraint cannot be added, because the table contains rows that do not satisfy the constraint definition.

<i>Table 18. Class Code 23: Constraint Violation (continued)</i>	
SQLSTATE Value	Meaning
23513	The resulting row of the INSERT or UPDATE does not conform to the check constraint definition.
23515	The unique index could not be created or unique constraint added, because the table contains duplicate values of the specified key.
23522	The range of values for the identity column or sequence is exhausted.
23523	An invalid value has been provided for the SECURITY LABEL column.
23525	A violation of a constraint imposed by an XML values index occurred.
23526	An XML values index could not be created because the table data contains values that violate a constraint imposed by the index.

<i>Table 19. Class Code 24: Invalid Cursor State</i>	
SQLSTATE Value	Meaning
24501	The identified cursor is not open.
24502	The cursor identified in an OPEN statement is already open.
24504	The cursor identified in the UPDATE, DELETE, SET, or GET statement is not positioned on a row.
24506	The statement identified in the PREPARE is the statement of an open cursor.
24510	An UPDATE or DELETE operation was attempted against a delete or update hole
24512	The result table does not agree with the base table.
24513	FETCH NEXT, PRIOR, CURRENT, or RELATIVE is not allowed, because the cursor position is not known.
24516	A cursor has already been assigned to a result set.
24517	A cursor was left open by a function or method.
24518	A cursor is not defined to handle row sets, but a rowset was requested.
24519	A hole was detected on a multiple-row FETCH statement, but indicator variables were not provided.
24520	The cursor identified in the UPDATE or DELETE statement is not positioned on a rowset.
24521	A positioned DELETE or UPDATE statement specified a row of a rowset, but the row is not contained within the current rowset.
24522	The fetch orientation is inconsistent with the definition of the cursor and whether rowsets are supported for the cursor.
24524	A FETCH CURRENT CONTINUE was requested, but there is no truncated LOB or XML data to return.

<i>Table 20. Class Code 25: Invalid Transaction State</i>	
SQLSTATE Value	Meaning
25000	An insert, update, or delete operation or procedure call is invalid in the context where it is specified.

<i>Table 21. Class Code 26: Invalid SQL Statement Identifier</i>	
SQLSTATE Value	Meaning
26501	The statement identified does not exist.

<i>Table 22. Class Code 2D: Invalid Transaction Termination</i>	
SQLSTATE Value	Meaning
2D521	SQL COMMIT or ROLLBACK are invalid in the current operating environment.
2D528	Dynamic COMMIT or COMMIT ON RETURN procedure is invalid for the application execution environment
2D529	Dynamic ROLLBACK is invalid for the application execution environment.

<i>Table 23. Class Code 34: Invalid Cursor Name</i>	
SQLSTATE Value	Meaning
34000	Cursor name is invalid.

<i>Table 24. Class Code 35: Invalid Condition Number</i>	
SQLSTATE Value	Meaning
35000	Condition number is invalid.

<i>Table 25. Class Code 36: Cursor Sensitivity Exception</i>	
SQLSTATE Value	Meaning
36001	A SENSITIVE cursor cannot be defined for the specified select-statement.

<i>Table 26. Class Code 38: External Function Exception</i>	
SQLSTATE Value	Meaning
XXXXX	Valid error SQLSTATES returned by an SQL routine. Also used for RAISE_ERROR and SIGNAL.
38xxx	Valid error SQLSTATES returned by an external routine or trigger.
38000	A Java routine has exited with an exception.
38001	The external routine is not allowed to execute SQL statements.
38002	The external routine attempted to modify data, but the routine was not defined as MODIFIES SQL DATA.

<i>Table 26. Class Code 38: External Function Exception (continued)</i>	
SQLSTATE Value	Meaning
38003	The statement is not allowed in a routine.
38004	The external routine attempted to read data, but the routine was not defined as READS SQL DATA.
38503	A user-defined function or procedure has abnormally terminated (abend).
38504	A routine, trigger, or anonymous block has been interrupted by the user.
38505	An SQL statement is not allowed in a routine on a FINAL CALL.
38H01	An MQSeries function failed to initialize.
38H02	MQSeries Application Messaging Interface failed to terminate the session.
38H03	MQSeries Application Messaging Interface failed to properly process a message.
38H04	MQSeries Application Messaging Interface failed in sending a message.
38H05	MQSeries Application Messaging Interface failed to read/receive a message.
38H06	An MQSeries Application Messaging Interface message was truncated.
38H10	Error occurred during text search processing.
38H11	Text search support is not available.
38H12	Text search is not allowed on a column because a text search index does not exist on the column.
38H13	A conflicting search administration procedure or command is running on the same text search index.
38H14	Text search administration procedure error.

<i>Table 27. Class Code 39: External Function Call Exception</i>	
SQLSTATE Value	Meaning
39004	A null value is not allowed for an IN or INOUT argument when using PARAMETER STYLE GENERAL or an argument that is a Java primitive type.
39501	An output argument value returned from a function or a procedure was too long.

<i>Table 28. Class Code 3B: Savepoint Exception</i>	
SQLSTATE Value	Meaning
3B001	The savepoint is not valid.
3B501	A duplicate savepoint name was detected.
3B502	A RELEASE or ROLLBACK TO SAVEPOINT was specified, but a savepoint does not exist.
3B503	A SAVEPOINT, RELEASE SAVEPOINT, or ROLLBACK TO SAVEPOINT is not allowed in a trigger, function, or global transaction.

<i>Table 29. Class Code 3C: Ambiguous Cursor Name</i>	
SQLSTATE Value	Meaning
3C000	The cursor name is ambiguous.

<i>Table 30. Class Code 40: Transaction Rollback</i>	
SQLSTATE Value	Meaning
40001	Deadlock or timeout with automatic rollback occurred.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation</i>	
SQLSTATE Value	Meaning
42501	The authorization ID does not have the privilege to perform the specified operation on the identified object.
42502	The authorization ID does not have the privilege to perform the operation as specified.
42503	The specified authorization ID or one of the authorization IDs of the application process is not allowed.
42504	A specified privilege, security label, or exemption cannot be revoked from a specified authorization-name.
42505	Connection authorization failure occurred.
42506	Owner authorization failure occurred.
42509	SQL statement is not authorized, because of the DYNAMICRULES option.
42510	The authorization ID does not have the privilege to create functions or procedures in the WLM environment.
42512	The authorization ID does not have security to the protected column.
42513	The authorization ID does not have the MLS WRITE-DOWN privilege.
42517	The specified authorization ID is not allowed to use the trusted context.
42601	A character, token, or clause is invalid or missing.
42602	A character that is invalid in a name has been detected.
42603	An unterminated string constant has been detected.
42604	An invalid numeric or string constant has been detected.
42605	The number of arguments specified for a scalar function is invalid.
42606	An invalid hexadecimal constant has been detected.
42607	An operand of an aggregate function or CONCAT operator is invalid.
42608	The use of NULL or DEFAULT in VALUES or an assignment statement is invalid.
42609	All operands of an operator or predicate are parameter markers.
42610	A parameter marker or the null value is not allowed.
42611	The column, argument, parameter, or global variable definition is invalid.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
42612	The statement string is an SQL statement that is not acceptable in the context in which it is presented.
42613	Clauses are mutually exclusive.
42614	A duplicate keyword or clause is invalid.
42615	An invalid alternative was detected.
42617	The statement string is blank or empty.
42618	A variable is not allowed.
42620	Read-only SCROLL was specified with the UPDATE clause.
42621	The check constraint or generated column expression is invalid.
42622	A name or label is too long.
42623	A DEFAULT clause cannot be specified.
42625	A CASE expression is invalid.
42626	A column specification is not allowed for a CREATE INDEX that is built on an auxiliary table.
42629	Parameter names must be specified for SQL routines.
42630	An SQLSTATE or SQLCODE variable is not valid in this context.
42631	An expression must be specified on a RETURN statement in an SQL function.
42633	An AS clause is required for an argument of XMLATTRIBUTES or XMLFOREST.
42634	The XML name is not valid.
42701	The same target is specified more than once for assignment in the same SQL statement.
42702	A column reference is ambiguous, because of duplicate names.
42703	An undefined column or parameter name was detected.
42704	An undefined object or constraint name was detected.
42705	An undefined server-name was detected.
42707	A column name in ORDER BY does not identify a column of the result table.
42708	The locale specified in a SET LOCALE or locale sensitive function was not found.
42709	A duplicate column name was specified in a key column list.
42710	A duplicate object or constraint name was detected.
42711	A duplicate column name was detected in the object definition or ALTER TABLE statement.
42712	A duplicate table designator was detected in the FROM clause or REFERENCING clause of a CREATE TRIGGER statement.
42713	A duplicate object was detected in a list or is the same as an existing object.
42714	A host variable can be defined only once.
42718	The local server name is not defined.
42721	The special register name is unknown at the server.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
42723	A routine with the same signature already exists in the schema, module, or compound block where it is defined.
42724	Unable to access an external program used for a user-defined function or a procedure.
42725	A routine was referenced directly (not by either signature or by specific instance name) or by both signature and specific instance name, but there is more than one specific instance of that routine.
42726	Duplicate names for common table expressions were detected.
42732	A duplicate schema name in a special register was detected.
42734	A duplicate parameter-name, SQL variable name, label, or condition-name was detected.
42736	The label specified on the GOTO, ITERATE, or LEAVE statement is not found or not valid.
42737	The condition specified is not defined.
42749	An XML schema document with the same target namespace and schema location already exists for the XML schema.
4274A	An XSROBJECT is not found in the XML schema repository.
4274B	A unique XSROBJECT could not be found in the XML schema repository.
4274C	The specified attribute was not found in the trusted context.
4274D	The specified attribute already exists in the trusted context.
4274E	The specified attribute is not supported in the trusted context.
4274M	An undefined period name was detected.
42801	Isolation level UR is invalid, because the result table is not read-only.
42802	The number of target values is not the same as the number of source values.
42803	A column reference in the SELECT or HAVING clause is invalid, because it is not a grouping column; or a column reference in the GROUP BY clause is invalid.
42804	The result expressions in a CASE expression are not compatible.
42805	An integer in the ORDER BY clause does not identify a column of the result table.
42806	A value cannot be assigned to a variable, because the data types are not compatible.
42807	The data-change statement is not permitted on this object.
42808	A column identified in the INSERT or UPDATE operation is not updatable.
42809	The identified object is not the type of object to which the statement applies.
42810	A base table is not identified in a FOREIGN KEY clause.
42811	The number of columns specified is not the same as the number of columns in the SELECT clause.
42813	WITH CHECK OPTION cannot be used for the specified view.
42814	The column cannot be dropped, because it is the only column in the table.
42815	The data type, length, scale, value, or CCSID is invalid.
42816	A datetime value or duration in an expression is invalid.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
42817	The column cannot be dropped because a view or constraint is dependent on the column, the column is part of a partitioning key, or the column is a security label column.
42818	The operands of an operator or function are not compatible or comparable.
42819	An operand of an arithmetic operation or an operand of a function that requires a number is invalid.
42820	A numeric constant is too long, or it has a value that is not within the range of its data type.
42821	A data type for an assignment to a column or variable is not compatible with the data type.
42822	An expression in the ORDER BY clause or GROUP BY clause is not valid.
42823	Multiple columns are returned from a subquery that only allows one column.
42824	An operand of LIKE is not a string, or the first operand is not a column.
42825	The rows of UNION, INTERSECT, EXCEPT, or VALUES do not have compatible columns.
42826	The rows of UNION, INTERSECT, EXCEPT, or VALUES do not have the same number of columns.
42827	The table identified in the UPDATE or DELETE is not the same table designated by the cursor.
42828	The table designated by the cursor of the UPDATE or DELETE statement cannot be modified, or the cursor is read-only.
42829	FOR UPDATE OF is invalid, because the result table designated by the cursor cannot be modified.
42830	The foreign key does not conform to the description of the parent key.
42831	Null values are not allowed in a column of a primary key, a column of a unique key, a ROWID column, a row change timestamp column, a row-begin column, a row-end column, or a column of an application period.
42832	The operation is not allowed on system objects.
42834	SET NULL cannot be specified, because no column of the foreign key can be assigned the null value.
42835	Cyclic references cannot be specified between named derived tables.
42836	The specification of a recursive, named derived table is invalid.
42837	The column cannot be altered, because its attributes are not compatible with the current column attributes.
42842	A column or parameter definition is invalid, because a specified option is inconsistent with the column description.
42845	An invalid use of a NOT DETERMINISTIC or EXTERNAL ACTION function was detected.
42846	Cast from source type to target type is not supported.
42849	The specified option is not supported for the routine type.
42852	The privileges specified in GRANT or REVOKE are invalid or inconsistent. (For example, GRANT ALTER on a view.)
42855	The assignment of the LOB or XML to this variable is not allowed. The target variable for all fetches of a LOB or XML value for this cursor must be the same for all FETCHes.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
42856	The alter of a CCSID to the specified CCSID is not valid.
42866	The data type in either the RETURNS clause or the CAST FROM clause in the CREATE FUNCTION statement is not appropriate for the data type returned from the sourced function or RETURN statement in the function body.
42872	FETCH statement clauses are incompatible with the cursor definition.
42873	An invalid number of rows was specified in a multiple-row FETCH or multiple-row INSERT.
42877	The column name cannot be qualified.
42878	An invalid function or procedure name was used with the EXTERNAL keyword.
42879	The data type of one or more input parameters in the CREATE FUNCTION statement is not appropriate for the corresponding data type in the source function.
42880	The CAST TO and CAST FROM data types are incompatible, or would always result in truncation of a fixed string.
42882	The specific instance name qualifier is not equal to the function name qualifier.
42883	No routine was found with a matching signature.
42884	No routine was found with the specified name and compatible arguments.
42885	The number of input parameters specified on a CREATE FUNCTION statement does not match the number provided by the function named in the SOURCE clause.
42886	The IN, OUT, or INOUT parameter attributes do not match.
42887	The function or table-reference is not valid in the context where it occurs.
42888	The table does not have a primary key.
42889	The table already has a primary key.
42890	A column list was specified in the references clause, but the identified parent table does not have a unique constraint with the specified column names.
42891	A duplicate constraint already exists.
42893	The object or constraint cannot be dropped, altered, or transferred or authorities cannot be revoked from the object, because other objects are dependent on it.
42894	The value of a column or sequence attribute is invalid.
42895	For static SQL, an input variable cannot be used, because its data type is not compatible with the parameter of a procedure or user-defined function.
42898	An invalid correlated reference or transition table was detected in a trigger.
42899	Correlated references and column names are not allowed for triggered actions with the FOR EACH STATEMENT clause.
428A1	Unable to access a file referenced by a file reference variable.
428B0	Nesting not valid in ROLLUP, CUBE, or GROUPING SETs.
428B3	An invalid SQLSTATE was specified.
428B4	The part clause of a LOCK TABLE statement is not valid.
428B7	A number specified in an SQL statement is out of the valid range.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
428C1	The data type or attribute of a column can only be specified once for a table.
428C2	Examination of the function body indicates that the given clause should have been specified on the CREATE FUNCTION statement.
428C4	The number of elements on each side of the predicate operator is not the same.
428C7	A ROWID or reference column specification is not valid or used in an invalid context.
428C9	A column defined as GENERATED ALWAYS cannot be specified as the target column of an insert or update operation.
428D2	AS LOCATOR cannot be specified for a non-LOB parameter.
428D3	GENERATED is not allowed for the specified data type or attribute of a column.
428D4	A cursor specified in a FOR statement cannot be referenced in an OPEN, CLOSE, or FETCH statement.
428D5	The ending label does not match the beginning label.
428D6	UNDO is not allowed for NOT ATOMIC compound statements.
428D7	The condition value is not allowed.
428D8	The sqlcode or sqlstate variable declaration is not valid.
428EC	The fullselect specified for the materialized query table is not valid.
428EK	The schema qualifier is not valid.
428EW	The table cannot be converted to or from a materialized query table.
428F2	An integer expression must be specified on a RETURN statement in an SQL procedure.
428F4	The SENSITIVITY specified on FETCH is not allowed for the cursor.
428F5	The invocation of a routine is ambiguous.
428F9	A sequence expression cannot be specified in this context.
428FA	The scale of the decimal number must be zero.
428FB	Sequence-name must not be a sequence generated by the system.
428FC	The length of the encryption password is not valid.
428FE	The data is not a result of the ENCRYPT function.
428FJ	ORDER BY or FETCH FIRST is not allowed in the outer fullselect of a view or materialized query table.
428FL	A data change statement is not allowed in the context in which it was specified.
428FM	An SQL data change statement within a SELECT specified a view which is not a symmetric view.
428FP	Only one INSTEAD OF trigger is allowed for each kind of operation on a view.
428FQ	An INSTEAD OF trigger cannot be created because of how the view is defined.
428FR	A column cannot be altered as specified.
428FS	A column cannot be added to an index.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
428FT	The partitioning clause specified on CREATE or ALTER is not valid.
428FY	A column cannot be added, dropped, or altered in a materialized query table.
428G3	FINAL TABLE is not valid when the target view of the SQL data change statement in a fullselect has an INSTEAD OF trigger defined.
428G4	Invalid use of INPUT SEQUENCE ordering.
428G5	The assignment clause of the UPDATE statement must specify at least one column that is not an INCLUDE column.
428G8	The view cannot be enabled for query optimization.
428GB	A character could not be converted and substitution characters are not allowed.
428GC	An invalid string unit was specified for a function.
428GH	The data type of one or more parameters specified in the ADD VERSION clause does not match the corresponding data type in the routine being altered.
428GI	An XML schema is not complete because an XML schema document is missing.
428GJ	The table cannot be truncated because DELETE triggers exist for the table or the table is a parent table of a referential constraint that would be affected by the statement.
428GK	An ALTER TRUSTED CONTEXT attempted to remove one or more of the minimum required attributes.
428GL	The system authorization ID specified for a trusted context is already specified in another trusted context.
428GM	The trusted context is already defined to be used by this authorization ID or PUBLIC.
428GN	The specified authorization ID or PUBLIC is not defined in the specified trusted context.
428GU	A table must include at least one column that is not implicitly hidden.
428H2	Data type is not supported in the context where it is being used.
428H7	Expression cannot be computed as a single value for the query.
428H8	The object must be defined as secure because another object depends on it for row-level or column-level access control.
428H9	PERMISSION or MASK cannot be altered.
428HA	An argument of a user-defined function must not reference a column for which a column mask is defined.
428HB	A permission or mask cannot be created on the specified object.
428HC	A column mask is already defined for the specified column.
428HD	The statement cannot be processed because a column mask cannot be applied or the definition of the mask conflicts with the statement.
428HJ	The organization clause specified on CREATE or ALTER is not valid.
428HK	The specified hash space is not valid for the implicitly created table space.
428HL	Another version of the routine exists and is defined with an incompatible option.
428HM	The table cannot be used as a system-period temporal table or an archive-enabled table.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
428HN	The period specification is not valid.
428HW	The period specification or period clause in an index or constraint is not valid.
428HX	The table is not valid for a history table or archive table.
428HY	The period specification or period condition is not valid.
428HZ	The temporal attribute of the table was not valid for the specified ALTER operation.
428I1	The columns updated by the XMLMODIFY function were not specified in the UPDATE SET clause.
428I4	The combination of UNNEST arguments are not valid.
428I5	The attributes of an object at one location do not match the attributes of the same object at another location.
428I6	The archive enabled table is not allowed in this context.
428IC	Invalid combination of replication overrides for data change operation
428ID	Model columns specified in an AI-Db function could not be determined or are not usable
42902	The object of the INSERT, UPDATE, or DELETE is also identified (possibly implicitly through a view) in a FROM clause.
42903	Invalid use of an aggregate function or OLAP function.
42905	DISTINCT is specified more than once in a subselect.
42906	An aggregate function in a subquery of a HAVING clause includes an expression that applies an operator to a correlated reference.
42907	The string is too long in the context it was specified.
42908	Column list not valid.
42909	CREATE VIEW includes an operator or operand that is not valid for views.
42911	A decimal divide operation is invalid, because the result would have a negative scale.
42912	A column cannot be updated, because it is not identified in the UPDATE clause of the select-statement of the cursor.
42914	The DELETE is invalid, because a table referenced in a subquery can be affected by the operation.
42915	An invalid referential constraint has been detected.
42917	The object cannot be explicitly dropped, altered, or replaced.
42918	A user-defined data type cannot be created with a system-defined data type name (for example, INTEGER).
42924	An alias resolved to another alias rather than a table or view at the remote location.
42925	Recursive named derived tables cannot specify SELECT DISTINCT and must specify UNION ALL.
42927	The function cannot be altered to NOT DETERMINISTIC or EXTERNAL ACTION because it is referenced by one or more existing views.
42932	The program preparation assumptions are incorrect.

<i>Table 31. Class Code 42: Syntax Error or Access Rule Violation (continued)</i>	
SQLSTATE Value	Meaning
42939	The name cannot be used, because the specified identifier is reserved for system use.
42945	ALTER CCSID is not allowed on a table space or database that contains a view.
42961	The server name specified does not match the current server.
42962	The column type is not allowed in an index, a key, generated column, or a constraint.
42963	Invalid specification of a security label column.
42969	The package was not created.
42972	An expression in a join-condition or ON clause of a MERGE statement references columns in more than one of the operand tables.
42986	The source table of a rename operation is referenced in a context where it is not supported.
42987	The statement or routine is not allowed in a trigger.
42988	The operation is not allowed with mixed ASCII data.
42993	The column, as defined, is too large to be logged.
42995	The requested function does not apply to global temporary tables.
42996	A specified column may not be used in a partition key.
42997	Capability is not supported by this version of the Db2 application requester, Db2 application server, or the combination of the two.
429B1	A procedure specifying COMMIT ON RETURN cannot be the target of a nested CALL statement.
429BB	The data type of a column, parameter, or SQL variable is not supported.
429BD	RETURN must be the last SQL statement of the atomic compound statement within an SQL row or table function.
429BI	The condition area is full and cannot handle more errors for a NOT ATOMIC statement.
429BN	A CREATE statement cannot be processed when the value of CURRENT SCHEMA differs from CURRENT SQLID.
429BQ	The specified alter of the data type or attribute is not allowed.
429BS	Invalid index definition involving an XMLPATTERN clause or a column defined with a data type of XML.
429BV	Invalid specification of a ROW CHANGE TIMESTAMP column.
429BW	The statement cannot be processed due to related implicitly created objects.
429BX	The expression for an index key is not valid.
429BY	The statement is not allowed when using a trusted connection.
429C1	A data type cannot be determined for an untyped expression.
429CB	The attributes of the table or column are not supported for the table type.

<i>Table 32. Class Code 44: WITH CHECK OPTION Violation</i>	
SQLSTATE Value	Meaning
44000	The INSERT or UPDATE is not allowed, because a resulting row does not satisfy the view definition.

<i>Table 33. Class Code 46: Java Errors</i>	
SQLSTATE Value	Meaning
46001	The URL specified on an install or replace of a jar procedure did not identify a valid jar file.
46002	The jar name specified on the install, replace, or remove of a Java procedure is not valid.
46003	The jar file cannot be removed, a class is in use by a procedure.
46007	A Java function has a Java method with an invalid signature.
46008	A Java function could not map to a single Java method.
4600C	The jar cannot be removed. It is in use.
4600D	The value provided for the new Java path is invalid.
4600E	The alter of the jar failed because the specified path references itself.
46103	A Java routine encountered a ClassNotFoundException exception.
46501	The install or remove jar procedure specified the use of a deployment descriptor.
46502	A user-defined procedure has returned a DYNAMIC RESULT SET of an invalid class. The parameter is not a Db2 result set.

<i>Table 34. Class Code 51: Invalid Application State</i>	
SQLSTATE Value	Meaning
51002	The package corresponding to an SQL statement execution request was not found.
51003	Consistency tokens do not match.
51004	An address in the SQLDA is invalid.
51005	The previous system error has disabled this function.
51006	A valid connection has not been established.
51008	The release number of the program or package is not valid.
51015	An attempt was made to execute a section that was found to be in error at bind time.
51021	SQL statements cannot be executed until the application process executes a rollback operation.
51024	An object cannot be used, because it has been marked inoperative.
51030	The procedure referenced in a DESCRIBE PROCEDURE or ASSOCIATE LOCATOR statement has not yet been called within the application process.
51032	A valid CCSID has not yet been specified for this Db2 for z/OS subsystem.
51033	The operation is not allowed because it operates on a result set that was not created by the current server.

<i>Table 34. Class Code 51: Invalid Application State (continued)</i>	
SQLSTATE Value	Meaning
51034	The routine defined with MODIFIES SQL DATA is not valid in the context in which it is invoked.
51035	A PREVIOUS VALUE expression cannot be used because a value has not been generated for the sequence yet in this session.
51036	An implicit connect to a remote server is not allowed because a savepoint is outstanding.
51039	The ENCRYPTION PASSWORD value is not set.
51043	Procedure cannot be called because the nested environment already called an autonomous procedure.

<i>Table 35. Class Code 53: Invalid Operand or Inconsistent Specification</i>	
SQLSTATE Value	Meaning
53001	A clause is invalid, because the table space is a workfile.
53004	DSNDB07 is the implicit workfile database.
53014	The specified OBID is invalid.
53022	Variable or parameter is not allowed.
53035	Key limits must be specified in the CREATE or ALTER INDEX statement.
53036	The number of PARTITION specifications is not the same as the number of partitions.
53037	A partitioned index cannot be created on a table.
53038	The number of key limit values is zero or greater than the number of columns in the key.
53039	The PARTITION clause of the ALTER statement is omitted or invalid.
53040	The buffer pool cannot be changed as specified.
53041	The page size of the buffer pool is invalid.
53043	Columns with different field procedures cannot be compared.
53044	The columns have a field procedure, but the field types are not compatible.
53045	The data type of the key limit constant is not the same as the data type of the column.
53088	LOCKMAX is inconsistent with the specified LOCKSIZE.
53089	The number of variable parameters for a stored procedure is not equal to the number of expected variable parameters.
53090	Only data from one encoding scheme, either ASCII, EBCDIC or Unicode, can be referenced in the same SQL statement.
53091	The encoding scheme specified is not the same as the encoding scheme currently in use for the containing table space.
53092	Type 1 index cannot be created for a table using the ASCII encoding scheme.
53093	The CCSID ASCII or UNICODE clause is not supported for this database or table space.
53094	The PLAN_TABLE cannot be created with the FOR ASCII clause.
53095	CREATE or ALTER statement cannot define an object with the specified encoding scheme.

<i>Table 35. Class Code 53: Invalid Operand or Inconsistent Specification (continued)</i>	
SQLSTATE Value	Meaning
53096	The PARTITION clause was specified on CREATE AUXILIARY TABLE, but the base table is not partitioned.
53098	The auxiliary table cannot be created because a column was specified that is not a LOB column.
53099	A WLM ENVIRONMENT name must be specified on the CREATE FUNCTION statement.
530A1	An ALTER TABLE statement specified FLOAT as the new data type for a column, but there is an existing index or constraint that restricts the use of FLOAT.
530A2	The PARTITIONING clause is not allowed on the specified index.
530A3	Invalid specification for routine specified
530A4	The options specified on ALTER statement are not the same as those specified when the object was created.
530A5	The REGENERATE option is only valid for an index with key expressions.
530A7	EXCHANGE DATA is not allowed because the tables do not have a defined clone relationship.
530A8	A system parameter is incompatible with the specified SQL statement.
530A9	A temporal table is not allowed in this context.

<i>Table 36. Class Code 54: SQL or Product Limit Exceeded</i>	
SQLSTATE Value	Meaning
54001	The statement is too long or too complex.
54002	A string constant is too long.
54004	The statement has too many table names or too many items in a SELECT or INSERT list.
54005	The sort key is too long, or has too many columns.
54006	The result string is too long.
54008	The key is too long, a column of the key is too long, or the key has too many columns.
54010	The record length of the table is too long.
54011	Too many columns were specified for a table, view, or table function.
54012	The literal is too long.
54024	The check constraint, generated column, or key expression is too long.
54025	The table description exceeds the maximum size of the object descriptor.
54027	The catalog has the maximum number of user-defined indexes.
54035	An internal object limit exceeded.
54038	Maximum depth of nested routines or triggers was exceeded.
54041	The maximum number of internal identifiers has been reached.
54042	Only one index is allowed on an auxiliary table.
54051	Value specified on FETCH ABSOLUTE or RELATIVE is invalid.

<i>Table 36. Class Code 54: SQL or Product Limit Exceeded (continued)</i>	
SQLSTATE Value	Meaning
54054	The number of partitions is exceeded.
54055	The maximum number of versions has been reached for a table or index.
54058	The internal representation of an XML path is too long.
54065	The maximum of 99999 implicitly generated object names has been exceeded.
54068	Seamless automatic client reroute retry limit exceeded.

<i>Table 37. Class Code 55: Object Not in Prerequisite State</i>	
SQLSTATE Value	Meaning
55002	The explanation table is not defined properly.
55003	The DDL registration table is not defined properly.
55004	The database cannot be accessed, because it is no longer a shared database.
55006	The object cannot be dropped, because it is currently in use by the same application process.
55007	The object cannot be altered, because it is currently in use by the same application process.
55011	The operation is disallowed, because the workfile database is not in the stopped state.
55012	A clustering index is not valid on the table.
55014	The table does not have an index to enforce the uniqueness of the primary key.
55015	The ALTER statement cannot be executed, because the pageset is not in the stopped state.
55016	The ALTER statement is invalid, because the pageset has user-managed data sets.
55017	The table cannot be created in the table space, because it already contains a table.
55019	The object is in an invalid state for the operation.
55020	A work file database is already defined for the member.
55023	An error occurred calling a procedure.
55030	A package specified in a remote BIND REPLACE operation must not have a system list.
55035	The object cannot be dropped because it is protected.
55048	Encrypted data cannot be encrypted.
55058	The DEBUG MODE cannot be changed for a routine that was created with DISABLE DEBUG MODE.
55059	The currently active version for a routine cannot be dropped.
55063	The XML schema is not in the correct state for the operation.
55078	The table is already in the specified state.
55079	The operation cannot be performed because the XML column is not in the versioning format.

Table 38. Class Code 56: Miscellaneous SQL or Product Error

SQLSTATE Value	Meaning
56010	The subtype of a string variable is not the same as the subtype at bind time, and the difference cannot be resolved by character conversion.
56016	The ranges specified for data partitions are not valid.
56018	A column cannot be added to the table, because it has an edit procedure.
56023	An invalid reference to a remote object has been detected.
56025	An invalid use of AT ALL LOCATIONS in GRANT or REVOKE has been detected.
56027	A nullable column of a foreign key with a delete rule of SET NULL cannot be part of the key of a partitioned index.
56031	The clause or scalar function is invalid, because mixed and DBCS data are not supported on this system.
56036	Specific and non-specific volume IDs are not allowed in a storage group.
56038	The requested feature is not supported in this environment.
56040	CURRENT SQLID cannot be used in a statement that references remote objects.
56045	The application must issue a rollback operation to back out the change that was made at the read-only application server.
56052	The remote requester tried to bind, rebind, or free a trigger package.
56053	The parent of a table in a read-only shared database must also be a table in a read-only shared database.
56054	User-defined data sets for objects in a shared database must be defined with SHAREOPTIONS(1,3).
56055	The database is defined as SHARE READ, but the table space or indexspace has not been defined on the owning system.
56056	The description of an object in a SHARE READ database must be consistent with its description in the OWNER system.
56057	A database cannot be altered from SHARE READ to SHARE OWNER.
56059	An error occurred when binding a triggered SQL statement.
56060	An LE function failed.
56062	A distributed operation is invalid, because the unit of work was started before DDF.
56064	The bind operation is disallowed, because the program depends on functions of a release from which fallback has occurred.
56065	The bind operation is disallowed, because the DBRM has been modified or was created for a different release.
56066	The rebind operation is disallowed, because the plan or package depends on functions of a release from which fallback has occurred.
56067	The rebind operation is disallowed, because the value of SYSPACKAGE.IBMREQD is invalid.
56072	Execution failed due to the function not supported by a downlevel server that will not affect the execution of subsequent SQL statements.

<i>Table 38. Class Code 56: Miscellaneous SQL or Product Error (continued)</i>	
SQLSTATE Value	Meaning
56073	Execution failed due to the function not supported by a downlevel server that will affect the execution of subsequent SQL statements.
56080	The data type is not allowed in Db2 private protocol processing.
56084	An unsupported SQLTYPE was encountered in a select list or input list.
56088	ALTER FUNCTION failed because functions cannot modify data when they are processed in parallel.
56089	Specified option requires type 2 indexes.
56090	The alter of an index or table is not allowed.
56095	A bind option is invalid.
56096	Bind options are incompatible.
560A1	The table space name is not valid.
560A2	A LOB table and its associated base table space must be in the same database.
560A3	The table is not compatible with the database.
560A4	The operation is not allowed on an auxiliary table.
560A5	An auxiliary table already exists for the specified column or partition.
560A6	A table cannot have a LOB column unless it also has a ROWID column or cannot have an XML column unless it also has a DOCID.
560A7	GBPCACHE NONE cannot be specified for a table space or index in GRECP.
560A8	An 8K or 16K buffer pool pagesize is invalid for a WORKFILE object.
560A9	A discontinued parameter, option, or clause was specified.
560AB	The data type is not supported in an SQL routine.
560AD	A view name was specified after LIKE in addition to the INCLUDING IDENTITY COLUMN ATTRIBUTES clause.
560AE	The specified table or view is not allowed in a LIKE clause.
560B1	Procedure failed because a result set was scrollable but the cursor was not positioned before the first row.
560B2	Open failed because the cursor is scrollable but the client does not support scrollable cursors.
560B3	Procedure failed because one or more result sets cannot be returned by the procedure to the calling application.
560B5	Local special register is not valid as used.
560B8	The SQL statement cannot be executed because it was precompiled at a level that is incompatible with the current value of the ENCODING bind option or special register.
560B9	Hexadecimal constant GX is not allowed.
560BF	The cryptographic facility has not been installed.
560C3	An AFTER trigger cannot modify a row being inserted for an INSERT statement.

<i>Table 38. Class Code 56: Miscellaneous SQL or Product Error (continued)</i>	
SQLSTATE Value	Meaning
560C5	The package must be bound or rebound to be successfully executed.
560C7	ALTER VIEW failed.
560CC	ALTER INDEX failed.
560CG	An XML value contains a combination of XML nodes that causes an internal identifier limit to be exceeded.
560CH	The maximum number of children nodes for an XML node in an XML value is exceeded.to be exceeded.
560CK	Explain monitored statements failed.
560CM	An error occurred in a key expression evaluation.
560CU	The VARCHAR option is not consistent with the option specified when the procedure was created.
560CV	Invalid table reference for table locator.
560CY	A period specification or period clause is not valid as specified.
560D5	The statement cannot be executed by the query accelerator.
560DC	An error was detected while using the z/OS Unicode Services.

<i>Table 39. Class Code 57: Resource Not Available or Operator Intervention</i>	
SQLSTATE Value	Meaning
57001	The table is unavailable, because it does not have a primary index.
57002	GRANT and REVOKE are invalid, because authorization has been disabled.
57003	The specified buffer pool has not been activated.
57004	The table is unavailable, because it lacks a partitioned index.
57005	The statement cannot be executed, because a utility or a query limit or threshold was exceeded.
57006	The object cannot be created, because a DROP or CREATE is pending.
57007	The object cannot be used, because an operation is pending.
57008	The date or time local format exit has not been installed.
57010	A field procedure could not be loaded.
57011	Virtual storage or database resource is not available.
57012	A non-database resource is not available. This will not affect the successful execution of subsequent statements.
57013	A non-database resource is not available. This will affect the successful execution of subsequent statements.
57014	Processing was canceled as requested.
57015	Connection to the local Db2 not established.
57017	Character conversion is not defined.

<i>Table 39. Class Code 57: Resource Not Available or Operator Intervention (continued)</i>	
SQLSTATE Value	Meaning
57018	A DDL registration table or its unique index does not exist.
57023	The DDL statement cannot be executed, because a DROP is pending of a DDL registration table.
57033	Deadlock or timeout occurred without automatic rollback.
57051	The estimated CPU cost exceeds the resource limit.
57053	A table is not available in a routine or trigger because of violated nested SQL statement rules.
57054	A table is not available until the auxiliary tables and indexes for its externally stored columns have been created.
57057	The SQL statement cannot be executed due to a prior condition in a DRDA chain of SQL statements.
57062	Adjustment not allowed for a period as a result of a data change operation.

<i>Table 40. Class Code 58: System Error</i>	
SQLSTATE Value	Meaning
XXXXX	Valid error SQLSTATEs returned from user application, including a user exit program.
58001	The database cannot be created, because the assigned DBID is a duplicate.
58002	An exit has returned an error or invalid data.
58003	An invalid section number was detected.
58004	A system error (that does not necessarily preclude the successful execution of subsequent SQL statements) occurred.
58006	A system error occurred during connection.
58008	Execution failed due to a distribution protocol error that will not affect the successful execution of subsequent DDM commands or SQL statements.
58009	Execution failed due to a distribution protocol error that caused deallocation of the conversation.
58010	Execution failed due to a distribution protocol error that will affect the successful execution of subsequent DDM commands or SQL statements.
58011	The DDM command is invalid while the bind process in progress.
58012	The bind process with the specified package name and consistency token is not active.
58013	The SQLCODE is inconsistent with the reply message.
58014	The DDM command is not supported.
58015	The DDM object is not supported.
58016	The DDM parameter is not supported.
58017	The DDM parameter value is not supported.
58018	The DDM reply message is not supported.

<i>Table 40. Class Code 58: System Error (continued)</i>	
SQLSTATE Value	Meaning
58026	The number of variables in the statement is not equal to the number of variables in SQLSTTVRB.

<i>Table 41. Class Code 5UA: Common Utilities and Tools</i>	
SQLSTATE Value	Meaning
5UA01	The task cannot be removed because it is currently executing.

Appendix E. Db2 abend completion codes (X'04E' and X'04F')

X'04E' and X'04F' system abend completion codes identify internal errors encountered during Db2 operation, diagnostic information for problem determination, and subsystem actions initiated by the Db2 subcomponent involved in the error.

An X'04E' abend completion code indicates that Db2 detected an internal error and abended a Db2 internal task (TCB) or a user-connected task. Errors associated with an X'04E' abend completion code might be preceded by an MVS system code or by internal errors. The diagnostic material generated by the X'04E' abend must be examined to determine the source of the error that actually resulted in a subsequent task or subsystem termination.

An X'04F' abend completion code indicates that Db2 detected a severe error and abended the entire Db2 subsystem. When an X'04F' is issued, Db2 determined that continued operation could result in the loss of data integrity. Errors associated with an X'04F' abend completion code might be preceded by an MVS system error or by one or more Db2 X'04E' abend completion codes.

The following table summarizes the diagnostic information and subsystem actions available to Db2 when these abend completion codes are issued. Some pieces of this information are not relevant to some error situations and will not help in problem diagnosis. In these cases, Db2 does not produce any diagnostic information that is unnecessary. The information that Db2 produces for a given error depends upon the specific problem. The MVS services that provide diagnostic information are discussed in [z/OS diagnostic services \(Db2 Messages\)](#)

Table 42. Abend completion codes

	X'04E'	X'04F'
Explanation	Error during Db2 normal operation	Severe error; continued operation may jeopardize data integrity
System action	- Internal Db2 task is abended - Connected user task is abended	- The entire Db2 subsystem is abended - User task with an active Db2 connection may be abnormally terminated with an X'04F' - Possible MEMTERM (memory termination) of connected allied address space
Diagnostic information	- SVC dump - SYS1.LOGREC entries - VRA data entries	- SYS1.LOGREC entries - VRA data entries
Associated reason codes	- Db2 abend reason code - Associated MVS system codes	- Subsystem termination reason code - MVS system completion codes and X'04E' codes that precede the X'04F' abend

Table 42. Abend completion codes (continued)

	X'04E'	X'04F'
Location of accompanying codes	• SVC dump title • Message DSNW050I • Register 15 of SDWA section "General Purpose Registers at Time of Error" • SYS1.LOGREC entries • VRA data entries	• SYS1.LOGREC entries • VRA data entries • Message DSNV086E, which is sent to MVS system operator

Appendix F. Resource types for messages and codes in Db2 for z/OS

Various messages, reason codes, and SQL codes in Db2 for z/OS include type codes that identify particular types of resources. In some cases, specific resource names are also identified.

The following table describes the type of resource associated with each type code. The abbreviations in the "Name, Content, Format" column are explained in [Table 44 on page 1396](#).

Table 43. Resource Types

TYPE Code	Type of Resource	Name, Content, Format
00000100	Database	DB
00000200	Table space	DB.SP
00000201	Index space	DB.SP
00000202	Table space	RD.DB.TS
00000205	Compression Dictionary	DB.SP
00000210	Partition	DB.SP.PT
00000220	Data set	DSN
00000230	Temporary file	SZ
00000240	Database procedure	DBP
00000300	Page	DB.SP.PT.PG
00000301	Index minipage	DB.SP.PG.MP
00000302	Table space page	DB.SP.PG
00000303	Index space page	DB.SP.PG
00000304	Table space RID	DB.SP.RID
00000305	Index access/table space RID	DB.SP.RID
00000306	Index access/table space page	DB.SP.PG
00000307	Index space EOF	DB.SP.01
00000308	Table space page	DB.SP.PT.PG
00000309	Index space page	DB.SP.PT.PG
0000030A	Table space RID	DB.SP.PT.RID
00000400	ICF catalog	IC
00000401	Authorization function	
00000402	Security Server	SAF/RACF return/reason codes
00000500	Storage group	SG
00000602	EDM DBD Space	
00000603	EDM DYNAMIC STATEMENT Space	

Table 43. Resource Types (continued)

TYPE Code	Type of Resource	Name, Content, Format
00000604	EDM skeleton storage	
00000605	EDM above-the-bar storage	
00000606	EDM below-the-bar storage	
00000700	Buffer pool space	BP
00000701	Group buffer pool	GBP
00000800	Plan	PL
00000801	Package	COLLECTION.PACKAGE.- CONTOKEN
00000802	BINDLOCK01 through BINDLOCK20	BINDLOCK01 through BINDLOCK20
00000803	Package and thread	COLLECTION.PACKAGE.- CONTOKEN.THREADTOKEN.- MEMBERNAME
00000804	Package	COLLECTION.PACKAGE. (VERSION)
00000805	Collection	COLLECTION
00000900	32KB data area	
00000901	Sort storage	
00000903	Hash anchor	DB.SP.PG.AI
00000904	RIDLIST storage	
00000905	IRLM storage	
00000906	Db2	MEMBER
00000907	LOB storage	
00000908	Basic Floating Point Extensions Facility	
00000909	Extended Time-of-Day (TOD) Clock	
0000090A	XML storage	
00000A00	Table	RD.CR.TB
00000A10	Alias	RELDEP. OWNER. ALIAS. RD.CR.AL
00000A11	Distinct type	SC.DT
00000A12	User-defined function	SC.SN
00000A13	Stored procedure	SC.SN
00000A14	Sequence	
00000A16	Role	
00000A17	Trigger	

Table 43. Resource Types (continued)

TYPE Code	Type of Resource	Name, Content, Format
00000A20	Session variable	
00000B00	View	RD.CR.VW
00000C00	Index	RD.CR.IX
00000C01	Index	CR.IX
00000D00	DBID/OBID	RD.DI.OI
00000D01	DBID/OBID	DI.OI
00000D02	OBID	OI
00000E00	SU limit exceeded	CN
00000F00	Auxiliary column	DI.OI. ROWID. COLN or DI.OI. DOCID. COLN
00000F01	LOB lock	DIX.PIX. ROWID. VRSN
00000F81	XML lock	DIX.PIX. DOCID
00001000	DDF	LOCATION or SUBSYSTEM ID
00001001	System conversation	LU.MODE. RTNCD. FDBK2. RCPRI. RCSEC. SENSE
00001002	Agent conversation	LU.MODE. RTNCD. FDBK2. RCPRI. RCSEC. SENSE
00001003	CNOS processing	LU. MODE. RTNCD. FDBK2. RCPRI. RCSEC. SENSE
00001004	CDB (Communication database)	LOCATION. AUTHORIZATION ID. PL
00001005	DB access agent	LOCATION
00001006	DRDA-related error	
00001007	TCP/IP domain name	LINKNAME. DOMAIN. ERRNO
00001008	TCP/IP service name	LOCATION. SERVICE. ERRNO
00001080	ACCEL	SERVER.DOMAIN
00001102	Bootstrap data set (BSDS)	MEMBER
00001202	Dynamic Statement Cache	MEMBER.STMTID
00002000	Table space CS-claim class	DB.SP
00002001	Table space RR-claim class	DB.SP
00002002	Table space write-claim class	DB.SP
00002003	Index space CS-claim class	DB.SP
00002004	Index space RR-claim class	DB.SP
00002005	Index space write-claim class	DB.SP
00002006	Table space partition CS-claim class	DB.SP.PT
00002007	Table space partition RR-claim class	DB.SP.PT

Table 43. Resource Types (continued)

TYPE Code	Type of Resource	Name, Content, Format
00002008	Table space partition write-claim class	DB.SP.PT
00002009	Index space partition CS-claim class	DB.SP.PT
00002010	Index space partition RR-claim class	DB.SP.PT
00002011	Index space partition Write-claim class	DB.SP.PT
00002100	Table space DBET entry	DB.SP
00002101	Index space DBET entry	DB.SP
00002102	Table space partition DBET entry	DB.SP.PT
00002103	Index space partition DBET entry	DB.SP.PT
00002104	Logical partition DBET entry	DB.SP.PT
00002105	DBET hash chain lock timeout	INTERNAL LOCK NN DP.SP, DBID.PSID, or none
00002200	Routine parameter storage	DBP
00002201	Debug agent storage	DBP
00002300	ICSF encryption and decryption facilities	
00002301	True random number generation features of IBM z14 or later hardware	
00003000	Code (release maintenance_level or system parameter)	REL, APAR, ZPARM
00003002	Number of Stored Procedures	
00003072	Index	
00003073	Index	
00003328	Release dependency	
00003329	DBID/OBID	DI.OI
00003330	OBID limit exceeded	
00003840	LOB column	
00004000	Profile exception threshold exceeded	PID.PTYPE.PNAME
00004001	Access list entry	ALET

The following table contains the definitions for the acronyms provided for the "Name, Content, Format" column of the preceding table, [Table 43 on page 1393](#).

Table 44. Definitions for resource type name, content, and format

Where	Stands for
AI	Hash anchor ID
ALIAS	Alias owner
APAR	APAR number
AUTHORIZATION ID	Db2 authorization identifier

Table 44. Definitions for resource type name, content, and format (continued)

Where	Stands for
BP	Buffer pool identifier
CN	Column name
COLLECTION	Collection-ID of the package
COLN	Column number within the base table of the LOB column that has been marked invalid.
CONTOKEN	Consistency token of the package
CR	Creator of the object
DB ^{"1" on page 1399}	Database name
DBP	Database procedure name
DI	DBID in decimal of resource
DIX	DBID in hexadecimal
DOMAIN	TCP/IP domain name or IP address
DSN	Data set name
FDBK2	VTAM secondary return code
GBP	Group buffer pool name
IC	ICF catalog alias name
IX	Index name
LOCATION	Location in which the specified resource is not available
LU	Logical unit name
MEMBER	Group member name
MODE	Logical unit mode name
MP	Hexadecimal mini-page number
NN	Decimal number of the hash chain
OI	OBID in decimal of resource
OWNER	Alias owner
PACKAGE	Package identifier
PG	Hexadecimal page number
PID	Profile ID
PIX	PSID in hexadecimal
PL	Plan identifier
PNAME	The name of the profile filtering scope
PT	Decimal partition number
PTYPE	The type of the profile filtering scope
RCPRI	APPC primary return code

Table 44. Definitions for resource type name, content, and format (continued)

Where	Stands for
RCSEC	APPC secondary return code
RD ^{"2" on page 1399}	Db2 release dependency mark
REL	Db2 release name
RELDEP	Db2 release dependency mark
RID	Record Identifier
RTNCD	VTAM primary return code
SENSE	SNA sense codename
SERVER	Accelerator server name
SG	Storage group name
SP	Space name
STMTID	The identifier of the statement in the dynamic statement cache.
SZ	Temporary file page size
ST	Space allocation type in work file database. This type is used when the value of the WFDBSEP subsystem parameter is YES. When this type (ST) is used with resource type 00000100 and reason code 00C90084, message DSNT501I specifies the missing resource name as Db2-MANAGED SPACE WITHOUT SECONDARY ALLOCATION OR USER-MANAGED SPACE. This resource name implies either an segmented (non-universal) table space that is managed by Db2 and has a SECQTY value of 0 or any user-managed table space. When this type (ST) is used with resource type 00000200 and reason code 00E7009A, SQLCODE -904 specifies the missing resource name as Db2-MANAGED SPACE WITH SECONDARY ALLOCATION. This resource name implies either a partition-by-growth table space regardless of the SECQTY value or a table space that is segmented (non-universal) with a non-zero value for SECQTY. For more information, see: SEPARATE WORK FILES field (WFDBSEP subsystem parameter) (Db2 Installation and Migration) DSNT501I (Db2 Messages) "-904" on page 227
TB	Table name
TS	Table space name
VERSION	Version identifier of the package

Table 44. Definitions for resource type name, content, and format (continued)

Where	Stands for
VW	View name

Notes:

1. DB can also refer to DI or ST. SP, TS, and TB can also refer to OI. TS can also refer to ST. Db2 sometimes does not have access to resource names, and uses DBID or OBID instead.
2. RD can be represented as a white space or blank to indicate no release dependency, or Y or N to indicate whether it is IBMREQD.

Appendix G. Service task plan names in Db2 for z/OS

Db2 service tasks use plan names.

Table 45. Db2 system plan names

Plan name	Usage
'ACT' + X'000000000000'	The plan for authorization
'AUTOSPCT'	The plan for a thread that invokes an autonomous procedure
'BCT' + X'000000000000'	The plan for unallocated threads and Db2 service tasks
'DISTSERV'	The plan for a database access thread from an application using DRDA access
'DSNBIND' + X'00'	The plan for bind
'DSNUTIL'	The plan for utilities
'STARTCT' + X'00'	The plan for start-up
'?RRSAF '	The plan name for RRSAF CREATE THREAD with the <i>collection</i> parameter

Appendix H. ABEND codes associated with DSN1COPY misuse

Several of the 00C9... codes are frequently associated with improper use of the DSN1COPY utility.

The following tables represent the possible combinations of ABEND reason codes, CSECT-names, and ERQUAL values that can result from the improper use of DSN1COPY. Improper use includes, but is not limited to:

- Specifying the wrong OBIDXLAT values
- Not restoring all the data sets of the table space or index space to the same level
- Restoring data sets to a level that does not match the definition in the catalog and directory
- Restoring one table space type to a different type, such as segmented to simple

These tables are not meant to be exhaustive, but contains the more common codes, or those that are likely to have been caused by DSN1COPY misuse. However, this does not eliminate the possibility that the occurrence of these ABEND codes can be caused by other errors, such as an inconsistent DBD, or a Db2 internal error. The numbers in each Explanation column refer to the notes that follow the last table.

Table 46. ABEND reason code 00C90101

Notes

The following explanations are groups of inconsistencies that relate to the ABEND codes. Items 1 through 7 apply to user table spaces. Items 8 through 13 apply to index spaces. Within each group are examples of specific inconsistencies representing each group.

1. Record or field length in the data does not match the length in the OBD:
 - Either the fixed lengths do not match, or the variable length of the record is greater than the maximum allowed in the OBD.
2. Record OBID in the data does not agree with the OBD:
 - OBD corresponding to the OBID from the data cannot be found in the DBD, or the OBD in the DBD is of a different type.
3. Number of columns in the data row does not match the OBD definition:
 - An ALTER ADD COLUMN was performed, but the copy of the data is downlevel with respect to the ALTER ADD DBD.
4. Index does not match the data:
 - Either the index entry does not exist for the data record, or the index entry points to a missing or bad data record.
5. Data in one table space is inconsistent with related data in another table space:
 - Referential integrity; parent and dependent are in different table spaces.

6. Table space definition in the OBD is inconsistent with the data:
 - SEGSIZES do not match.
 - Table space type is different (simple restored into segmented).
 - Segment anchor in the OBD points to an invalid first segment (segment not allocated).
7. Table space is inconsistent within itself:
 - Not all data sets are restored to the same level.
 - Broken segment chains.
 - Base and overflow records are not consistent.
8. Total key length in the index page or entry does not match the key length in the OBD:
 - Index data restored with the wrong index or downlevel index.
9. Key length derived from data passed into the Index Manager does not match the length in the index page or entry:
 - Data or index restored to inconsistent states.
10. Index OBID in the index does not agree with the OBD:
 - OBD corresponding to the OBID from the index cannot be found in the DBD, or the OBD in the DBD is of a different type.
11. Index space definition in the OBD is inconsistent with the index data:
 - Inconsistent subpage directory.
 - Cannot find the key in the partition high-key directory.
 - Keys not found.
12. Index space is inconsistent within itself:
 - Not all data sets are restored to the same level.
 - Index entry not connected to the root page.
13. Log RBA is unavailable for the associated table space or index space.

Information resources for Db2 for z/OS and related products

You can find the online product documentation for Db2 13 for z/OS and related products in IBM Documentation.

For all online product documentation for Db2 13 for z/OS, see [IBM Documentation](https://www.ibm.com/docs/en/db2-for-zos/13) (<https://www.ibm.com/docs/en/db2-for-zos/13>).

For other PDF manuals, see PDF format manuals for Db2 13 for z/OS (https://www.ibm.com/docs/en/SSEPEK_13.0.0/home/src/tpc/db2z_pdfmanuals.html).

Notices

This information was developed for products and services offered in the US. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

*IBM Director of Licensing IBM Corporation

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions:

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Statement at <http://www.ibm.com/privacy>.
